Nürnberg trials (1945–46) Trials of former NAZI PARTY leaders held in Nürnberg, Ger. At the end of World War II, the International Military Tribunal was established by the U.S., Britain, France, and the Soviet Union to indict and try former Nazis as war criminals. The tribunal defined the offenses as crimes against peace (planning and waging of war in violation of treaties), crimes against humanity (extermination, deportation, and GENOCIDE), and WAR CRIMES. After 216 court sessions, 3 of the original 22 defendants were acquitted, 4 (including KARL DÖNITZ and ALBERT SPEER) were sentenced to prison for terms of 10 to 20 years, 3 (including RUDOLF HESS) were sentenced to life imprisonment, and 12 (including WILHELM KEITEL, JOACHIM VON RIBBENTROP, ALFRED ROSENBERG, ARTHUR SEYSS-INQUART, and JULIUS STREICHER) were sentenced to death by hanging. HERMANN GÖRING committed suicide before he could be executed, and MARTIN BORMANN was convicted in absentia.

Nurse, Sir Paul M. (b. Jan. 25, 1949, Norwich, Norfolk, Eng.) British scientist. He earned a Ph.D. from the University of East Anglia in 1973 and was a professor at the University of Oxford from 1987 to 1993. In 1996 he was named director general of the Imperial Cancer Research Fund (now Cancer Research UK). In the mid-1970s he conducted research on yeast and discovered the gene that regulates different phases of the cell cycle. He later found the corresponding gene in humans. His work aided in the understanding of cancer cell development. Nurse shared a Nobel Prize with R. TIMOTHY HUNT and LELAND H. HARTWELL in 2001.

nurse shark Only Atlantic species (*Ginglymostoma cirratum*) of 25 carpet SHARK species (family Orectolobidae). Yellow- or gray-brown, sometimes with dark spots, it may grow to over 13 ft (4 m) long. It may attack swimmers, especially when provoked, but is not related to the dangerous gray nurse (*Odontaspis arenarius*), a SAND SHARK.

nursery Place where plants are grown for transplanting, for use as stocks for budding and grafting, or for sale. Nurseries produce and distribute woody and herbaceous plants, including ornamental trees, shrubs, and bulb crops. While most nursery-grown plants are ornamental, the nursery business also includes fruit plants and certain PERENNIAL vegetables used in home gardens (e.g., asparagus, rhubarb). See also FLORICULTURE.

nursery rhyme Verse customarily told or sung to small children. Though the oral tradition of nursery rhymes is ancient, the largest number date from the 16th, 17th, and (most frequently) 18th centuries. Apparently most rhymes were originally composed for adults, many as popular ballads and songs. The earliest known published collection is *Tommy Thumb's* (*Pretty*) *Song Book* (1744), including "Little Tom Tucker," "Sing a Song of Sixpence," and "Who Killed Cock Robin?" The most influential collection was *Mother Goose's Melody* (1781), including "Jack and Jill," "Ding Dong Bell," and "Hush-a-bye Baby on the Tree Top."

nursing Health-care profession providing physical and emotional care to the sick and disabled and promoting health in all individuals through activities including research, health education, and patient consultation. Nursing gained recognition in the 19th century with the activities of FLORENCE NIGHTINGALE. Many nurses have specialties (e.g., psychiatry, critical care). Nurse-practitioners, clinical nurse specialists, nurse-anesthetists, and nurse-midwives undertake tasks traditionally performed by physicians. Nursing degrees go as high as the doctorate, and staff positions include administration. In addition to health-care settings, nurses practice in schools, the military, industry, and private homes. Community (public health) nurses educate the public on topics such as nutrition and disease prevention.

nursing home Facility for care (usually long-term) of patients who are not sick enough to need hospital care but are not able to remain at home. Historically, most residents were elderly or ill or had chronic irreversible and disabling disorders, and medical and nursing care was minimal. Today nursing homes have a more active role in health care, helping patients prepare to live at home or with a family member when possible. They help conserve expensive hospital facilities for the acutely ill and improve the prospects of the chronically disabled. However, quality of care varies widely, and the potential for abuse exists.

Nuṣayriyyah See ʿALAWIYYAH

Nut \ˈnůt\ In EGYPTIAN RELIGION, a goddess of the sky. She represented the vault of the heavens and was often depicted as a woman arched over the earth god GEB. Nut was believed to swallow the sun in the evening and to give birth to it again in the morning. She was sometimes portrayed as a cow, the form she took to carry the sun god, RE, on her back to the sky. On five days preceding the New Year, Nut gave birth successively to the deities OSIRIS, HORUS, SETH, ISIS, and Nephthys.

nut Dry, hard, one-seeded FRUIT consisting of a kernel, usually oily, surrounded by a hard or brittle shell that does not split open at maturity. Nuts include CHESTNUTS, FILBERTS, and WALNUTS; but other so-called nuts are botanically seeds (BRAZIL NUT, PISTACHIO), LEGUMES (PEANUT), or drupes (ALMOND and COCONUT). Most edible nuts are well known as dessert nuts. Some nuts are sources of oil or fat. Not all nuts are edible; some are used for ornament.

© 2006 Encyclopædia Britannica, Inc.

nut In technology, a fastening device consisting of a square or hexagonal block, usually of metal, with a hole in the centre having internal, or female, threads that fit on the male threads of an associated BOLT or SCREW. Bolts or screws with nuts are widely used for fastening machine and structural components. See also FASTENER.

nuthatch Any of about 22 species (genus *Sitta*, family Sittidae) of songbirds that are 4–7.5 in. (9.5–19 cm) long and have a short, square tail, short neck, and thin, pointed bill. Most are forest dwellers; some live in rocky areas. Nuthatches search tree trunks and rocks for insects, often descending headfirst. They also eat seeds, which they may store for winter. The nest is a grass- or hair-lined cavity. Nuthatches are most common from Eurasia to Japan and southward; four species occur in North America. Most are bluish above and white or reddish below; there may be a black eye stripe or a cap.

European nuthatch (*Sitta europaea*)
BRUCE COLEMAN LTD.

nutmeg Spice made from the seed of a tropical tree (*Myristica fragrans*), native to the Moluccas of Indonesia. It has a distinctive pungent fragrance and is used in cooking and sachets and as incense. The tree yields fruit eight years after sowing, reaches its prime in 25 years, and bears fruit for 60 years or longer. The name nutmeg is also applied in different countries to other fruits or seeds, including the Brazilian nutmeg (*Cryptocarya moschata*), the Peruvian nutmeg (*Laurelia aromatica*), and the California nutmeg (*Torreya californica*).

Nutmeg (*Myristica fragrans*)
G.R. ROBERTS

nutria *or* **coypu** Semiaquatic South American RODENT (*Myocastor coypus*) in the hutia family (Capromyidae). The nutria has small ears, a long, rounded, scaly tail, partially webbed hind feet, and broad orange incisors. It is about 40 in. (1 m) long, including the tail, and may weigh 18 lbs (8 kg). Its reddish brown fur consists of coarse guard hairs overlying a soft undercoat. The nutria lives in a shallow burrow along a pond or river and mainly eats aquatic plants. Because their fur is valuable, nutrias were introduced into North America and Europe, and in some places have become pests that damage crops and compete with other wildlife.

Nutria (*Myocastor coypus*) feeding.
DOUGLAS FISHER

nutrition Processes of taking in and utilizing food substances. Food generates energy and supplies materials used in body tissues and processes. CALORIES are supplied by CARBOHYDRATES (SUGARS and STARCHES), FATS, and PROTEINS. Other nutrients include minerals, VITAMINS, and dietary FIBRE. Minerals are used in many ways—IRON for HEMOGLOBIN; CALCIUM for bones, teeth, and cellular processes; SODIUM and POTASSIUM to regulate HOMEOSTASIS, IODINE to produce thyroid HORMONES. Trace minerals have functions that are less well-understood. Fibre is not broken down chemically in the body but aids DIGESTION, lowers blood CHOLESTEROL, and may help prevent some CANCERS and HYPERTENSION. Different amounts of these nutrients exist in different foods; a varied diet ensures an adequate supply. Nutritional supplements, required by some people, do not compensate for an unhealthy diet. Sufficient WATER is always essential. Inadequate nutrient intake or absorption leads to MALNUTRITION and disease.

Nuuk \'nük\ *or* **Godthåb** \'gôt-ˌhȯp\ City (pop., 2000 est.: 13,838), capital of GREENLAND. Located on the southwestern coast near the mouth of Godthåb Gulf, it is Greenland's main port. The modern city dates from 1721, when a Norwegian missionary founded a colony near the site of Vesterbygden, a 10th-century Norse settlement. It is the seat of the parliament and supreme court and has foreign consulates, a teachers' college, and research stations. Government administration, hunting, fishing, and farming are the main occupations. Most transportation is by boat or helicopter.

Nüwua *or* **Nu Kua** \'nüē-'gwä\ In Chinese mythology, the patroness of matchmakers. As wife or sister of the legendary emperor Fuxi, she helped establish norms for marriage (including the use of go-betweens) and regulated conduct between the sexes. She is represented with a human head and the body of a snake or fish. She repaired the pillars of the heavens and the broken corners of the earth, which the rebel Gong Gong had destroyed in a fit of anger, and her beautiful palace was said to be the prototype for the walled cities of China.

Nyakyusa \nyȧk-'yü-sə\ *or* **Ngonde** \əŋ-'gȯn-dā\ Bantu-speaking people living north of Lake MALAWI in Tanzania, and in Malawi. They speak a BANTU LANGUAGE of the Niger-Congo family. Traditionally they lived in unique age villages. All the boys of a district aged 11–13 would leave their paternal homes and establish a new hamlet, eventually marrying and bringing their wives there; their native village would die as its founders died in old age. With modern land shortages, this practice has largely stopped. The Nyakyusa, who are primarily hoe cultivators, number more than one million.

nyala \nē-'ä-lə\ Slender ANTELOPE (*Tragelaphus angasi*) of South Africa having a crest of hair along the back from head to tail and standing 3.5 ft (110 cm). The male, which has loosely spiraled horns and a long fringe on the throat and underparts, is dark brown with reddish brown on the lower legs, white on the face and neck, and vertical white stripes on the body. The female is reddish brown with more conspicuous striping. Nyalas live alone or in small groups in forests. The rare mountain nyala (*T. buxtoni*) of central Ethiopia is grayish brown.

Nyasa, Lake See Lake MALAWI

Nyasaland See MALAWI

Nyaya \'nyä-yə\ One of the six DARSHANS (orthodox systems) of Indian philosophy, important for its analysis of logic and epistemology and for its detailed model of the reasoning method of inference. Like other darshans, Nyaya is both a philosophy and a religion; its ultimate concern is to bring an end to human suffering, which results from ignorance of reality. It recognizes four valid means of knowledge: perception, inference, comparison, and testimony.

Nyerere \ni-'rar-ē**, Julius (Kambarage)** (b. March 1922, Butiama, Tanganyika—d. Oct. 14, 1999, London, Eng.) First prime minister of independent Tanganyika (1961), first president of Tanzania (1964–85), and the major force behind the ORGANIZATION OF AFRICAN UNITY (OAU; now African Union). He taught in Catholic schools before studying history and economics in Britain. As leader of the Tanganyika African National Union (TANU), he advocated peaceful change, social equality, and ethnic harmony. In elections in 1958–60 TANU won many seats in the legislature. As president he collectivized village farmlands, carried out mass literacy campaigns, and instituted universal education. He sought to make Tanzania economically self-sufficient, an effort that ultimately failed. In 1979 he authorized the invasion of Uganda to overthrow IDI AMIN. Within the OAU he advocated the overthrow of white-supremacist governments in South Africa, Rhodesia, and South West Africa. After retiring from politics in 1990, Nyerere devoted the rest of his life to farming and diplomacy.

Nyerere, 1981
HANOS/LIAISON AGENCY

Nyiragongo \ˌnyē-rä-'gȯŋ-gō**, Mount** Active volcano, VIRUNGA MOUNTAINS, east-central Africa. It lies in the volcano region of VIRUNGA NATIONAL PARK, eastern Congo (Kinshasa), near the border with Rwanda. It is 11,385 ft (3,470 m) high, with a main crater 1.3 mi (2 km) wide and 820 ft (250 m) deep containing a liquid lava pool. Some older craters are noted for their plant life.

Nykvist \'nüē-kvist,\ *English* \'nī-kvist**, Sven** (b. Dec. 3, 1922, Moheda, Swed.) Swedish cinematographer. He joined the Swedish movie

© 2006 Encyclopædia Britannica, Inc.

company Sandrews in 1941, shot his first film in 1945, and his first for INGMAR BERGMAN in 1953. He became Bergman's regular cinematographer at Svensk Filmindustri in 1960. Best known for his subtle, luminous camera work in a long series of Bergman films, he won Academy Awards for *Cries and Whispers* (1972) and *Fanny and Alexander* (1983). With U.S. directors, he shot movies such as *The Unbearable Lightness of Being* (1988) and *Crimes and Misdemeanors* (1989).

nylon Any synthetic PLASTIC material composed of polyamides of high MOLECULAR WEIGHT and usually, but not always, manufactured as a fibre. Nylons were developed by Du Pont in the 1930s. The successful production of a useful fibre by chemical synthesis from compounds readily available from air, water, and coal or petroleum stimulated expansion of research on POLYMERS, leading to a rapidly growing family of synthetics. Nylon can be made to form fibres, filaments, bristles, or sheets to be manufactured into YARN, TEXTILES, and cordage, and it can also be formed into molded products. It has high resistance to wear, heat, and chemicals. Most applications are in the form of filaments in such articles as hosiery, parachutes, and outerwear. See also W. H. CAROTHERS.

nymph In GREEK MYTHOLOGY, any of a large class of minor female divinities. Nymphs were usually associated with features of the natural world, such as trees and water. Though not immortal, they were extremely long-lived, and they tended to be well disposed toward humans. They were grouped according to the sphere of nature with which they were connected.

nymph In entomology, the sexually immature form of insects that undergo incomplete METAMORPHOSIS (e.g., GRASSHOPPERS). The nymph is similar to the adult but differs in body proportions and (in winged species) has only wing buds, which develop into wings after the first few molts (see MOLTING). During each successive growing stage (instar), the nymph begins to resemble the adult more closely. The nymphs of aquatic species (also called naiads), such as DRAGONFLIES, have gills and other modifications for an aquatic existence. At maturity, they float to the surface or crawl out of the water, undergo a final molt, and emerge as winged adults.

nymphaeum \nim-ˈfē-əm\ Ancient Greek and Roman sanctuary consecrated to water nymphs. Nymphaea also served as reservoirs and assembly chambers for weddings. The name, originally denoting a natural grotto with springs, later referred to an artificial grotto or building filled with plants, sculpture, fountains, and paintings. Nymphaea existed at Corinth, Antioch, and Constantinople, and remains have been found in Rome, Asia Minor, Syria, and northern Africa.

Nymphenburg porcelain German hard-paste, or true, PORCELAIN produced in Bavaria from the mid-18th century to the present day. Its fame rests on its figures, particularly those in the ROCOCO STYLE modeled between 1754 and 1763 by Franz Anton Bustelli (1723–1763). Tableware and vases produced at the factory in Nymphenburg, on the outskirts of Munich, often contain ozier, or basketwork, pattern borders.

Nyoro \ˈnyȯr-ō\ *or* **Bunyoro** Bantu-speaking people of west-central Uganda. Until the 18th century the Bunyoro kingdom included present-day Uganda. It declined in the 18th and 19th century, surrendering its preeminence to the BUGANDA kingdom. It was brought into the Uganda Protectorate by the British. Today the Nyoro, numbering about 700,000, live in scattered settlements and cultivate millet, sorghum, and plantains.

Nystad, Treaty of See SECOND NORTHERN WAR

Oahu \ō-'wä-hü\ Island (pop., 2000: 876,165) of Hawaii, U.S. Situated between the islands of Kauai and Molokai, it occupies 607 sq mi (1,574 sq km) and is the third largest and most densely populated of the Hawaiian Islands. Of volcanic origin, it has two parallel mountain groups, the Koolau Range and Waianae Ranges, which are connected by a central plateau. It is the site of Honolulu, Pearl Harbor, and Waikiki. Military installations, tourism, pineapples, and sugar are important to its economy.

oak Any of about 450 species of ornamental and timber trees and shrubs that make up the genus *Quercus* in the beech family, found throughout temperate climates. Oaks are deciduous trees that bear spring catkins (male flowers) and spikes (female flowers) on the same tree. The leaves have lobed, toothed, or smooth margins. The fruit is the acorn. They are hardy and long-lived shade trees. White oaks have smooth leaves and rapidly germinating sweet acorns; red, or black, oaks have bristle-tipped leaves and bitter, hairy acorns. Red- and white-oak lumber is used in construction, flooring, furniture, millwork, barrel making, and the production of crossties, structural timbers, and mine props. The genus includes many ornamentals and natural hybrids.

Oakland City (pop., 2000: 399,484), western California, U.S., on the eastern side of San Francisco Bay. Settled by the Spanish in 1820, it was incorporated as a city in 1854. In 1869 it was chosen as the terminus of the first transcontinental railroad, which led to the development of its deepwater port. It suffered damage and loss of life in the earthquake of 1989, which also damaged the Bay Bridge that connects it with San Francisco. Lake Merritt, near the central business district, is a wildfowl refuge surrounded by parkland. Several colleges are located in Oakland.

Oakley, Annie *orig.* **Phoebe Anne Moses** (b. Aug. 13, 1860, Darke county, Ohio, U.S.—d. Nov. 3, 1926, Greenville, Ohio) U.S. sharpshooter. As a child she won acclaim for her marksmanship. She later toured vaudeville circuits with her marksman husband, Frank Butler. In 1885 they joined Buffalo Bill's Wild West Show; she was one of the show's star attractions for most of the next 16 years. Oakley's famous act included shooting off the end of a cigarette held in Butler's lips, hitting the thin edge of a playing card from 30 paces, and shooting distant targets while looking into a mirror. In 1887 she was presented to Queen Victoria, and later in Berlin she performed her cigarette trick with, at his insistence, Crown Prince William (later Kaiser William II) holding the cigarette.

OAS See Organization of American States

oasis Fertile tract of land that occurs in a desert wherever a permanent supply of fresh water is available. Oases vary in size from about 2.5 acres (1 hectare) around small springs to vast areas of naturally watered or irrigated land. Underground water sources account for most oases; their springs and wells are supplied from sandstone aquifers whose intake areas may be more than 500 mi (800 km) away. Two-thirds of the population of the Sahara live in oases, where the date palm is the main source of food; the palm also provides shade for growing citrus fruits, figs, peaches, apricots, vegetables, and cereal grains.

Oates, Joyce Carol (b. June 16, 1938, Lockport, N.Y., U.S.) U.S. writer. Oates taught at the University of Windsor (1967–78) and Princeton University (from 1978). Beginning with the story collection *By the North Gate* (1963) and the novel *With Shuddering Fall* (1964), she wrote prolifically, often portraying people whose intensely experienced lives end in bloodshed and self-destruction owing to forces beyond their control. Her major novels include *them* (1969), *Do with Me What You Will* (1973), *Foxfire* (1993), and *Beasts* (2002). Also significant is a parodic gothic series including *Bellefleur* (1980), *A Bloodsmoor Romance* (1982), and *Mysteries of Winterthurn* (1984).

Oates, Titus (b. Sept. 15, 1649, Oakham, Rutland, Eng.—d. July 12/13, 1705, London) English fabricator of the Popish Plot. Son of a Baptist preacher, he was ordained in the Church of England. Although jailed for perjury in 1674, he became chaplain to the Protestants in the household of the Catholic 6th duke of Norfolk in 1677. In 1678, with the fanatically anti-Catholic Israel Tonge, he invented the Popish Plot, a fictitious Jesuit conspiracy to kill Charles II and place his Catholic brother James (later James II) on the throne. Oates's testimony caused some 35 persons to be executed, but inconsistencies in his story emerged, and he was convicted of perjury and imprisoned in 1685; released in 1688, he died in obscurity.

oats Hardy cereal plant (*Avena sativa*), cultivated in temperate regions, that is able to live in poor soil. The edible starchy grain is used primarily as livestock feed, but is also processed into rolled oats and oat flour for human consumption. High in carbohydrates, oats also provide protein, fat, calcium, iron, and B vitamins. Oat straw is used for animal feed and bedding.

OAU See Organization of African Unity

Oaxaca \wä-'hä-kä\ State (pop., 2000: 3,438,765), southern Mexico. Bounded by the Pacific Ocean, it occupies 36,275 sq mi (93,952 sq km) and includes most of the Isthmus of Tehuantepec. The capital is Oaxaca city. The Sierra Madre del Sur ends at the isthmus. Remains of pre-Columbian Zapotec and Mixtec structures are found at Mitla and Monte Albán. It has the largest population of Indian descent in Mexico. It is an agricultural and mining area.

Oaxaca *in full* **Oaxaca de Juárez** City (pop., 2000: 251,846), capital of Oaxaca state, southern Mexico. It lies in the fertile Oaxaca Valley, about 5,000 ft (1,500 m) above sea level. Founded in 1486 as an Aztec garrison and conquered by the Spanish in 1521, it had an important role in Mexican history and was the home of Benito Juárez and Porfirio Díaz. It is noted for its 16th-century architecture and its handicrafts.

Ob \'ȯb\ **River** River, west-central Russia. Flowing across western Siberia northwestward from the Altai Mountains of central Asia, it courses through the Gulf of Ob into the Kara Sea of the Arctic Ocean. It is about 2,268 mi (3,650 km) long. Its middle course is through taiga, swampy coniferous forest with expanses of marshland. In the north are vast stretches of icy, treeless tundra. The Ob is an important source of hydroelectric power and one of Siberia's major transportation routes during the six months of the year when it is not frozen.

Obadiah \ˌō-bə-'dī-ə\ (fl. between the 9th and 6th century BC) One of the 12 Minor Prophets in the Bible, traditional author of the book of Obadiah. The shortest book of the Hebrew scriptures, it consists of one chapter of 21 verses. (It is part of a larger book, The Twelve, in the Jewish canon.) Nothing is known of Obadiah, whose name means "servant of Yahweh (God)." He castigates Edom for failing to help Israel repel foreign invaders and announces that the Day of Judgment is near for all nations. The final verses predict the restoration of the Jews to their native land.

O'Bail, John See Cornplanter

obelisk Tapered four-sided pillar, originally erected in pairs at the entrance to ancient Egyptian temples. The Egyptian obelisk was carved from a single piece of stone, usually granite, and embellished with hieroglyphics. It was wider at its square or rectangular base than at its pyramidal top, and could be over 100 ft (30 m) high. During the Roman empire, many obelisks were transported from Egypt to Italy. A well-known modern obelisk is the Washington Monument.

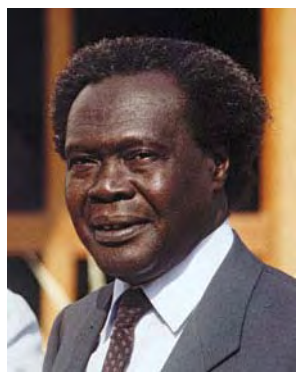
Oberammergau See Passion play

Oberlin College Private liberal arts college in Oberlin, Ohio. Founded in 1833, it was the first U.S. college to admit women and the first to admit black students on an equal footing with whites. In its early years it was a station on the Underground Railroad. It has faculties of arts, communications, foreign languages, law, letters, mathematics, psychology, public service, science, and social sciences, as well as a music conservatory.

obesity Excessive body fat. It is usually caused by sedentary habits and a diet high in fat, alcohol, or total calories. Calories consumed but not used are stored as fat. Rare causes include glandular defects and excess steroids (see Cushing syndrome). Obesity raises the risk of heart disease and diabetes mellitus. Treatment, by reducing calorie intake and increasing exercise, is best undertaken with a doctor's advice.

obia *or* **obeah** \'ō-bē-ə\ In West African folklore, a gigantic animal that steals into villages by night to kidnap girls on behalf of witches. In some Caribbean cultures the word is used to refer to overpowering and extremely evil forms of witchcraft and sorcery. Bewitched objects, bur-

© 2006 Encyclopædia Britannica, Inc.



ied with the intent of causing harm, are sometimes called obia. A person who uses the power of obia is called an obiama or obiaman.

object-oriented programming (OOP) Computer programming that emphasizes the structure of data and their encapsulation with the procedures that operate upon it. It is a departure from traditional or procedural programming. OOP languages incorporate objects that are self-contained collections of computational procedures and DATA STRUCTURES. Programs can be written by assembling sets of these predefined objects in far less time than is possible using conventional procedural languages. OOP has become extremely popular because of its high programming productivity. C++ and Objective-C (early 1980s) are object-oriented versions of C that have gained much popularity. See also JAVA.

oblation In Christianity, the offering up by the faithful of any gift for use usually by the clergy, the church, or the sick or poor. The bread and wine offered for consecration in the EUCHARIST are oblations. In the Middle Ages children dedicated to a monastery and left there to be brought up were called oblates. Later, oblates were laity who lived at or in close connection with a monastery but who did not take religious vows. Members of certain Roman Catholic communities take the title oblate (e.g., the Oblates Regular of St. Benedict).

oboe Double-reed WOODWIND INSTRUMENT. The oboe developed out of the more powerful SHAWM in the early 17th century. Intended (unlike the shawm) for indoor use with stringed instruments, its tone was softer and less brilliant. With its sweet but piercing sound, it was by the end of the 17th century the principal wind instrument of the orchestra and military band and, after the violin, the leading solo instrument of the time. The early oboe had only 2 keys, but in France by 1839 the number of keys had gradually increased to 10. With the decline in popularity of the military band, the oboe likewise declined somewhat in popularity. Today the orchestra generally includes two oboes. The oboe d'amore, an alto oboe with a pear-shaped bell, was especially popular in the 18th century; the modern alto oboe is the ENGLISH HORN.

Obote \ō-'bō-tā**, (Apollo) Milton** (b. Dec. 28, 1924, Akoroko village, Lango, Uganda—d. Oct. 10, 2005, Johannesburg, S.Af.) First prime minister (1962–70) and president (1966–71, 1980–85) of Uganda. Elected to the Legislative Council in 1958, he led his country to independence in 1962. As prime minister, he accepted a constitution that granted federal status to five traditional kingdoms, including BUGANDA, but in 1966 he sent troops under Gen. IDI AMIN to subdue Buganda's ruler, Mutesa II, and later abolished all the kingdoms. Obote was overthrown in a 1971 coup led by Amin, but, after Amin was deposed in 1979, Obote returned to Uganda and established a repressive government. He was again ousted in 1985 and eventually settled in Zambia.

Milton Obote.
PETER KEMP/AP

Obraztsov \ˌō-brəst-'sȯf**, Sergey Vladimirovich** (b. July 5, 1901, Moscow, Russia—d. May 8, 1992, Moscow) Russian puppeteer. While working as an actor in Moscow (1922–31), he gave independent vaudeville-style puppet shows. In 1931 he was chosen to be the first director of Moscow's State Central Puppet Theatre. There his performances, displaying technical excellence and stylistic discipline, established puppetry as an art form in the Soviet Union, and on worldwide tours he inspired the formation of several rod-puppet theatres. His notable productions included *Aladdin's Magic Lamp* (1940), *An Unusual Concert* (1946), and *Don Juan* (1976).

Obrecht \'ō-ˌbrekt**, Jakob** (b. Nov. 22, 1452, Bergen-op-Zoom, Brabant—d. 1505, Ferrara) Flemish composer. Little is known of his origins or education, but in 1484 he was appointed instructor of choirboys at Cambrai cathedral and then held a position in Brugge. His compositional style is notable for its warm, graceful melodies and clear harmonies. Most outstanding are his 29 masses; he also wrote about 30 motets and some secular music. Despite his contemporary renown, he had little influence on later composers, since his works were not widely distributed and his intellectual but exuberant music came to seem old-fashioned with the advent of JOSQUIN des Prez.

Obregón \ˌō-brā-'gōn**, Álvaro** (b. Feb. 19, 1880, Alamos, Mex.—d. July 17, 1928, Mexico City) President of Mexico (1920–24). A skillful military leader who fought for the moderate presidents FRANCISCO MADERO and VENUSTIANO CARRANZA during the MEXICAN REVOLUTION, he was largely responsible for the liberal constitution of 1917. In response to Carranza's increasingly reactionary policies, Obregón took a leading role in the revolt that deposed him and was himself elected president in 1920. He managed to impose relative peace and prosperity on his war-torn country. He was elected again in 1928 but was shot and killed before assuming office.

Obrenović dynasty \ȯ-'bren-ə-ˌvēᵗʸ\ Family that provided Serbia with five rulers between 1815 and 1903. Its founding member, Miloš (1780–1860), was prince of Serbia (1815–39, 1858–60). His elder son, Milan III, reigned only 26 days before dying in 1839. Miloš's second son, Michael III, was prince on two occasions (1839–42, 1860–68). A cousin, Milan IV (1854–1901), became prince in 1868 and then king of Serbia (1882–89). His son Alexander (1876–1903) succeeded him as king in 1889, but he was assassinated in 1903.

O'Brian, Patrick *orig.* **Richard Patrick Russ** (b. Dec. 12, 1914, near London, Eng.—d. Jan. 2, 2000, Dublin, Ire.) British writer. He was the eighth of nine children; an early marriage ended in divorce, and after World War II he married again, changed his name, and moved to a small, secluded coastal town in France near the Spanish border. He received little critical notice until age 54, when he began publishing his 18th-century seafaring series featuring Capt. Jack Aubrey and ship's surgeon Stephen Maturin; it eventually numbered 20 books (1969–99) and was compared with the works of HERMAN MELVILLE, ANTHONY TROLLOPE, and MARCEL PROUST.

O'Brien, Flann *orig.* **Brian Ó Nuallain** (b. Oct. 5, 1911, Strabane, County Tyrone, Ire.—d. April 1, 1966, Dublin) Irish novelist, dramatist, and newspaper columnist. Under the name Myles na gCopaleen, he wrote a column for the *Irish Times* for 26 years. He is most celebrated for the novel *At Swim-Two-Birds* (1939), a literary experiment that combines folklore, legend, humour, poetry, and linguistic games. His other novels include *The Hard Life* (1961) and *The Dalkey Archive* (1964).

O'Brien, Lawrence *in full* **Lawrence Francis O'Brien, Jr.** (b. July 7, 1917, Springfield, Mass., U.S.—d. Sept. 28, 1990, New York, N.Y.) U.S. political official. He managed JOHN F. KENNEDY's successful campaigns for the U.S. Senate (1952, 1958) and presidency (1960). He later served as Kennedy's special assistant (1961–65), as U.S. postmaster general (1965–68), as chairman of the Democratic National Committee (1968–69, 1970–73), and as commissioner of the National Basketball Association (1975–84).

O'Brien, William Smith (b. Oct. 17, 1803, Dromoland, County Clare, Ire.—d. June 18, 1864, Bangor, Caernarvonshire, Wales) Irish political insurgent. He served in the British House of Commons (1828–48) and initially supported the Anglo-Irish legislative union (see Act of UNION). In 1843 he joined the anti-union Repeal Association, and in 1846 he broke with DANIEL O'CONNELL to lead the radical Young Ireland movement. In 1848 he supported violent revolution and led an abortive insurrection in County Tipperary. Convicted of high treason, he received a death sentence that was commuted to exile in Tasmania. He was released in 1854 and pardoned in 1856.

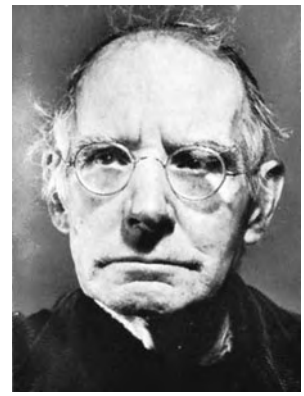
obscenity Act, utterance, writing, or illustration that is deemed deeply offensive according to contemporary community standards of morality and decency. Though most societies have placed restrictions on the content of literary and graphic works, it was not until relatively modern times that sexuality became a major focus of societal concern. One of the first systematic efforts to suppress books

© 2006 Encyclopædia Britannica, Inc.

deemed to be immoral or heretical was undertaken by the Roman Catholic church in the 16th century. Modern obscenity laws can be viewed as direct responses to the social and technological changes (e.g., the creation of the printing press and the development of the Internet) that have permitted the wide and easy distribution of sexually explicit materials. The Supreme Court of the United States has ruled that materials are obscene if they appeal predominantly to a prurient interest in sexual conduct, depict or describe sexual conduct in a patently offensive way, and lack serious literary, artistic, political, or scientific value. Material deemed obscene under this definition is not protected in the U.S. by the free-speech guarantee of the 1st Amendment. See also freedom of speech; pornography.

observatory Structure containing telescopes and other instruments for observing celestial objects and phenomena. Observatories can be classified by the part of the electromagnetic spectrum they can receive. Most are optical, observing in and near the region of the visible spectrum. Some are equipped to detect radio waves; others (space observatories) are Earth satellites and other spacecraft that carry special telescopes and detectors to study celestial sources of high-energy radiation (e.g., gamma rays, ultraviolet radiation, X-rays) from above the atmosphere. Stonehenge may have been an early predecessor of the optical observatory. Perhaps the first observatory that used instruments to accurately measure the positions of celestial objects was built c. 150 BC by Hipparchus. The first notable premodern European observatory was that at Uraniborg, built for Tycho Brahe in 1576. Observatory House, in Slough, Eng., built and operated by William Herschel (see Herschel family), was one of the technical wonders of the 18th century. Today the world's largest groupings of optical telescopes are atop Mauna Kea, in Hawaii, and Cerro Tololo, in Chile. Other major observatories include Arecibo Observatory; Mount Wilson Observatory; Palomar Observatory; and Royal Greenwich Observatory.



obsessive-compulsive disorder Mental disorder in which an individual experiences obsessions or compulsions, either singly or together. An obsession is a persistent disturbing preoccupation with an unreasonable idea or feeling (such as of being contaminated through shaking hands with someone). A compulsion is an irresistible impulse to perform an irrational act (such as repeatedly washing the hands). The two phenomena are usually, but not always, linked in the obsessive-compulsive person. Onset of the illness has been linked to malregulation of the neurotransmitter serotonin as well as to the ill effects of high stress.

obsidian Natural glass of volcanic origin that is formed by the rapid cooling of viscous lava. It has a glassy lustre and is slightly harder than window glass. It is typically jet black, but the presence of hematite (iron oxide) produces red and brown varieties, and tiny gas bubbles may create a golden sheen. It is sometimes used as a semiprecious stone. Obsidian was used by American Indians and others for weapons, implements, tools, and ornaments, and by the ancient Aztecs and Greeks for mirrors.

obstetrics and gynecology \ˌgī-nə-ˈkä-lə-jē\ Medical and surgical specialty concerned with the management of pregnancy and childbirth and with the health of the female reproductive system. Obstetrics, first practiced by midwives, developed as a medical discipline in the 17th–19th centuries, adopting the use of forceps in delivery, anesthetics, and antiseptic methods. The last two made cesarean section possible. Obstetricians confirm pregnancy, diagnose ectopic pregnancy, conduct prenatal care, perform amniocentesis, deliver babies, and perform abortions. In the late 20th century a backlash against the excessive medicalization of birth led to a revival of midwifery and encouragement of natural childbirth. Gynecologists do routine pelvic exams, take samples for Pap smears, advise on and prescribe birth control, and treat reproductive system disorders (e.g., endometriosis, hormonal imbalances, problems with menstruation and menopause). They perform surgery to prevent conception (tubal ligation), repair pelvic injuries, and remove cysts and tumours from the uterus, cervix, and ovaries. Both specialties are involved in diagnosis and treatment of infertility. See also hysterectomy.

Obuchi \ˈō-bu̇-chē**, Keizō** (b. June 25, 1937, Nakanojō, Japan—d. May 14, 2000, Tokyo) Japanese politician. A graduate of Waseda University, he was first elected to the Diet (legislature) in 1963, where he spent 12 terms, serving as chairman of the finance committee (1976) and minister for foreign affairs (1997). As Japan's prime minister (1998–2000), Obuchi had to deal with Japan's flagging economy and the related Asian economic crisis.

O'Casey, Sean *orig.* **John Casey** (b. March 30, 1880, Dublin, Ire.—d. Sept. 18, 1964, Torquay, Devon, Eng.) Irish playwright. Born to a poor Protestant family, he educated himself and worked from age 14 at manual labour. He embraced the Irish nationalist cause, changed his name to its Irish form, and became active in the labour movement and its paramilitary Irish Citizen Army. By 1915 he had turned from politics to writing realistic tragicomedies about Dublin slum dwellers in war and revolution. The Abbey Theatre produced three of his earliest and best plays—*The Shadow of a Gunman* (1923), *Juno and the Paycock* (1924), and *The Plough and the Stars* (1926)—which caused riots by Irish patriots. When his antiwar play *The Silver Tassie* was rejected by the Abbey, O'Casey moved to England, where it was produced in 1929. His later plays include *Red Roses for Me* (1946); he also published a six-volume autobiography (1939–56).

Occam's razor See Ockham's razor

occasionalism Type of mind-body dualism that maintains that apparent interactions between mental and physical events are in reality the result of God's constant causal action. Starting from Descartes's mind-body dualism, the occasionalists, whose most prominent exponents were Nicolas de Malebranche and Arnold Geulincx, drew the conclusions that there can be no interaction between mind and body, and that all causality is immanent, within one order or the other, and any appearance of mind affecting body or of body affecting mind must be explained as the result of a special intervention by God, who, on the occasion of changes in one substance, produces corresponding changes in the other.

Occitan \ˈäk-sə-ˌtan\ **language** *or* **Provençal** \ˌprō-ˌvän-ˈsäl, ˌprä-vən-ˈsäl\ **language** Romance language spoken in Occitania, a region of southern France. The 1.5 million people of this region use Occitan dialects in everyday life and French as their official and cultural language. The term *langue d'oc* is based on the use of the word *oc* for "yes." The name *Provençal* originally referred to the dialects of the Provence region, used by medieval troubadours and as a standard and literary language in France and northern Spain in the 12th–14th centuries. Today's major dialects are those of Limousin, Auvergnat, Provence, and Languedoc. Gascon, spoken in southwestern France and usually classified as an Occitan dialect, is sometimes considered a distinct language. Occitan is closely related to Catalan and, despite recent French influences, has more in common with Spanish than with French.

occultism Theories, practices, and rituals based on esoteric knowledge of the world of spirits and unknown forces. The wide range of occult beliefs and practices includes astrology, alchemy, divination, magic, and witchcraft and sorcery. Devotees of occultism seek to explore spiritual mysteries through what they regard as higher powers of the mind. The Western tradition of occultism has its roots in Hellenistic magic and alchemy (especially the Hermetic writings ascribed to Thoth) and in the Jewish mysticism associated with the Kabbala.

Occupation (of Japan) (1945–52) Military occupation of Japan by the Allied Powers after its defeat in World War II. Theoretically an international occupation, in fact it was carried out almost entirely by the U.S. under Gen. Douglas MacArthur. During the Occupation period, Japanese soldiers and civilians from abroad were repatriated to Japan, arms industries were dismantled, and political prisoners were released. Wartime leaders stood trial for war crimes, and seven were executed. A new constitution, vesting power in the people, replaced the Meiji Constitution; in it Japan renounced its right to wage war, the emperor was reduced to ceremonial status, and women were given the right to vote. The Occupation administration also carried out land reform, reducing the number of farmers who were tenants from 46% to 10%, and began the breakup of the zaibatsu (business conglomerates). Labour unions were initially encouraged, but as fears of leftist organizations grew with the advent of the Cold War, stronger governmental control of labour was supported. The education system, seen as elitist, was revised to resemble the U.S. system. Though

© 2006 Encyclopædia Britannica, Inc.

the U.S. wanted to end the Occupation in 1947, the Soviet Union vetoed a peace treaty with Japan; a treaty was signed in 1951, and the Occupation ended the following year.

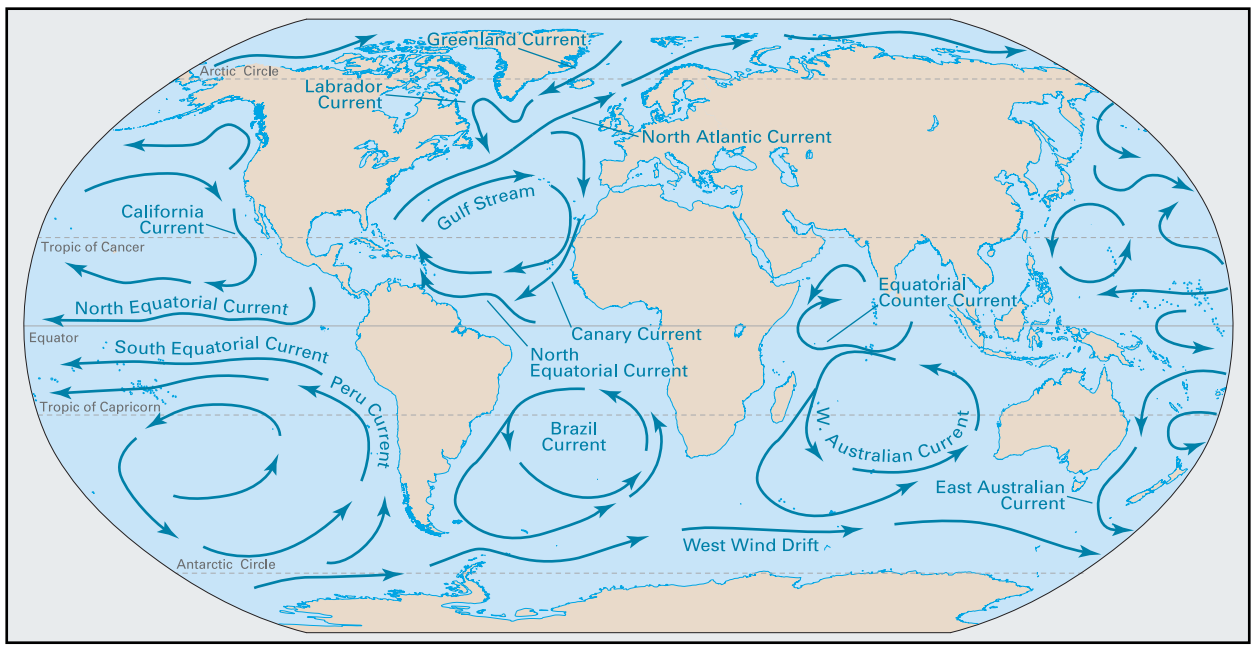
occupational disease Illness associated with a particular occupation. The Industrial Revolution's long working hours, dim light, lack of fresh air, and dangerous machinery fostered illness and injury in general, but certain occupations (e.g., mining) carry particular risks (e.g., black lung, a type of PNEUMOCONIOSIS). Twentieth-century innovations (including use of new chemicals and radioactive materials) caused an increase in certain cancers (e.g., leukemia and bone cancer in workers exposed to radiation) and injuries. So-called "sick buildings" (in which pathogens grow in air circulation systems) contribute to health problems among office workers. Occupational medicine also covers work-related emotional stresses. See also ASBESTOSIS; INDUSTRIAL MEDICINE.

occupational medicine See INDUSTRIAL MEDICINE

occupational therapy Use of activities to promote health and independence, particularly after the acute phase of illness. Such therapy is often vital for reorienting patients unable to work for long periods. Occupational therapists assess patients' abilities, tailor programs to restore physical function, and devise ways to help those with permanent limitations carry out everyday functions. See also PHYSICAL MEDICINE AND REHABILITATION.

occupational training See EMPLOYEE TRAINING

ocean Large, continuous body of salt water. Ocean covers nearly 71% of the Earth's surface and is divided into major oceans and smaller seas. The three principal oceans, the Pacific, Atlantic, and Indian, are largely delimited by land and submarine topographic boundaries. All are connected to what is sometimes called the Southern Ocean, the waters encircling Antarctica. Important marginal seas, primarily in the Northern Hemisphere, are partially enclosed by landmasses or ISLAND ARCS. The largest are the Arctic Ocean and adjacent seas, Caribbean and adjacent waters, Mediterranean, Bering Sea, Sea of Okhotsk, Yellow and China Seas, and Sea of Japan.

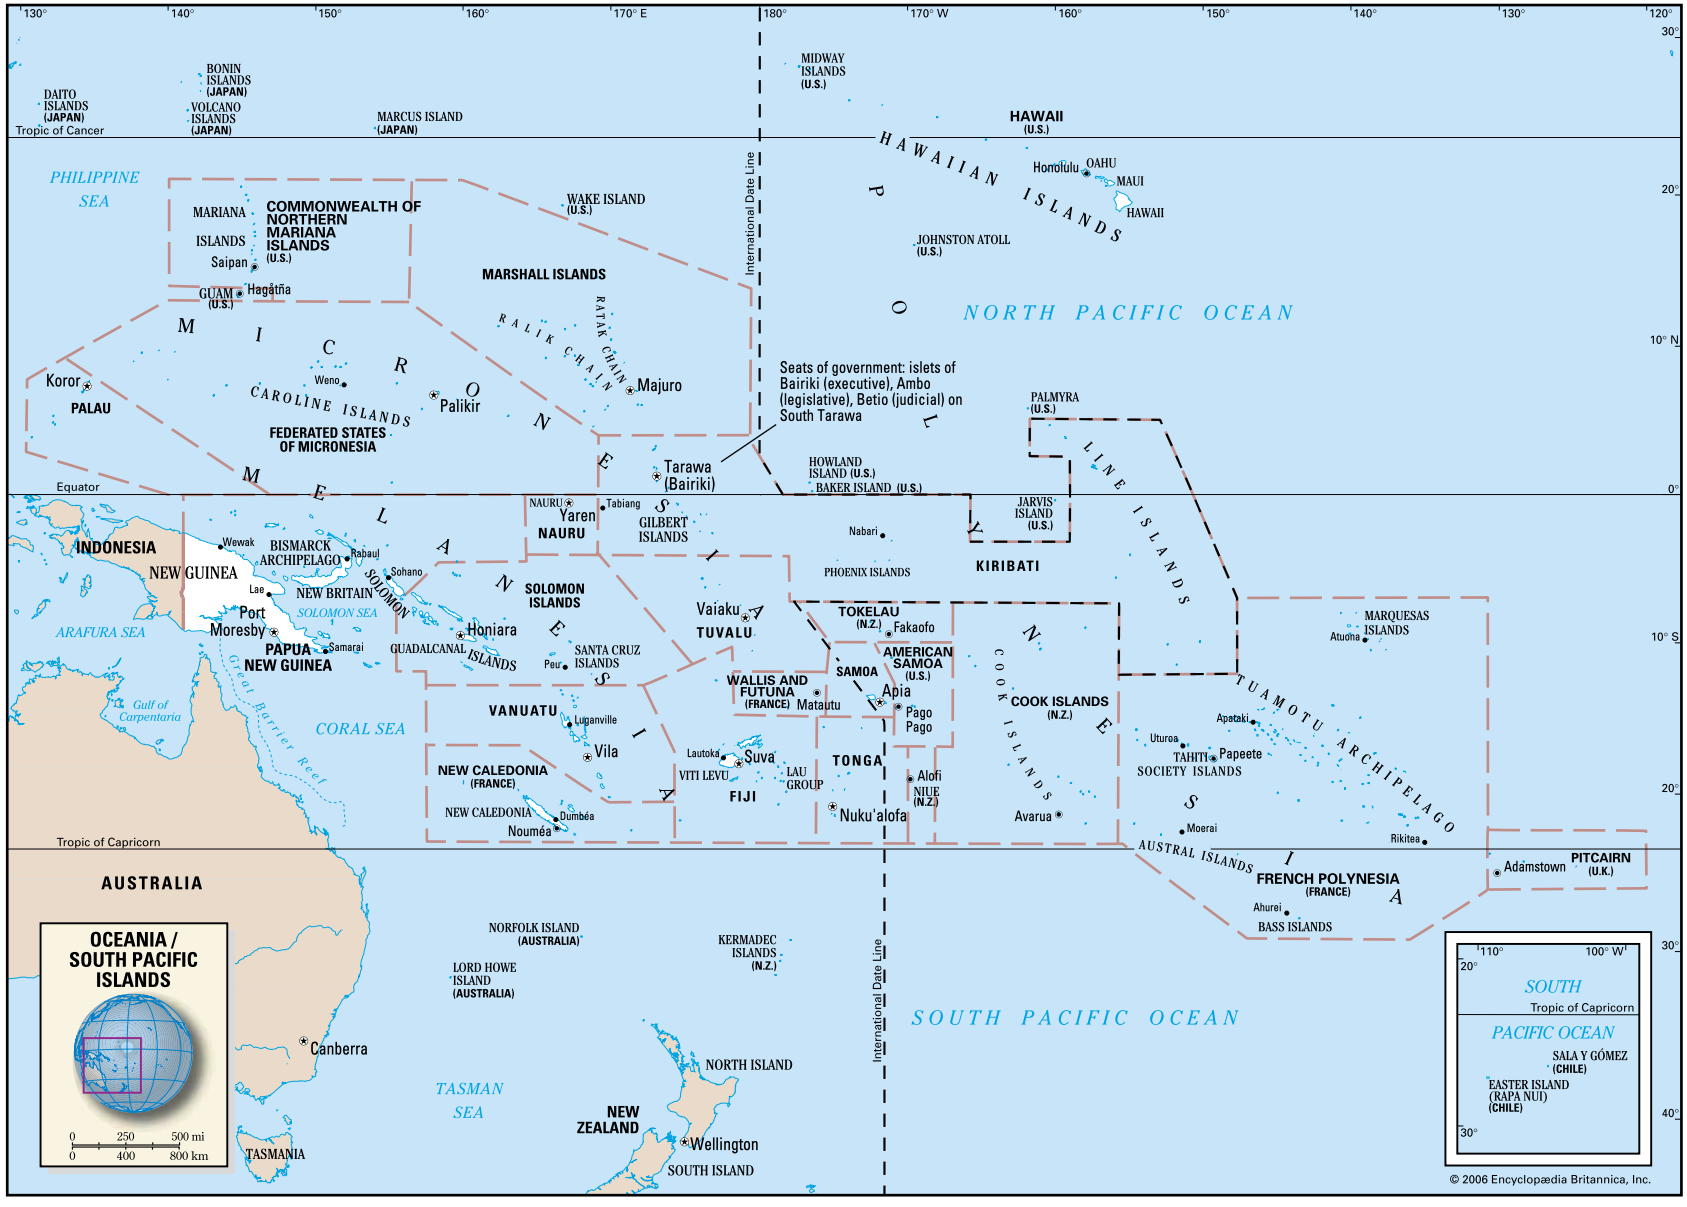


ocean current Horizontal and vertical circulation system of ocean waters, produced by gravity, wind friction, and water density variation. CORIOLIS FORCES cause ocean currents to move clockwise in the Northern Hemisphere and counterclockwise in the Southern Hemisphere and deflect them about 45° from the wind direction. This movement creates distinctive currents called gyres. Major ocean currents include the Gulf Stream–North Atlantic–Norway Current in the Atlantic Ocean, the Peru (Humboldt) Current off South America, and the West Australia Current.

ocean liner Large merchant ship that visits designated ports on a regular schedule, carrying whatever cargo and passengers are available on the date of sailing. The first liners were operated in the North Atlantic, notably by SAMUEL CUNARD of Britain, beginning in 1840. Their heyday lasted from the late 19th to the mid-20th century. Many were extraordinarily luxurious. Among the most famous were Cunarders such as the *Mauretania* and the *Queen Mary*; the German *Vaterland* (later renamed *Leviathan*), for many years the largest ship afloat; the ill-fated *TITANIC*; and the *United States*. Their reign ended in the 1960s with the rise of jet travel, but liners ranging from cruise ships to refrigerated cargo ships continued to sail.

ocean perch See REDFISH

Oceania \ˌō-shē-'a-nē-ə\ Collective name for the islands scattered throughout most of the Pacific Ocean. The term especially refers to islands of the central and southern Pacific, including those of MICRONESIA, MELANESIA, and POLYNESIA; NEW ZEALAND is often included and sometimes AUSTRALIA. In its most restricted sense, excluding Australia but including PAPUA NEW GUINEA, Oceania includes more than 10,000 islands and has a land area of about 317,000 sq mi (821,000 sq km). See map on following page.



Oceanic \ˌō-shē-'a-nik\ **arts** Literary, performing, and visual arts of the Pacific islands of OCEANIA, including Australia as well as Polynesia, Melanesia, and Micronesia. Their isolation and wide range of environmental conditions led to the development of a rich variety of artistic styles. Religion and ritual strongly influence every aspect of Oceanic life, and their association with the arts is especially close. Religious symbolism infuses not only the objects, dances, and speeches used in ritual but also the materials and tools used to create them. Oceanic literature includes both complex oral traditions and a more modern body of works written primarily in English. The traditional oral transmission of literature necessitated rhythmic cadences and stock formulas to aid memory. Favoured subjects are tales of the gods and spirits and creation myths. Musical styles are multitudinous, though all regions, with some Melanesian exceptions, emphasize vocals using instruments to produce supranormal voices. Consequently most instruments are technically crude though often elaborately decorated in keeping with their extramusical function as gifts and cult objects. Polynesian song and dance is rooted in societal structure, and chants praise chiefs or high-ranking guests while the dancers' movements

Major surface currents of the world's oceans. Subsurface currents also move vast amounts of water, but are not known in such detail.

© 2006 Encyclopædia Britannica, Inc.

© 2006 Encyclopædia Britannica, Inc.

narrate rather than act out the meaning. Australian and Melanesian dance has a historical function describing the activities of gods and ancestors—in the latter instance, dancers don elaborate costumes and masks. In all the islands the significant movements are made with the upper half of the body, while the feet merely keep time. The visual arts display ingenious use of environmental possibilities: a staggering range of materials are used, often in collage-style combination. Wood is the main artistic medium; secondary materials included clay, shell, and stone. Extant works include wooden masks, clubs, and religious effigies; carved stone sculptures; feather cloaks and helmets; and bark cloth stenciled with bold, dense geometric designs The most famous monuments of Oceanic art are the gargantuan stone figures of EASTER ISLAND. With the arrival of European colonists, the arts in these regions began to reflect European traditions and styles. See also BISJ POLE.

oceanic \ˌō-shē-'a-nik\ **plateau** *or* **submarine plateau** Large submarine elevation rising sharply at least 660 ft (200 m) above the surrounding seafloor and having an extensive, relatively flat or gently tilted summit. Most plateaus are steplike interruptions of the CONTINENTAL SLOPES. Some, however, occur well beyond the continental margins. They stand alone, high above the surrounding seafloor, and are believed to be fragments of continents that were isolated during CONTINENTAL DRIFT and SEAFLOOR SPREADING.

Oceanic religions Non-Christian religions practiced in OCEANIA. Traditional Melanesian religions, which are giving way under the pressures of Christianity and capitalism, hold that ancestral ghosts and other spirits are participants in daily life. Their presence and effects are manifested in dreams, in divination, and in human successes and failures. Magic is widely practiced, and sorcery is seen as the major cause of death and illness. The traditional religions of Micronesia, which have largely died out, recognized several high gods and many other spirits, including the spirits of ancestors and the dead. Magic played an important role. In Polynesia, each of the gods, whether high or local, had its own ritual requirements, and schools of priests were often required to carry them out. All things were believed to possess MANA, which had to be protected by complicated rules and taboos. The Polynesians often offered human sacrifices on important occasions, such as the formal investiture of a priest or chief. With the introduction of modern goods, the peoples of all these islands became susceptible to CARGO CULTS.

oceanic ridge Continuous, submarine mountain chain extending approximately 50,000 mi (80,000 km) through all the world's oceans, separating them into distinct basins. The main ridge extends down the middle of the Atlantic Ocean, passes between Africa and Antarctica, turns north to the Indian Ocean, then continues between Australia, New Zealand, and Antarctica and across the Pacific basin to the mouth of the Gulf of California. Lateral ridges extend from islands on the axis of the oceanic ridge to coasts of adjacent continents. The oceanic ridge system is the largest feature of the Earth's surface after the continents and the ocean basins themselves; it is explained by the theory of PLATE TECTONICS as a boundary between diverging plates where molten rock is brought up from deep beneath the Earth's crust. See also SUBDUCTION ZONE.

oceanic trench See DEEP-SEA TRENCH

oceanography Scientific discipline concerned with all aspects of the world's oceans and seas, including their physical and chemical properties, origin and geology, and life forms. Research entails sampling seawater and marine life, remote sensing of oceanic processes with aircraft and satellites, and exploration of the seafloor. Oceanography aids in predicting weather and climate, in exploitation of the Earth's resources, and in understanding the effects of pollutants. See also MARINE GEOLOGY.

Oceanside City (pop., 2000: 161,029), southwestern California, U.S. Located along the Pacific coast on the Gulf of Santa Catalina, north of SAN DIEGO, it is a beach resort. The city was incorporated in 1888, and its growth was spurred in 1942 by the opening of a U.S. Marine Corps base, Camp Pendleton, to the north. Nearby is the restored Mission San Luis Rey (founded 1798).

ocelot \'ä-sə-ˌlät\ Species (*Leopardus pardalis*) of CAT found in forests, grasslands, and brush-covered regions from Texas to northern Argentina. The ocelot is 36–52 in. (90–130 cm) long, excluding the 12–16-in. (30–40-cm) tail. It stands about 18 in. (45 cm) and weighs 24–35 lbs (11–16 kg). The upper body varies from whitish to tawny yellow to gray. The head, neck, and body are marked by specific patterns of black stripes and spots: spots on the head, two stripes on each cheek, oblong spots arranged in chainlike bands on the body, and bars or blotches on the tail. The ocelot hunts at night for small mammals, birds, reptiles, and fish. It is listed as an endangered species in the U.S.

Ocelot (*Felis,* or *Leopardus, pardalis*).
WARREN GARST/TOM STACK AND ASSOCIATES

Ochoa, Ellen (b. May 10, 1958, Los Angeles, Calif., U.S.) U.S. astronaut. She earned a master's degree (1981) and a doctorate (1985) in electrical engineering at Stanford University. Specializing in the development of optical systems, she later helped create several systems and methods that were awarded patents. In 1990 Ochoa was selected to participate in NASA's astronaut program, and the following year she completed her training to become the first Hispanic female astronaut. In April 1993 she served as mission specialist aboard the shuttle *Discovery*. Ochoa's later missions included traveling to the International Space Station in 1999 and 2002.

Ochoa \ō-'chō-ə**, Severo** (b. Sept. 24, 1905, Luarca, Spain—d. Nov. 1, 1993, Madrid) Spanish-born U.S. molecular biologist. He received his M.D. and subsequently studied in Germany and Britain before immigrating to the U.S. in 1941, where he taught principally at New York University. In 1955, while researching high-energy phosphates, he discovered an enzyme in bacteria that enabled him to synthesize RNA. The enzyme normally breaks down RNA, but in a test tube it runs its natural reaction in reverse. It has been valuable in enabling scientists to understand and recreate the process whereby the hereditary information contained in genes is translated into enzymes that determine each cell's functions and character. With ARTHUR KORNBERG he received a 1959 Nobel Prize.

Ochs \'äks**, Adolph Simon** (b. March 12, 1858, Cincinnati, Ohio, U.S.—d. April 8, 1935, Chattanooga, Tenn.) U.S. newspaper publisher. Ochs grew up in Tennessee, where he worked for various newspapers. At age 20 he borrowed $250 to become proprietor of the moribund *Chattanooga Times*, which he developed into one of the South's leading newspapers. He gained control of the financially faltering *NEW YORK TIMES* in 1896. Despising YELLOW JOURNALISM, he adopted the slogan "All the News That's Fit to Print" and emphasized comprehensive and trustworthy news gathering. Under his ownership the *Times* became one of the world's outstanding newspapers. From 1900 he was a director of the ASSOCIATED PRESS. Ochs's son-in-law, ARTHUR H. SULZBERGER, was the first in a succession of family heirs to lead the New York Times Co.

Ockeghem \'ō-kə-gem**, Johannes** *or* **Jean d'Ockeghem** (b. c. 1410—d. Feb. 6, 1497, Tours, France?) Flemish composer and singer. He is first mentioned as a member of an Antwerp choir in 1443. He held a series of posts in the Low Countries and France; he may have been associated with Gilles Binchois (c. 1400–60) and GUILLAUME DUFAY, and Antoine Busnois (c. 1430–92) may have been his student. Though universally admired, his output over a career of more than 50 years was small, comprising 14 mass cycles, about 10 motets, and about 20 chansons. His richly sonorous works often reflect intricate structural principles.

Ockham \'ä-kəm**, William of** *or* **William of Occam** (b. c. 1285, Ockham, Surrey?, Eng.—d. 1347/49, Munich, Bavaria) English Franciscan philosopher, theologian, and political writer. A late Scholastic thinker, he is regarded as the founder of a form of nominalism, the school of thought that denies that UNIVERSALS have any reality apart from the individual things signified by the universal or general term. He is also remembered as the originator of the medieval rule of logical economy known as OCKHAM'S RAZOR. He was excommunicated by Pope JOHN XXII for his defense of the Franciscan notion of poverty and the rights of the empire against the papacy.

Ockham's razor Methodological principle of parsimony in scientific explanation. Traditionally attributed to William of OCKHAM, the principle prescribes that entities are not to be multiplied beyond necessity. In practice, this means that if a phenomenon can be explained without assuming

© 2006 Encyclopædia Britannica, Inc.

the existence of an entity, then philosophers and scientists should not assume the entity's existence. The history of science provides many examples of the principle's application (e.g., the rejection by scientists of the hypothesis of a luminiferous ether in response to Albert Einstein's Special Theory of Relativity). See also materialism.

Ocoee \ō-'kō-ē\ **River** River, rising in the Blue Ridge in northeastern Georgia and flowing through southeastern Tennessee, U.S. In northern Georgia it is called the Toccoa River; at the Blue Ridge Dam its waters form Blue Ridge Lake. Three other dams on the river are all in Tennessee. The four dams are run by the Tennessee Valley Authority. The river is about 70 mi (115 km) long.

O'Connell, Daniel *known as* **the Liberator** (b. Aug. 6, 1775, near Cahirciveen, County Kerry, Ire.—d. May 15, 1847, Genoa, Kingdom of Sardinia) Irish nationalist leader. A lawyer, he gradually became involved in the struggle for Catholic Emancipation, organizing nationwide "aggregate meetings" of Irish Catholics to petition for their legal rights. In 1823 he cofounded the Catholic Association, which won support from Irish political and church leaders. After helping win passage of the 1829 Emancipation Act, which allowed Irish Catholics to serve in the British Parliament, he was elected to the House of Commons. He supported the Whig Party in return for Irish reform measures but became disenchanted with the administration's inaction. In 1839 he formed the Repeal Association to dissolve the Anglo-Irish Act of Union. A series of illegal mass meetings in Ireland led to his arrest for sedition in 1843. After his release in 1844, he faced dissension from William Smith O'Brien's radical Young Ireland movement.

O'Connor, Feargus Edward (b. c. July 18, 1796, Connorville, County Cork, Ire.—d. Aug. 30, 1855, London, Eng.) Irish leader of Chartism. He practiced law and served in the British Parliament (1832–35). He turned to radical agitation in England and was active in the Chartist movement as a popular public speaker. His journal *Northern Star* (1837) gave his views wide circulation. He became the Chartists' leader in 1841 but was unable to effect passage of the Chartist petition in 1848. After a mental collapse, he was declared insane in 1852.

O'Connor, (Mary) Flannery (b. March 25, 1925, Savannah, Ga., U.S.—d. Aug. 3, 1964, Milledgeville, Ga.) U.S. writer. She spent most of her life on her mother's farm in Milledgeville, Ga. A devout Roman Catholic, she usually set her works in the rural South and often examined the relationship between the individual and God by putting her characters in grotesque and extreme situations. Her first novel, *Wise Blood* (1952), combines a keen ear for common speech, a caustic religious imagination, and a flair for the absurd that characterized all of her work. With the story collections *A Good Man Is Hard to Find* (1955) and *Everything That Rises Must Converge* (1965), she was acclaimed as a master of the form. Her other work of fiction was the novel *The Violent Bear It Away* (1960). Long crippled by lupus, she died at age 39. The Flannery O'Connor Award for Short Fiction is the preeminent American award of its kind.

O'Connor, Frank *orig.* **Michael O'Donovan** (b. 1903, Cork, County Cork, Ire.—d. March 10, 1966, Dublin) Irish writer. Brought up in poverty, O'Connor became a librarian and a director of Dublin's Abbey Theatre. He won popularity in the U.S. for short stories in which apparently trivial incidents illuminate Irish life. They appeared in volumes including *Guests of the Nation* (1931) and *Crab Apple Jelly* (1944) and in *The New Yorker* magazine. He also wrote critical studies on Irish life and literature and translations of Gaelic works of the 9th–20th centuries, including the great 17th-century satire *The Midnight Court* (1945).

O'Connor, Sandra Day *orig.* **Sandra Day** (b. March 26, 1930, El Paso, Texas, U.S.) U.S. jurist. After graduating first in her law school class at Stanford University (1950), she entered private practice in Arizona. She served as an assistant state attorney general (1965–69) before being elected in 1969 to the state senate, where she became the first woman in the U.S. to hold the position of majority leader (1972–74). After serving on the superior court of Maricopa county and the state court of appeals, she was nominated in 1981 by Pres. Ronald Reagan to the Supreme Court of the United States, becoming the first female justice in the court's history. Known for her dispassionate and meticulously researched opinions, she proved to be a moderate and pragmatic conservative who sometimes sided with the court's liberal minority on social issues (e.g., abortion rights). O'Connor retired from the court in 2006.

OCR *in full* **optical character recognition** Scanning and comparison technique intended to identify printed text or numerical data. It avoids the need to retype already printed material for data entry. OCR software attempts to identify characters by comparing shapes to those stored in the software library. The software tries to identify words using character proximity and will try to reconstruct the original page layout. High accuracy can be obtained by using sharp, clear scans of high-quality originals, but it decreases as the quality of the original declines.

Octavian See Caesar Augustus

October Manifesto Document issued by Tsar Nicholas II in October 1905. In response to the unrest caused by the Russian Revolution of 1905 and on the advice of his minister Sergey Witte, Nicholas promised to guarantee civil liberties and establish a popularly elected Duma. The manifesto satisfied the moderate revolutionaries, and further unrest was crushed. In 1906 the Fundamental Laws were established to serve as a constitution and to create the Duma. The Duma was in fact given only a limited voice in the government, and the civil rights actually granted were far less substantial than those promised by the manifesto.

October Revolution See Russian Revolution of 1917

octopus In general, any eight-armed cephalopod of the order Octopoda; specifically, members of a large, widely distributed group (genus *Octopus*) of shallow-water species. Species range from about 2 in. (5 cm) to 18 ft (5.5 m) long with an arm span up to 30 ft (9 m). The head is usually only slightly demarcated from the saccular body. Each arm is contractile and bears fleshy suckers. Two sharp beaks and a filelike organ in the mouth drill crustacean shells and rasp away flesh. Most octopuses crawl along the bottom; when alarmed, they may jet-propel themselves backward, and they sometimes eject an inky substance to cloud the water and protect themselves from predators. They can change colour rapidly, a reflection of their environment or mood. The common octopus (*O. vulgaris*) is thought to be the most intelligent of all invertebrates.

Octopus granulatus, a South African species.

oculus \'ä-kyə-ləs\ (Latin: "eye") In architecture, any of several elements resembling an eye, such as a round or oval window or the round opening at the top of some domes (see Pantheon). The capital of an Ionic column features an oculus in the form of a disk at the centre of each of its spiral scrolls.

Oda Nobunaga \'ō-dä-ˌnō-bù-'nä-gä\ (b. 1534, Owari province, Japan—d. June 21, 1582, Kyōto) With Toyotomi Hideyoshi and Tokugawa Ieyasu, one of the three unifiers of premodern Japan. He brought the domain of his birth, Owari, under his control and followed that success by defeating the huge forces of a neighbouring daimyo. In 1562 he formed an alliance with Ieyasu, and together they captured Kyōto, which Nobunaga controlled from 1573, thereby ending the Ashikaga shogunate (see Muromachi period). He then turned his attention to crushing the militant Tendai Buddhist monks of Enryaku temple, destroying their headquarters in 1571. He spent the next decade fighting the fanatically religious Ikkō sect, defeating their fortress-monastery in Ōsaka in 1580. His efforts to weaken the strength of the Buddhist temples extended to permitting Jesuit missionaries to build a church in Kyōto; his own interest in Christianity was purely political. In 1582 he had conquered central Japan and was attempting to extend his control over western Japan when he was wounded by a discontented general and committed suicide.

ode Ceremonious lyric poem on an occasion of dignity in which personal emotion and universal themes are united. The form is usually marked by exalted feeling and style, varying line length, and complex stanza forms. The term *ode* derives from a Greek word alluding to a choric song, usually accompanied by a dance. Forms of odes include the Pindaric ode, written to celebrate public events such as the Olympic games, and the form associated with Horace, whose intimate, reflective odes have two- or four-line stanzas and polished metres. Both were revived during

© 2006 Encyclopædia Britannica, Inc.

the Renaissance and influenced Western lyric poetry into the 20th century. The ode (*qaṣīdah*) also flourished in pre-Islamic Arabic poetry.

Odense \'ü-ən-zə,\ *English* \'ō-den-sə\ City and municipality (2000 est.: 183,912), north-central Funen Island, Denmark. Sacred in pagan times as the sanctuary of Odin, the Norse god of war, it first appears in records c. AD 1000. A bishop's seat from the 10th century, it became a centre of pilgrimage to the shrine of Canute IV. It was burned in 1247, but many medieval structures remain. It grew after its port and harbour were built and the Odense Canal was opened in 1804. Denmark's third largest city, it is a shipbuilding and manufacturing centre. The home of Hans Christian Andersen, who was born there, is now a museum.

Oder-Neisse Line \'ō-dər-'nī-sə\ Polish-German border along the Oder and Neisse rivers proposed by the Allied Powers at the end of World War II. After inconclusive talks at the Yalta Conference to redraw the Polish-German border so as to grant more territory to Poland, the Soviet Union unilaterally occupied all territory east of its preferred Oder-Neisse line. The U.S. and Britain, dubious about Soviet domination of an enlarged Poland, protested the action but eventually agreed to the provisional border, which was not recognized by West Germany until it signed treaties with the Soviet Union and Poland in 1970.

Oder \'ō-dər\ **River** *or* **Odra** \'ȯ-drä\ **River** *ancient* **Viadua** River, northern Europe. It flows from its source in the Oder Mountains in the Czech Republic north through western Poland, where it forms the boundary between Poland and Germany. As the second largest river emptying into the Baltic Sea, it is economically important as a transport route. Navigable for 475 mi (765 km), it is connected by canal with the Vistula River and with the western European waterway system. It was partially internationalized under the Treaty of Versailles in 1919. Considered German until the 1945 Potsdam settlement, it was formally recognized as the Polish-German border in 1950 by East Germany and in 1970 by West Germany.

Odessa City (pop., 2001: 1,029,000), southwestern Ukraine. A Tatar fortress was established in Odessa in the 14th century. The city was ceded to Russia in 1791 and became its second most important port after Saint Petersburg, with grain as its principal export. It was a centre of revolutionary activity in 1905 (see Russian Revolution of 1905), and it suffered heavy damage in World War II. Odessa is a major seaport and industrial centre, with shipbuilding, engineering, and oil refineries. It is also a cultural centre, with a university, museums, and theatres.

Odets \ō-'dets**, Clifford** (b. July 18, 1906, Philadelphia, Pa., U.S.—d. Aug. 14, 1963, Hollywood, Calif.) U.S. playwright. He acted with repertory companies in 1923–28 and joined the Group Theatre in 1931. His first play, the social-protest drama *Waiting for Lefty* (1935), helped establish his and the company's reputation. He followed it with *Awake and Sing!* (1935) and *Golden Boy* (1937). In the late 1930s he moved to Hollywood, where he wrote screenplays and directed the movies *None but the Lonely Heart* (1944) and *The Story on Page One* (1959). His later plays include *The Big Knife* (1949), *The Country Girl* (1950), and *The Flowering Peach* (1954).

odeum \ō-'dē-əm\ Comparatively small, often semicircular roofed theater of ancient Greece and Rome used for musical performances. One still in use was built by Herodes Atticus at the base of the Athenian Acropolis (AD 161). Odea were constructed in most cities of the Roman empire for use as assembly halls as well as for performances. See also amphitheater.

Odin \'ō-din\ *or* **Wotan** \'vō-ˌtän\ One of the principal Norse gods. A war god from earliest times, Odin appeared in Scandinavian heroic literature as the protector of heroes. Fallen warriors were believed to join him in Valhalla. Odin was the great magician among the gods and was associated with runic writing. His eight-legged horse, Sleipnir, could gallop through the air and over the sea. Odin was usually depicted as a tall old man with a flowing beard and only one eye (the other he gave in exchange for wisdom); he wore a cloak and a wide-brimmed hat and carried a spear. The wolf and the raven were dedicated to him.

Odo of Bayeux \'ō-dō...bā-'yœ\ *or* **Earl of Kent** (b. c. 1036—d. February 1097, Palermo) Bishop of Bayeux, Normandy, and half brother of William I (the Conqueror). He fought in the Battle of Hastings and probably commissioned the Bayeux Tapestry. Made earl of Kent in 1067, he guarded southeastern England and ruled (with others) in William's absence. William imprisoned him (1082–87) for raising troops without royal permission, and he later joined a rebellion in support of Robert II. He helped organize the First Crusade and died on his way to the Holy Land.

Odoacer \ˌō-dō-'ā-sər\ *or* **Odovacar** \ˌō-dō-'vā-kər\ (b. c. 433—d. March 15, 493, Ravenna) First barbarian king of Italy (476–493). A German warrior in the Roman army, he led a revolt against the usurper Orestes (475). He was proclaimed king by his troops in 476, the date that traditionally marks the end of the Western Roman Empire. Odoacer paid homage to the Eastern emperor, Zeno, but asserted his own right to rule Italy. He conquered Dalmatia (482), defeated the Rugi (487–488), and retook Sicily from the Vandals. By attacking the Eastern Empire, he alienated Zeno, who encouraged the Ostrogothic king Theodoric to invade Italy (489). Theodoric captured almost the entire peninsula and killed Odoacer after inviting him to a banquet.

Odra River See Oder River

Odum, Howard W(ashington) (b. May 24, 1884, near Bethlehem, Ga., U.S.—d. Nov. 8, 1954, Chapel Hill, N.C.) U.S. sociologist. In 1920 Odum joined the faculty of the University of North Carolina, where he established its departments of sociology and public welfare and founded the journal *Social Forces* (1922). His scholarly focus was folk sociology, particularly of Southern blacks, for whom he urged equal opportunity. His books include *Southern Regions of the United States* (1936) and *American Regionalism* (1938, with Harry Moore).

Odysseus \ō-'di-sē-əs\ *Roman* **Ulysses** \yü-'li-sēz\ Hero of Homer's *Odyssey*. According to Homer, Odysseus was the king of Ithaca. His shrewdness, resourcefulness, and endurance enabled him to capture Troy (through the device of the Trojan horse) and endure nine years of wandering and adventures before reaching his home in Ithaca, where his wife, Penelope, and son, Telemachus, awaited him. Classical opinion was divided on whether he was an unscrupulous politician or a wise and honourable statesman. Odysseus has been one of the most frequently portrayed figures in literature, treated by numerous Greek and Roman poets and by later writers such as William Shakespeare (*Troilus and Cressida*), Níkos Kazantzákis (*The Odyssey: A Modern Sequel*), and (metaphorically) by James Joyce (*Ulysses*) and Derek Walcott (*Omeros*).

Odysseus slaying the suitors, detail of a red-figure *skyphos* from Tarquinii, c. 450 BC; in the Staatliche Museen zu Berlin, Ger.
COURTESY OF THE STAATLICHE MUSEEN ZU BERLIN, GER.

Ōe \'ō-e\ **Kenzaburō** (b. Jan. 31, 1935, Ehime prefecture, Shikoku, Japan) Japanese novelist. Ōe first attracted attention on the literary scene while still a student at the University of Tokyo. His works, written in a rough prose style that at times nearly violates the natural rhythms of Japanese, reflect his life and epitomize the rebellion of the post-World War II generation. They include *A Personal Matter* (1964), which uses the birth of an abnormal baby to investigate the problem of culturally disinherited youth; *Hiroshima Notes* (1965); and *The Silent Cry* (1967). He received the Nobel Prize for Literature in 1994.

Oedipus \'e-də-pəs, 'ē-də-pəs\ In Greek mythology, a king of Thebes who unwittingly killed his father and married his mother. In the most familiar version of the story, Laius, king of Thebes, was warned by an oracle that his son would slay him. When his wife, Jocasta, bore a son, he exposed the baby on a mountainside, but the infant Oedipus was saved by a shepherd and adopted by the king of Corinth. In early manhood, as Oedipus traveled toward Thebes, he met Laius, who provoked a quarrel; in the

© 2006 Encyclopædia Britannica, Inc.

ensuing fracas, Oedipus killed him. He then rid Thebes of the destructive Sphinx by answering her riddle; as a reward he was given the throne of Thebes and the hand of the widowed queen—his mother. They had four children, including Antigone. When at last they learned the truth, Jocasta committed suicide and Oedipus blinded himself and went into exile. Oedipus has served as the hero of many tragedies, most notably Sophocles' *Oedipus Rex* and *Oedipus at Colonus*.

Oedipus complex In psychoanalytic theory, a desire for sexual involvement with the parent of the opposite sex and a sense of rivalry with the parent of the same sex. The term was introduced by Sigmund Freud in his *Interpretation of Dreams* (1899) and is derived from the mythological Oedipus, who killed his father and married his mother; its female analogue is the Electra complex. Considered a normal stage in the development of children ages three to five, it ends when the child identifies with the parent of the same sex and represses its sexual instincts. Freud believed that the process of overcoming the Oedipus complex gave rise to the superego.

Oehlenschläger \'œ-lens-ˌleg-ər**, Adam Gottlob** (b. Nov. 14, 1779, Vesterbro, Den.—d. Jan. 20, 1850, Copenhagen) Danish poet and dramatist, considered the national poet of Denmark. He became the leader of Romanticism in Danish literature with his poem *The Golden Horns* (1802). Important collections of his poetry, with several lyrical dramas, appeared in 1802 and 1805. His plays drawing on Nordic history and mythology include *Earl Haakon the Great* (1807). His most significant later work is the poetic epic *The Gods of the North* (1819), a kind of modern *Edda*.

Oenghus See Maponos

Oerter \'ər-tər**, Al(fred)** (b. Sept. 19, 1936, Astoria, N.Y., U.S.) U.S. discus thrower. He won gold medals at four consecutive Olympic Games (1956, 1960, 1964, 1968) and set world records four times between 1962 and 1964. He was the first to throw the discus over 200 ft.; he recorded his best throw (212.5 ft [64.78 m]) at the 1968 Olympics.

O'Faolain \ō-'fā-lən, ō-'fa-lən**, Sean** *orig.* **John Francis Whelan** (b. Feb. 22, 1900, Cork, County Cork, Ire.—d. April 20, 1991, Dublin) Irish writer. He became involved in anti-British activities during the Irish insurrection (1918–21) and taught (1926–33). After achieving success with his first story collection, *Midsummer Night Madness* (1932), and the novel *A Nest of Simple Folk* (1933), he wrote full-time. He is known for carefully crafted, lyrical short stories about Ireland's lower and middle classes, often examining the decline of the nationalist struggle or the oppressive provincialism of Irish Catholicism. His other works include *Bird Alone* (1936), *A Life of Daniel O'Connell* (1938), and *Vive moi!* (1964), his autobiography.

Off-Broadway Small-scale theatrical productions in New York City. The term was first used to refer to experimental plays produced on low budgets in small theatres, which provided an alternative to the commercially oriented Broadway theatres. Off-Broadway theatres grew in quality and importance after 1952, with the success of José Quintero's productions. Plays by Edward Albee, Sam Shepard, and Lanford Wilson were first produced off Broadway, as were avant-garde works by Eugène Ionesco, Samuel Beckett, and Harold Pinter. Many new plays are now staged in well-equipped Off-Broadway houses, and Off-Broadway theatre has its own set of awards, the Obies. As production costs increased, smaller and more experimental theatres emerged; these were quickly labeled Off-Off-Broadway.

Offa \'ȯ-fə\ (d. July 796) One of the most powerful kings in Anglo-Saxon England. He became king of Mercia (757–796) after seizing power during a civil war. He extended his rule over most of southern England and married his daughters to the rulers of Wessex and Northumbria. Eager to form European diplomatic ties, Offa signed a commercial treaty with Charlemagne (796) and allowed the pope to increase his control over the English church. He built Offa's Dyke to divide Mercia from Welsh lands.

Offa's Dyke Earthwork in western England. It stretches 169 mi (270 km) from the River Severn near Chepstow to the seaward end of the River Dee's estuary. It was built by Offa of Mercia to fortify the boundary between his kingdom and the lands of the Welsh; for centuries it marked the England-Wales boundary. It consisted of a plain bank (in places some 60 ft [18 m] high) and a ditch (12 ft [3.7 m] deep). Many sections remain, and a walking path now runs its length.

Offenbach \'ȯ-fən-ˌbäk**, Jacques** *orig.* **Jacob Offenbach** (b. June 20, 1819, Cologne—d. Oct. 5, 1880, Paris, France) German-born French composer. Son of a cantor, he studied at the Paris Conservatoire but had to leave for lack of funds. He first wrote theatre music as conductor of the Théâtre-Français (from 1850); in 1855 he opened his own theatre, Bouffes-Parisiens, for which he wrote many celebrated one-act works. He began writing longer operettas and had a string of hits, including *Orpheus in the Underworld* (1858), *La Belle Hélène* (1864), *La Vie Parisienne* (1866), and *The Grand Duchess of Gérolstein* (1867). Offenbach is credited with writing in a fluent, elegant style and with a highly developed sense of both characterization and satire. He spent his last three years on his only grand opera, *The Tales of Hoffmann*, which remained unfinished at his death and was first produced in 1881.

Office of Strategic Services (OSS) (1942–45) U.S. agency formed for the purpose of obtaining information about and sabotaging the military efforts of enemy nations during World War II. It was headed by William J. ("Wild Bill") Donovan (1883–1959). With some 12,000 staff, the OSS collected and analyzed information on areas of the world in which U.S. military forces were operating. It used agents inside Nazi-occupied Europe, including Berlin; carried out counterpropaganda and disinformation activities; produced analytical reports for policy makers; and staged special operations (e.g., sabotage and demolition) behind enemy lines to support guerrillas and resistance fighters. Many of its functions were later assumed by the Central Intelligence Agency.

offset printing *or* **offset lithography** *or* **litho-offset** In commercial printing, a widely used technique in which the inked image on a printing plate is imprinted on a rubber cylinder and then transferred (offset) to paper or other material. The rubber cylinder gives great flexibility, permitting printing on wood, cloth, metal, leather, and rough paper. In offset printing the matter to be printed is neither raised above the surface of the printing plate (as in letterpress printing) nor sunk below it (as in intaglio, or gravure, printing). Offset printing, a development of lithography, is based on the principle that water and grease do not mix, so that a greasy ink can be deposited on grease-treated printing areas of the plate, while nonprinting areas, which hold water, reject the ink. The offset plate is usually of zinc or aluminum or a combination of metals, with the surface treated to render it porous and then coated with a photosensitive material. Exposure to an image hardens the coating on printing areas; the coating on nonprinting areas is washed away, leaving wetted metal that will reject ink. See also xerography.

offshore bar See sandbar

O'Flaherty, Liam (b. Aug. 28, 1896, Inishmore, Aran Islands, County Galway, Ire.—d. Sept. 7, 1984, Dublin) Irish novelist and short-story writer. He abandoned his training for the priesthood and became a soldier in World War I, a migrant labourer in the Americas and the Middle East, and a revolutionary in Ireland. A leading writer of the Irish literary renaissance, he combined brutal naturalism, psychological analysis, poetry, and biting satire with an abiding respect for the Irish people. His novels include *Thy Neighbour's Wife* (1923), *The Informer* (1925; film, 1935), *Skerrett* (1932), *Famine* (1937), and *Insurrection* (1950).

Ogaden \ˌō-gə-'den\ Region, eastern Ethiopia. In the triangular wedge that juts into Somalia, it is a dry, barren plain sparsely populated by Somali-speaking nomadic pastoralists. Conquered in the late 19th century by the Ethiopian emperor Menilek II, it was invaded by Italy in 1935 and made part of Italian East Africa. Liberated in 1941, it remained under British administration until 1948. It was invaded by Somalia in 1977 and retaken by Ethiopia in 1978, with help from Cuba and the Soviet Union.

Ogata Kenzan \ō-'gä-tä-'ken-ˌzän\ *orig.* **Ogata Shinsei** (b. 1663, Kyōto, Japan—d. June 3, 1743, Edo) Japanese potter, calligrapher, and painter. Many of his designs reflect his classical Chinese and Japanese education. The *iro-e* ("colour painting") of his pottery is particularly fine, and his calligraphy, seen in his wares and paintings, was distinctive. His best-known works include a plate with a picture of a cedar grove and the *Hana-kago* ("Flower Baskets"), a watercolour hanging scroll.

Ogbomosho \ˌōg-bō-'mō-shō\ City (pop. 1995 est.: 711,900), southwestern Nigeria. Founded in the mid-17th century, it was an outpost of the Oyo empire until the Muslim Fulani conquests in the early 19th century. As a centre of resistance, the walled town attracted many Oyo refugees. Located northeast of Ibadan, it is one of Nigeria's largest urban centres. It is also a trading centre and rail junction.

© 2006 Encyclopædia Britannica, Inc.

ogham \'ä-gəm\ **writing** *or* **ogam writing** *or* **ogum writing** Alphabetic script used for writing the Irish and Pictish (see Picts) languages on stone monuments, mostly c. AD 400–600. In its simplest form, it consists of four sets of strokes, or notches, each set containing five letters composed of from one to five strokes, thus creating 20 letters. A fifth set of five symbols, called *forfeda* ("extra letters"), was probably a later development. Most inscriptions are short and consist only of names. Of the more than 400 inscriptions known, about 330 are from Ireland.

Ogilvy \'ō-gəl-vē**, David M(ackenzie)** (b. June 23, 1911, West Horsley, Surrey, Eng.—d. July 21, 1999, near Bonnes, France) British advertising executive. After an Oxford education, he worked as an apprentice chef and stove salesman before taking a job in an advertising agency. He spent a year in the U.S. learning American advertising techniques. In 1948, with Anderson Hewitt, he formed Hewitt, Ogilvy, Benson & Mather, which became one of the world's largest advertising firms. He is noted for reminding his colleagues that "the consumer is not a moron," and his ads for brands such as Schweppes and Rolls-Royce were admired for their creativity.

Oglethorpe, James (Edward) (b. Dec. 22, 1696, London, Eng.—d. June 30/July 1, 1785, Cranham Hall, Essex, Eng.) English army officer. After serving in the British army from 1712 to 1722, he entered Parliament, where he became interested in prison reform. In 1732 he secured a charter for a colony in what became Georgia, where debtors could start a new life and persecuted Protestants could practice freely. He accompanied the first settlers to found Savannah (1733) and led the defense of the territory against attacks by Spain (1739, 1742). He returned to England in 1743.

Ögödei \'ō-gə-ˌdā\ (b. 1185, Mongolia—d. 1241, Karakorum) Son of Genghis Khan who succeeded his father in 1229 and greatly expanded the Mongol empire. He established his headquarters in central Mongolia and built the capital city of Karakorum. Like his father, he carried out simultaneous campaigns by relying on generals who acted independently but were subject to his orders. Allying himself with China's Southern Song dynasty, Ögödei attacked the Jurchen dynasty in northern China, taking its capital in 1234. Meanwhile, his nephew Batu defeated Russia while other generals were attacking Iran and Iraq. Only Ögödei's death (during a drinking bout) prevented the Mongols from invading western Europe. See also Golden Horde; Kublai Khan; Möngke.

Ogooué River *or* **Ogowe** \ˌō-gō-'wā\ **River** River, west-central Africa, mainly in Gabon. It rises in the Republic of the Congo and flows northwest, then west, emptying into the Atlantic Ocean south of Port-Gentil after a course of 750 mi (1,200 km). It is navigable for less than one-third of its length but is heavily used for shipping goods, including lumber, to the coast.

ogum writing see ogham writing

O'Hara, John (Henry) (b. Jan. 31, 1905, Pottsville, Pa., U.S.—d. April 11, 1970, Princeton, N.J.) U.S. novelist and short-story writer. O'Hara developed the objective, straightforward style he used in his fiction while working as a critic and reporter in New York City. His works stand as a social history of upwardly mobile Americans of the 1920s through the 1940s. Among them are the popular novels *Appointment in Samarra* (1934); *Butterfield 8* (1935; film, 1960); *Pal Joey* (1940), adapted as a musical; *Ten North Frederick* (1955; film, 1958); and *From the Terrace* (1958; film, 1960).

O'Higgins, Bernardo (b. probably Aug. 20, 1776/78, Chillán, Chile, Viceroyalty of La Plata—d. October 1842, Peru) South American revolutionary leader and first Chilean head of state (1817–23). The illegitimate son of a Spanish officer of Irish origin, he was educated in Peru, Spain, and England, where his Chilean nationalism was awakened. When Napoleon invaded Spain (1808) and Spanish control of Chile relaxed, he became a member of Chile's new congress. He led the defensive forces when Chile was invaded by royalists from Peru in 1814; defeated, he fled to Argentina. He returned in 1817 with José de San Martín and defeated the Spanish. Elected supreme director of Chile, he established a working governmental organization, but his reforms antagonized conservatives and he resigned.

Ohio State (pop., 2000: 11,353,140), U.S., north-central region. Bordered by Michigan, Pennsylvania, West Virginia, Kentucky, and Indiana, it covers 44,828 sq mi (116,104 sq km). Its capital is Columbus. Lake Erie is on its northern boundary; the Ohio River forms part of its southeastern and southern boundary. Ohio was originally inhabited by prehistoric Hopewell mound builders, who disappeared c. AD 400. The earliest European explorers found the area occupied by Miami, Shawnee, and other Indian peoples. The region was ceded to Britain by France after the French and Indian War. In 1803 it became the 17th state and the first state carved out of the Northwest Territory (see Northwest Ordinances). During the 19th century, it became one of the first great industrial states because of its location, transport facilities, and natural resources, including coal, petroleum, and natural gas. Although manufacturing is its most important economic activity, nearly two-thirds of the state is still farmland. It was the birthplace or residence of eight U.S. presidents—William H. Harrison, Ulysses S. Grant, Rutherford B. Hayes, James Garfield, Benjamin Harrison, William McKinley, William H. Taft, and Warren G. Harding. Its major cities include Columbus, Cleveland, Cincinnati, Toledo, Akron, and Dayton.

Ohio Co. Organization of Englishmen and Virginia colonists, established in 1748 to promote trade with American Indians and secure British control of the Ohio River valley for settlement. Activity in the area claimed by France led to the last French and Indian War (1754). A separate organization, the Ohio Co. of Associates (1786), founded Marietta, Ohio, the first permanent settlement north of the Ohio River.

Ohio Idea Proposal to redeem American Civil War bonds in paper money instead of gold. The plan, part of the debate between hard-money advocates and soft-money or Greenback movement supporters after the Civil War, was sponsored by George Pendleton and was especially popular in the Midwest. Endorsed by the Democratic Party in 1868, it died with the election of Ulysses S. Grant and passage of the Public Credit Act (1869), which provided for payment of government obligations in gold.

Ohio River Major river, eastern central U.S. Formed by the confluence of the Allegheny and Monongahela rivers, it flows northwest out of Pennsylvania, and west and southwest to form the state boundaries of Ohio–West Virginia, Ohio-Kentucky, Indiana-Kentucky, and Illinois-Kentucky. After a course of 975 mi (1,569 km), it empties into the Mississippi River at Cairo, Ill. It is navigable and has supported commerce since the earliest settlements. The river's strategic importance was recognized by the 1750s. After the French and Indian War, the English controlled the territory around the river.

Ohio State University U.S. state university system consisting of a main campus in Columbus and branches in five other locations. It was established in 1870 as a land-grant institution. The main campus is a comprehensive research institution, with colleges of agriculture, dentistry, law, medicine, and veterinary medicine. Research facilities include a transportation research centre, a freshwater laboratory, a supercomputer centre, and a polar research centre.

Ohm, Georg Simon (b. March 16, 1789, Erlangen, Bavaria—d. July 6, 1854, Munich) German physicist. While teaching mathematics at the Jesuits' College in Cologne (1817–27), he discovered that the flow of electric current through a conductor is directly proportional to the potential difference, or voltage, and inversely proportional to the resistance. He resigned when his theory (Ohm's law) was coldly received. His theory soon came to be widely recognized, and he subsequently taught in Nürnberg (1833–49) and Munich (1849–54). The physical unit measuring electrical resistance was named for him.

Ohm, detail of a lithograph
HISTORIA-PHOTO

Ohm's law Relationship between the potential difference (voltage), electric current, and resistance in an electric circuit. In 1827 Georg Simon Ohm discovered that at constant temperature, the current I in a circuit is directly proportional to the potential difference V, and inversely proportional to the resistance R, or $I = V/R$. Resistance is generally measured in ohms (Ω). Ohm's law may also be expressed in terms of the electromotive force E of an electric energy source, such as a battery, or $E = IR$. In an alternating-current circuit, when the combination of resistance and reactance, called impedance Z, is constant, Ohm's law is applicable and $V/I = Z$.

© 2006 Encyclopædia Britannica, Inc.

oil Any greasy substance liquid at room temperature and insoluble in water. It may be a fixed (nonvolatile) oil, an ESSENTIAL OIL, or a mineral oil (see PETROLEUM). Fixed oils and FATS (derived from animals and plants) have the same chemical composition—both are ESTERS of GLYCEROL and FATTY ACIDS. These oils have a variety of industrial and food uses. Linseed, tung, and other drying oils are highly unsaturated (see SATURATION); these and large quantities of soybean, sunflower, and safflower oils (also constituents of foods) are used in paints and varnishes. When exposed to air they absorb oxygen and polymerize (see POLYMERIZATION), forming a tough coating. Some specialty oils and oil derivatives are also used in leather dressing and textile manufacture.

oil-drop experiment See MILLIKAN OIL-DROP EXPERIMENT

oil painting Painting in oil colours, a medium consisting of pigments suspended in drying oils. Oil paint enables both fusion of tones and crisp effects and is unsurpassed for textural variation. The standard consistency of oil paint is a smooth, buttery paste. It is applied with brushes or a thin palette knife, usually onto a stretched linen canvas. Finished oil paintings are often coated with varnish. Oil as a painting medium is recorded as early as the 11th century, though the practice of easel painting with oil colours stems directly from 15th-century techniques of painting with tempera (see TEMPERA PAINTING). In the 16th century oil colour emerged as the basic painting material in Venice; it has been the most widespread medium for easel paintings ever since.

oil seal *or* **shaft seal** In MACHINES, a device that prevents the passage of fluids along a rotating shaft. Seals are necessary when a shaft extends from a housing (enclosure) containing oil, such as a pump or a gearbox. Leather, synthetic rubber, and silicones are among the materials used for the sealing ring. See also BEARING.

oil shale Any fine-grained SEDIMENTARY ROCK that contains solid organic matter (KEROGEN) and yields significant quantities of oil when heated. This SHALE OIL is a potentially valuable FOSSIL FUEL, but the present methods of mining and refining it are expensive, damage the land, pollute the water, and produce carcinogenic wastes. Thus, oil shale will probably not be exploited on a wide scale until other petroleum resources have been nearly depleted. Estonia, China, and Brazil have facilities for producing relatively limited quantities, and the U.S. government operates an experimental plant in Colorado.

Oise \'wäz\ **River** River, northern France. It is formed by the confluence of two streams, one rising near Chimay in Belgium and the other near Rocroi in France. Flowing southwest into the SEINE, the Oise is 188 mi (302 km) long. It is a link in the canal system between the Seine and the canals of northern France.

Oisín See OSSIAN

Oistrakh \'ȯi-ˌsträk**, David (Fyodorovich)** (b. Sept. 30, 1908, Odessa, Ukraine, Russian Empire—d. Oct. 24, 1974, Amsterdam, Neth.) Russian violinist. After his debut in 1928, he entered and won a number of prestigious competitions. He performed for Soviet troops at the front during World War II and made debuts in the West in the 1950s. DMITRY SHOSTAKOVICH dedicated both his violin concertos to him. Oistrakh taught at the Moscow Conservatory from 1934; one of his most distinguished students was his son Igor (b. 1931), who himself joined the conservatory's faculty in 1958.

Ojibwa \ō-'jib-wā\ *or* **Chippewa** \'chi-pə-ˌwȯ\ North American PLAINS INDIAN people living mostly in southern Canada and the north-central U.S. Ojibwa is an Algonquian language. The people's name, spelled Ojibwe in Canada and given as Chippewa in official U.S. documents, is derived from an Algonquian word *ojib-ubway*, meaning "puckering," probably referring to a type of moccasin. They call themselves Anishinaabe or Anishinabek, meaning "Spontaneously Created" or "Original Man." They formerly inhabited a region north of the Great Lakes but during the 17th–18th centuries moved west to what is now northern Minnesota. Each Ojibwa tribe was divided into migratory bands. In the autumn, bands separated into family units for hunting; in summer, families gathered at fishing sites. They grew corn and collected wild rice. The Midewiwin, or Grand Medicine Society, was the major Ojibwa religious organization. The Ojibwa are one of the largest Native American groups in North America today, numbering about 50,000 in the U.S. and more than 100,000 in Canada. They are closely related to the Ottawa and Potawatomi.

Ojukwu \ō-'jük-wü**, Odumegwu** (b. Nov. 4, 1933, Nnewi, Nigeria) Governor of Eastern Region, Nigeria (1966–67), and head of the secessionist state of BIAFRA (1967–70). A member of the IGBO, Ojukwu was educated at Oxford University. He was appointed head of the traditional Igbo homelands in the east following the overthrow of Nigeria's civilian government by Igbo military leaders. He stayed on in that capacity even after members of the opposition HAUSA and YORUBA staged a successful countercoup. Mounting secessionist pressures compelled him to declare the Eastern Region an independent state in 1967. Following the Biafra conflict he fled to Côte d'Ivoire; he returned to Nigeria in 1982.

Oka \ō-'kä\ **River** River, western RUSSIA. The largest right-bank tributary of the VOLGA RIVER, it flows 932 mi (1,500 km) north to Kaluga, then east to join the Volga at NIZHNY NOVGOROD. Navigable for most of its length, except during winter, it is an important trade artery for lumber and grain.

okapi \ō-'kä-pē\ RUMINANT species (*Okapia johnstoni*) in the GIRAFFE family that lives alone in Congo rain forests, eating leaves and fruit. Its neck and legs are proportionately shorter than the giraffe's, and females, which are larger than males, stand about 5 ft (1.5 m) at the shoulder. The sleek coat is deep brown on the front of the body; the upper legs are black-and-white-striped, and the lower legs are white, with black rings above the hooves. The male's short horns are covered with skin except at the tips.

Okapi (*Okapia johnstoni*)
KENNETH W. FINK—ROOT RESOURCES

Okavango \ˌō-kä-'väŋ-gō\ **River** *in Angola* **Cubango River** River, southwest-central Africa. It is the fourth longest river system in the region. Rising in central Angola, it forms a section of the boundary between Angola and Namibia. It empties into the Okavango Swamp, a large wetland north of Lake NGAMI in northern Botswana, after a course of about 1,000 mi (1,600 km). It is unnavigable except for small craft, and its banks are sparsely settled; a major problem for inhabitants is control of the TSETSE FLY. The Moremi Wildlife Reserve in the northeastern corner of the swamp teems with wildlife.

Okeechobee \ˌō-kə-'chō-bē**, Lake** Lake, southeastern Florida, U.S. It is the third largest freshwater lake wholly within the country. It drains to the sea through the EVERGLADES. It is a remnant of the prehistoric Pamlico Sea, and its name means "Big Water" in the language of the Hitchiti Indians. There is a Seminole reservation on the lake's northwestern shore.

O'Keeffe, Georgia (b. Nov. 15, 1887, near Sun Prairie, Wis., U.S.—d. March 6, 1986, Santa Fe, N.M.) U.S. painter. She studied art in Chicago and New York City, where she met and married the photographer ALFRED STIEGLITZ. By the early 1920s, her highly individualistic painting style had emerged, as typified by such works as *Black Iris* (1926). Her subjects were often enlarged views of the skulls and other bones of animals, flowers and plant organs, shells, rocks, mountains, and other natural forms. Her mysteriously suggestive images of bones and flowers set against a perspectiveless space have inspired a variety of erotic, psychological, and symbolic interpretations. Her later works celebrate the clear skies and desert landscapes of New Mexico, where she moved after her

"Near Abiquiu, New Mexico," oil on canvas by Georgia O'Keeffe, 1930; in the Metropolitan Museum of Art, New York City
THE METROPOLITAN MUSEUM OF ART, NEW YORK CITY, ALFRED STIEGLITZ COLLECTION, 1963 (63.204). REPRODUCED BY PERMISSION OF THE ESTATE OF GEORGIA O'KEEFFE, COPYRIGHT 1984/85 BY THE METROPOLITAN MUSEUM OF ART; PHOTOGRAPH BY MALCOLM VARON

© 2006 Encyclopædia Britannica, Inc.

husband's death in 1946. She is regarded by critics as one of the most original and important American artists, and her works are highly popular among the general public.

Okefenokee \ˌō-kə-fə-ˈnō-kē\ **Swamp** Swamp and wildlife refuge, southeastern Georgia and northeastern Florida, U.S. It has an area of more than 600 sq mi (1,550 sq km). Located about 50 mi (80 km) inland from the Atlantic coast, it is bounded by the low, sandy Trail Ridge, which prevents direct drainage into the Atlantic. It has diverse and abundant wildlife. Exotic flowers, such as rare orchids, abound. In 1937 a large area of the swamp, almost all in Georgia, was made the Okefenokee National Wildlife Refuge.

Okhotsk \ə-ˈkȯtsk**, Sea of** Arm of the northwestern Pacific Ocean. Bounded by the Siberian coast, the Kamchatka Peninsula and the Kuril Islands, Hokkaido, and Sakhalin Island, it covers 611,000 sq mi (1,580,000 sq km). It connects the ports of the Russian Far East. Ice floes impede navigation in winter, and dense fog is a hindrance during the summer.

Okinawa \ˌō-kē-ˈnä-wä\ Island of Japan, located in the Ryukyu archipelago, in the East China Sea. The largest island in the Ryukyu chain, it is about 70 mi (112 km) long and 7 mi (11 km) wide, with an area of 463 sq mi (1,199 sq km). It was the site of severe fighting between the U.S. and Japan in World War II. In April 1945 U.S. troops made an amphibious landing on Okinawa, which was heavily defended by the Japanese. In a three-month-long campaign, both sides sustained heavy casualties before U.S. forces gained control of the island. In 1972 the United States returned jurisdiction over Okinawa to Japan, though U.S. military installations remained.

Oklahoma State (pop., 2000: 3,450,654), southwest-central U.S. Bordered by Colorado, Kansas, Missouri, Arkansas, Texas, and New Mexico, it covers 69,898 sq mi (181,035 sq km). Its capital is Oklahoma City. The Red River forms its southern boundary; the Arkansas River flows across northeastern Oklahoma. Its highest point is Black Mesa (4,973 ft [1,516 m]), located in the Panhandle. Evidence of inhabitation by the Clovis and Folsom cultures 15,000–10,000 years ago has been found. Until the expedition of Francisco Vázquez de Coronado in 1541, the area was home to representatives of at least three major Indian language groups. Spanish control of the area lasted until 1800, when it passed to the French. In 1803 the area became part of the U.S. with the Louisiana Purchase. In 1828 the U.S. Congress reserved Oklahoma for settlement by Indians, and it became known as Indian Territory. In 1890 the western part was organized as Oklahoma Territory. The two were merged and admitted to the union as the 46th state in 1907. Cattle raising and farming are the mainstays of the economy. Mineral products include natural gas, petroleum, coal, and stone. The state's heritage is reflected in Indian and cowboy museums. A barge system links the state's second major city, Tulsa, to the Gulf of Mexico.

Oklahoma City City (pop., 2000: 506,132), capital of Oklahoma, U.S. Settled during the Oklahoma land rush in 1889, it was incorporated as a city in 1890 and became the state capital in 1910. It expanded rapidly after the discovery of petroleum in the area in 1928. The largest city in the state and its main commercial, financial, industrial, and transportation centre, it is the chief marketing and processing point for the livestock industry. It is home to the National Cowboy Hall of Fame, Myriad Gardens, and an annual rodeo competition. In 1995 it was the site of a deadly act of domestic terrorism, when the Alfred P. Murrah Federal Building was bombed, killing 168 people and injuring 500.

okra Herbaceous, hairy, annual plant (*Hibiscus esculentus* or *Abelmoschus esculentus*), of the mallow family, grown for its edible fruit. Okra leaves are deeply notched; flowers are yellow with a crimson centre. The fruit, or pod, is a tapering, 10-angled capsule 4–10 in. (10–25 cm) long. Only the tender, unripe fruit is eaten; it is prepared in a number of ways and is a defining ingredient of the gumbos of the southern U.S. Because of its large amount of mucilage (a gelatinous substance), okra is used to thicken broths. In some countries the seeds are used as a substitute for coffee.

Okra (*Hibiscus esculentus*, or *Abelmoschus esculentus*).
DEREK FELL

Oktoberfest Annual festival in Munich, Germany, lasting two weeks and ending on the first Sunday of October. It began in 1810 as a horse race celebrating the wedding of the crown prince of Bavaria, later King Louis I (1786–1868). The race was soon combined with the state agricultural fair, and food and drink were offered. In the late 20th century the Munich breweries celebrated Oktoberfest by setting up large temporary beer halls, each seating 3,000–5,000 people, and hiring bands to entertain the crowds as they ate and drank. Total beer consumption during the festival exceeds a million gallons.

Ōkubo Toshimichi \ˈō-kù-bō-ˌtō-shē-ˈmē-chē\ (b. Sept. 26, 1830, Kagoshima, Japan—d. May 14, 1878, Tokyo) Japanese samurai leader from the domain of Satsuma who, with Saigō Takamori, arranged an alliance with the domain of Chōshū to work for the overthrow of the Tokugawa shogunate (see Tokugawa period) and the restoration of the emperor as head of government. After the Meiji Restoration of 1868, Ōkubo became a dominant figure in the new government. He traveled to the West and returned convinced that Japan needed rapid economic development and modernization to survive. He supported the establishment of technical schools, loans to private businesses, and government-sponsored factory development. In 1873 he argued against those who favoured invading Korea and prevailed. He was assassinated in 1878 by discontented samurai. See also Kido Takayoshi; Meiji period.

Ōkuma Shigenobu \ˈō-kù-mä-ˌshē-ge-ˈnō-bù\ (b. March 11, 1838, Saga, Japan—d. Jan. 10, 1922, Tokyo) Japanese politician of the Meiji period who twice served as prime minister. His initial contribution to the new government was to oversee the reorganization of Japan's fiscal system. Later, after making radical proposals for a new Japanese constitution and exposing corruption in proposed sales of government property, he was forced out of government. In 1882 he formed the Rikken Kaishintō ("Progressive Party"), which favoured English parliamentary government. With Itagaki Taisuke he created a new party in 1898, the Kenseitō ("Constitutional Party"). They formed a short-lived government with Ōkuma as prime minister. Ōkuma's second tenure as prime minister (1914–16) was more successful. He is also remembered as the founder of Waseda University (1882). See also Meiji Constitution.

Okumura Masanobu \ˌō-kù-ˈmůr-ä-ˌmä-sä-ˈnō-bù\ *or* **Genpachi** \gen-ˈpä-chē\ *orig.* **Okumura Shinmyō** (b. 1686, Edo, Japan—d. 1764/68, Edo) Japanese painter and publisher of illustrated books. His style is noted for its vividness and graceful, restrained lines. He was one of the first Japanese artists to adopt Western perspective, to which he was introduced by Chinese prints. He produced large-scale prints depicting scenes such as the insides of theatres and stores. Such prints were called *uki-e* ("looming picture") for their foreshortened perspective. He is also said to have founded the format of *habahiro hashira-e*, or wide, vertical prints.

Ōkuninushi \ˈō-kù-nē-ˈnù-shē\ Central hero in the mythology of the Izumo branch of Shintō in Japan. Ōkuninushi built the world with the help of the dwarf deity Sukunahikona, and he ruled Izumo until the appearance of the divine grandchild, Ninigi. In modern Japanese folk belief, Ōkuninushi is a god who heals and who makes marriages happy.

Olaf I Tryggvason \ˈō-läf-ˈtrœg-və-sȯn\ (b. c. 964—d. c. 1000) Viking king of Norway (995–c. 1000). The son of a Norwegian chieftain, he joined Viking attacks on England in 991 and 994. He returned to Norway and was accepted as king on the death of Haakon the Great in 995. Olaf imposed Christianity on the Norwegian coast but had little influence in the interior. His missionaries introduced Christianity to the Shetland, Faroe, and Orkney islands and to Iceland and Greenland. He was killed in the Battle of Svolder, which is celebrated in medieval Scandinavian poetry.

Olaf II Haraldsson \hä-räl-sȯn\ *or* **Saint Olaf** (b. c. 995—d. July 29, 1030, Stiklestad, Nor.; feast day July 29) King of Norway (1016–28). A Viking warrior, he fought against the English in 1009–11 but assisted Ethelred II against the Danes in 1013. He returned to Norway after his conversion to Christianity and gained control over the country by 1016. Olaf sent missionaries throughout his realm, and his religious code (1024) established the Church of Norway. He was driven out of Norway by Canute the Great (1028) and was killed trying to reconquer the country two years later. He became a national hero and the patron saint of Norway.

Olaf V *Norwegian in full* **Olav Alexander Edward Christian Frederik** (b. July 2, 1903, Appleton House, near Sandringham, Norfolk, Eng.—d. Jan. 17, 1991, Oslo, Nor.) King of Norway (1957–91). Son of King Haakon VII, Olaf became a celebrated sportsman, winning the gold medal in yachting at the 1928 Olympics. In World War II he lived in exile with his family in England and was named head of the Norwegian armed forces in 1944. From 1955 he served as regent for his father, whom he succeeded as king in 1957. Like other constitutional monarchs, Olaf's duties were largely ceremonial.

Olaf V, 1973
KNUDSENS FOTOSENTER

Olajuwon \ə-'lä-zhù-ˌwän\, Hakeem (Abdul) (b. Jan. 21, 1963, Lagos, Nigeria) Nigerian-born U.S. basketball player. He attended the University of Houston and led its team to the NCAA finals in 1983 and 1984. In 1994 the 7-ft (2.13-m) Olajuwan led the Houston Rockets to the NBA championship. Nicknamed "the Dream," he holds the all-time record for blocked shots (3,830) and finished his career with 26,946 points and 13,748 rebounds.

Olbers's paradox Paradox of why the sky is dark at night. If the universe is endless and uniformly populated with luminous stars, every line of sight must end at the surface of a star and the night sky should be bright with no dark spaces between stars. This paradox is widely attributed to Heinrich Wilhelm Olbers (1758–1840), who discussed it in 1823, though Johannes Kepler first advanced the problem in 1610 as an argument against the notion of a limitless universe with infinite stars. The paradox has since been resolved: we can see no farther than the light-travel distance within the lifetime of the universe, and light becomes redshifted to invisibility (see redshift).

Olbia \'ōl-byä\ *formerly* **Terranova Pausania** Town (pop., 2001 prelim.: 40,746), northeastern Sardinia, Italy. Originally a Greek colony, it passed to the Romans and was the site of a Roman victory over the Carthaginian general Hanno in 259 BC. It was rebuilt by Pisan colonists in 1198 and named Terranova Pausania. Renamed Olbia in 1939, it is the main passenger port for connections with the Italian mainland. It has Phoenician and Roman ruins.

Old Believers Russian dissenters who refused to accept liturgical reforms imposed on the Russian Orthodox Church by Nikon in 1652–58. Numbering in the millions in the 17th century, the Old Believers endured persecution for years, and several of their leaders were executed. They split into a variety of sects, of which the two main groups were the Popovtsy (priestly sects) and Bezpopovtsy (priestless sects). In 1971 the council of the Russian Orthodox Church rescinded all the anathemas of the 17th century and recognized the full validity of the old rites.

Old Catholic church Any of a group of Western Catholic churches that separated from Rome after the First Vatican Council promulgated the doctrine of papal infallibility (1869–70). Old Catholic churches in the Netherlands, Germany, Switzerland, Austria, Poland, and elsewhere joined together in 1889 to form the Union of Utrecht. The Old Catholics accept the Bible, the Apostles' and Nicene creeds, and the seven sacraments. Their chief authority in church government is the conference of bishops. They have long used the vernacular in public worship; confession to a priest is not obligatory, and in some Old Catholic churches the celibacy of the clergy is optional.

Old Church Slavonic language *or* **Old Church Slavic language** Oldest attested Slavic language, known from a small corpus of 10th- or 11th-century manuscripts, most written in the Glagolitic alphabet (see Cyrillic alphabet). The Old Church Slavonic documents, all translations from Christian ecclesiastical texts, resulted from the mission to the Moravian Slavs of Saints Cyril and Methodius, though all but one of the surviving manuscripts were actually copied in South Slavic-speaking areas. Beginning in the 11th century, the influence of the vernacular languages in cultural focal areas (Serbia, Bulgaria-Macedonia, Ukraine, and Russia) led to regional variations in Church Slavonic. It remained the literary language of Eastern Orthodoxy in South Slavic and East Slavic lands into modern times and is still the liturgical language of Slavic Orthodoxy and the Slavic Eastern rite church.

Old English *or* **Anglo-Saxon** Language spoken and written in England before AD 1100. It belongs to the Anglo-Frisian group of Germanic languages. Four dialects are known: Northumbrian (in northern England and southeastern Scotland), Mercian (central England), Kentish (southeastern England), and West Saxon (southern and southwestern England). Mercian and Northumbrian are often called the Anglian dialects. Most extant Old English writings are in the West Saxon dialect. The great epic poem of Old English is *Beowulf*; the first period of extensive literary activity occurred in the 9th century. Old English had three genders (masculine, feminine, neuter) for nouns and adjectives; nouns, pronouns, and adjectives were also inflected for case. Old English had a greater proportion of strong (irregular) verbs than does Modern English, and its vocabulary was more heavily Germanic. See also Middle English; English language.

Old English script See black letter script

Old English sheepdog Shaggy working dog developed in early 18th-century England and used primarily to drive sheep and cattle to market. It has a shuffling, bearlike gait and a dense, solid-coloured or white-marked gray or blue-gray coat. It stands 21–26 in. (53–66 cm) tall and weighs over 55 lb (25 kg). Its long, dense, weather-resistant coat covers the eyes but does not obscure vision. The tail is usually removed soon after birth.

Old Farmer's Almanac See Farmer's Almanac

Old Ironsides See USS Constitution

Old Norse language Classical Germanic language used c. 1150–1350, the literary language of the Icelandic sagas, skaldic poetry, and Eddas. The terms Old Norse and Old Icelandic are sometimes used interchangeably because Icelandic records of this period are more plentiful and of greater literary value than those in the other Scandinavian languages, but Old Norse also embraces the ancestors of modern Norwegian, Danish, Swedish, and Faroese.

Old Point Comfort Historic point and part of the city of Hampton, southeastern Virginia, U.S. It is located at the entrance to Hampton Roads, opposite Norfolk. Named by the colonists of Jamestown in 1607, it has been the site of fortifications, including Fort George and Fort Monroe, since 1609. The latter was a Union base during the American Civil War. It was a popular seaside resort in the 19th and early 20th centuries.

Old Testament Sacred scriptures of Judaism and, with the New Testament, of Christianity. Written almost entirely in the Hebrew language between 1200 and 100 BC, the Old Testament (also called the Hebrew Bible or Tanakh) is an account of God's dealings with the Hebrews as his chosen people. In the Hebrew Bible, the first six books tell how the Israelites became a people and settled in the Promised Land, the following seven books describe the development of Israel's monarchy and the messages of the prophets, and the last 11 books contain poetry, theology, and some additional historical works. Christians divided some of the original Hebrew books into two or more parts, specifically, Samuel, Kings, and Chronicles (two parts each), Ezra-Nehemiah (two separate books), and the Minor Prophets (12 separate books). The content of the Old Testament varies according to religious tradition, the Jewish, Roman Catholic, and Protestant canons all differing from each other as to which books they include. See also Apocrypha, Bible.

Old Vic London theatre company. The company's theatre opened in 1818 as the Royal Coburg; renamed the Royal Victoria in 1833, it became popularly known as the Old Vic. The company, managed by Lilian Baylis, began a regular Shakespeare season in 1914. From the 1930s it was noted for its memorable productions of Shakespeare's plays and other classics, with actors such as John Gielgud, Laurence Olivier, and Ralph Richardson. The company was dissolved in 1963 and formed the nucleus of the new National Theatre, which performed at the Old Vic theatre until moving to a new building in 1976.

Old World monkey Any of some 100 species of monkeys (the catarrhine ["downward-nosed"] monkeys) that live in Africa, on the Red Sea coast of Arabia, and in Asia from Afghanistan to Indonesia. Catarrhines generally have a narrow nose, a narrow septum, close-set nostrils directed forward or down, bony ear passages, two premolars in each half of each

© 2006 Encyclopædia Britannica, Inc.

jaw, a nonprehensile tail (if any), and hard patches of bare skin (ischial callosities) on the buttocks. Zoologists gather all Old World monkeys into a single family, Cercopithecidae. There are two subfamilies: Cercopithecinae, or monkeys with cheek pouches (MACAQUES, BABOONS, VERVETS, MANDRILLS, and others); and Colobinae, or leaf monkeys (langurs, COLOBUS MONKEYS, PROBOSCIS MONKEYS, and others). See also NEW WORLD MONKEY.

Oldenbarnevelt \ˌōl-dən-ˈbär-nə-vəlt**, Johan van** (b. Sept. 14, 1547, Amersfoort, Spanish Netherlands—d. May 13, 1619, The Hague, Neth.) Dutch statesman and a founding father of Dutch independence. A lawyer in the province of Holland, he helped WILLIAM I negotiate the Union of Utrecht (1579). Appointed "great pensionary" of Holland, he mobilized Dutch resources for the military goals of MAURICE OF NASSAU. As foreign secretary of the Union's seven provinces, he negotiated a triple alliance with France and England against Spain (1596). He later concluded the Twelve Years' Truce with Spain (1609), which reaffirmed Holland's dominant role in the republic. In 1617 he sided with the moderate Arminians in religious strife against the stricter Calvinists (known as Counter-Remonstrants) and Prince Maurice; he was arrested in 1618, convicted of religious subversion, and beheaded.

Oldenburg Former German state, since 1946 part of Lower SAXONY, Germany. It was held by the counts of Oldenburg from c. 1100 until 1667, when it passed to Denmark. In the late 18th century it was ruled by the bishop of Lübeck, who was made duke of Oldenburg by JOSEPH II, the Holy Roman emperor. It became a grand duchy in the early 19th century and took Prussia's side in the Austro-Prussian War of 1866. It joined the German Empire in 1871. Its last grand duke abdicated in 1918. The 17th-century grand-ducal palace in the city of Oldenburg (pop., 2002 est.: 155,908) is now a state museum of art and culture.

Oldenburg, Claes (Thure) (b. Jan. 28, 1929, Stockholm, Swed.) Swedish-born U.S. POP ART sculptor. The son of a consular official, he spent part of his early life in the U.S. He graduated from Yale University and attended the Art Institute of Chicago before doing freelance illustrations for magazines. He turned to sculpture after moving to New York City in 1956. Like other practitioners of Pop art, he chose banal subjects from consumer culture, but for "soft sculptures" such as *Giant Clothespin* (1976) and *Giant Soft Shuttlecock* (1995) he chose subjects with close human associations. His frequent use of soft, yielding vinyl gave the objects human, often sexual overtones.

Oldowan \ˈäl-də-wən\ **industry** STONE-TOOL INDUSTRY of the early PALEOLITHIC (beginning c. 2.5 million years ago) characterized by crudely worked pebble tools. Oldowan tools, made of quartz, quartzite, or basalt, are chipped in two directions to form simple, rough implements for chopping, scraping, or cutting. The industry is associated with early hominids, such as *HOMO HABILIS* and possibly also *AUSTRALOPITHECUS robustus*, and has been found at OLDUVAI GORGE (from which its name derives), Lake Turkana (see LAKE TURKANA REMAINS), and the Afar region of Ethiopia. Oldowan tools were made for nearly 1.5 million years before the emergence of the ACHEULEAN INDUSTRY.

Olduvai \ˈōl-də-ˌwī, ˈōl-də-ˌwā\ **Gorge** Archaeological site on the eastern Serengeti Plain, northern Tanzania. It is a steep-sided ravine about 30 mi (48 km) long and 295 ft (90 m) deep. Deposits exposed in the sides of the gorge cover a time span from c. 2,100,000 to 15,000 years ago and have yielded the remains of more than 50 HOMININS as well as the most complete sequence of stone tool industries. The site first came to public notice in 1959 when Louis and Mary Leakey (see LEAKEY FAMILY) uncovered the first specimens of *Paranthropus*, a hominin related to *AUSTRALOPITHECUS*. Remains of *HOMO HABILIS*, *HOMO ERECTUS*, and *HOMO SAPIENS* have since been found. These discoveries have strengthened the argument that the human lineage originated in Africa. See also STONE TOOL INDUSTRY; OLDOWAN INDUSTRY.

oleander \ˈō-lē-ˌan-dər\ Any of the ornamental evergreen shrubs of the genus *Nerium* (DOGBANE FAMILY), which have poisonous milky juice. Numerous varieties of flower colour in the common oleander, or rosebay (*N. oleander*), have been introduced from greenhouse culture and are grown outdoors in warmer climates. All parts of the plant are very toxic if eaten, and contact with them may cause skin irritation.

oleaster family \ˈō-lē-ˌas-tər\ Family Elaeagnaceae, composed of three genera of hardy shrubs and small trees, found in the Northern Hemisphere, especially in steppe and coastal regions. The plants' tiny, distinctive scales give them a silvery or rust-coloured sheen. Many members of the family perform NITROGEN FIXATION. The berries of several species are edible. Ornamental shrubs in this family include buffalo berry or silverberry (*Shepherdia argentea*), oleaster or Russian olive (*Elaeagnus angustifolia*), and sea buckthorn (*Hippophae rhamnoides*).

olefin \ˈō-lə-fən\ *or* **alkene** Any unsaturated HYDROCARBON containing one or more pairs of carbon atoms linked by a double bond (see COVALENT BOND, SATURATION). Olefins may be classified by whether the double bond is in a ring (cyclic) or a chain (acyclic, or aliphatic) or by the number of double bonds (monoolefin, diolefin, etc.). Rare in nature, olefins are obtained by the cracking of PETROLEUM fractions at high temperatures. The simplest ones (ETHYLENE, propylene, butylene, butadiene, and isoprene) are the basis of the PETROCHEMICALS industry. They react by adding other chemical agents at the double bond to form derivatives or POLYMERS.

Olga, Saint *or* **Saint Helga** (b. c. 890—d. 969, Kiev; feast day July 11) Princess of Kiev. The first recorded female ruler in Russia, she served as regent of Kiev (945–964) after the assassination of her husband Igor I (877?–945); she avenged his death by having his murderers scalded to death. Probably baptized (c. 957) at Constantinople, she became the first member of the ruling family of Kiev to adopt Christianity. She was canonized as the first Russian saint of the Orthodox church.

oligarchy \ˈä-li-ˌgär-kē, ˈō-li-ˌgär-kē\ Rule by the few, often seen as having self-serving ends. Aristotle used the term pejoratively for unjust rule by bad men, contrasting oligarchy with rule by an ARISTOCRACY. Most classic oligarchies have resulted when governing elites were recruited exclusively from a ruling class, which tends to exercise power in its own interest. The term is considered outmoded today because "few" conveys no information about the nature of the ruling group.

Oligocene \ˈä-li-gō-ˌsēn\ **Epoch** Major division of the TERTIARY PERIOD, from c. 33.7 to 23.8 million years ago. It follows the EOCENE EPOCH and precedes the MIOCENE EPOCH. The term (from the Greek for "few recent forms") refers to the small number of modern animals that originated during this epoch. Oligocene climates appear to have been temperate, and many regions were nearly tropical. Grasslands expanded, and forested regions dwindled. The vertebrates of the northern continents had an essentially modern aspect that is a result less of the appearance of new forms than of the extinction of archaic vertebrates at the close of the Eocene.

oligopoly \ˌäl-ə-ˈgä-pə-lē\ Market situation in which producers are so few that the actions of each of them have an impact on price and on competitors. Each producer must consider the effect of a price change on the others. A cut in price by one may lead to an equal reduction by the others, with the result that each firm will retain about the same share of the market as before but with a lower profit margin. Competition in oligopolistic industries thus tends to manifest itself in nonprice forms such as advertising and product differentiation. Oligopolies in the U.S. include the steel, aluminum, and automobile industries. See also CARTEL, MONOPOLY.

oligosaccharide \ˌä-li-gō-ˈsa-kə-ˌrīd\ Any CARBOHYDRATE with a few (between 3 and about 6 to 10) units of simple SUGARS (MONOSACCHARIDES). A wide variety of oligosaccharides are made by partially breaking down POLYSACCHARIDES. Most of the few naturally occurring oligosaccharides are found in plants; those in animals tend to be combined in glycoproteins.

olive Subtropical, broad-leaved tree (*Olea europaea*) or its edible fruit. The olive was being grown on the island of Crete c. 3500 BC, and Semitic peoples apparently were cultivating it as early as 3000 BC. Its cultivation was important to the ancient Greeks and Romans and spread to all the countries bordering the Mediterranean. Today olives are grown primarily for olive oil, valued both for its distinctive taste and fragrance and for its dietary benefits. Fresh olives must be treated to neutralize their extreme bitterness before they can be eaten. The olive family (Oleaceae) comprises about 900 species in 24 genera of woody plants. Native to forested regions, members of the family grow worldwide except in the Arctic; they are evergreen in tropical and warm temperate climes and deciduous in colder zones. The family includes ASH trees, which yield HARDWOOD timber, and horticultural favourites such as the LILAC, JASMINE, PRIVET, and FORSYTHIA. Many members of the family are cultivated for their beautiful and fragrant flowers.

Oliver, King *orig.* **Joseph Oliver** (b. May 11, 1885, Abend, La., U.S.—d. April 8, 1938, Savannah, Ga.) U.S. JAZZ cornetist and bandleader. Oliver grew up in New Orleans and established himself as the city's preeminent cornetist, coleading a band with trombonist Kid Ory (1886–1973) before moving to Chicago in 1918. In 1922 Oliver hired his

© 2006 Encyclopædia Britannica, Inc.

New Orleans protégé Louis Armstrong to join him in Chicago in his Creole Jazz Band. Their recordings together, including "Dipper Mouth Blues," are jazz classics.

Olives, Mount of Limestone ridge, east of Jerusalem. Frequently mentioned in the Bible, it is holy both in Judaism and in Christianity. Politically it is part of the municipality of Greater Jerusalem under Israeli administration. Its slopes have been the most sacred burial ground in Judaism for centuries. The peak generally regarded as the Mount of Olives is 2,652 ft (808 m) in elevation. Nearby is the site held by tradition to be the Garden of Gethsemane, which is associated with the betrayal and Crucifixion of Jesus.

Olivetti & C. SpA \ˌä-lə-'ve-tē\ Historic Italian electronics and telecommunications company. Founded in 1908 by Camillo Olivetti (1868–1943), the firm began by making typewriters. Camillo's son Adriano studied manufacturing and plant management in the U.S. in the 1920s, and as company president from 1938 made Olivetti into Europe's principal maker of business machines. The company later produced calculators, microcomputers, and copiers. In 1982 its U.S. subsidiary was purchased by Docutel Corp. In the late 1990s Olivetti sold off its money-losing computer business and remade itself as a telecommunications company with holdings in mobile and fixed-line telephones. It became a subsidiary of Telecom Italia in 1993.

Olivier \ə-'li-vē-ˌā**, Laurence (Kerr), Baron Olivier (of Brighton)** (b. May 22, 1907, Dorking, Surrey, Eng.—d. July 11, 1989, near London) British actor, director, and producer. He began his professional career in 1926 and joined the Old Vic company in 1937, playing many major Shakespearean roles. With Ralph Richardson he codirected the Old Vic (1944–50), and he acted in some of its greatest productions, including *Richard III*, *Henry IV*, and *Oedipus Rex*. He was knighted in 1947. From 1950 he directed and acted under his own management; his notable productions included *Antony and Cleopatra* and *The Entertainer* (1957). He was the founding director of the National Theatre (1962–73), one of whose theatres is now named for him. In 1970 he was created a life peer, the first actor ever to be so honoured. His many films include *Wuthering Heights* (1939), *Rebecca* (1940), *Hamlet* (1948, Academy Award), *The Entertainer* (1960), and *Othello* (1965). He was married to the actresses Vivien Leigh and (from 1961) Joan Plowright (b. 1929).

olivine \'ä-lə-ˌvēn\ Any member of a group of common magnesium, iron silicate minerals. Olivines occur in many igneous rocks and are a major constituent of the Earth's upper mantle. They also have been found in some lunar rocks and in many meteorites. Olivine forms yellow to greenish yellow crystals and is sometimes used in making bricks. Transparent green olivine (precious olivine) is called peridot.

Olmec \'äl-ˌmek\ First elaborate pre-Columbian culture of Mesoamerica. The Olmec lived in the lowland gulf coast of what is now southern Mexico. Developing a wide trading network, their cultural influence spread north to the Valley of Mexico and south to Central America; later native religions and iconography throughout Mesoamerica have Olmec roots. Their oldest known building site, San Lorenzo, which dates to c. 1150 BC, is remarkable for its colossal stone sculptures of human heads. The dominant motif in Olmec art is the figure of a god that is a hybrid of a jaguar and a human infant. Olmec buildings, monuments, and art style all indicate a complex and nonegalitarian society.

Olmsted, Frederick Law (b. April 26, 1822, Hartford, Conn., U.S.—d. Aug. 28, 1903, Brookline, Mass.) U.S. landscape architect. He traveled throughout the American South in the 1850s and won fame for several books describing its slaveholding culture. During an extended vacation in Europe, he became profoundly impressed with English landscaping, which he described in *Walks and Talks of an American Farmer in England* (1852). In 1857 he was hired as superintendent of New York City's newly planned Central Park. With the architect Calvert Vaux (1824–95), he won a competition to design the park, and he became its chief architect in 1858. The result was a nature-lover's paradise incorporating lawns, woods, ponds, and meandering paths; it represented one of the first attempts in the U.S. to apply art to the improvement of nature in a public park. Other Olmsted parks include Prospect Park in Brooklyn, New York City; a Niagara Falls, N.Y., park project; an extensive system of parks and parkways in Boston; and the World's Columbian Exposition (later Jackson Park) in Chicago. As chairman of the first Yosemite commission, he helped secure the area as a permanent public park.

Olmütz \'ōl-mütsˌ**Punctation of** (Nov. 29, 1850) Agreement signed at Olmütz (now Olomouc, Cz.Rep.) between Prussia and Austria. In response to an appeal from the elector of Hesse for help against rebellious subjects, Prussia and Austria sent troops. They threatened to clash, and when Russia sided with Austria, Prussia withdrew. In the Olmütz agreement, Prussia gave up its plans to create a union of German states without Austria and accepted Austria's reconstitution of the German Confederation. Prussia resented the diplomatic reverse and considered itself humiliated.

Olney, Richard (b. Sept. 15, 1835, Oxford, Mass., U.S.—d. April 8, 1917, Boston, Mass.) U.S. statesman. As U.S. attorney general (1893–95) under Pres. Grover Cleveland, he set a precedent by using an injunction to break the Pullman Strike (1894). Appointed U.S. secretary of state in 1895, he was confronted with Venezuela's request for support in its border dispute with Britain over the boundary between Venezuela and British Guiana. Olney's aggressive note to Britain, known as the Olney Corollary, demanded that Britain submit the dispute to arbitration and reasserted U.S. sovereignty in the Western Hemisphere in accordance with the Monroe Doctrine. The matter was in fact settled by arbitration two years after Olney's retirement in 1897.

Olt \'ōlt\ **River** River, southern Romania. It rises close to the headwaters of the Mureş River in eastern Transylvania at an elevation of 5,900 ft (1,800 m). It is 308 mi (496 km) long and flows south through the southern Carpathian Mountains to enter the Danube River opposite Nikopol. There are several resorts and spas along its course through the mountains.

Olympia Ancient sanctuary and site of the Olympic Games, northwestern Peloponnese, southern Greece. Located 10 mi (16 km) inland from the Ionian Sea, it was on the northern bank of the Alpheus River. A centre of Greek religious worship, it held the primarily athletic contests in honour of Zeus every four years, beginning in 776 BC. In the temple of Zeus, built c. 460 BC, was the statue of Zeus by Phidias, one of the Seven Wonders of the World. Excavations have uncovered many ruins, including temples and the stadium.

Olympia City (pop., 2000: 42,514), capital of Washington state, U.S. It lies at the southern end of Puget Sound, southwest of Tacoma. Originally called Smithfield, it was renamed for the nearby Olympic Mountains and incorporated as a city in 1859. It developed port facilities and a lumber-based economy, supplemented by oyster farming and other industries. Its harbour is the site of a large merchant reserve fleet. Located at the base of the Olympic Peninsula, it is the gateway to Olympic National Park.

Olympic Games Sports festival. In ancient Greece it was a Panhellenic festival held every fourth year and made up of contests of sports, music, and literature. Since 1896 the name has been used for a modified

revival of the ancient Games, consisting of international athletic contests held at four-year intervals. The original Games included footraces, the discus and javelin throws, the long jump, boxing, wrestling, the pentathlon, and chariot races. After the subjugation of Greece by Rome, the Games declined; they were finally abolished about AD 400. They were revived in the late 19th century through efforts led in part by Pierre, baron de COUBERTIN; the first modern Games were held in Athens. The first Winter Games were held in 1924. The direction of the modern Olympic movement and the regulation of the Games are vested in the International Olympic Committee, headquartered at Lausanne, Switz. Until the 1970s the Games adhered to a strict code of amateurism, but since that time professional players have also been allowed to participate. Programs for the Summer Games include competition in ARCHERY, BASEBALL, BASKETBALL, BOXING, CANOEING, CYCLING, DIVING, equestrian sports, FENCING, FIELD HOCKEY, FOOTBALL (soccer), GYMNASTICS, HANDBALL, JUDO, the modern PENTATHLON, ROWING, SAILING, SHOOTING, SOFTBALL, SWIMMING, TABLE TENNIS, TENNIS, TRACK AND FIELD (athletics), the TRIATHLON, VOLLEYBALL, WATER POLO, WEIGHTLIFTING, and WRESTLING. The program for the Winter Games includes the BIATHLON, BOBSLEDDING, ICE HOCKEY, LUGEING, SKELETON SLEDDING, SNOWBOARDING, and numerous ice SKATING and SKIING events. Events are periodically added and dropped.

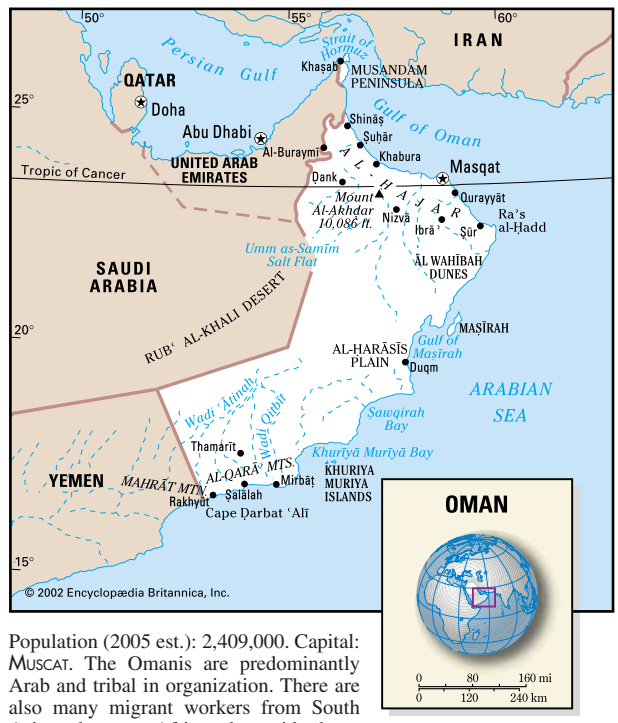
Olympic Mountains Segment of the Pacific Coast Ranges, northwestern Washington, U.S. The mountains extend across the Olympic Peninsula south of the Strait of JUAN DE FUCA and west of PUGET SOUND within OLYMPIC NATIONAL PARK. The chief peaks are Mount Olympus, at 7,965 ft (2,428 m), and Mount Constance, at 7,743 ft (2,360 m). There is heavy rainfall, creating rainforests dominated by Douglas fir and Sitka spruce. Some trees are nearly 300 ft (90 m) high and 8 ft (2.5 m) in diameter.

Olympic National Park National park, northwestern Washington, U.S. Established in 1938 to preserve the OLYMPIC MOUNTAINS and their forests and wildlife, it covers 1,442 sq mi (3,735 sq km); it includes a strip of Pacific Northwest shoreline geographically separated from the rest of the park. There are more than 60 glaciers in the park. The western part includes rainforests; the eastern slopes feature lakes; and the ocean shore section contains scenic beaches and three Indian reservations.

Olympus, Mount Mountain peak, northeastern Greece. At 9,570 ft (2,917 m), it is the highest mountain in Greece. It is part of the Olympus range, lying on the border between Macedonia and THESSALY, near the Gulf of Salonika. The summit is snowcapped and often has cloud cover. In ancient Greece, it was regarded as the abode of the gods and the site of the throne of ZEUS.

Olympus Mons Large VOLCANO on MARS, the largest known volcano in the solar system. It consists of a central structure that ascends about 13 mi (21 km) above Mars's mean radius and is 335 mi (540 km) wide at the base; it is surrounded by an outward-facing cliff rising as much 6 mi (10 km) above the surrounding area. At the summit is a crater 53 mi (85 km) in diameter. For comparison, Earth's largest volcano, MAUNA LOA, is 75 mi (120 km) wide at the base and rises 5.6 mi (9 km) above the ocean floor.

Olynthus \ō-'lin-thəs\ Ancient Greek city, on the Chalcidice Peninsula, northeastern Greece. From the late 5th century BC it was the head of a strong confederacy of Greek towns known as the Chalcidian League. It was destroyed by PHILIP II in 348 BC. Excavations have revealed the grid plan of the ancient town and provided material for studying the relationship between Classical and Hellenistic Greek art.



om \'ōm\ In HINDUISM and other Indian religions, a sacred syllable considered the greatest of all MANTRAS. The syllable *om* is composed of the three sounds *a-u-m* (in the SANSKRIT LANGUAGE, the vowels *a* and *u* join to become *o*), which represent three important triads: earth, atmosphere, and heaven; the major Hindu gods, BRAHMA, VISHNU, and SHIVA; and the sacred Vedic scriptures, Rig, Yajur, and Sama (see VEDIC RELIGION). Thus om mystically embodies the essence of the universe. It is uttered at the beginning and end of Hindu prayers, chants, and meditation and is also freely used in Buddhist and Jain rituals.

Omagh \'ō-mä\ District (pop., 2001: 47,735) and town (pop., 1991: 18,000), Northern Ireland. Formerly in County Tyrone, the district was established in 1973. The area was ruled by the ancient O'Neill family (5th–16th centuries), passing to English rule after the flight of Hugh O'Neill in 1607. It was the site of sectarian violence in 1998, when a car bomb killed 29 people. Most of the land is grazed by dairy cattle or sheep, and the rivers contain salmon and trout. Omagh town, the district seat, is a market and light-manufacturing centre.

Omaha \'ō-mə-ˌhȯ, 'ō-mə-ˌhä\ City (pop., 2000: 390,007), eastern Nebraska, U.S., on the Missouri River, north of its junction with the Platte River. The city's name, meaning "upstream people," referred to the Omaha Indians. Omaha was founded in 1854 and incorporated as a city in 1857. In 1863 it became the starting point for the UNION PACIFIC RAILROAD Co.'s first transcontinental railroad and soon grew into a centre of trade and industry. The largest city in the state, it is a major livestock and grain market, as well as a railroad, meat-packing, and insurance centre. It is home to the University of Nebraska and the Joslyn Art Museum.

O'Mahony, John (b. 1816, near Mitchelstown, County Cork, Ire.—d. Feb. 6, 1877, New York, N.Y., U.S.) Irish-American founder of the U.S. branch of the Fenian Brotherhood (see FENIAN MOVEMENT), an Irish secret revolutionary society. An Irish resistance leader, he fled to New York in 1853, where he founded and led (1858–66) the Fenians. By 1865 the American Fenian group had become large and prosperous and was sending money and arms to Ireland. O'Mahony reluctantly backed the Irish Fenians' decision to stage military raids in Canada against the British, part of a scheme to hold Canada hostage for the cause of Irish freedom. The raids failed and he resigned, but he was later called out of retirement (1872–77). See also JOHN O'NEILL.

Oman \ō-'män\ *officially* **Sultanate of Oman** *formerly* **Muscat and Oman** Country, Middle East, southwestern Asia. It is on the southeast coast of the ARABIAN PENINSULA. Area: 119,500 sq mi (309,500 sq km).

Population (2005 est.): 2,409,000. Capital: MUSCAT. The Omanis are predominantly Arab and tribal in organization. There are also many migrant workers from South Asia and eastern Africa who reside there. Languages: Arabic (official), others. Religions: Islam (official); also Hinduism, Christianity. Currency: Omani rial. Oman is a hot, arid country with high humidity along the coast. The Ḥajar Mountains parallel the shore of the Gulf of Oman, reaching an elevation of more than 10,000 ft (3,000 m). A broad expanse of sandy desert covers much of the country. Oman has a developing mixed economy, and the production and export of petroleum is its largest sector. It is a hereditary monarchy, with an advisory council; its head of state and government is the sultan. Human habitation dates to about the 3rd millennium BC. The Omani tribal system dates to Arab migration during the 2nd century AD. It was ruled by imams (Muslim religious leaders) of the Ibādī sect from the early Islamic period (mid-8th century) until the 12th century, when local rule was established. The Portuguese controlled the coastal areas c. 1507–1650, when they were expelled. The Āl Bū Saʿīd, a dynasty founded in the mid-18th century, still rules Oman. The kingdom expanded into eastern Africa in the 18th–19th century, where its capital was at ZANZIBAR. Oil was discovered in 1964. In 1970 the sultan was

© 2006 Encyclopædia Britannica, Inc.

deposed by his son, who began a policy of modernization, and under him Oman joined the Arab League and the United Nations. In the First Persian Gulf War, Oman cooperated with the forces allied against Iraq. It subsequently continued to expand its foreign relations.

Oman, Gulf of Northwestern arm of the Arabian Sea, between the eastern part of the Arabian Peninsula and Iran. It is about 230 mi (370 km) wide and 340 mi (545 km) long and connects with the Persian Gulf through the Strait of Hormuz. It is the only entrance to the Persian Gulf from the Arabian Sea and Indian Ocean and is important as a shipping route for the oil-producing area around the Persian Gulf.

Omar, Mosque of See Dome of the Rock

Omar Khayyam \ˌō-ˌmär-ˌkī-ˈyäm\ *byname of* **Ghiyāth al-Dīn Abū al-Fatḥ ʿUmar ibn Ibrāhīm al-Neyshābūrī al-Khayyāmī** (b. May 18, 1048, Neyshābūr, Khorāsān—d. Dec. 4, 1131, Neyshābūr) Persian poet, mathematician, and astronomer. Educated in the sciences and philosophy, he was renowned in his country and time for his scientific achievements, but few of his prose writings survive. His verses attracted little attention until his *robāʿīyāt* ("quatrains") were loosely translated into English by Edward FitzGerald and published in 1859. Many of the quatrains (each of which was intended as an independent poem) are of doubtful attribution; most scholars agree on the authenticity of about 50, with controversy over some 200 others.

ombudsman \ˈäm-ˌbůdz-mən\ *Swedish* **representative** Representative assigned by a large organization or a government to investigate citizen complaints and suggest solutions. An ombudsman's office was established by the Swedish constitution of 1809. The idea soon spread to other Scandinavian countries and later to New Zealand, Britain, Germany, Israel, and some states or provinces in the U.S., Australia, and Canada. An ombudsman's responsibility is to receive and investigate complaints and to serve as an independent and impartial arbiter in recommending what may be done to satisfy the complainant or in explaining why no action is necessary. Ombudsmen are now used in universities, corporations, municipalities, and institutions such as hospitals.

Omdurman \ˌäm-dər-ˈman\ City (pop., 1993 est.: 1,267,000), east-central Sudan. It is situated on the left bank of the Nile River just below the confluence of the Blue and White Niles. It was an insignificant village until the victory of al-Mahdī over the British in 1885. It grew rapidly after al-Mahdī and his successor, ʿAbd Allāh, made it their capital. It was captured by Anglo-Egyptian forces in 1898 but continued to develop into the cultural, religious, and commercial centre of The Sudan. Sites of interest include ʿAbd Allāh's house (now a museum) and the tomb of al-Mahdī.

The tomb of al-Mahdī in Omdurman, The Sudan.
CHARLES BEERY/SHOSTAL ASSOCIATES

Omega Centauri \ō-ˈmā-gə-sen-ˈtȯr-ī\ Brightest globular cluster, located in the constellation Centaurus. It has a magnitude of 3.7 and is visible to the unaided eye as a faint luminous patch. One of the nearer globular clusters (about 17,000 light-years away), it is estimated to contain hundreds of thousands of stars, including several hundred variable stars. John Herschel (see Herschel family) was the first to recognize it as a star cluster and not a nebula.

omen Observed phenomenon that is interpreted as signifying good or bad fortune. The many and varied omens that the ancients noted included lightning, cloud movements, the flights of birds, and the paths of sacred animals. Each type of omen was gauged according to specific meaningful characteristics, such as the kinds of bird in flight or the direction of flight in relation to the observer.

Ometecuhtli \ˌō-mā-ˈtā-ˌkůt-lē\ Aztec deity, the Lord of Duality or Lord of Life. With his female counterpart, Omecíhuatl (Lady of Duality), he lived in Omeyocan, the 13th and highest Aztec heaven. He was represented by symbols of fertility, and his image was adorned with ears of corn. He was the only Aztec god to have neither a temple nor a formal cult. Seeing him as remote in the heavens, the Aztecs assumed he would never interact with them directly, but they felt his presence in rituals and in the rhythms of nature.

omnivore \ˈäm-nə-ˌvōr\ Animal that eats both plant and animal matter. Most omnivorous species do not have highly specialized food-processing structures or food-gathering behaviour. Many animals generally considered carnivores are actually omnivorous; for example, the red fox eats fruits and berries as well as mammals and birds. See also herbivore.

Omsk \ˈȯmsk\ City (pop., 2002: 1,133,900), west-central Russia. It is located in southwestern Siberia at the confluence of the Irtysh and Om rivers. Founded in 1716 as a military stronghold, Omsk became a city in 1804. It remained the headquarters of the Siberian Cossacks until the late 19th century. In 1918–19 it was the seat of the anti-Bolshevik government of Adm. Aleksandr Kolchak. Its growth was spurred by the building of the Trans-Siberian Railroad in the 1890s and the onset of World War II. Pipelines from the Volga-Urals and western Siberian oil fields supply the refinery, and the petrochemical industry is also is important.

On See Heliopolis

Onassis, Aristotle (Socrates) (b. Jan. 20, 1906, Smyrna, Tur.—d. March 15, 1975, Neuilly-sur-Seine, near Paris, France) Greek shipping magnate and international businessman. The son of a tobacco dealer, he started a tobacco-importing business in Buenos Aires, Arg. He was made consul general after negotiating a trade agreement for the Greek government. A millionaire by age 25, he bought his first freight ships in 1932. In the 1940s and '50s his fleet grew until it was larger than the navies of many countries. He acquired business interests in Monte Carlo, and from 1957 to 1974 he owned and operated Olympic Airways, the Greek national airline. He conducted a long affair with Maria Callas, and in 1968 married Jacqueline Kennedy (see Jacqueline Kennedy Onassis).

Onassis, Jacqueline Kennedy *orig.* **Jacqueline Bouvier** (b. July 28, 1929, Southampton, N.Y., U.S.—d. May 19, 1994, New York, N.Y.) U.S. first lady, socialite, and editor. After graduating from George Washington University in 1951 she took a job as a reporter-photographer at the *Washington Times-Herald*. In 1953 she married Sen. John F. Kennedy, who became president in 1961. As first lady, she restored the White House to its original Federal style and conducted a televised tour of the residence. Her graciousness, elegance, and beauty endeared her to the American public, and her broad culture and ease in speaking Spanish and French impressed foreign leaders. After her husband's assassination in 1963 she moved to New York with their children, Caroline (b. 1957) and John, Jr. (1960–99). In 1968 she married Aristotle Onassis. After his death in 1975, she returned to New York, where she became a book editor.

Oñate \ōn-ˈyä-tā**, Juan de** (b. 1550?, New Spain—d. 1630) Spanish conquistador. The son of wealthy parents in Zacatecas, New Spain, he married a granddaughter of Hernán Cortés. He received permission to govern the colony of New Mexico, which he founded in 1598. He sent exploring parties throughout the American Southwest to search for gold and led an expedition into present-day Kansas in 1601. Still searching for gold, he explored the region west to the Colorado River and south to the Gulf of California (1604). He resigned in 1607. Tried for his brutal treatment of Indians and settlers while governor, he was found guilty and exiled from the colony in 1614.

onchocerciasis See river blindness

oncogene \ˈäŋ-kə-ˌjēn\ Gene that can cause cancer. It is a sequence of DNA that has been altered or mutated from its original form, the proto-oncogene (see mutation). Proto-oncogenes promote the specialization and division of normal cells. A change in their genetic sequence can result in uncontrolled cell growth, ultimately causing the formation of a cancerous tumour. In humans, proto-oncogenes can be transformed into oncogenes in three ways: point mutation (alteration of a single nucleotide base pair), translocation (in which a segment of the chromosome breaks off and attaches to another chromosome), or amplification (increase in the number of copies of the proto-oncogene). Oncogenes were first discovered in certain retroviruses and were later identified as cancer-causing agents in many animals. See also J. Michael Bishop; Harold Varmus.

Ondaatje \än-ˈdä-chā**, (Philip) Michael** (b. Sept. 12, 1943, Colombo, Ceylon) Sri Lankan-born Canadian novelist and poet. He immigrated to Montreal at age 19 and attended the University of Toronto and

© 2006 Encyclopædia Britannica, Inc.

Queen's University. His fascination with the American West led to one of his most celebrated works, the pastiche *The Collected Works of Billy the Kid* (1970). His novel *The English Patient* (1992, Booker Prize; film, 1996) won him international recognition; it was followed by *Anil's Ghost* (2000). His musical poetry and prose are a blend of myth, history, jazz, memoirs, and other forms.

Onega \ə-'nye-gə**, Lake** Lake, northwestern Russia. Located between Lake Ladoga and the White Sea, it is the second-largest lake in Europe. It has an area of 3,753 sq mi (9,720 sq km) and is 154 mi (248 km) long. It empties into the Svir River and is frozen for about half of each year. It is connected with the Baltic and White seas by canal and with the Volga River basin by a waterway, enabling it to play an important part in international trade and transport.

Oneida \ō-'nī-də\ North American Indian people living mainly in what is now central New York and Wisconsin, U.S., and Canada. They constitute one of the original five nations of the Iroquois Confederacy. Their language is Iroquoian. They call themselves Oneyoteaka, meaning "People of the Standing Stone." The Oneida were semisedentary and practiced corn agriculture. Longhouses sheltered families related through maternal descent and belonging to one of three clans, Bear, Turtle, or Wolf. Each community had a local council that guided the chief or chiefs. The Oneida supported the colonist cause in the American Revolution and were attacked by the pro-British Iroquois under Joseph Brant. By the mid-19th century most Oneida had dispersed. They number some 12,000.

Oneida Community Utopian religious community founded by John H. Noyes in Oneida, N.Y., in 1848. Noyes, who believed that the Second Coming of Jesus Christ had occurred in AD 70, and his disciples formed their first religious society in Putney, Vt., in 1841 in order to establish the millennial kingdom. Their practice of "complex marriage," according to which each adult community member was married to each adult of the opposite sex, aroused the hostility of the townspeople, and they were obliged to move to Oneida. The Oneida group lived communally and flourished for 30 years, supporting itself by farming and manufacturing steel traps, silverware, and other items. The community broke up in 1879, and two years later the remaining members reorganized it as a commercial enterprise, which is noted for the manufacture of silver plate.

O'Neill, Eugene (Gladstone) (b. Oct. 16, 1888, New York, N.Y., U.S.—d. Nov. 27, 1953, Boston, Mass.) U.S. playwright. The son of a touring actor, he spent an itinerant youth as a seaman, heavy drinker, and derelict, then began writing plays while recovering from tuberculosis (1912). His one-act *Bound East for Cardiff* (1916) was produced by the experimental Provincetown Players, which also staged his other early plays (1916–20). *Beyond the Horizon* was produced on Broadway in 1920, earning him his first Pulitzer Prize. Enormously prolific, he often wrote about tortured family relationships and the conflict between idealism and materialism. Soon recognized as a major dramatist, he became widely translated and produced. His many plays of the 1920s include *The Emperor Jones* (1921), *The Hairy Ape* (1922), *Anna Christie* (1922; Pulitzer Prize), *Desire Under the Elms* (1925), *The Great God Brown* (1926), and *Strange Interlude* (1928; Pulitzer Prize). Among his later plays are *Mourning Becomes Electra* (1931), *Ah! Wilderness* (1933; his only comedy), *The Iceman Cometh* (1946), and the autobiographical *Long Day's Journey into Night* (produced 1956; Pulitzer Prize), considered his masterpiece. O'Neill was awarded the Nobel Prize for Literature in 1936, the first U.S. playwright so honoured.

O'Neill, John (b. March 8, 1834, County Monaghan, Ire.—d. Jan. 7, 1878, Omaha, Neb., U.S.) Irish-born military leader of the American branch of the Fenians, a secret Irish nationalist society. He arrived in the U.S. in 1848 and settled in Tennessee, where he joined the Fenians. A supporter of its scheme to invade Canada to win Irish freedom from Britain, in 1866 he led a group of 600 men across the Niagara River and captured Fort Erie before fleeing back to the U.S. In 1870 he led a raid along the Vermont border that was repulsed; he led another raid on Manitoba in 1871. See also John O'Mahony.

Ōnin War \'ō-nin\ (1467–77) Civil war in central Japan that destroyed the remnants of central governmental authority and led to a century of warfare. The conflict sprang from a succession dispute, with one powerful clan supporting the brother of the Ashikaga shogun (military ruler) and another supporting the shogun's infant son. It ended in stalemate, but clans across Japan became involved in hopes of increasing their territory through victory. The nation was at last reunified in the late 16th and early 17th centuries under Oda Nobunaga, Toyotomi Hideyoshi, and Tokugawa Ieyasu. See also Muromachi period; Warring States period.

onion Herbaceous biennial plant (*Allium cepa*) of the lily family, probably native to South Asia but now grown worldwide, and its edible bulb. Among the hardiest and oldest garden-vegetable plants, onions bear a cluster of small, greenish white flowers on one or more leafless stalks. The leaf base swells to form the underground mature edible onion. Onions are pungent; because they contain a sulfur-rich volatile oil, peeling or slicing them can cause a person's eyes to tear. Onions vary in size, shape, colour, and pungency. Though low in standard nutrients, they are valued for their flavour. Onions have been claimed to cure colds, earaches, and laryngitis and have been used to treat animal bites, powder burns, and warts; like their close relative garlic, they are being studied for other suspected beneficial qualities. See also allium.

Onion (*Allium cepa*)

Onsager \'ōn-ˌsä-gər**, Lars** (b. Nov. 27, 1903, Oslo, Nor.—d. Oct. 5, 1976, Coral Gables, Fla., U.S.) Norwegian-born U.S. chemist. He immigrated to the U.S. and taught principally at Yale University. His development of a general theory of irreversible chemical processes, described as the "fourth law of thermodynamics," gained him a 1968 Nobel Prize. He also applied the laws of thermodynamics to systems not in equilibrium. His explanation of the movement of ions in solution as related to turbulence and fluid density had a major effect on the development of physical chemistry.

Ontario Province (pop., 2001: 11,874,400), the second largest in Canada. Situated between Hudson Bay and James Bay and the St. Lawrence River–Great Lakes chain, it is bordered by the U.S. and the Canadian provinces of Quebec and Manitoba. It covers 412,581 sq mi (1,068,580 sq km). Its capital is Toronto. Before European settlement, the area was inhabited by Iroquois and Algonquin Indian tribes. In the 17th century it was visited by French explorers and missionaries. It passed to the British in 1763 after the French and Indian War. It was the scene of many battles in the War of 1812. The area was known as Canada West from 1841 until 1867, when it became one of four provinces of the new Dominion of Canada. Northern Ontario has a rocky and rugged terrain with thick forests, bogs, lakes, and extensive mineral reserves. Southern Ontario is an important farming and industrial region and is the centre of Canada's population and urban development. Ottawa, the national capital, is also in Ontario.

Ontario, Lake Smallest and easternmost of the Great Lakes of North America. Bounded by New York and Ontario, and with the U.S.-Canada border passing through it, the lake is roughly elliptical; its major axis, 193 mi (311 km) long, lies nearly east to west, and its greatest width is 53 mi (85 km). The Niagara River is the lake's main feeder. There are five islands at its eastern end, where the lake discharges into the St. Lawrence River near Kingston, Ont. The Welland Canal and the Niagara River connect it to Lake Erie to the southwest. It was visited by Samuel de Champlain in 1615; its early French name was Lac Frontenac. Ports on the lake include Toronto and Hamilton, Ont., and Rochester and Oswego, N.Y.

ontological argument Argument that proceeds from the idea of God to the reality of God. It was first clearly formulated by St. Anselm in his *Proslogion* (1077–78); a later famous version is given by René Descartes. Anselm began with the concept of God as that than which nothing greater can be conceived. To think of such a being as existing only in thought and not also in reality involves a contradiction, since a being that lacks real existence is not a being than which none greater can be conceived. A yet greater being would be one with the further attribute of existence. Thus the unsurpassably perfect being must exist; otherwise it would not be unsurpassably perfect. This is among the most discussed and contested arguments in the history of thought.

ontology Theory of being as such. It was originally called "first philosophy" by Aristotle. In the 18th century Christian Wolff contrasted ontology, or general metaphysics, with special metaphysical theories of

© 2006 Encyclopædia Britannica, Inc.

souls, bodies, or God, claiming that ontology could be a deductive discipline revealing the essences of things. This view was later strongly criticized by David Hume and Immanuel Kant. Ontology was revived in the early 20th century by practitioners of phenomenology and existentialism, notably Edmund Husserl and his student Martin Heidegger. In the English-speaking world, interest in ontology was renewed in the mid-20th century by W.V.O. Quine; by the end of the century it had become a central discipline of analytic philosophy. See also idealism; realism; universal.

onychophoran \ˌä-ni-'kä-fə-rən\ Any of about 90 species of free-living terrestrial invertebrates in the class Onychophora (sometimes considered a phylum). They are sometimes called velvet worms for their velvety skin. The common genus *Peripatus* occurs in the West Indies, Central America, and northern South America. Onychophorans are slender and segmented; each segment has a pair of short legs. Species range from 0.6 to 6 in. (14–150 mm) long. They live in humid, hidden spots: in forest litter, wood crevices, termite nests, or the soil, sometimes to a depth of more than 3 ft (1 m). They use their jaws to open captured prey (often small insects) and suck out the juices.

onyx \'ä-niks\ Striped, semiprecious variety of the silica mineral agate with white and black alternating bands. Other varieties include carnelian onyx, with white and red bands, and sardonyx, with white and brown bands. Its properties are the same as those of quartz. Onyx is used in carved cameos and intaglios because its layers can be cut to show a colour contrast between the design and the background. It is found worldwide, but chiefly in India and South America.

Oort cloud Vast spherical cloud of small, icy bodies orbiting the Sun at distances ranging from about 0.3 light-year to one light-year or more that is probably the source of most long-period comets. In 1950 the Dutch astronomer Jan Hendrik Oort (1900–92) noted that no comets have orbits that would indicate an interstellar origin. He proposed that the Sun is surrounded by billions of these objects, which are only occasionally detectable when they enter the inner solar system. The Oort cloud is believed to be composed of primordial bodies dating from the formation of the solar system (see solar nebula). Whether the Oort cloud merges, in its inner region, into the disk-shaped Kuiper belt is not known.

Op art *or* **Optical art** Branch of mid-20th-century geometric abstract art that deals with optical illusion. Op art painters devised complex optical spaces by manipulating repetitive forms such as parallel lines, checkerboard patterns, and concentric circles or by creating chromatic tension from the juxtaposition of complementary colours, thereby creating the illusion of movement. Principal artists of the Op movement in the late 1950s and the '60s include Victor Vasarely, Bridget Riley (b. 1931), and Larry Poons (b. 1937).

opal A hydrated, noncrystalline silica mineral used extensively as a gemstone. Its chemical composition is similar to that of quartz but generally with a variable water content. Pure opal is colourless, but impurities generally give it various dull colours ranging from yellow and red to black. Black opal is especially rare and valuable. White opal and fire opal, characterized by yellow, orange, or red colour, are much more common. Various forms of common opal are widely used as abrasives, insulation material, and ceramic ingredients. Opal is most abundant in volcanic rocks, especially in areas of hot-spring activity. The finest gem opals have been found in Australia; other areas that yield gem material include Japan, Mexico, Honduras, India, New Zealand, and the U.S.

Black opal from Australia; in the collection of the Department of Earth Sciences, Washington University, St. Louis, Mo.
JOHN H. GERARD

OPEC *in full* **Organization of the Petroleum Exporting Countries** Multinational organization established in 1960 to coordinate the petroleum production and export policies of its members. Iran, Iraq, Kuwait, Saudi Arabia, and Venezuela were the original members; they were joined by Qatar (1961), Indonesia and Libya (1962), Abu Dhabi (1967; membership transferred to the United Arab Emirates, 1974), Algeria (1967), and Nigeria (1971). Ecuador (1973) and Gabon (1975) are no longer OPEC members. Policy decisions are taken by consensus at its Vienna headquarters. In 1973 OPEC began a series of oil price increases in retaliation for Western support of Israel in the 1973 Arab-Israeli war, and OPEC members' income greatly increased as a result. Internal dissent, the development of alternative energy sources in the West, and Western exploitation of oil sources in non-OPEC countries subsequently combined to reduce the organization's influence. OPEC countries supply about two-fifths of the world's oil consumption and possess about two-thirds of the world's proven oil reserves.

open cluster *or* **galactic cluster** Any group of Population I (see Populations I and II) stars with a common origin, held together by mutual gravitation (not to be confused with a cluster of galaxies). Stars in open clusters are much more scattered than those in globular clusters. All known open clusters contain from about 10 to 1,000 or more stars (about half contain fewer than 100) and have diameters of 5–75 light-years. More than 1,000 have been discovered in the Milky Way Galaxy; well-known examples include the Pleiades and the Hyades.

Open Door policy Statement of U.S. foreign policy toward China. Issued by U.S. secretary of state John Hay (1899), the statement reaffirmed the principle that all countries should have equal access to any Chinese port open to trade. The U.S. sent notes to Britain, Germany, France, Italy, Japan, and Russia explaining the policy to prevent them from establishing separate spheres of influence in China. Their replies were evasive, but the U.S. considered them acceptances of the policy. Japan's violation of the policy in 1937 led the U.S. to impose an oil embargo. The policy was discontinued with the communist takeover of China in 1949.

open-heart surgery Any surgical procedure opening the heart and exposing one or more of its chambers, most often to repair valve disease or correct congenital heart malformations (see congenital heart disease). Invention of the heart-lung machine (see artificial heart), which allows the heart to be stopped during surgery, made it possible. The first successful open-heart surgery was performed in the U.S. in 1953 by John H. Gibbon, Jr., to close an atrial septal defect.

open-hearth process *or* **Siemens-Martin process** Steelmaking technique that for most of the 20th century accounted for most steel made in the world. William Siemens made steel from pig iron in a reverberatory furnace of his design in 1867. The same year the French manufacturer Pierre-Émile Martin (1824–1915) used the idea to produce steel by melting wrought iron with steel scrap. Siemens used the waste heat given off by the furnace: he directed the fumes from the furnace through a brick checkerwork, heating it to a high temperature, and then used the same path to introduce air into the furnace; the preheated air significantly increased the flame temperature. The open-hearth process furnace (which replaced the Bessemer process) has itself been replaced in most industrialized countries by the basic oxygen process and the electric furnace. See also reverberatory furnace.

open market operation Any of the purchases and sales of government securities and commercial paper by a central bank in an effort to regulate the money supply and credit conditions. Open market operations can also be used to stabilize the prices of government securities. When the central bank buys securities on the open market, it increases the reserves of commercial banks, making it possible for them to expand their loans and investments. It also increases the price of government securities, equivalent to reducing their interest rates, and decreases interest rates generally, thus encouraging investment. If the central bank sells securities, the effects are reversed. Open market operations are usually performed with short-term government securities such as treasury bills.

opera Musical drama made up of vocal pieces with orchestral accompaniment, overtures, and interludes. Opera was invented at the end of the 16th century in an attempt by the Camerata (an academy of Florentine poets, musicians, and scholars) to imitate ancient Greek drama, which was known to have been largely sung or chanted. Since no actual Greek music was known, composers had considerable freedom in reconceiving it. Imitations of Greek pastoral poetry became the basis for early opera libretti. The first operas, *Dafne* by Jacopo Peri (1561–1633) in 1598 and by Giulio Caccini about the same time, are now lost; the earliest surviving opera is Peri's *Euridice* (1600). They consisted of lightly accompanied vocal melody closely imitating inflected speech. Claudio Monteverdi, the greatest early operatic figure, composed the first masterpiece, *Orfeo*, in 1607; unlike its predecessors, it is scored for a small orchestra. With this work,

RECITATIVE began to be clearly distinguished from ARIA, an achievement that would prove decisive for opera's future success. In France, JEAN-BAPTISTE LULLY produced a prototype for courtly opera that influenced French opera through the mid-18th century. JEAN-PHILIPPE RAMEAU, GEORGE FRIDERIC HANDEL, and CHRISTOPH WILLIBALD GLUCK were the most significant opera composers of the first two-thirds of the 18th century; their works were surpassed by the brilliant operas of WOLFGANG AMADEUS MOZART. In the early 19th century, GIOACCHINO ROSSINI and GAETANO DONIZETTI dominated Italian opera. In the later 19th century the greatest works were those of GIUSEPPE VERDI and RICHARD WAGNER; the latter, with his bold innovations, became the most influential operatic figure since Monteverdi. RICHARD STRAUSS and GIACOMO PUCCINI wrote the most popular late 19th- and early 20th-century operas. Though the death of Puccini in 1924 is often cited as the end of grand opera, new and often experimental works—by composers such as ALBAN BERG, BENJAMIN BRITTEN, GIAN CARLO MENOTTI, JOHN ADAMS, and PHILIP GLASS—continued to be produced to critical acclaim. Opera entered the 21st century as a vibrant and global art form. See also BALLAD OPERA; OPERETTA.

operating system (OS) SOFTWARE that controls the operation of a COMPUTER, directs the input and output of data, keeps track of files, and controls the processing of COMPUTER PROGRAMS. Its roles include managing the functioning of the computer hardware, running the applications programs, serving as an interface between the computer and the user, and allocating computer resources to various functions. When several jobs reside in the computer simultaneously and share resources (MULTITASKING), the OS allocates fixed amounts of CPU time and MEMORY in turn or allows one job to read data while another writes to a printer and still another performs computations. Through a process called time-sharing, a large computer can handle interaction with hundreds of users simultaneously, giving each the perception of being the sole user. Modern computer operating systems are becoming increasingly machine-independent, capable of running on any HARDWARE platform; a widely used platform-independent operating system in use today on MAINFRAME computers is UNIX. Most PERSONAL COMPUTERS run on Microsoft's WINDOWS operating system, which grew out of and eventually replaced MS-DOS. See also LINUX.

operationalism In the philosophy of SCIENCE, the attempt to define all scientific concepts in terms of specifically described operations of measurement and observation. The length of a rod, for example, may be defined as the number of times a certain stick can be laid end to end alongside it. Propositions that are not amenable to verification through measurement and observation are rejected as meaningless (see also LOGICAL POSITIVISM). Operationalists rejected the idea of nature as a thing-in-itself existing behind the appearances observed in experimentation. Operationalism is closely associated with the work of the U.S. physicist Percy W. Bridgman (1882–1961).

operations management See PRODUCTION MANAGEMENT

operations research Application of scientific methods to management and administration of military, government, commercial, and industrial systems. It began during World War II in Britain when teams of scientists worked with the Royal Air Force to improve radar detection of enemy aircraft, leading to coordinated efforts to improve the entire system of early warning, defense, and supply. It is characterized by a systems orientation, or systems engineering, in which interdisciplinary research teams adapt scientific methods to large-scale problems that must be modeled, since laboratory testing is impossible. Examples include resource allocation and replacement, inventory control, and scheduling of large-scale construction projects.

operator, differential See DIFFERENTIAL OPERATOR

operetta Musical drama similar to OPERA, usually with a romantically sentimental plot, employing songs, dances, and orchestral interludes interspersed with spoken dialogue. The modern tradition begins with JACQUES OFFENBACH, who wrote some 90 operettas and inspired a Viennese tradition that began with the works of Franz von Suppé and JOHANN STRAUSS. In Britain most of the 14 comic operettas (1871–96) of W.S. GILBERT and ARTHUR SULLIVAN have been enduringly popular. In the U.S. the works of such European immigrant composers as VICTOR HERBERT and RUDOLF FRIML were widely popular in the early 20th century. See also MUSICAL.

operon \'ä-pər-ˌän\ Genetic regulatory system of single-celled organisms (PROKARYOTES) and their viruses, in which GENES coding for functionally related proteins are clustered along the DNA, enabling their expression to be coordinated in response to the cell's needs. By providing a means to produce proteins only when and where they are required, the operon allows the cell to conserve energy. A typical operon consists of a group of structural genes that code for enzymes involved in a metabolic pathway, such as the biosynthesis of an amino acid. A single unit of messenger RNA is transcribed from the operon and is then translated into separate proteins. Operons are controlled by various regulatory elements that respond to environmental cues. The operon system was first proposed by FRANÇOIS JACOB and JACQUES MONOD in the early 1960s.

Opet \'ō-ˌpet\ Ancient Egyptian festival of the New Year. In the celebration of Opet, statues of AMON and MUT and their son KHONS were carried down the Nile on barges in a ritual journey from their shrines at KARNAK to the temple of LUXOR. There the statues remained about 24 days, a festival time for Luxor. The images were returned to Karnak by the same route in a second public appearance that closed the festival.

Ophite \'ä-ˌfīt, 'ō-ˌfīt\ Member of any of several Gnostic sects that flourished in the Roman empire in the 2nd century AD and for several centuries thereafter. The sects shared a dualistic theology, opposing a beneficent and entirely spiritual Supreme Being to a chaotic and evil material world. To the Ophites, the human dilemma resulted from the mixture of these conflicting spiritual and material elements in human nature. Only gnosis, the esoteric knowledge of good and evil, could redeem one from the bonds of matter. See also DUALISM, GNOSTICISM.

ophthalmology \ˌäf-thəl-'mä-lə-jē\ Medical specialty dealing with the EYES, dating to 1805. FRANS C. DONDERS's 1864 advances in OPTICS allowed EYEGLASSES to be fitted to vision problems. The ophthalmoscope made it possible to look inside the eye and relate eye defects to internal conditions. More recent advances include eye exams, early treatment of congenital defects, and eye banks to store corneas for transplants. Ophthalmologists test visual function and examine the eye for faulty development, disease, injury, degeneration, aging, or refractive errors. They prescribe treatment for eye disease and lenses for refraction and perform surgery when needed. See also OPTOMETRY, VISUAL-FIELD DEFECT.

Ophüls \'ō-fᾱls**, Max** *orig.* **Max Oppenheimer** (b. May 6, 1902, Saarbrücken, Ger.—d. March 26, 1957, Hamburg, W.Ger.) German film director. An actor, stage director, and producer in Germany and Austria (1921–30), he gained renown as a film director with *Liebelei* (1933). He left Nazi Germany and directed popular but undistinguished films in France, Russia, Italy, and The Netherlands until 1940, when he moved to the U.S. In Hollywood he directed *The Exile* (1947), *Letter from an Unknown Woman* (1948), and *The Reckless Moment* (1949). He returned to France to make *The Roundabout* (1950), *House of Pleasure* (1952), and *The Sins of Lola Montes* (1955), considered his masterpiece. His son, Marcel (b. 1927), worked in France principally as a maker of documentary films, most notably *The Sorrow and the Pity* (1971), which examines French conduct under German occupation.

Opie, Eugene Lindsay (b. July 5, 1873, Staunton, Va., U.S.—d. March 12, 1971, Bryn Mawr, Pa.) U.S. pathologist. He received his M.D. from Johns Hopkins University. Early in his career, he correctly deduced that degenerative changes in the islets of Langerhans caused DIABETES MELLITUS and theorized that blockage of the junction of the bile and pancreatic ducts caused acute PANCREATITIS. He later showed that TUBERCULOSIS (TB) was spread by contact, including from one family member to another. His work led to use of X-ray films to detect asymptomatic TB, the sputum test to predict the chance of its spread, and injection of heat-killed tubercle bacilli to prevent infection.

opium Organic compound, a NARCOTIC drug known since ancient Greek times, obtained from exuded juice of immature fruit capsules of the OPIUM POPPY. Opium has legitimate medical uses, as the source of the ALKALOIDS CODEINE and MORPHINE and their derivatives. It is also used illicitly, either raw or purified as alkaloids and their derivatives (including HEROIN). Opium alkaloids of one type (e.g., morphine, codeine) act on the NERVOUS SYSTEM, mimicking the effects of ENDORPHINS; they are ANALGESIC, narcotic, and potentially addicting (see DRUG ADDICTION). Those of a second type, including papaverine and noscapine, relieve smooth muscle spasms and are not analgesic, narcotic, or addicting. Habitual opium use produces physical and mental deterioration and shortens life. Overdose can cause death by depressing RESPIRATION.

opium poppy Flowering plant (*Papaver somniferum*) of the family Papaveraceae, native to Turkey. OPIUM, MORPHINE, CODEINE, and HEROIN are

© 2006 Encyclopædia Britannica, Inc.

all derived from the milky fluid found in its unripe seed capsule. A common garden annual in the U.S., the opium poppy bears blue-purple or white flowers 5 in. (13 cm) wide on plants about 3–16 ft (1–5 m) tall, with lobed or toothed silver-green foliage. It is also grown for its tiny nonnarcotic ripe seeds, which are kidney-shaped and grayish blue to dark blue; the seeds are used in bakery products and for seasoning, oil, and birdseed.

Opium Wars Two trading wars of the mid-19th century in China. The first (1839–42 was between China and Britain, and the second (1856–60; also called the Arrow War or Anglo-French War) was between China and a British-French alliance. Trade developed between China and Western countries from the late 16th century. The Chinese, accustomed to tributary relationships with others, required that Westerners pay for Chinese goods with silver currency. To offset a growing negative flow of silver at home, the British created a market for opium in China and began importing it there illegally. As demand for opium grew, China tried to stop the practice, and hostilities broke out. Britain quickly triumphed, and the resultant Treaty of Nanjing (Nanking;1842; the first of a series of unequal treaties between China and Western countries and, eventually, Japan) was a blow to China. The outbreak of the second war resulted in the Treaty of Tianjin (Tientsin; 1858), which required further Chinese concessions. When China refused to sign subsequent treaties, Beijing (Peking) was captured and the emperor's summer palace burned. The overall result of these conflicts was to weaken the Chinese imperial system, greatly expand Western influence in China, and pave the way for such uprisings as the Taiping and Boxer rebellions. See also Canton system; British East India Company; Lin Zexu.

Oporto See Porto

opossum Any of about 66 species (family Didelphidae) of New World, mostly arboreal, nocturnal marsupials. Highly adaptable and prolific, opossums have changed little in millions of years. The North American species, the stout-bodied common, or Virginia, opossum (*Didelphis marsupialis*), grows to 40 in. (100 cm) long. It is largely white and has an opposable clawless toe on each hind foot; with its long, hairless, prehensile tail, it resembles a large rat. Up to 25 grublike, 0.07-oz (2-g) newborns compete for the 13 nipples in the pouch, where the survivors spend four or five weeks; they spend the following eight to nine weeks clinging to the mother's back. The common opossum may feign death ("play possum") if surprised. It eats small animals, insects, and fruit, and sometimes domestic poultry and cultivated grain. See also possum.

Virginia, or common, opossum (*Didelphis virginiana*).
ROBERT J. ELLISON—THE NATIONAL AUDUBON SOCIETY COLLECTION/PHOTO RESEARCHERS

Oppenheimer, J(ulius) Robert (b. April 22, 1904, New York, N.Y., U.S.—d. Feb. 18, 1967, Princeton, N.J.) U.S. theoretical physicist. He graduated from Harvard University, did research at Cambridge University, and earned a doctorate from Göttingen University. He returned to the U.S. to teach at the California Institute of Technology (1929–47). His research focused on energy processes of subatomic particles, and he trained a generation of American physicists. In World War II he was named director of the army's atomic-bomb project, later known as the Manhattan Project, and set up the laboratory in Los Alamos, N.M., that remains a principal weapons-research laboratory. He directed the Institute for Advanced Study in Princeton (1947–66). He strongly opposed the development of the hydrogen bomb, and in 1953 he was suspended from secret nuclear research as an alleged communist sympathizer and a security risk; the case, which pitted him against Edward Teller, became a worldwide cause célèbre. In 1963 he was reinstated and awarded the Enrico Fermi Award.

opportunity cost In economic terms, the opportunities forgone in the choice of one expenditure over others. For a consumer with a fixed income, the opportunity cost of buying a new dishwasher might be the value of a vacation trip never taken or several suits of clothes unbought. The concept of opportunity cost allows economists to examine the relative monetary values of various goods and services.

opposition, square of Geometrical representation of the traditional logical relations of opposition (contradictories, contraries, subalterns) among the four types of propositions (universal affirmative or A-proposition, universal negative or E, particular affirmative or I, particular negative or O) in the Aristotelian doctrine of the syllogism. At the top left is the A; at the top right is the E; below the A is the I; and below the E is the O. The A and the O, like the E and I, are contradictories (diagonal relations); the A and the E are contraries; and the I is subaltern to (hence implied by) the A, the O subaltern to the E. Whereas contradictories have opposite truth-values (one true, the other false), contraries cannot both be true but can both be false.

optical activity Ability of a substance to rotate the plane of polarization of a beam of light passed through it, either as crystals or in solution. Clockwise rotation as one faces the light source is "positive," or dextrorotary; counterclockwise rotation "negative," or levorotary. Louis Pasteur was the first to recognize that molecules with optical activity are stereoisomers (see isomerism). Optical isomers occur in pairs that are nonsuperimposable mirror images of one another. They have the same physical properties except for their effect on polarized light; in chemical properties they differ only in their interactions with other stereoisomers (see asymmetric synthesis).

optical character recognition See OCR

optical scanner See optical scanner

optics Science concerned with the production and propagation of light, the changes it undergoes and produces, and closely related phenomena. Physical optics deals with the nature and properties of light; geometric optics deals with the formation of images by mirrors, lenses, and other devices that use light. Optical data processing involves manipulation of the information content of an image formed by coherent (one-wavelength) optical systems. The study of optics has led to the development of devices such as eyeglasses and contact lenses, telescopes, microscopes, cameras, binoculars, lasers, and optical fibres (see fibre optics).

Optimates and Populares \ˌäp-ti-ˈmā-tēz...ˌpäp-yə-ˈlar-ēz\ Ideological positions in ancient Rome that became defined in the early 1st century BC. Both groups came from the wealthier classes. The Optimates (Latin: "Best Ones," "Aristocrats") promoted the dominance of the Senate and the proper balance of the constitution. The Populares ("Demagogues," "Populists") used and defended the powers of the popular assemblies and the office of tribune and advocated such measures as land distribution, debt cancellation, and subsidized grain allowances. Their polarization led to civil wars—notably those between Julius Caesar and Pompey and between Octavian (Augustus) and Mark Antony—and the fall of the republic with Augustus's accession.

optimization Field of applied mathematics whose principles and methods are used to solve quantitative problems in disciplines including physics, biology, engineering, and economics. Questions of maximizing or minimizing functions arising in the various disciplines can be solved using the same mathematical tools (see maximum; minimum). In a typical optimization problem, the goal is to find the values of controllable factors determining the behaviour of a system (e.g., a physical production process, an investment scheme) that maximize productivity or minimize waste. The simplest problems involve functions (systems) of a single variable (input factor) and may be solved with differential calculus. Linear programming was developed to solve optimization problems involving two or more input variables. See also simplex method.

optometry \äp-ˈtä-mə-trē\ Profession concerned with examining the eyes for defects or faults of refraction. Optometrists prescribe optical aids (e.g., eyeglasses, contact lenses), supervise eye exercise programs to treat vision problems, and examine the eyes for disorders such as glaucoma and cataracts. They are generally not licensed to prescribe drugs or trained to perform surgery. See also ophthalmology.

opuntia \ō-ˈpən-shə\ Any plant of the genus *Opuntia*, the largest genus of the cactus family. Native to the New World, it has characteristic small bristles with backward-facing barbs. Subgroups are based on the form of the stem segments: chollas have cylindrical joints, while prickly pears have flat joints. Sizes range from tiny, cold-hardy forms to treelike varieties. In the Northern Hemisphere, opuntia is found farther north than any other cactus.

Opus Dei *Latin* **"work of God"** Roman Catholic lay and clerical organization whose actions and beliefs have been both criticized and praised. Its members seek personal Christian perfection, strive to implement Christian ideals in their chosen occupations, and promote Christian values to society as a whole. Opus Dei, in full Prelature of the Holy Cross and Opus Dei, was founded in 1928 in Spain by Josemaría Escrivá de Balaguer y Albá (canonzied in 2002). It is theologically conservative and accepts the teaching authority of the church without question. It was granted special status as the first and only personal prelature in the church by Pope John Paul II in 1982 and has established numerous vocational schools and universities. It is also highly controversial, accused of secrecy, using cult-like recruiting practices, and having grand political ambitions. There are separate organizations for men and women, which, since 1982, have been headed by a prelate elected by its members. At the beginning of the 21st century priests constituted only a tiny percentage of the organization, numbering roughly 1,600 of the nearly 84,000 members living in 80 countries.

oracle Source of a divine communication delivered in response to a petitioner's request. Ancient Greece and Rome had many oracles. The most famous was that of Apollo at Delphi, where the medium was a woman over 50 called the Pythia. After bathing in the Castalian spring, she apparently would descend into a basement cell, mount a sacred tripod, and chew the leaves of the laurel, sacred to Apollo. Her utterances, which were often highly ambiguous, were interpreted by priests. Other oracles, including those at Claros (Apollo), Amphicleia (Dionysus), Olympia (Zeus), and Epidaurus (Asclepius), were consulted through various other methods; for example, the oldest of the oracles, that of Zeus at Dodona, spoke through the whispering of the leaves of a sacred oak. At some shrines, the inquirer would sleep in the holy precinct and receive an answer in a dream.

oral tradition Cultural information passed on from one generation to the next by storytellers. The forms of oral tradition include poetry (often chanted or sung), folktales, and proverbs as well as magical spells, religious instruction, and recollections of the past. Music and rhyme commonly serve as both entertainment and aids to memory. Epic poems concerning the destiny of a society or summarizing its myths often begin as oral tradition and are later written down. In oral cultures, oral tradition is the only means of communicating knowledge. The prevalence of radio, television, and newspapers in Western culture has led to the decline of oral tradition, though it survives among old people and some minority groups as well as among children, whose games, counting rhymes, and songs are transmitted orally from generation to generation.

Oran \ō-ˈrän\ City (pop., 1998: 692,516), northwestern Algeria. Situated on the Mediterranean Sea, it is about midway between Tangier, Morocco, and Algiers. With the adjacent Mers el-Kebir, it is the country's second largest port. Founded in the 10th century by Andalusians as a base for trade with the northern African hinterland, it was held by the Spanish until 1708, when it fell to the Ottomans. It was devastated by an earthquake in 1790. In 1792 the Ottomans settled a Jewish community there. In 1831 it was occupied by the French, who established a modern port and naval base. In World War II (1939–45) it came under the control of the Allied Powers. Most of its European inhabitants left after Algerian independence in 1962. It is divided into a waterfront and the old and new city sections built on terraces above it.

orange Any of several species of small trees or shrubs in the genus *Citrus* of the rue (or citrus) family and their fruits. Grown in tropical and subtropical regions, the nearly round fruits have leathery, oily rinds and edible, juicy inner flesh rich in vitamin C. Key commercial species include the China (sweet, or common) orange; the mandarin orange (including tangerines); and seedless navel oranges. The tree has broad, glossy, medium-size evergreen leaves, leafstalks with narrow wings, and very fragrant flowers. It bears fruit abundantly for 50–80 years. Oranges do not improve in quality off the tree, so they are picked when fully ripe. A sizeable portion of the U.S. crop is processed for frozen concentrated juice. By-products include essential oils, pectin, candied peel, orange marmalade, and stock feed.

Orange, house of Princely dynasty and royal family of The Netherlands. The title began with William I (the Silent), prince of Orange-Nassau, who was stadtholder (viceroy) of the Netherlands, as were his descendants until 1795. In 1815 William VI became William I, king of The Netherlands. Through his descendants, the male line of the royal dynasty continued until 1890, when Wilhelmina, daughter of William III, became queen. In 1908 she decreed that her descendants should be styled princes and princesses of Orange-Nassau.

Orange Free State Former province, central South Africa. Before the arrival of the Europeans, the area was the home of Bantu-speaking peoples. Afrikaners came in large part during the Great Trek of the 1830s. Britain administered the territory from 1848 to 1854; then the independent Orange Free State was established. British rule was reimposed following the South African War in 1902, though self-government was later restored. In 1910 it became the Orange Free State province of the Union of South Africa (from 1961 the Republic of South Africa). After the South African elections of 1994, it became the province of Free State. Blacks make up about 80% of the population; most of the whites speak Afrikaans. The province's capital is Bloemfontein.

Orange River River, southern Africa. It rises in the Lesotho Highlands as the Sinqu River and flows west as the Orange across South Africa. It passes the southern edge of the Kalahari Desert and winds through the Namib Desert before draining into the Atlantic Ocean in South Africa. It forms the border between South Africa and Namibia. It is about 1,300 mi (2,100 km) long. There are some irrigated sections along the river and many dams but no large towns.

orangutan \ə-ˈraŋ-ə-ˌtaŋ\ *or* **orang** Species (*Pongo pygmaeus*, family Hominidae) of arboreal great ape, found only in the lowland swamp forests of Borneo and Sumatra but originally in the tropical forests of South Asia as well. The orangutan (Malaysian for "person of the forest") has a short thick body, long arms, short legs, and shaggy reddish hair. Males are about 4.5 ft (137 cm) tall and weigh about 185 lb (85 kg); females are smaller. Orangutans are placid, deliberate, ingenious, and persistent. Males have flat, fatty cheekpads and a baglike, pendulous swelling at the throat. Orangutans use all four limbs to walk and climb. They eat mostly figs and other fruits and some leaves, bark, and insects. They sleep in trees on a platform built of interwoven branches. Adults are solitary and live far apart, coming together only for a brief courtship. The mother carries and nurses the single young for almost three years. Though generally silent, the adult male has a loud, roaring "long call." The orangutan is an endangered species.

Male orangutan (*Pongo pygmaeus*) with cheek pads.

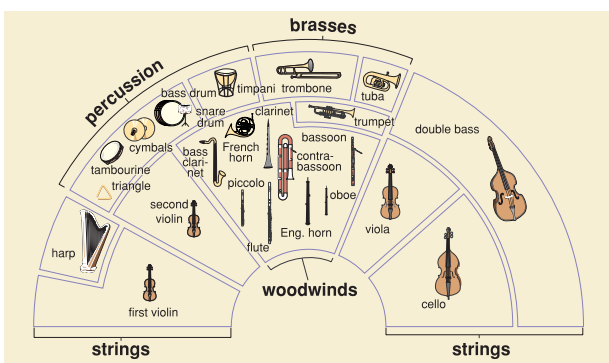
Oranjestad \ō-ˈrän-yə-ˌstät\ Seaport and chief administrative town (pop., 2000: 26,355), Aruba, Netherlands Antilles. It is located on the western coast of this Caribbean island. It is a free port and a petroleum-processing and shipping centre.

oratorio Large-scale musical composition on a sacred subject for solo voices, chorus, and orchestra. The term derives from the oratories, community prayer halls set up by St. Philip Neri in the mid 16th century in a Counter-Reformation attempt to provide locales for religious edification outside the church itself, and the oratorio remained a nonliturgical (and non-Latin) form for moral musical entertainment. The first oratorio, really a religious opera, was written in 1600 by Emilio del Cavaliere, and the oratorio's development closely followed that of opera. Giacomo Carissimi produced an important body of Italian oratorios, and Marc-Antoine Charpentier transferred the oratorio to France in the later 17th century. In Germany the works of Heinrich Schütz anticipate the oratorio-like Passions of Johann Sebastian Bach. The most celebrated oratorio composer was George Frideric Handel; his great English works include the incomparable *Messiah* (1742). Handel inspired Franz Joseph Haydn's great *Creation* (1798) and exerted great influence on the 19th-century oratorio, whose composers include Hector Berlioz, Felix Mendelssohn, and Franz Liszt. Though the oratorio thereafter declined, 20th-century oratorio composers included Edward Elgar, Igor Stravinsky, Arthur Honegger, and Krzysztof Penderecki.

Orbison, Roy (b. April 23, 1936, Vernon, Texas, U.S.—d. Dec. 6, 1988, Hendersonville, Tenn.) U.S. singer and songwriter. He formed his first

© 2006 Encyclopædia Britannica, Inc.



musical group at age 13. His first single, "Ooby Dooby" (1956), was followed in the early 1960s by a string of hits, carefully crafted ballads of loneliness and heartache that included "Only the Lonely," "I Can't Stop Loving You," "Crying," "In Dreams," and "Oh, Pretty Woman." He was known for his soaring voice, one of the most operatic in all rock music. His career waned after the death of his wife in a motorcycle accident (1966) and the death of two sons in a fire (1968). He made a comeback in the 1980s; with Bob Dylan, George Harrison (1943–2001), and Tom Petty (b. 1953) he formed the band the Traveling Wilburys.

orbital Mathematical expression, called a WAVE FUNCTION, that describes properties characteristic of no more than two ELECTRONS near an atomic nucleus or molecule. An orbital can be considered a three-dimensional region in which there is a 95% probability of finding an electron. Atomic orbitals are designated by a combination of numerals and letters (e.g., 1*s*, 2*p*, 3*d*, 4*f*). The numerals are the principal quantum number and are related to the atomic energy level and distance from the nucleus; the letters indicate the orbital's angular momentum and hence its shape. An *s* orbital with zero net orbital angular momentum is spherical. A *p* orbital with one fundamental unit of angular momentum, $\hbar$, is shaped somewhat like a dumbbell ($\hbar$ is Planck's constant, h, divided by 2π). The shapes of the other orbitals are more complicated. Molecular orbitals have geometries determined by the overlap of two or more atomic orbitals and are designated by Greek symbols, e.g., σ and π.

orca See KILLER WHALE

Orcagna \ôr-'kän-yä**, Andrea** *orig.* **Andrea di Cione** (b. c. 1308, Florence?, Republic of Florence—d. c. 1368, Florence) Florentine painter, sculptor, and architect. A goldsmith's son, he was the leading member of a family of painters and the most prominent Florentine artist of the mid 14th century. His altarpiece for the Strozzi Chapel in Florence's Santa Maria Novella (1354–57) shows his ability to unify the multiple panels of a polyptych. As a sculptor he is known for a single work: the tabernacle in the guild oratory of Or San Michele (1352–60), a decorative structure of great complexity that is among the finest examples of the expressive art that sprang up in Tuscany after the Black Death. He was employed as architect on Florence's Duomo (cathedral) in 1357 and 1364–67.

orchestra Instrumental ensemble of varying size and composition. Today the term *orchestra* usually refers to the traditional large Western ensemble of bowed STRINGED INSTRUMENTS with BRASS, WOODWIND, and PERCUSSION instruments, with several players to each string part. The development of the orchestra coincides with the early history of OPERA. A major antecedent of the modern orchestra was that of the mid-17th-century French court, especially as employed by Jean-Baptiste Lully; it was dominated by 24 bowed strings but also often included woodwind instruments. Trumpets, horns, and timpani were often added in the early 18th century and were standard by the time of Franz Joseph Haydn. During the 19th century there was a considerable expansion, particularly in the number and variety of wind and percussion instruments; some works called for well over 100 musicians. The symphony orchestra changed little in the 20th century. See also ORCHESTRATION.

Standard layout of a modern symphony orchestra.
© MERRIAM-WEBSTER INC.

orchestration Art of choosing which instruments to use for a given piece of music. The sections of the ORCHESTRA historically were separate ensembles: the stringed instruments for indoors, the woodwind instruments for outdoors, the horns for hunting, and trumpets and drums for battle or royal ceremony. Once entirely dependent on what was available or customary, composers began to explore the musical potential of instrumental combinations with the advent of the modern orchestra in the mid- to late 18th century. The first great orchestration text was written by Hector Berlioz in 1844.

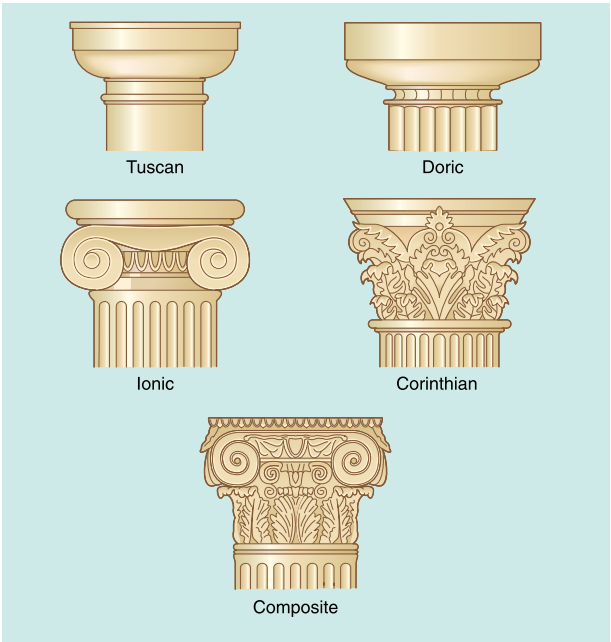
orchid Any of the 15,000–35,000 species in 400–800 genera of nonwoody perennial plants that make up the family Orchidaceae. Bearing attractive flowers, orchids grow in most of the nonpolar world, especially in tropical regions, in soil or on other plants. Hybrids with showy flowers for the commercial trade come from the genera *Cattleya*, *Cymbidium*, *Vanda*, and *Laelia*. Flowers vary widely in size, colour, and shape, but all are bilaterally symmetrical and have three sepals. Most orchids photosynthesize, but some live on dead organic material or absorb food from a fungus living in their roots. VANILLA is extracted from the seedpod of the genus *Vanilla*. Many folk medicines, local beverages, and foods are prepared from parts of orchid plants.

Orchid (*Polystachya bella*).
SVEN SAMELIUS

orchitis \ôr-'kī-təs\ INFLAMMATION and swelling of the TESTES, caused by infection (most often MUMPS) or chemical or physical injury. The testicles' rich blood and lymphatic supply block most infections in the absence of severe injury. Usual symptoms are high fever, sudden pain in the testicle, nausea and vomiting, and swelling, tightness, and tenderness of the gland. Fluids with pus or blood may accumulate in the scrotum, which is generally red and thickened. Treatment may include antibiotics, bed rest, support of the testes, compresses, and surgery or drainage.

Orchomenus \ôr-'kä-mə-nəs\ Ancient city, northwestern Boeotia, Greece. It was the northernmost fortified town in Mycenaean times and controlled a large part of Boeotia. In c. 550 BC it became one of the first cities to coin money, thereby gaining fame for its wealth. It was frequently attacked and finally destroyed by Thebes in the 4th century BC. Excavations have revealed that it was an important Neolithic and Bronze Age site, with a beehive temple and palace.

Orczy \'ōrt-sē**, Emmuska (Magdalena Rosalia Marie Josepha Barbara), Baroness** (b. Sept. 23, 1865, Tarnaörs, Hung.—d. Nov. 12, 1947, London, Eng.) Hungarian-born British novelist. The daughter of a noted musician, she was educated in Brussels and Paris and studied art in London. She became famous as the author of *The Scarlet Pimpernel* (1905), a swashbuckling adventure set in the era of the French Revolution. Her sequels did not match its great popular success. She also wrote detective stories.



Ord River River, northeastern Western Australia. The Ord rises in the Albert Edward Range and flows east and north to the Cambridge Gulf; it is about 200 mi (320 km) long. Discovered in 1879 by Alexander Forrest, it was named for Harry Ord, governor of Western Australia. The Ord River Project is designed to prevent flooding and collect irrigation water.

ordeal In customary law, a test of guilt or innocence in which the accused undergoes dangerous or painful tests believed to be under supernatural control. Ordeals by fire or water are the most common. Burns suffered while passing through fire (as in Hindu custom) or rejection (i.e., being buoyed up) by a body of water (as in witch trials) would be regarded as proof of guilt. In ordeal by combat, as in the medieval duel, the victor is said to win not by his own strength but because supernatural powers have intervened on the side of the right.

order In CLASSICAL ARCHITECTURE, any of several styles defined by the particular type of COLUMN, base, CAPITAL, and ENTABLATURE they use. There are five major orders: Doric, Ionic, and Corinthian (all developed in Greece), and Tuscan and Composite (developed in Rome). The form of the capital is an order's most distinguishing characteristic. Both the Doric and Ionic orders originated in wooden temples. The Doric is squat and simple. The Ionic, distinguished by the scrolls, or volutes, on its capital, resembles a

© 2006 Encyclopædia Britannica, Inc.

capital I. The Corinthian capital is more ornate, with carved acanthus leaves and scrolls. The Romans modified the Greek orders to produce the Tuscan (a simplified form of the Doric) and Composite (a combination of the Ionic and Corinthian) orders. See also COLOSSAL ORDER.

Capital styles for the five major orders of Classical architecture.

order in council In Britain, a regulation traditionally issued by the sovereign on the advice of the PRIVY COUNCIL. In modern practice, an order is issued only on the advice of ministers, and the minister in charge of the department concerned with the order's subject matter is responsible to Parliament for its contents. Most orders in council today are issued to implement legislation passed by Parliament.

Order of the Garter See Order of the GARTER

ordinary differential equation Equation containing DERIVATIVES of a FUNCTION of a single VARIABLE. Its order is the order of the highest derivative it contains (e.g., a first-order DIFFERENTIAL EQUATION involves only the first derivative of the function). Because the derivative is a rate of change, such an equation states how a function changes but does not specify the function itself. Given sufficient initial conditions, however, such as a specific function value, the function can be found by various methods, most based on INTEGRATION.

Ordovician \ˌȯr-də-ˈvi-shən\ **Period** Interval of geologic time, 490–443 million years ago, the second oldest period of the PALEOZOIC ERA. It follows the CAMBRIAN and precedes the SILURIAN. During the Ordovician, many of the landmasses were aligned in the tropics. Life was dominated by marine invertebrates, but some forms of land plants may have appeared during the middle of the period. Spores suggesting a tropical terrestrial environment have been found in rocks of that age.

Ordzhonikidze \ər-jən-yik-ˈyēd-zə**, Grigory (Konstantinovich)** (b. Oct. 24, 1886, Goresha, Russia—d. Feb. 18, 1937, Moscow, Russia, U.S.S.R.) Russian communist leader. After the RUSSIAN REVOLUTION OF 1917, he became chairman of the Caucasian bureau (1921) and helped the Red Army conquer Georgia, forcing its merger with Armenia and Azerbaijan into the Transcaucasian Federal Republic and then into the Soviet Union. He became a member of the Politburo (1930) and commissar for heavy industry (1932), but in the mid-1930s he opposed JOSEPH STALIN's industrial policy. His sudden death was ascribed to natural causes, but NIKITA KHRUSHCHEV later charged (1956) that Stalin had driven him to suicide.

ore Aggregate of economically important MINERALS that is sufficiently rich to separate for a profit. Although more than 3,500 mineral species are known, only about 100 are considered ore minerals. The term originally applied only to metallic minerals (see NATIVE ELEMENT) but now includes such nonmetallic substances as SULFUR, calcium fluoride (FLUORITE), and barium sulfate (BARITE). Ore is always mixed with unwanted rocks and minerals, known collectively as gangue. The ore and the gangue are mined together and then separated. The desired element is then extracted from the ore. The metal may be still further refined (purified) or alloyed with other metals.

oregano Flavourful dried leaves and flowering tops of any of various perennial herbs of the MINT family, particularly *Origanum vulgare*. Oregano is an essential ingredient of Mediterranean cuisines; in the U.S., use of oregano rose sharply in the late 20th century, largely because of the popularity of pizza. Native to the Mediterranean and western Asia, the herbs are now naturalized in parts of Mexico and the U.S.

Oregon State (pop., 2000: 3,421,399), U.S., northwestern region. Lying on the Pacific Ocean, it is bordered by Washington, Idaho, Nevada, and California. It covers 97,073 sq mi (251,419 sq km). Its capital is SALEM. The COLUMBIA RIVER forms its northern boundary; the SNAKE RIVER is its upper eastern boundary. The CASCADES RANGE, with Mount HOOD, is in western central Oregon. First sighted by Spanish explorers, it was visited by FRANCIS DRAKE in 1579 and by JAMES COOK in 1778. The area was inhabited by many American Indian peoples when in 1792 Capt. Robert Gray explored the COLUMBIA RIVER, giving the U.S. a claim to the region. The river's mouth was reached by the LEWIS AND CLARK EXPEDITION in 1805. The first white settlement was founded at Astoria in 1811 by the fur trader JOHN J. ASTOR. Settlement of the area accelerated from c. 1843 with mass migration over the OREGON TRAIL. It was part of the Oregon Territory and was admitted to the Union as the 33rd state in 1859. The state's economy is dependent on its forests, farms, and livestock. Salmon and shellfish are the bases of the fishing industry. Centres of population, arts, and education are PORTLAND, EUGENE, and Medford.

Oregon Caves National Monument National monument, southwestern Oregon, U.S. It is a single cave comprising a series of chambers joined by subterranean corridors on four levels. Located in the Siskiyou Mountains near the California border, the monument was established in 1909. It has an area of 488 acres (197 hectares). It contains many stalagmites, STALACTITES, and other formations.

Oregon Question Dispute over ownership of the Pacific Northwest region of North America. Spain, Russia, the U.S., and Britain all had claims to the region based on exploration or settlement. Spain vacated its claims after the NOOTKA SOUND CONTROVERSY and in an 1819 treaty with the U.S. The U.S. and Britain established a joint claim over the Oregon Country in 1818. Russia abandoned its claims in separate treaties (1824–25). A compromise Oregon Treaty between the U.S. and Britain (1846) drew the U.S.-Canada land boundary at 49°N.

Oregon Trail Major U.S. route to the Northwest in the 19th century. It stretched about 2,000 mi (3,200 km), from Independence, Mo., to the Columbia River region of Oregon. First used by fur traders and missionaries, it was heavily used in the 1840s by travelers to Oregon, including settlers of the "great migration," led by MARCUS WHITMAN. Of all western trails, it was in use for the longest period, surviving competition from the railroad by serving as a trail for eastward cattle and sheep drives.

Orestes \ȯ-ˈres-tēz\ In GREEK MYTHOLOGY, the son of AGAMEMNON and Clytemnestra. According to HOMER, Orestes was away when his father returned from TROY to meet his death at the hands of Aegisthus, his wife's lover. On reaching manhood, Orestes avenged his father by killing Aegisthus and Clytemnestra. AESCHYLUS's dramatic trilogy the *Oresteia* recounts the murder and the pursuit of Orestes by the FURIES for the crime of matricide. In EURIPIDES' *Iphigeneia in Tauris*, Orestes is reunited with his sister IPHIGENEIA and regains his father's kingdom.

Øresund \ˈœ-rə-ˌsən\ Almost tideless strait between SJÆLLAND island, Denmark, and Skåne, Sweden, connecting the Kattegat Strait with the BALTIC SEA. It is one of the busiest sea lanes in the world, though ice sometimes impedes navigation in severe winters. Three large islands within it divide the waters into channels. The strait's principal ports are COPENHAGEN and Helsingør in Denmark and MALMÖ and Hälsingborg in Sweden.

Orff, Carl (b. July 10, 1895, Munich, Ger.—d. March 29, 1982, Munich) German composer and music educator. He trained at the Munich Academy and held several musical posts thereafter. In the 1920s he grew interested in early Baroque music and the association of music with movement.

© 2006 Encyclopædia Britannica, Inc.

In 1924 he cofounded a school for which he devised a comprehensive music education program (Orff Schulwerk) involving improvisation on specially designed gamelan-like percussion instruments; the program has since come into wide international use. He typically used repetitive rhythms, bare harmonies, and powerfully direct vocal parts, as in his best-known work, the secular oratorio *Carmina Burana* (1937), which is based on a manuscript of medieval poems.

organ Keyboard instrument in which pressurized air produces notes by means of a series of tuned pipes. The simplest organs consist of a single rank of pipes, each corresponding to a single key. They are arranged over a wind chest connected to the keys by a set of valves and fed with a supply of air by electrically or mechanically activated bellows. By pulling out knobs, called stops, the player engages new ranks of pipes. Two distinct types of pipes are used: flue pipes (both open and stopped) produce sound by directing air against the edge of an opening in the pipe, whereas reed pipes sound by means of a thin metal tongue inside the pipe that vibrates against a fixed projection next to it. A large organ may have five or more banked keyboards, or manuals, each of which controls a distinctive group of pipes. Most organs also have pedalboards played with the feet. A large organ's pipes may vary in length from about 1 in. to 32 ft (2.5 cm to 10 m), resulting in a huge nine-octave range. The earliest organ (c. 250 BC) was the Greek *hydraulis*, in which the wind was regulated by water pressure. The bellows-fed organ appeared about the 7th century AD. The organ became firmly associated with the church by the 10th century. As organs became widespread, different regions pursued different modes of construction and sought different tonal ideals. The Baroque German organ is ideally suited to polyphony, while the French taste for variety of timbres eventuated in ARISTIDE CAVAILLÉ-COLL's vast "orchestral" organs. See also HARMONIUM.

TONI SCHNEIDERS

Organ Pipe Cactus National Monument National monument, southwestern Arizona, U.S., at the Mexican border. It was established in 1937. With an area of 330,689 acres (133,929 hectares), it preserves segments of the mountainous SONORAN DESERT and is named for the organ-pipe cactus. Wildlife includes GILA MONSTERS, antelope, coyotes, and a variety of birds.

organic compound Substance whose MOLECULES contain one or more (often many more) CARBON ATOMS (excluding carbonates, cyanides, carbides, and a few others; see INORGANIC COMPOUND). Until 1828 (see UREA), scientists believed that organic compounds could be formed only by life processes (hence the name). Since carbon has a far greater tendency to form molecular chains and rings than do other elements, its COMPOUNDS are vastly more numerous (many millions have been described) than all others known. Living organisms consist mostly of water and organic compounds: PROTEINS, CARBOHYDRATES, FATS, NUCLEIC ACIDS, HORMONES, VITAMINS, and a host of others. Natural and synthetic fibres and most fuels, drugs, and plastics are organic. HYDROCARBONS contain only carbon and hydrogen; organic compounds with other FUNCTIONAL GROUPS include CARBOXYLIC ACIDS, ALCOHOLS, ALDEHYDES, KETONES, PHENOLS, ETHERS, ESTERS, and other, more complex, molecules, including HETEROCYCLIC COMPOUNDS, ISOPRENOIDS, and AMINO ACIDS.

organic farming *or* **organic gardening** System of CROP cultivation that uses biological methods of fertilization and pest control as substitutes for chemical FERTILIZERS and PESTICIDES, which are regarded by supporters of organic methods as harmful to health and the environment and unnecessary for successful cultivation. It was initiated as a conscious rejection of modern agri-chemical techniques in the 1930s by the British agronomist Sir Albert Howard. Miscellaneous organic materials, including animal MANURE, COMPOST, grass turf, STRAW, and other crop residues, are applied to fields to improve both soil structure and moisture-holding capacity and to nourish soil life, which in turn nourishes plants. (Chemical fertilizers, by contrast, feed plants directly.) Biological pest control is achieved through preventive methods, including diversified farming, CROP ROTATION, the planting of pest-deterrent species, and the use of INTEGRATED PEST MANAGEMENT techniques. Bioengineered strains are avoided. Since organic farming is time-consuming, organically grown produce tends to be expensive. Organic produce formerly accounted for a minuscule portion of total American farm output, but it has seen a huge proportional increase in sales in recent years.

Organization for Economic Cooperation and Development See Organization for ECONOMIC COOPERATION AND DEVELOPMENT

Organization of African Unity (OAU) See AFRICAN UNION

Organization of American States (OAS) International organization formed in 1948 to replace the PAN-AMERICAN UNION. It promotes economic, military, and cultural cooperation among its members, which include almost all the independent states of the Western Hemisphere. (Cuba's membership was suspended in 1962.) The OAS's main goals are to maintain peace in the Western Hemisphere and to prevent intervention in the region by any outside state. Since the end of the Cold War in the early 1990s, the OAS has more actively encouraged democratic government in member states, in part by organizing missions to observe and monitor elections. organized crime Crime committed on a national or international scale by a criminal association; also, the associations themselves. Such associations engage in offenses such as cargo theft, fraud, robbery, kidnapping for ransom, and the demanding of "protection" payments. Their principal source of income derives from the supply of illegal goods and services for which there is continuous public demand, such as drugs, prostitution, "loan-sharking" (i.e., the lending of money at extremely high interest rates), and gambling. They are characterized by a hierarchy of ranks with assigned responsibilities; the coordination of activities among subgroups; the division of geographic territory among different associations; a commitment to total secrecy; efforts to corrupt law-enforcement authorities; and the use of extreme violence, including murder, against rival associations, informers, and other enemies. International rings of smugglers, jewel thieves, and drug traffickers have existed throughout Europe and Asia, and Sicily and Japan have centuries-old criminal organizations. In the U.S., organized crime flourished in the 20th century, especially during the PROHIBITION era. In the late 20th and early 21st centuries, it became immensely powerful in Russia, taking advantage of a weak and impoverished government and widespread official corruption. See also MAFIA; YAKUZA.

organum \'ȯr-gə-nəm\ Early polyphonic setting of plainchant (see GREGORIAN CHANT), the earliest form of COUNTERPOINT. The oldest written organum (c. 900), which evidently reflects a prevailing improvisational practice, consists of two lines moving simultaneously, note against note, the added line often paralleling the chant line a fourth or a fifth below. Later the added line acquired greater melodic individuality and independence. Organum consisting of more than one note against each chant note (florid or melismatic organum) appeared by the early 12th century. Three- and four-voice organum were first composed by the NOTRE-DAME SCHOOL. Organum died out with the advent of the 13th-century MOTET.

Orhon River *or* **Orkhon** \'ȯr-ˌkȯn\ **River** River, north-central MONGOLIA. Some 700 mi (1,130 km) long, it rises from the slopes of the Hangayn Mountains and flows east, then north past the ruins of KARAKORUM. The 8th-century funerary stelae discovered in the river's valley in 1889 contain some of the oldest known Turkic writing, called the Orhon inscriptions. The river is navigable for shallow-draft vessels only in July and August.

oriel Bay window in an upper story, supported from below by projecting CORBELS. Usually semihexagonal or rectangular in plan, oriels first became prevalent early in the 15th century. They were often placed over gateways or entrances to manor houses and public buildings of the late Gothic and Tudor periods. In cities of North Africa and the Middle East, the *moucharaby* is an oriel that uses grills or lattices in place of glass and shutters. See also BRISE-SOLEIL.

Orient Express Luxury train that ran from Paris to Constantinople (Istanbul) for over 80 years (1883–1977). Developed by the Belgian businessman Georges Nagelmackers, its luxuriously furnished cars became

the symbol of glamour for European society. Europe's first transcontinental express train, it covered over 1,700 mi (2,740 km); after 1919 the route extended from Calais and Paris to Lausanne and via the Simplon Pass to Milan, Venice, Zagreb, and beyond. Service was suspended during both world wars. Discontinued in 1977, it was revived in 1982 to run between London and Venice as the "Venice Simplon Orient Express."

orientation In architecture, the position of a building on its site. In Mesopotamia and Egypt, as well as in pre-Columbian Central America, a building's important features, such as entrances and passages, faced the rising sun. Mosques are oriented so that the MIHRAB faces Mecca. Christian churches have usually been oriented with the apse or altar at the eastern end. Orientation is frequently planned to take maximum advantage of daily and seasonal variations of sunlight. A structure's optimal orientation is usually a compromise between its function, location, and the prevailing environmental factors of solar radiation, light, humidity, and wind that make up the site's microclimate.

orienteering Cross-country footrace in which each participant uses a map and compass to navigate between checkpoints along an unfamiliar course. Introduced in Sweden in 1918, it later spread throughout Europe. World championships have been held since 1966. Runners set out at intervals; the winner is the runner who completes the course in the fastest time. Orienteering is also practiced by cyclists, canoeists, horseback riders, and skiers.

origami See PAPER FOLDING

Origen \'ȯr-i-jən\ *orig.* **Oregenes Adamantius** (b. c. 185, probably Alexandria, Egypt—d. c. 254, Tyre, Phoenicia) Greek theologian, one of the Fathers of the Church. Probably the son of a Christian martyr, Origen studied philosophy in Alexandria and served as head of its catechetical school for 20 years. He later settled in Palestine and founded a school of philosophy and theology. He traveled widely as a preacher; he was imprisoned and tortured during the persecutions of the emperor DECIUS in 250 but survived to die several years later. His greatest work, the *Hexapla*, is a synopsis of six versions of the Hebrew scriptures. His writings, influenced by NEOPLATONISM and STOICISM, stress that providence seeks to restore all souls to their original blessedness and emphasize the centrality of the Word (LOGOS) in the cosmos. He held that even Satan was not beyond repentance and salvation, a view for which he was condemned. Although attacked as a heretic, Origen remained an influential thinker throughout late antiquity and the Middle Ages.

original sin In Christian doctrine, the condition or state of SIN into which each human being is born, or its origin in ADAM's disobedience to God when he ate the fruit of the tree of knowledge of good and evil. His guilt was transmitted to his descendants. Though GENESIS describes Adam's sufferings as the consequence of his disobedience, it does not make Adam's sin hereditary. The main scriptural basis of the doctrine is found in the writings of St. PAUL; St. AUGUSTINE helped make humanity's sinful nature a central element in orthodox Christian theology. Medieval theologians continued to explore the issue, and THOMAS AQUINAS offered a more optimistic view of human nature in his teachings on original sin than had Augustine. MARTIN LUTHER and JOHN CALVIN accepted a more Augustinian understanding, and modern evolutionary theory and biblical source criticism raised new challenges for the definition of original sin.

Orinoco \ˌōr-ē-'nō-kō\ **River** Major river, South America. It rises on the western slopes of the Parima Mountains along the border between Venezuela and Brazil. It flows in a giant arc through Venezuela for about 1,700 mi (2,740 km) and enters the Atlantic Ocean near the island of Trinidad. It forms part of the border between Colombia and Venezuela. With its tributaries, it is the northernmost of South America's four major river systems. The aquatic fauna include the PIRANHAS and the Orinoco CROCODILE. The river basin is largely inhabited by indigenous Indian groups.

oriole Any songbird of 24 species in the Old World genus *Oriolus* (family Oriolidae) or 30 species in the New World genus *Icterus* (family Icteridae). Males typically are black and yellow or black and orange, with some white. Females are less colourful. Orioles are not easily seen but may be detected by their loud whistling and jarring notes. All are insect eaters (several species also eat fruit) in woodlands and gardens, chiefly in warm regions. The only European species is the 9.5-in. (24-cm) golden oriole (*O. oriolus*). Other *Oriolus* species are found in Africa, Asia, and Australia. The Baltimore oriole (*I. galbula*) breeds in North America east of the Rocky Mountains. See photograph above.

Golden oriole (*Oriolus oriolus*)
H. SCHREMPP—BRUCE COLEMAN INC.

Orion \ə-'rī-ən\ In GREEK MYTHOLOGY, a powerful hunter. He was sometimes said to be the son of POSEIDON. He drove the wild beasts out of the island of Chios and fell in love with Merope, daughter of the island's king. Disapproving of Orion, the king had him blinded, but his vision was restored by the rays of the rising sun. He later went to Crete to live and hunt with ARTEMIS. Some legends hold that he was killed by Artemis or APOLLO out of jealousy; another tells that he was fatally bitten by a scorpion. After his death the gods placed him in the sky as a constellation.

Orion \ə-'rī-ən\ **Nebula** Bright NEBULA, faintly visible to the unaided eye in the sword of the hunter's figure in the constellation Orion. About 1,500 light-years from Earth, it contains hundreds of very hot young stars clustered about a group of four massive stars known as the Trapezium. Radiation primarily from these four stars excites the nebula to glow. Discovered in the early 17th century, it was the first nebula to be photographed (1880).

Orissa State (pop., 2001 prelim: 36,706,920), eastern India. It lies on the Bay of BENGAL and is bordered by ANDHRA PRADESH, CHHATTISGARH, JHARKHAND, and WEST BENGAL states. It occupies an area of 60,119 sq mi (155,707 sq km), and its capital is BHUBANESHWAR; Cuttack is the largest city. Part of the ancient kingdom of KALINGA, it was a stronghold of HINDUISM before its conquest by the Afghan rulers of Bengal in 1568, when it became part of the Mughal Empire. It was ruled by Britain from 1803 until India's independence in 1947 and became a state in 1950. Situated in a tropical savanna that is subject to cyclones, it has a largely rural population, which is engaged mainly in agriculture. Crops include rice, oilseed, jute, and sugarcane. It has a rich artistic heritage and contains some of the best examples of Indian art and architecture.

Orizaba See CITLALTÉPETL

Orkhon River See ORHON RIVER

Orkney Islands Island group (pop., 2001: 19,245), Scotland. Lying north of the Scottish mainland, it comprises more than 70 islands and islets and constitutes the Orkney council area. The Orkney Islands, only 20 of which are inhabited, were the Orcades of ancient Classical literature. There is much evidence of prehistoric inhabitants. Norse raiders arrived in the late 8th century AD and colonized the islands in the 9th century. Thereafter they were ruled by Norway and Denmark until Scotland annexed them in 1472. It is a prosperous agricultural area. KIRKWALL is the administrative seat.

Orlando City (pop., 2000: 185,951), central Florida, U.S. Settlement began c. 1844 around an army post. It was renamed in 1857 to honour Orlando Reeves, an army sentry killed during the SEMINOLE WARS. After 1950 the development of the aerospace complex at Cape CANAVERAL and, after 1971, of nearby DISNEY WORLD boosted the city's population and economy. It is also the centre of a citrus farming region.

Orlando, Vittorio Emanuele (b. May 19, 1860, Palermo, Italy—d. Dec. 1, 1952, Rome) Italian politician and prime minister (1917–19). He was elected to Italy's Chamber of Deputies in 1897 and served in cabinet positions from 1903. As prime minister, he led Italy's delegation to the PARIS PEACE CONFERENCE, but he was unable to obtain concessions from the Allies for Italian-claimed territory and resigned. As president of the Chamber of Deputies (1919–25), he resigned in protest against the electoral fraud of BENITO MUSSOLINI's Fascist Party. He was president of the postwar Constituent Assembly (1946–47).

Orléans \ȯr-lā-'äⁿ\ *ancient* **Aurelianum** City (pop., 1999: 113,126), capital of the Centre *région*, north-central France. It was conquered by Julius CAESAR in 52 BC and became an intellectual centre under CHARLEMAGNE. It was a major cultural centre in the Middle Ages and became a royal duchy under PHILIP VI in 1344. During the HUNDRED YEARS' WAR, the English siege in 1429 was relieved by JOAN OF ARC, known as the Maid of Orléans, and her troops. Located on the LOIRE RIVER in a fertile valley, it is important for market gardening, horticulture, and textile production.

© 2006 Encyclopædia Britannica, Inc.

Orléans, house of Name of the cadet or junior branch of the Valois and Bourbon houses of France. Of the four dynasties of princes, Philippe I (1336–75) died without an heir. Descendants of the second dynasty, headed by Louis I (1372–1407), held the title until 1545. The third dynasty was headed by Gaston (1608–60), whose title from 1626 passed to the fourth dynasty under Philippe I (1640–1701), younger brother of Louis XIV. Philippe's descendants included Louis-Philippe-Joseph, duke d'Orléans, and Louis-Philippe, king of France from 1830 to 1848.

Orléans, Louis-Philippe-Joseph, duke d' *known as* **Philippe Égalité** (b. April 13, 1747, Saint-Cloud, France—d. Nov. 6, 1793, Paris) French Bourbon prince who supported popular democracy in the French Revolution. A cousin of Louis XVI, he disapproved of Marie-Antoinette and lived away from the royal court at Versailles. In 1787 he was exiled to his estates for challenging the king's authority. In 1789 he was elected to the Estates General and soon joined the Third Estate. After joining the Jacobin Club (1791), he renounced his title of nobility (1792) and accepted the name Philippe Égalité from the Paris Commune. In the National Convention, he supported the radicals, but, after his son Louis-Philippe defected to the Austrians, he was accused of conspiracy, arrested, and guillotined.

Orlov \ər-'lȯf**, Aleksey (Grigoryevich), Count** (b. Oct. 5, 1737, Lyutkino, Tver province, Russia—d. Jan. 5, 1808, Moscow) Russian military officer. He became an officer in the Russian guards and adviser to his brother Count Grigory G. Orlov, with whom he planned the overthrow of Peter III (1762) and the installation of Catherine II as empress. Promoted to major general, he was given command of the Russian fleet in the Russo-Turkish War.

Orlov, Grigory (Grigoryevich), Count (b. Oct. 17, 1734, Lyutkino, Tver Province, Russia—d. April 24, 1783, Neskuchnoye, near Moscow) Russian military officer and lover of Catherine II. An artillery officer, he fought in the Seven Years' War. While stationed in St. Petersburg, he met the grand duke Peter (later Peter III) and his wife, Catherine, whose lover Orlov became c. 1760. After Peter ascended the throne (1762), Orlov and his brother, Count Aleksey Orlov, planned the coup d'état that overthrew Peter and made Catherine empress of Russia. As Catherine's close adviser, he proposed agrarian reforms to help the serfs, but little was accomplished. He lost favour at court c. 1772.

Ormandy, Eugene *orig.* **Jenö Ormandy Blau** (b. Nov. 18, 1899, Budapest, Austria-Hungary—d. March 12, 1985, Philadelphia, Pa., U.S.) Hungarian-born U.S. conductor. A violin prodigy, he became professor of violin at the Budapest Royal Academy at age 17. In 1921 he went to New York City, where he played in and conducted a theatre orchestra; he gained national prominence as conductor of the Minneapolis Symphony Orchestra (1931–36). He shared conductorship of the Philadelphia Orchestra with Leopold Stokowski for two years before becoming sole conductor in 1938, and he led the orchestra until he was made laureate in 1980. Ormandy shaped the orchestra's sound by developing the lush, velvety string colour that became its trademark, and the orchestra made scores of recordings under him.

ormolu \'ȯr-mə-ˌlü\ (from French *dorure d'or moulu*, "gilding with gold paste") Gold-coloured alloy made up of copper, zinc, and sometimes tin in various proportions but usually at least 50% copper. It is used in mounts (ornaments on borders, edges, and as angle guards) for furniture and for other decorative purposes. After the molten alloy has been poured into a mold and allowed to cool, it is gilded with powdered gold mixed with mercury. It is then fired at a temperature that evaporates the mercury, leaving a gold surface. Ormolu was first produced in France in the mid-17th century, and France remained its main centre of production. See photograph opposite.

Ormonde, James Butler, 12th earl and 1st duke of (b. Oct. 19, 1610, London, Eng.—d. July 21, 1688, Kingston Lacy, Dorset) Anglo-Irish statesman. Born into the prominent Butler family of Ireland, he succeeded to the earldom of Ormonde in 1632. In service to the English crown in Ireland from 1633, he fought against the Catholic rebellion from 1641. He concluded a peace with the Catholic confederacy in 1649, then rallied support for Charles II, but he was forced to flee when Oliver Cromwell landed at Dublin. He was Charles's adviser in exile (1650–60). After the Restoration he was appointed lord lieutenant of Ireland (1662–69, 1677–84), where he encouraged Irish commerce and industry. He was created a duke in 1682.

Ormuz See Hormuz

ornamentation In music, the addition of notes for expressive and aesthetic purposes. For example, a long note may be ornamented by repetition or by alternation with a neighboring note ("trill"); a skip to a non-adjacent note can be filled in with the intervening notes; or the resolution of a dissonance (see consonance and dissonance), because of its inevitability, can be delayed.

ornamentation In architecture, applied embellishment in various styles that is a distinguishing characteristic of buildings, furniture, and household items. Ornamentation often occurs on entablatures, columns, the tops of buildings, and around entryways and windows, especially in the form of moldings. Throughout antiquity and into the Renaissance, and later for religious buildings, applied ornament was very important, often having symbolic meaning. The anthemion petal motif was especially popular on the moldings of ancient Greek cornices. Other motifs from antiquity include the Egyptian cartouche (oval), fretwork (banding) of capitals, fluting and reeding of columns, bas-relief egg-and-dart moldings (with alternating oval and pointed forms), and scrollwork such as that found on Ionic capitals and in the running-dog pattern (or wave scroll). Brattishing refers to the continuous embellishment around the top of a wall, common in the Gothic period. The diaper motif, an allover pattern of small repeated shapes, was also often used in this period. The use of strapwork (interlaced scrollwork), which originated with Islamic metalwork, is characteristic of Mannerist architecture and furniture.

Orne \'ȯrn\ **River** River, northwestern France. It is 94 mi (152 km) long and flows through the Orne and Calvados departments past Caen into the English Channel. Its bridges were seized by the Allied forces during the World War II Normandy Campaign in June 1944.

ornithischian \ˌȯr-nə-'this-kē-ən\ Any of the "bird-hipped" dinosaur species (order Ornithischia), herbivores with hip bones arranged like those of modern birds, with the pubis bone pointed backward. Many species had a toothless, horny beak and powerful cheek teeth. Ornithischians flourished from the Late Triassic to the Late Cretaceous Epoch (227–65 million years ago). Many species (in the suborder Cerapoda) were bipedal and had ornate skull structures. Some were quadrupedal, with a massive head culminating in a great bony frill. Other quadrupeds (in the suborder Thyreophora) had small heads and were heavily plated and armoured along the back, and some had armour on the flanks and head as well. See also protoceratops; saurischian; stegosaur; triceratops.

ornithology Branch of zoology dealing with the study of birds. Early writings on birds were largely anecdotal (including folklore) or practical (e.g., treatises on falconry and game-bird management). From the mid-18th century on, ornithology progressed from the description and classification of new species discovered in scientific expeditions to the examination of internal anatomy to the study of bird ecology and ethology. Ornithology is one of the few scientific fields in which nonprofessionals make substantial contributions; the field observations of birders provide valuable information on behaviour, ecology, distribution, and migration. Other information is gained by means of radar, radio transmitters, portable audio equipment, and bird banding, which provides information on longevity and movements.

Secretary decorated with ormolu mounts, marquetry, and intarsia, French, c. 1770; in the Wallace Collection, London

COURTESY OF TRUSTEES OF THE WALLACE COLLECTION, LONDON

orogeny \ȯ-'rä-jə-nē\ Mountain-building event, generally one that occurs in a geosyncline. Orogeny tends to occur during a relatively short geologic time frame. It is usually accompanied by folding and faulting of strata and by the deposition of sediments in areas adjacent to the orogenic belt. Orogenies may result from continental collisions, the underthrusting of continents by oceanic plates, the overriding of oceanic ridges by continents, and other causes. See also Acadian orogeny, Alleghenian orogeny, Alpine orogeny, Laramide orogeny, Taconic orogeny.

Oromo \ō-'rō-mō\ *pejorative* **Galla** Major ethnic group of Ethio-

© 2006 Encyclopædia Britannica, Inc.

pia, numbering more than 20 million, or nearly one-third of the population, and occupying much of its central and south-central regions. They speak a Cushitic language of the Afroasiatic family. They are a diverse group, having assimilated and intermarried with other peoples since the 16th century. Traditionally the Oromo were nomadic herders, but today most are settled agriculturalists. Politically they are largely subjugated to the dominant Amhara. In religion they are divided among Islam, the Ethiopian Orthodox faith, and traditional beliefs.

Orontes \ō-'rän-tēz\ **River** River, Middle East. Rising in the Biqāʿ Valley of Lebanon and flowing north between the Lebanon and Anti-Lebanon mountains, it passes the cities of Ḥimṣ and Ḥamāh in Syria, where it has been dammed to form Ḥimṣ Lake. Northwest of Ḥamāh it enters Turkey, where it flows west past the ancient city of Antioch and empties into the Mediterranean Sea. It is unnavigable for most of its 355 mi (571 km) length but is an important source of water for irrigation.

Orozco \ō-'rōs-kō**, José Clemente** (b. Nov. 23, 1883, Ciudad Guzmán, Mex.—d. Sept. 7, 1949, Mexico City) Mexican mural painter. When he lost his left hand at 17, he abandoned architectural studies for painting, pursuing Mexican themes. As a caricaturist for a revolutionary paper, he explored Mexico City's slums and painted a series of watercolours, *House of Tears*, on the lives of prostitutes. The reaction of moralists forced him to flee to the U.S. in 1917, but in 1919 the new government of Álvaro Obregón welcomed him back, and he joined Diego Rivera and David Alfaro Siqueiros in creating large-scale murals for public buildings, in which he continued his radical social commentary. Again forced to abandon Mexico in 1927, he worked until 1934 in the U.S., where his style evolved and matured in murals from coast to coast. In 1934, his international reputation firmly established, he returned to Mexico and embarked on his most technically impressive and emotionally expressive murals, including *Catharsis* (1934), in the Palacio de Bellas Artes. He was a leader among those who raised Mexican art to a position of international eminence.

Orpheus Greek legendary hero who sang and played the lyre so beautifully that animals, trees, and rocks danced around him. When his wife, Eurydice, was killed by a snake, he went to the underworld in search of her, and his music and grief so moved Hades that he agreed to let Orpheus take Eurydice back to the land of the living on the condition that neither of them look back as they left. On seeing the Sun, Orpheus turned to share his delight with Eurydice, and she disappeared. Orpheus was later torn to pieces by maenads, and his head, still singing, floated to Lesbos, where an oracle of Orpheus was established. By the 5th century BC, a Hellenistic mystery religion (the Orphic mysteries), based on Orpheus's songs and teachings, had arisen. His story became the subject of some of the earliest operas.

Orphic mysteries See mystery religions

Orphism Trend in Cubism that gave priority to colour. Its name, bestowed in 1912 by Guillaume Apollinaire, recalls not only the legendary Orpheus but the Symbolist painters' description of Paul Gauguin's use of colour as "Orphic art." Among the painters who worked in this style were Robert Delaunay, Fernand Léger, Francis Picabia, and Marcel Duchamp. The best-known example is Delaunay's abstract *Simultaneous Composition: Sun Disks* (1912–13), in which superimposed circles of colour have their own rhythm and movement.

Orr, Bobby *in full* **Robert Gordon Orr** (b. March 20, 1948, Parry Sound, Ont., Can.) Canadian-born U.S. ice-hockey player. He was signed to a junior amateur contract by Boston Bruins scouts when he was 12. He joined the Bruins in 1966 and played with them for 10 seasons, helping them to the playoffs in eight consecutive seasons and to two Stanley Cup victories (1970, 1972). The first defenseman to lead the National Hockey League in scoring (1970, 1975), he is the only player ever recognized as the most valuable defenseman eight years in a row (1967–68 to 1974–75).

CANADA WIDE—PICTORIAL PARADE/EB INC.

Ørsted \'œr-stəd**, Hans Christian** (b. Aug. 14, 1777, Rudkøbing, Den.—d. March 9, 1851, Copenhagen) Danish physicist and chemist. In 1820 he discovered that electric current in a wire can deflect a magnetized compass needle, a phenomenon that inspired the development of electromagnetic theory. His 1820 discovery of piperine, one of the pungent components of pepper, was an important contribution to chemistry, as was his preparation of metallic aluminum in 1825. In 1824 he founded a society devoted to the spread of scientific knowledge among the general public. In 1932 the oersted was adopted as the physical unit of magnetic field strength.

Ortega \ôr-'tā-gə\ **(Saavedra), (José) Daniel** (b. Nov. 11, 1945, La Libertad, Nic.) President of Nicaragua (1984–90). In 1963 he became a member of the Sandinista National Liberation Front and organized urban resistance to the corrupt dictatorship of the Somoza family. Jailed and later exiled, he returned secretly to Nicaragua and helped unite opposition to Somoza. After the Sandinistas prevailed in 1979, he coordinated the ruling junta; in 1984 he was elected Nicaragua's president. U.S. efforts to destabilize his government led to economic hardship and a protracted war, and Ortega lost his bid for reelection in 1990, 1996, and again in 2001. See also Violeta Chamorro; contras.

Ortega y Gasset \ôr-'tā-gä-ē-gä-'set**, José** (b. May 9, 1883, Madrid, Spain—d. Oct. 18, 1955, Madrid) Spanish philosopher. He taught at the University of Madrid from 1911 and lived abroad from 1931 to 1946. Though influenced by Neo-Kantianism, he diverged from it in works such as *Adam in Paradise* (1910), *Quixote's Meditations* (1914), and *Modern Theme* (1923). He saw individual life as the fundamental reality; for absolute reason he substituted reason as a function of life; for absolute truth he substituted the perspective of each individual. Sharing his generation's preoccupation with Spain's problems, he founded the periodicals *España* (1915), *El sol* (1917), and *Revista de Occidente* (1923). Of his other works, the best known are *Invertebrate Spain* (1922) and *The Revolt of the Masses* (1929), which foreshadowed the Spanish Civil War. He greatly influenced Spain's 20th-century cultural and literary renaissance.

orthoclase \'ôr-thə-ˌklās\ Common alkali feldspar mineral, potassium aluminosilicate ($KAlSi_3O_8$), that usually occurs as variously coloured grains in granite. Orthoclase is used in the manufacture of glass and ceramics; occasionally, transparent crystals are cut as gems. It is primarily important as a rock-forming mineral, however, and is abundant in igneous rocks, pegmatites, and gneisses. The feldspar minerals consist of sodium, potassium, and calcium aluminosilicates, and any feldspar may be chemically classed by the percentage of each of these three pure compounds, called end-members. Orthoclase is the potassium-bearing end-member of the system. Microcline is a lower temperature structural form of the same chemical composition as orthoclase.

Orthoclase from Serra de Peneda, Portugal

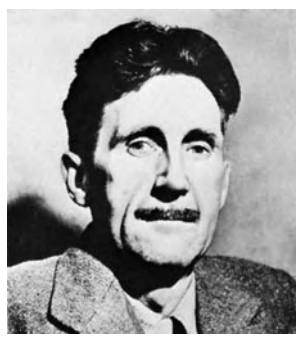
Orthodox Catholic Church See Eastern Orthodoxy

Orthodox Judaism Religion of Jews who adhere strictly to traditional beliefs and practices; the official form of Judaism in Israel. Orthodox Jews hold that both the written law (Torah) and the oral law (codified in the Mishna and interpreted in the Talmud) are immutably fixed and remain the sole norm of religious observance. Orthodox Judaism has held fast to such practices as daily worship, dietary laws, intensive study of the Torah, and separation of men and women in the synagogue. It also enjoins strict observance of the Sabbath and does not permit instrumental music during communal services. A leading center of Orthodoxy in the U.S. is New York's Yeshiva Univ.

orthogonal polynomials A system of polynomials that are mutually orthogonal (orthogonality is the higher-dimensional analog of perpendicularity), useful in solving differential equations arising in physics and engineering. The study of such systems began with Adrien-Marie Legendre (1752–1833), who employed a system now known as Legendre polynomials in the solution of problems in celestial mechanics. Other famous examples are the sets of Hermite and Chebyshev polynomials.

orthogonality \ôr-ˌthä-gə-'na-lə-tē\ In mathematics, a property synonymous with perpendicularity when applied to vectors but applicable

© 2006 Encyclopædia Britannica, Inc.



more generally to FUNCTIONS. Two elements of an INNER PRODUCT SPACE are orthogonal when their inner product—for vectors, the dot product (see VECTOR OPERATIONS); for functions, the definite INTEGRAL of their product—is zero. A set of orthogonal vectors or functions can serve as the basis of an inner product space, meaning that any element of the space can be formed from a linear combination (see LINEAR TRANSFORMATION) of the elements of such a set.

orthopedics \ˌȯr-thə-ˈpē-diks\ *or* **orthopedic surgery** Medical specialty concerned with the SKELETON and its associated structures. Orthopedists treat FRACTURES, strained MUSCLES, torn LIGAMENTS and TENDONS, and other injuries and deal with acquired and congenital skeletal deformities and the effects of degenerative diseases such as OSTEOARTHRITIS. Originally dependent on heavy braces and splints, orthopedics now uses bone grafts, hip and other joint replacements, prostheses (see PROSTHESIS), special footwear, and braces to enhance mobility. Orthopedics uses the techniques of PHYSICAL MEDICINE AND REHABILITATION and OCCUPATIONAL THERAPY in addition to those of traditional medicine and surgery.

Orton, Joe *orig.* **John Kingsley Orton** (b. Jan. 1, 1933, Leicester, Leicestershire, Eng.—d. Aug. 9, 1967, London) British dramatist. Originally an unsuccessful actor, he turned to writing, finding success in 1964 when his radio play *The Ruffian on the Stair* was broadcast by the BBC. His three full-length plays, *Entertaining Mr. Sloane* (1964), *Loot* (1965), and *What the Butler Saw* (produced posthumously, 1969), were black comedies that scandalized audiences with their examination of moral corruption, violence, and sexual rapacity. Orton's career was cut short when he was murdered by K.L. Halliwell, his lifelong companion, who afterward committed suicide.

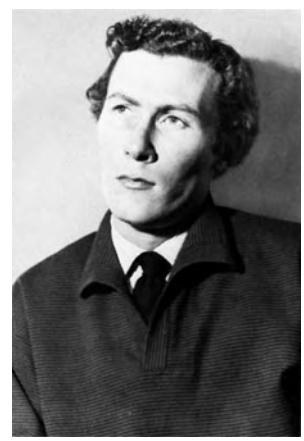
Orwell, George *orig.* **Eric Arthur Blair** (b. 1903, Motihari, Bengal, India—d. Jan. 21, 1950, London, Eng.) British novelist, essayist, and critic. Instead of accepting a scholarship to a university, Orwell went to Burma to serve in the Indian Imperial Police (1922–27), an experience that changed him into a literary and political rebel. On returning to Europe, he lived in self-imposed poverty, gaining material for *Down and Out in Paris and London* (1933), and became a socialist. He went to Spain to report on the SPANISH CIVIL WAR and stayed to join the Republican militia. His war experiences, which gave him a lifelong dread of communism (he would later provide British intelligence services with lists of his fellow British communists), are recounted in *Homage to Catalonia* (1938). His novels typically portray a sensitive, conscientious, emotionally isolated individual at odds with an oppressive or dishonest social environment. His most famous works are the anti-Soviet satirical fable *Animal Farm* (1945) and *Nineteen Eighty-four* (1949), a dystopic vision of totalitarianism whose influence was widely felt in the postwar decades. His literary essays are also admired.

George Orwell.
BBC COPYRIGHT

oryx Any of four species (genus *Oryx*) of large stocky ANTELOPES living in herds on African and Arabian deserts and plains. Oryxes are 40–47 in. (102–120 cm) high. They have a mane and a tufted tail. The coat is grayish brown, whitish, or white, depending on the species, with dark patches on the face and forehead, a dark streak on either side of the eye, and various dark markings on the body and legs. Both sexes have long, sharp-tipped, straight or curved horns.



Arabian oryx (*Oryx leucoryx*)

Osage \ō-ˈsāj\ North American PLAINS INDIAN people living mostly in Oklahoma, U.S. Their language is SIOUAN. The name Osage is a French-derived version of their name for themselves, Wazhazhe. They lived variously in the Piedmont and Ozark plateaus and the western Missouri and southeastern Kansas prairies. Their culture was marked by the combination of village agriculture and buffalo hunting. Their villages consisted of LONGHOUSES; TEPEES were used during the hunting season. Their religious ceremonies divided clans into symbolic sky and earth groups. In the late 19th century the Osage were removed to a reservation in Oklahoma. The discovery of oil there made them a uniquely prosperous tribe. They number more than 18,000.

Osage \ō-ˈsāj, ˈō-ˌsāj\ **River** River, western Missouri, U.S. Formed by the junction of the Marais des Cygnes and Little Osage rivers, it is about 500 mi (800 km) long and is one of the principal tributaries of the MISSOURI RIVER. It flows east and northeast through Lake of the OZARKS and enters the Missouri just east of Jefferson City, Mo.

Ōsaka \ō-ˈsä-kä,\ *Japanese* \ˈō-sä-kä\ *ancient* **Naniwa** City (pop., 2000 prelim.: 2,598,589) and seaport, west-central HONSHU, Japan, on the northeastern shore of Ōsaka Bay. A long-established city and port, Naniwa was made a castle town by TOYOTOMI HIDEYOSHI in the 16th century. It was the leading commercial city of Japan during the TOKUGAWA PERIOD and the leading industrial city from the late 19th century. It was badly damaged by U.S. bombing during World War II. Once noted for its large textile industry, it is now a leading financial centre with heavy industries including machinery, iron and steel, and chemicals. With KŌBE and KYŌTO, it is part of Japan's second largest urban and industrial agglomeration. It is also a cultural and educational centre, with several universities and theatres.

Osborne, John (James) (b. Dec. 12, 1929, London, Eng.—d. Dec. 24, 1994, Shropshire) British playwright and film producer. Initially an actor, he cowrote his first play, *The Devil Inside Him* (1950), with Stella Linden. His *Look Back in Anger* (1956; film, 1959) ushered in a spate of vigorously realistic plays about contemporary British working-class life, making Osborne the first of the postwar ANGRY YOUNG MEN. His next play, *The Entertainer* (1957; film, 1960), told the story of a failing music-hall comedian; it was commissioned by the actor LAURENCE OLIVIER, who starred in the stage and film versions. Osborne wrote the screenplay for the film *Tom Jones* (1963, Academy Award), and his other plays include *Luther* (1961) and *Inadmissible Evidence* (1964).

John Osborne
UPI/BETTMANN NEWSPHOTOS

Oscan \ˈäs-kən\ **language** ITALIC LANGUAGE formerly spoken in southern and central Italy, related closely to UMBRIAN and more distantly to LATIN. It was probably the native tongue of the SAMNITE people of Italy's central mountainous region. Oscan was gradually displaced by Latin and apparently became extinct by the end of the 1st century AD. Modern knowledge of it comes from some 250 inscriptions written in a colonial LATIN ALPHABET, the GREEK ALPHABET, and an alphabet derived from that used for ETRUSCAN.

Osceola \ˌä-sē-ˈō-lə\ (b. c. 1804, Georgia, U.S.—d. Jan. 30, 1838, Charleston, S.C.) SEMINOLE Indian leader during the Second SEMINOLE WAR. The war began in 1835 when the U.S. government attempted to

Osceola, detail of a lithograph by George Catlin, 1838

force the Seminole off their traditional lands in Florida and into the Indian territory west of the Mississippi River. Osceola and his followers employed guerrilla tactics and forced a truce. During negotiations he was arrested and removed to a military fort at Charleston, S.C., where he died.

oscillator Mechanical or electronic device that produces a back-and-forth PERIODIC MOTION. A PENDULUM is a simple mechanical oscillator that swings with a constant amplitude, requiring the addition of energy at each swing only to compensate for the energy lost because of air resistance or friction. In electronic oscillators, ELECTRONS oscillate with a constant period and also require the addition of energy to replace energy loss. Electronic oscillators are used to generate ALTERNATING CURRENT and high-frequency currents for carrier waves in radio broadcasting. They are incorporated in a wide variety of electronic equipment.

oscilloscope \ə-'si-lə-ˌskōp\ *or* **cathode-ray oscilloscope** Electronic display device used to produce patterns on a screen that are the graphical representations of electrical signals. Time is normally on the horizontal axis, and a function of the voltage generated by the input signal to the oscilloscope on the vertical axis; four or more plots can be simultaneously shown. Because almost any physical phenomenon can be converted into a corresponding electric voltage, oscilloscopes find commercial, engineering, and scientific applications in acoustic research, television-production engineering, and electronics design.

Oshogbo \ō-'shōg-bō\ City (pop., 1996 est.: 476,800), Nigeria. Located northeast of IBADAN, it lies along the Oshun River. Originally settled by the Ilesha from Ibokun, it remained a small town until the early 19th century when an influx of YORUBA fleeing from FULANI conquerors arrived. In 1840 it was the scene of a battle won by Ibadan that proved to be the turning point in the Fulani-Yoruba wars. It was made part of Oyo state in 1976 and the capital of the newly created state of Osun in 1991. It is a trade centre for cocoa and palm oil; weaving and dyeing cotton cloth and growing tobacco are other local occupations.

Osiris \ō-'sī-rəs\ Ancient Egyptian god of the underworld. Osiris was slain by the god SETH, who tore apart the corpse and flung the pieces all over Egypt. The goddess ISIS, consort of Osiris, and her sister Nephthys found the pieces and gave new life to Osiris, who became the ruler of the underworld. Isis and Osiris then conceived HORUS. In the Egyptian concept of divine kingship, the king at death became Osiris and the new king was identified with Horus. Osiris also represented the power that brought life out of the earth. Festivals reenacting his fate were celebrated annually in towns throughout Egypt.

Osler \'ōs-lər**, Sir William** (b. July 12, 1849, Bond Head, Canada West, Can.—d. Dec. 29, 1919, Oxford, Oxfordshire, Eng.) Canadian physician and professor. He became the first to identify blood PLATELETS (1873) and later taught at the medical school at McGill University (1875–84) and then at Johns Hopkins University's medical school (1889–1905). There he helped transform clinical teaching; students studied patients in the wards and took their problems to the lab, and experts pooled their knowledge to benefit both patient and student in public teaching sessions. Osler's *Principles and Practice of Medicine* (1892) became the most popular medical textbook of its day. He was involved in the formation of two physicians' associations and the *Quarterly Journal of Medicine.* Osler nodes on the hand are seen in some cardiac infections, and two blood disorders also bear his name.

William Osler, at the bedside of a patient, while professor of medicine at Johns Hopkins, 1888–1904.

Oslo \'äz-lō,\ *Norwegian* \'üs-lü\ *formerly (1624–1925)* **Christiania** City and municipality (pop., 2002 est.: municipality, 512,589), capital of Norway. It lies at the northern end of Oslo Fjord and constitutes a separate county. It was founded by King HARALD III SIGURDSSON c. 1050. Haakon V built the Akershus fortress c. 1300. After it was destroyed by fire in 1624, King CHRISTIAN II of Denmark-Norway built a new town farther west and called it Christiania. It grew in the 19th century, partly by absorbing neighbouring towns, and replaced BERGEN as Norway's largest and most influential city. It was renamed Oslo in 1925 and developed rapidly after World War II. It is the country's principal commercial, industrial, and transportation centre, and its harbour is the largest and busiest in Norway.

osmosis \äz-'mō-səs\ Spontaneous passage or DIFFUSION of water or other SOLVENT through a semipermeable membrane. If a solution is separated from a pure solvent by a membrane that is permeable to the solvent but not to the solute, the solution will tend to become more dilute by absorbing solvent through the membrane. The pressure caused by the migration of solvent through the membrane is called osmotic pressure.

osprey \'äs-prē, 'äs-prā\ *or* **fish hawk** Species (*Pandion haliaetus*) of long-winged HAWK found along seacoasts and large interior waterways. Ospreys are about 26 in. (65 cm) long and brown above and white below, with some white on the head. An osprey flies over the water, hovers above its prey, and then plunges feet first, seizing the fish in its long, curved talons. Ospreys breed on all continents except South America, where they live only in winter. They usually nest, singly or in colonies, high in trees or on cliffs. Bioaccumulation of pesticides caused populations to dwindle in the 20th century, but they are now recovering.

Osroëne *or* **Osrhoene** \ˌäz-rə-'wē-nē\ Ancient kingdom, northwestern MESOPOTAMIA. Located between the TIGRIS and EUPHRATES rivers, it was situated across the modern frontier of Turkey and Syria, with its capital at Edessa (modern ŞANLIURFA, Tur.). Founded in c. 136 BC, it commanded strategic trade and military routes (1st century BC–2nd century AD). At different times it was allied with either PARTHIA or ROME. The kingdom was abolished by the Roman emperor CARACALLA in AD 216. In the 4th–7th centuries AD it was dominated by the wars between the BYZANTINE EMPIRE and the Persian Sāsānian dynasty. Under various Arab dynasties, it became a centre of reaction against Hellenism and the headquarters of Chaldean Syriac literature and learning. It fell to the Muslims in 638.

OSS See OFFICE OF STRATEGIC SERVICES

Osservatore Romano \ȯ-ˌser-vä-'tȯ-rā-rō-'mä-nō**, L'** *Italian* **"The Roman Observer"** Daily newspaper published in VATICAN CITY, one of the most influential papers in Italy and the de facto voice of the Holy See. Founded in 1861, it was subsidized by the Vatican from its start and was bought outright in 1890 by Pope LEO XIII. It regularly details the pope's activities and prints the text of papal speeches as the Vatican newspaper of record; it also reports and comments on political developments, stressing editorials and commentary over news and noting the religious and moral implications of events, institutions, and trends.

Ossian \'äs-ē-ən, 'äsh-ən\ *Gaelic* **Oisín** \'ōsh-yin\ Irish warrior-poet of the FENIAN CYCLE of hero tales. The name Ossian became known throughout Europe in 1762–63 when the Scottish poet James Macpherson (1736–96) published the epics *Fingal* and *Temora*, which he represented as translations of works by the 3rd-century Gaelic poet Ossian. The poems were widely acclaimed and influential in the Romantic movement, but their authorship was later doubted, notably by SAMUEL JOHNSON (1775), and they were eventually determined to have been written largely by Macpherson.

Ossianic ballads \ˌä-sē-'a-nik, ˌä-shē-'a-nik\ Irish Gaelic and Scottish lyric and narrative poems dealing with the legendary Finn MacCumhaill and his war band. They are named for Oisín (Ossian), the chief bard of the FENIAN CYCLE. Part of a common Scots-Irish Gaelic tradition, the ballads consist of more than 80,000 lines dating from the 11th to the 18th century. Unlike earlier Fenian literature, which reflected mutual respect between pagan and Christian tradition, they are stubbornly pagan and anticlerical, full of lament for past glories and contempt for the Christian present. Most of the poetry claimed for Oisín was in fact written by Scottish poet James Macpherson (1736–1796).

Ossianic cycle See FENIAN CYCLE

Ossory \'ä-sə-rē\ Ancient kingdom, Ireland. It became a semi-independent state within the kingdom of Leinster (c. 1st century AD). In the 9th century its king, Cerball, allied himself with the Norse invaders. His Irish descendants became known as the Fitzpatricks. The modern diocese of Ossory, with its see at Kilkenny, approximates the size of the ancient state.

Ostade \ȯs-'tä-də**, Adriaen van** (b. Dec. 10, 1610, Haarlem, Neth.—buried May 2, 1685, Haarlem) Dutch painter and printmaker.

© 2006 Encyclopædia Britannica, Inc.

Known for his Baroque genre paintings of peasant life, he also did religious subjects, portraits, and landscapes. The most important influence on his style was the work of Adriaen Brouwer. Like Brouwer, he delighted in scenes such as tavern brawls, usually in dimly lit interiors, as in *Carousing Peasants in an Interior* (c. 1638). He employed a broad, vigorous technique in a subdued range of colours. After he adopted a brighter palette in the 1640s, his subjects became less ribald, and from the 1650s he painted many of them in outdoor settings.

Ostend \ä-'stend\ **Manifesto** (1854) Secret document written by U.S. diplomats at Ostend, Belg., describing a plan to acquire Cuba from Spain. On orders from U.S. secretary of state William Marcy, three U.S. diplomats—minister to Britain James Buchanan, minister to France John Y. Mason, and minister to Spain Pierre Soulé—devised a plan to purchase or, if necessary, seize Cuba for the U.S. Publication of the aggressively worded document, and Soulé's advocacy of slavery, caused Marcy to denounce it.

osteoarthritis \ˌäs-tē-ō-är-'thrī-təs\ *or* **osteoarthrosis** *or* **degenerative joint disease** Most common joint disorder, afflicting over 80% of those who reach age 70. It does not involve excessive inflammation and may have no symptoms, especially at first. Cartilage softens and wears away, and bone grows in its place, distorting the joint's surface and causing pain, stiffness, and limited movement, usually in weight-bearing joints (vertebrae, knees, hips). Treatment may include analgesics, rest, weight loss, corticosteroids, and/or physical medicine and rehabilitation or an exercise program. Hip or knee replacement or surgical removal of unhealthy tissue may be needed.

osteogenesis imperfecta \ˌäs-tē-ō-'je-nə-səs-ˌim-pər-'fek-tə\ Group of connective-tissue diseases in which the bones are very fragile. Several forms probably reflect different degrees of expression of the same disorder. Persons with osteogenesis imperfecta type I are normal at birth, but fractures occur easily; in van der Hoeve syndrome the sclerae are bluish, bone deformities in the skull cause deafness, double-jointedness occurs, and skin is abnormally thin. Babies with osteogenesis imperfecta type II, if not stillborn, are born with fractures, and fractures continue to occur, causing severe crippling; survival to adulthood is rare.

osteopathy \ˌäs-tē-'ä-pə-thē\ Health-care profession founded by the U.S. physician Andrew Taylor Still (1828–1917) as a reform movement against the rather primitive 19th-century drugs and surgical techniques. It emphasizes the relationship between musculoskeletal structure and organ function. Osteopathic physicians learn to recognize and correct structural problems through manipulative and other therapies. Osteopathic hospitals provide general or specialized health care, including maternity and emergency care.

osteoporosis \ˌäs-tē-ō-pə-'rō-səs\ Generalized loss of bone density, causing skeletal weakness. Around age 40, the rate of bone resorption in humans starts to exceed the rate of bone formation. Women experience accelerated bone loss after menopause, when the estrogen level decreases. When the amount of bone falls below a certain threshold, fractures occur with little or no trauma. Prevention begins with adequate calcium intake in youth, when bone mass is built, and then throughout life. Weight-bearing exercise and vitamin D are important at all ages. Medications can inhibit bone resorption or prevent bone loss in patients who are at risk for developing osteoporosis.

Ostia \'ä-stē-ə\ Ancient Roman town. Originally at the mouth of the Tiber River, it would now be about 4 mi (6 km) upstream. The modern seaside resort of Ostia, Italy, is near the ancient city. It was probably founded in the 4th century BC and developed as a naval station, major port, and centre of the grain trade. It reached the height of its prosperity in the 2nd century AD, when it had a population of about 50,000. It suffered from the decline of the Roman economy in the 3rd century and from barbarian raids in the 5th century. Its Roman ruins were quarried for building materials in the Middle Ages and for sculptors' marble during the Renaissance. Excavations began in the 19th century, and about two-thirds of the Roman town can now be seen.

ostomy \'äs-tə-mē\ Surgical opening in the body, or the operation creating it, usually to allow discharge of wastes through the abdominal wall. It may be temporary, to relieve strain on damaged organs, or permanent, to replace normal channels congenitally missing or surgically removed (usually to treat cancer). A loop of bowel (the colon in colostomy and the ileum in ileostomy) is cut and the end brought through to the abdominal surface. Waste usually exits into a self-adhering bag worn over the opening, or an internal pouch may be made from body tissue.

Ostpolitik \'ȯst-pō-li-ˌtēk\ (German: "Eastern Policy") West German foreign policy begun in the late 1960s. Initiated by Willy Brandt as foreign minister and then chancellor, the policy was one of détente with Soviet-bloc countries, recognizing the East German government and expanding commercial relations with other Soviet-bloc countries. Treaties were concluded in 1970 with the Soviet Union, renouncing the use of force in their relations, and with Poland, recognizing Germany's 1945 losses east of the Oder-Neisse Line. The policy was continued by Chancellor Helmut Schmidt.

Ostrasia See Austrasia

Ostrava \'ȯ-strə-və\ City (pop., 2001 prelim.: 319,293), northeastern Czech Republic, at the confluence of the Opava and Oder rivers near the Moravian Gap. It was founded c. 1267 as a fortified town by Bruno, bishop of Olomouc, to protect the entry to Moravia from the north. Its castle was demolished in 1495. Historic buildings include a 13th-century church.

ostrich Two-toed, long-necked ratite (*Struthio camelus*, family Struthionidae) found in Africa, the largest living bird. An adult male ostrich may be nearly 9 ft (2.75 m) tall and weigh more than 330 lb (150 kg). Males are black, with white wing and tail plumes; females are brown. Ostriches live in flocks of 5–50, usually among grazing animals, and eat plants and an occasional small animal. Roaring, hissing males fight for three to five hens, which lay 15–60 eggs in a communal nest scraped in the ground. The male sits at night; the females take turns by day. One-month-old chicks can run with adults, at 40 mph (65 km/hr). To escape detection, an ostrich may lie on the ground with its neck outstretched, a habit that may have given rise to the notion that ostriches bury their heads in the sand.

Ostrogoth \'äs-trə-ˌgäth\ Member of a division of the Goths (Ostrogoth means "Eastern Goth") who built an empire north of the Black Sea in the 3rd century and established a kingdom in Italy in the late 5th century. At its zenith in the 4th century, the Ostrogoth empire stretched from the Don to the Dniester (in present-day Ukraine) and from the Black Sea to southern Belarus. The Ostrogoths were conquered by the Huns c. 370 and remained part of the Huns' empire until the mid 5th century. When the Hun empire collapsed (455), the Ostrogoths emerged as an independent people once again. Their greatest ruler, Theodoric, led the Ostrogothic invasion of Italy and declared himself king (493). Theodoric maintained good relations with the native population, especially the senatorial class, throughout most of his reign and promoted a cultural revival. The turmoil in Italy following his death provided the Byzantine emperor Justinian I with the opportunity to invade the peninsula. The ensuing war lasted almost 20 years (c. 535–54) and ended the national existence of the Ostrogoths.

Ostrovsky \ˌə-'strȯf-skē**, Aleksandr (Nikolayevich)** (b. April 12, 1823, Moscow, Russia—d. June 14, 1886, Shchelykovo) Russian playwright. His second play, *The Bankrupt* (1850), exposed bogus bankruptcy cases and led to his dismissal from the civil service. Most of his plays treat characters from the Russian merchant class; they include the comedies *Poverty Is No Disgrace* (1853), *The Thunderstorm* (1859), and *The Snow Maiden* (1873), adapted as an opera by Nikolay Rimsky-Korsakov. With his 47 plays Ostrovsky created a Russian national repertoire, and he is considered the greatest representative of the Russian realistic period.

Ostwald \'ȯst-ˌvält**, (Friedrich) Wilhelm** (b. Sept. 2, 1853, Riga, Latvia—d. April 4, 1932, near Leipzig, Ger.) Russian-German physical chemist. He moved to Germany in 1887. He wrote the influential *Textbook of General Chemistry*, 2 vol. (1885–87). With Jacobus H. van't Hoff in 1887 he founded the *Zeitschrift für physikalische Chemie*, which became for many years the most important journal in the field. His work at the University of Leipzig (1887–1906) established it as a great school of physical chemistry. In 1888 he discovered Ostwald's law of dilution of an electrolyte. He gave the first modern definition of a catalyst in 1894 and was awarded the Nobel Prize in 1909 for his work on catalysis. His process for the conversion of ammonia to nitric acid proved of great industrial importance. He is regarded as one of the founders of the field of physical chemistry.

O'Sullivan, Timothy H. (b. c. 1840, New York, N.Y., U.S.—d. Jan. 14, 1882, Staten Island, N.Y.) U.S. photographer. He learned photogra-

© 2006 Encyclopædia Britannica, Inc.

phy in Mathew B. Brady's studio in New York City, and during the American Civil War he photographed on many fronts as one of Brady's team. Perhaps his best-known picture is *Harvest of Death* (1863), showing Confederate dead at Gettysburg. O'Sullivan left Brady's employ over the issue of receiving proper credit for his work. After the war O'Sullivan often portrayed vast landscapes. He took part in surveys in Panama as well as in the western and southwestern U.S. and was appointed chief photographer for the Treasury Department in 1880.

Oswald, Lee Harvey (b. Oct. 18, 1939, New Orleans, La., U.S.—d. Nov. 24, 1963, Dallas, Texas) Accused assassin of Pres. John F. Kennedy. While serving in the U.S. Marines (1956–59) he began to express pro-Soviet and politically radical views. Shortly after his discharge he moved to the Soviet Union, where he unsuccessfully tried to become a Soviet citizen. He returned to the U.S. in 1962 with his Russian wife and daughter but retained his radical political beliefs. In April 1963 he allegedly shot at but missed Edwin Walker, an ultrarightist retired general. In October he took a job at the Texas School Book Depository in Dallas. On Nov. 22, 1963, from a window on its sixth floor, he allegedly fired three shots that killed Kennedy and wounded Gov. John B. Connally while the two men were riding in the president's motorcade. Oswald killed a patrolman who had detained him, but he was soon captured and arraigned. On November 24, while being transferred to an interrogation office, he was fatally shot by Jack Ruby, a nightclub owner.

other minds, problem of In epistemology, the problem of explaining how it is possible for one person to know anything about the quality of another person's inner experience, or even that other people have inner experiences at all. According to a standard example, because each person's pain sensation is private, one cannot really know that what another person describes as pain is really qualitatively the same as what one describes as pain oneself. Though the physical manifestations the other person exhibits can be perceived, it seems that only the other person can know the contents of his mind. The traditional justification for belief in other minds, the argument from analogy, was given its classic formulation by John Stuart Mill: because my body and outward behaviour are observably similar to the bodies and behaviour of others, I am justified by analogy in believing that others have feelings like my own and are not simply automatons. In the mid-20th century the argument from analogy was severely criticized by followers of the later Ludwig Wittgenstein. An approach to the problem of other minds from the perspective of existentialism is contained in *Being and Nothingness* (1943), by Jean-Paul Sartre.

Otis, Harrison Gray (b. Oct. 8, 1765, Boston, Mass.—d. Oct. 28, 1848, Boston, Mass., U.S.) U.S. politician. A nephew of James Otis, he practiced law and served in the Massachusetts legislature (1796–97, 1802–05), the U.S. House of Representatives (1797–1801), the state senate (1805–13, 1814–17), and the U.S. Senate (1817–22). He was later mayor of Boston (1829–32). A Federalist, he opposed the War of 1812 and was a leader of the Hartford Convention.

Otis, James (b. Feb. 5, 1725, West Barnstable, Mass.—d. May 23, 1783, Andover, Mass., U.S.) American Revolutionary statesman. He argued before the colonial court against the British-imposed writs of assistance (1761), reportedly stating "Taxation without representation is tyranny." He served in the provincial legislature (1761–69) and was a leading opponent, along with Samuel Adams, of the Stamp Act. He wrote political pamphlets upholding the colonists' cause, including *The Rights of the British Colonies Asserted and Proved* (1764). Struck on the head in a scuffle with a British official in 1769, he later became mentally unbalanced.

otitis \ō-'tī-təs\ Inflammation of the ear. Otitis externa is dermatitis, usually bacterial, of the auditory canal and sometimes the external ear. It can cause a foul discharge, pain, fever, and sporadic deafness. Otitis media is due to allergy or viral or bacterial infection of the middle ear. The bacterial form may be acute (causing earache, fever, and pus and requiring antibiotics) or chronic. It can invade the bone (mastoiditis), requiring surgery. Otitis in the inner ear (labyrinthitis) often arises from respiratory infection, syphilis, or otitis media. Symptoms include vertigo, vomiting, and hearing loss. Recovery is usually quick unless there is pus formation, which can destroy the inner-ear structures, causing permanent deafness in that ear.

otolaryngology \ˌō-tō-ˌlar-ən-'gä-lə-jē\ *or* **otorhinolaryngology** \ˌō-tō-ˌrī-nō-ˌlar-ən-'gä-lə-jē\ Medical specialty dealing with the ear, nose, and throat (see larynx, pharynx). The connection of these structures became known in the late 19th century. Otolaryngologists use an otoscope to examine the eardrum and a laryngoscope (developed in 1855) to inspect the larynx. They also test hearing and prescribe hearing aids. The operating microscope (developed in 1921) and flexible endoscopy now permit them to operate on delicate internal structures.

Otomanguean \ˌō-tə-'mäŋ-gā-ən\ **languages** Diverse family of more than 20 American Indian languages and language clusters concentrated in central and southern Mexico, with more than a million speakers. Several of the language clusters, such as Otomí (dispersed through eastern central Mexico), Chinantecan, Mixtecan, and Zapotecan (all spoken in the state of Oaxaca), are highly differentiated and may be considered language families in themselves. Otomanguean languages differ in many ways from other American Indian languages, for example, in the extensive use of tone.

Otomi \ˌō-tə-'mē\ Mesoamerican Indian population living in the central plateau region of Mexico. Traditionally, they practice shifting cultivation and raise livestock. Their crafts include spinning, weaving, pottery, and basketry, and their dress varies from traditional to modern. *Compadrazgo,* fictive kinship based on the relationship of godparent to godchild, is central to their society. Ritual obligations also bind a child's parents and godparents in a close relationship. They profess Roman Catholicism but identify the major saints with pre-Christian deities.

O'Toole, Peter (Seamus) (b. Aug. 2, 1932, Connemara, County Galway, Ire.) British actor. He studied drama at the Royal Academy of Dramatic Art. He made his London debut in 1956 and played Hamlet in the National Theatre's inaugural production in 1963. His film debut came in *Kidnapped* (1960), and he won international acclaim for *Lawrence of Arabia* (1962), for which he won a British Academy Award. Noted for his wit and intensity, he often played uncertain heroes or eccentrics, starring in films such as *Becket* (1964), *The Lion in Winter* (1968), *The Ruling Class* (1972), *The Stunt Man* (1980), *My Favorite Year* (1982), *The Last Emperor* (1987), and *Phantoms* (1998). His acting range extends from classical drama to contemporary farce. He received an Emmy Award for his performance as Bishop Cauchon in the television miniseries *Joan of Arc* (1999).

otorhinolaryngology See otolaryngology

ottava rima \ō-'tä-və-'rē-mə\ Italian stanza form composed of eight 11-syllable lines, rhyming *ababcbcc*. It originated in the late 13th and early 14th centuries and was established by Giovanni Boccaccio as the standard form for Italian epic and narrative verse. When the form appeared in English, the lines were shortened to 10 syllables. In the 17th–18th century, English ottava rima was written in iambic pentameter and used for heroic poetry. Notably effective in Lord Byron's *Beppo* (1818) and *Don Juan* (1819–24), it was also used by Edmund Spenser, John Milton, John Keats, Percy B. Shelley, Robert Browning, and William Butler Yeats.

Ottawa \'ä-tə-wə\ City (pop., 2001: 774,072), capital of Canada. It is located in southeastern Ontario, on the Ottawa, Gatineau, and Rideau rivers. The area was inhabited by American Indians when it was visited by Samuel de Champlain in 1613, and the nearby rivers served traders and explorers over the next two centuries. Its settlement developed after the construction of the Rideau Canal in 1826. Originally named Bytown, it was incorporated as the city of Ottawa in 1855. To resolve political disputes between Toronto and Quebec City and between Montreal and Kingston, it was selected as Canada's capital by Queen Victoria in 1857. In 2001 the city's population grew significantly after it was amalgamated with several local municipalities. The federal government is the major employer; many commercial and financial associations are also located there. It is the site of several educational and cultural institutions, including the National Arts Centre and the National Gallery of Canada.

Ottawa River River, eastern central Canada, the chief tributary of the St. Lawrence River. It rises in the Laurentian plateau of western Quebec and flows west to form the Quebec-Ontario border before joining the St. Lawrence west of Montreal. It is 790 mi (1,271 km) long and forms innumerable lakes. Explored by Samuel de Champlain in 1613, it became a major route for explorers, fur traders, and missionaries to the Great Lakes. In the 19th century the Rideau Canal was completed, linking Ottawa to Lake Ontario, and lumbering became important. It is now a source of hydroelectric power.

otter Any of 13 species of semiaquatic, web-footed carnivores in the weasel family (Mustelidae), found throughout Africa, North and South America, Europe, and Asia. Otters have the same general proportions as weasels. Size varies among species, but total length is typically 3–7 ft

© 2006 Encyclopædia Britannica, Inc.

(1–2 m), and weight is 6.5–60 lb (3–26 kg); the large SEA OTTER is an exception. Otter fur—e.g., that of North American river otters—is highly valued. Most species live near rivers, some live near lakes or streams, and the sea otter is completely marine. Otters eat small aquatic animals. They are inquisitive and playful; a favourite sport is sliding down mud or snow banks.

River otter (*Lutra canadensis*).
KENNETH W. FINK—ROOT RESOURCES

Otto I *known as* **Otto the Great** (b. Nov. 23, 912—d. May 7, 973, Memleben, Thuringia) Duke of Saxony (936–61), German king (936–73), and emperor (962–73). He extended the frontiers of the German kingdom, winning territory from the Slavs in the east, forcing the Bohemians to pay tribute (950), and gaining influence in Denmark and Burgundy. In 951 Otto became king of the Lombards and married the queen of Italy. He quelled a rebellion by his son in 955 and defeated the MAGYARS in the Battle of LECHFELD. Crowned emperor by Pope John XII in 962, he deposed John in 963 and replaced him with Leo VIII. He returned to Italy (966–72) to subdue Rome, and he betrothed his son, Otto II, to a Byzantine princess (972). He also extended his authority over the church and promoted missionary activity in lands he had conquered. By his death, Otto had created the most powerful state in western Europe and laid the foundation for the later Holy Roman Empire.

Otto III (b. July 980—d. Jan. 23, 1002, near Viterbo, Italy) German king (983–1002) and emperor (996–1002). He was elected German king at age 3, and his mother and grandmother served as regents until he came of age in 994. He went to Rome to put down a rebellion (996) and installed his cousin as Gregory V, the first German pope. After returning in 997 to quell another revolt, he made Rome the centre of his empire. He saw himself as leader of world Christianity and hoped to revive the glory of ancient Rome in a universal Christian state. When Rome rebelled against him (1001), he requested help from Bavaria but died before it arrived.

Otto IV *or* **Otto of Brunswick** (b. 1175/1182—d. May 19, 1218, Harzburg Castle, Lower Saxony) German king and Holy Roman emperor. He was elected German king (1198) by the Guelph faction (see GUELPHS AND GHIBELLINES) but was opposed by the HOHENSTAUFENS, who elected PHILIP of Swabia. The two factions were at war for several years, but after Philip's murder in 1208 a new election gave the throne to Otto. He was crowned emperor (1209) by Pope INNOCENT III after agreeing not to claim Sicily. When he violated this pact and conquered southern Italy (1210), the German princes invited FREDERICK II to replace him. With his uncle, JOHN of England, Otto invaded France, Frederick's ally; defeated at the Battle of BOUVINES, he was deposed in 1215.

Otto, Nikolaus August (b. June 10, 1832, Holzhausen, Nassau—d. Jan. 26, 1891, Cologne, Ger.) German engineer who developed the four-stroke INTERNAL-COMBUSTION ENGINE. He built his first gasoline-powered engine in 1861, and in 1876 he built an internal-combustion engine using the four-stroke cycle (four strokes of the piston for each explosion), which offered the first practical alternative to the STEAM ENGINE as a POWER source. Though the four-stroke cycle was patented in 1862 by Alphonse Beau de Rochas (1815–93), it is commonly known as the Otto cycle since Otto was the first to build such an engine.

Rudolf Otto, 1925.
FOTO-JANNASCH, MARBURG

Otto, Rudolf (b. Sept. 25, 1869, Peine, Prussia—d. March 6, 1937, Marburg, Ger.) German theologian, philosopher, and historian of religion. He taught at the Universities of Göttingen and Breslau, then settled in Marburg in 1917. His theories on religion were influenced by his journeys to Africa and Asia to study non-Christian faiths and by the writings of IMMANUEL KANT and FRIEDRICH SCHLEIERMACHER. In *The Idea of the Holy* (1917), Otto coined the term *numinous* to designate the nonrational element of religious experience—the awe, fascination, and blissful exultation inspired by the perception of the divine. He believed that religion provided an understanding of the world that was distinct from and beyond that of science. His other books include *Mysticism East and West* (1926), *India's Religion of Grace and Christianity* (1930), and *The Kingdom of God and Son of Man* (1938).

Ottoman Empire Former empire centred in ANATOLIA. It was named for Osman I (1259–1326), a Turkish Muslim prince in BITHYNIA who conquered neighbouring regions once held by the SELJŪQ DYNASTY and founded his own ruling line c. 1300. Ottoman troops first invaded Europe in 1345, sweeping through the Balkans. Though defeated by TIMUR in 1402, by 1453 the Ottomans, under MEHMED II (the Conquerer), had destroyed the BYZANTINE EMPIRE and captured its capital, Constantinople (now ISTANBUL), which henceforth served as the Ottoman capital. Under Selim I (r. 1512–20) and his son SÜLEYMAN I (the Magnificent; 1520–66), the Ottoman Empire reached its greatest peak. Süleyman took control of parts of Persia, most of Arabia, and large sections of Hungary and the Balkans. By the early 16th century the Ottomans had also defeated the MAMLŪK DYNASTY in Syria and Egypt; and their navy under BARBAROSSA soon seized control of much of the BARBARY COAST. Beginning with Selim, the Ottoman sultans also held the title of CALIPH, the spiritual head of Islam. Ottoman power began to decline in the late 16th century. Ottoman forces repeatedly besieged Vienna. After their final effort at taking the Austrian capital failed (1683), that and subsequent losses led them to relinquish Hungary in 1699. Corruption and decadence gradually undermined the government. In the late 17th and 18th centuries the RUSSO-TURKISH WARS and wars with Austria and Poland further weakened the empire, which in the 19th century came to be called the "sick man of Europe." Most of its remaining European territory was lost in the BALKAN WARS (1912–13). It sided with Germany in World War I (1914–18); postwar treaties dissolved the empire, and in 1922 the sultanate was abolished by MUSTAFA KEMAL ATATÜRK, who proclaimed the Republic of Turkey the following year. See also JANISSARY; TURK; YOUNG TURKS.

Ottonian \ä-'tō-nē-ən\ **art** Painting, sculpture, and other visual arts produced during the reigns of the German Ottonian emperors and their first successors from the Salic house (950–1050). Though it drew on the heritage of CAROLINGIAN ART, it developed a style of its own, particularly in painting and sculpture. Manuscript illuminators of the period were less concerned with naturalism than with expression through sober, dramatic gesture and a heightened use of colour. Ottonian large-scale wooden crucifixes and wooden reliquaries covered with gold leaf marked a return to sculpture in the round. Bronze casting, an antique art practiced by the Carolingians, flourished as well. Ottonian architecture was more regulated than Carolingian, with simple interior spaces and a more systematic layout. Ottonian architects provided impetus for the monumentality of ROMANESQUE ARCHITECTURE.

Otway, Thomas (b. March 3, 1652, Trotton, near Midhurst, Sussex, Eng.—d. April 14, 1685, London) English dramatist and poet. A failed actor, he turned to writing and had immense success with *Don Carlos* (produced 1676), considered the best of his rhymed heroic plays. His other plays include *The Orphan* (1680), a blank-verse domestic tragedy; *The Souldier's Fortune* (1680), a comedy; and his masterpiece, *Venice Preserv'd* (1682), one of the greatest theatrical successes of the period. A forerunner of sentimental drama, he is outstanding for his convincing presentations of human emotions in an age of heroic but artificial tragedies. *The Poet's Complaint of His Muse* (1680) is a powerful, gloomy autobiographical poem.

Ouachita \'wä-shə-ˌtȯ\ **River** *formerly* **Washita River** River, southwestern Arkansas and eastern Louisiana, U.S. Rising in the Ouachita Mountains, it flows southeast to join the RED RIVER after a course of 605 mi (973 km). Its lower reaches are known as the Black River. It has been a navigation route since the late 18th century; six locks and dams had been built on it by 1924.

Ouagadougou \ˌwä-gä-'dü-gü\ City (pop., 1993 est.: 690,000), capital of Burkina Faso, western Africa. It was the capital of the historic MOSSI kingdom of Wagadugu, which was founded in the 15th century. The Mossi king still lives in the city, though his powers have been eclipsed by the French colonial and postindependence administrations. A manufacturing

© 2006 Encyclopædia Britannica, Inc.

centre, it is the country's largest city and is connected by rail to Abidjan, Côte d'Ivoire. A biennial film festival, the largest in Africa, is held in the city.

Oudh \'aůd\ Former province of British India. Now the northeastern portion of Uttar Pradesh state, it received its name from Ayodhya, the capital of the ancient kingdom of Kosala, which was nearly coextensive with modern Oudh. It was taken by Muslim invaders in the 12th century, became part of the Mughal Empire in the 16th century, and was annexed by the British in 1856. In 1877 it was joined with Agra to form the United Provinces of Agra and Oudh. After India's independence in 1947 it became part of Uttar Pradesh.

Oudry \ü-'drē**, Jean-Baptiste** (b. March 17, 1686, Paris, France—d. April 30, 1755, Beauvais) French Rococo painter, tapestry designer, and illustrator. Like his paintings, Oudry's tapestries were highly regarded for their tonal subtlety and lively study of nature. His services were sought by Peter I the Great of Russia, the queen of Sweden, and Louis XV, who commissioned him to paint portraits of his dogs and appointed him official painter of the royal hunts.

Ouida \'wē-də\ *orig.* **Maria Louise Ramé** *or* **Maria Louise de la Ramée** (b. Jan. 1, 1839, Bury St. Edmunds, Suffolk, Eng.—d. Jan. 25, 1908, Viareggio, Italy) English novelist. Among her novels, most of them extravagant, melodramatic romances of fashionable life, are *Held in Bondage* (1863), *Strathmore* (1865), *Chandos* (1866), *Under Two Flags* (1867), and *Moths* (1880). She also wrote animal stories, including the popular *A Dog of Flanders* (1872). She settled in Florence in 1874, where reckless extravagance reduced her to acute poverty in later life.

Ouija board \'wē-jə\ Device for obtaining messages from the spirit world, sometimes used by a medium during a séance. The name derives from the French and German words for "yes" (oui/ja). The Ouija board is an oblong piece of wood or cardboard with letters of the alphabet inscribed in a half-moon along the edge. A small heart-shaped board is placed on top of it. Participants each lightly place a finger on the small board, which spirits supposedly move around on the larger board. As it touches the letters it may spell out words or sentences.

ounce Unit of weight in the avoirdupois system, the traditional European system of weight, which was incorporated into the British Imperial system and the U.S. system of weights and measures (see measurement). The ounce is equal to 1/16 lb (437.5 grains). In the troy and apothecaries' systems (two other traditional systems of weight), it is equal to 1/12 troy or apothecaries' lb (480 grains). The avoirdupois ounce is equal to 28.35 g, the troy ounce to 31.1 g. As a unit of volume, the fluid ounce is equal to 1/16 of a pint (29.57 ml) in the U.S. system, and to 1/20 of a pint (28.41 ml) in the British Imperial system. See also gram, International System of Units, metric system, pound.

Ouranus See Uranus

Ouse \'üz**, River** *or* **Great Ouse** River, central and eastern England. It rises in Northamptonshire and flows 156 mi (251 km) past Buckingham, Bedford, Huntington, and St. Ives to Earith, then to the North Sea. Locks make the river navigable upstream to Bedford.

Ouse, River River, northeastern England. It is formed in North Yorkshire and flows through York and Selby to join the River Aire. It merges with the River Trent to form the River Humber. The lower Ouse is a major transport route for industrial products and raw materials.

ousel See ouzel

Outer Banks Chain of barrier islands, North Carolina coast, U.S. Extending southward 175 mi (282 km) along the coast, it stretches from the Virginia border to Cape Lookout. Generally covered with sand dunes, the islands range from a few feet to more than 100 ft (160 m) in height. Most are linked by roads and causeways; there are numerous beaches, making the Outer Banks a popular resort area. Once a hideout for pirates and a place of shipwrecks, the islands have several historical sites, including Roanoke Island and Kitty Hawk, site of the Wright brothers' first powered flight.

Outer Mongolia See Mongolia

outwash Deposit of sand and gravel carried by running water from the melting ice of a glacier and laid down in stratified deposits. An outwash may be as much as 330 ft (100 m) thick at the edge of a glacier, and it may extend for many miles. Outwashes are the largest glacial deposits and provide a considerable source of windblown material.

Ouyang Xiu \'ō-'yäŋ-'shyü\ *or* **Ou-yang Hsiu** (b. 1007, Mianyang, Sichuan province, China—d. 1072, Yingzhou, Anhui province) Chinese poet, historian, and statesman. He served in various official positions but was repeatedly demoted or banished for his outspokenness. He called himself Zuiweng ("Old Drunkard"), built a pavilion of that name, and wrote an essay about it that is one of the most celebrated works in Chinese literature. Later put in charge of civil-service examinations, he favoured those who wrote in the simple, ancient style known as *guwen* and failed those who used literary embellishments, thus setting a new course in Chinese literature. His own writings in the *guwen* style, including *Xintangshu* (1060; "New History of the Tang Dynasty"), became a model that was long emulated. When the *Xintangshu* was finished, Ouyang was rapidly promoted to the highest councils of state, leaving a remarkable record in social, financial, and military affairs. He was falsely accused of having an affair with his daughter-in-law, a charge that injured his prestige. He repeatedly asked to be relieved of his duties, but instead he was sent to be magistrate successively in Anhui, Shandong, and Henan. As the leader of the reform movement of poetry and prose in the Northern Song dynasty, Ouyang established a monumental reputation by his epoch-marking creative works, and he is renowned as one of the Eight Great Masters of Tang and Song.

ouzel *or* **ousel** \'ü-zəl\ Species (*Turdus torquatus*) of songbird in the thrush family, characterized by a white crescent on the breast. A blackish bird, about 10 in. (25 cm) long, it breeds locally in uplands from Britain and Norway to the Middle East. The name was formerly applied to a closely related European blackbird (*T. merula*). The dipper is often called water ouzel.

Ring-ouzel (*Turdus torquatus*).
DRAWING BY JOHN P. O'NEILL/EB INC.

ovarian cancer Malignant tumour of the ovaries. Risk factors include early age of first menstruation (before age 12), late onset of menopause (after age 52), absence of pregnancy, presence of specific genetic mutations, use of fertility drugs, and personal history of breast cancer. Symptoms such as abdominal swelling, pelvic pressure or pain, and unusual vaginal bleeding often do not appear until ovarian cancer is advanced. Surgery, sometimes followed by chemotherapy or radiation therapy, is an effective treatment for most ovarian cancers.

ovary \'ō-və-rē\ In zoology, the female reproductive organ (see reproductive system) that produces eggs and sex hormones (estrogen and progesterone). Human females have two ovaries, almond-shaped organs about 1.5 in. (4 cm) long. They contain hollow balls of cells (follicles) that hold immature eggs. About 150,000–500,000 follicles usually are present at birth; by young adulthood, only about 34,000 remain. The number continues to decrease until menopause, when the few remaining follicles decay and the ovaries shrink and produce far less estrogen. Only 300–400 follicles mature and release an egg, which develops into an embryo if fertilized or, if not, passes from the body with menstruation. In botany, an ovary is the enlarged base of a flower's female organ (pistil). It contains ovules, which develop into seeds when fertilized, and matures into a fruit.

over-the-counter market Trading in stocks and bonds that does not take place on stock exchanges. Such trading occurs most often in the U.S., where requirements for listing stocks on the exchanges are strict. Schedules of fees for buying and selling securities are not fixed in the over-the-counter market, and dealers derive their profits from the markup of their selling price over the price they paid. Many bond issues and preferred-stock issues, including U.S. government bonds, are listed on the New York Stock Exchange but have their chief market over-the-counter. Other U.S. government securities, as well as state and municipal bonds, are traded over-the-counter exclusively. Institutional investors such as mutual funds often trade over-the-counter because they are given volume discounts not offered on the exchanges. The regulation of the over-the-counter market is carried out largely by the National Association of Securities Dealers,

© 2006 Encyclopædia Britannica, Inc.

created by Congress in 1939 to establish rules of conduct and protect members and investors from abuses. See also NASDAQ.

overpopulation Situation in which the number of individuals of a given species exceeds the number that its environment can sustain. Possible consequences are environmental deterioration, impaired quality of life, and a population crash (sudden reduction in numbers caused by high mortality and failure to produce viable offspring).

overtone In acoustics, a faint higher tone contained within almost any musical tone. A body producing a musical pitch—such as a taut string or a column of air within the tubular body of a wind instrument—vibrates not only as a unit but simultaneously also in sections, resulting in the presence of a series of overtones within the fundamental tone (i.e., the one identified as the actual pitch). Harmonics are a series of overtones resulting when the partial vibrations are of equal sections (e.g., halves, thirds, fourths). Partials are nonharmonic overtones—that is, tones the frequencies of which lie outside the harmonic series. Overtones contribute greatly to the TIMBRE of a given sound source, even though few listeners are aware of hearing any pitch except the fundamental. There are a few rare examples of the human voice creating overtones, notably in the chants of the Tibetan monks and the songs of the Tuvan throat singers. The latter can sometimes produce two overtones.

overture Musical introduction to a larger, often dramatic, work. Originating with CLAUDIO MONTEVERDI's *Orfeo* (1607), overtures served as openings for operas. The large-scale two- or three-part "French overture" invented by JEAN-BAPTISTE LULLY (1658) for his operas and ballets was widely imitated for a century. The sinfonia, the standard Italian overture form in the late 17th and 18th centuries, was a principal precursor of the three-part SONATA FORM and thus provided the model for the earliest symphonies, which consisted of three movements. In the 19th century, overtures independent of any larger work usually illustrated a literary or historical theme (see SYMPHONIC POEM). Overtures to OPERETTAS and MUSICALS have traditionally been medleys of their themes.

Ovett \ō-'vet**, Steve** *in full* **Stephen Michael Ovett** (b. Oct. 9, 1955, Brighton, Sussex, Eng.) British runner. He was the winner of gold (in the 800-m race) and bronze medals at the 1980 Olympic Games. In the course of his career, Ovett set six world records; however, his best-known races were those that pitted him against his countryman and rival SEBASTIAN COE.

Ovid \'ä-vid\ *Latin* **Publius Ovidius Naso** (b. March 20, 43 BC, Sulmo, Roman Empire—d. AD 17, Tomis, Moesia) Roman poet. A member of Rome's knightly class, Ovid dutifully started an official career but soon abandoned it for poetry. His first work, *The Loves*, was an immediate success. It was followed by *Epistles of the Heroines*; *The Art of Beauty*; *The Art of Love*, one of his best-known works; and *Remedies for Love*, all reflecting the sophisticated, pleasure-seeking society in which he moved. He was a well-established poet when he undertook perhaps his greatest work, *Metamorphoses*, on legends of transformations of human beings into nonhuman forms by gods; and *Fasti* ("Calendar"), an account of the Roman year and its religious festivals. His verse had immense influence because of its imaginative interpretations of classical myth and its supreme technical accomplishment. For unclear reasons, in AD 8 AUGUSTUS banished him to Tomis on the Black Sea; despite Ovid's many pleas, he was never allowed to return. He described his life in an autobiographical poem in *Sorrows*. He was extensively read and imitated in the Renaissance, and his influence was felt into modern times.

Oviedo \ō-'vyā-thō\ *ancient* **Asturias** City (pop., 2001: 201,154), capital of ASTURIAS, northwestern Spain. Oviedo lies on a hill surrounded by mountains and a fertile plain. Founded as a monastery in AD 757, it became the capital of the kingdom of Asturias in 810. It was one of the few Spanish towns never conquered by the MOORS and contains many medieval landmarks, including a 14th-century cathedral. The cathedral was badly damaged during the SPANISH CIVIL WAR. Oviedo is the centre of a mining region that produces coal and iron.

Ovimbundu \ˌō-vim-'bůn-dü\ Bantu-speaking people of central Angola. Numbering about 4 million, the Ovimbundu provided the major popular support for JONAS M. SAVIMBI and the National Union for the Total Independence of Angola (UNITA). They were formerly traders; today they farm, hunt, and raise livestock. About half the 22 Ovimbundu chiefdoms were tributary to a larger chiefdom before Portuguese intervention in the 20th century.

ovum See EGG

Owen, Robert (b. May 14, 1771, Newtown, Montgomeryshire, Wales—d. Nov. 17, 1858, Newtown) Welsh manufacturer and philanthropist. At his New Lanark cotton mills (Lanarkshire, Scot.), in partnership with JEREMY BENTHAM, he set up innovative social and industrial welfare programs, including improved housing and schools for young children. In *A New View of Society* (1813) he contended that character is wholly formed by one's environment. By 1817 his work had evolved into ideas presaging socialism and the cooperative movement, ideas he would spend much of his life preaching. He sponsored several experimental utopian communities of "Owenites" in Britain and the U.S., including one at New Harmony, Ind. (1825–28)—where Owen lost some 80% of his fortune—all of which proved short-lived. He strongly supported early labour unions, but opposition and repression swiftly dissolved them, and it was two generations before socialism again influenced unionism. He was the father of ROBERT DALE OWEN.

Owen, Robert Dale (b. Nov. 9, 1801, Glasgow, Scot.—d. June 24, 1877, Lake George, N.Y., U.S.) U.S. social reformer. In 1825 he emigrated with his father, ROBERT OWEN, to establish a community at New Harmony, Ind. He edited the local newspaper, the *New Harmony Gazette*, until 1827, when he became associated with FANNY WRIGHT. The two eventually settled in New York City, where Owen edited the *Free Enquirer*, and both were active in the WORKINGMEN'S PARTY. Owen returned to New Harmony in 1832. After serving in the Indiana legislature, he was elected to the U.S. House of Representatives (1843–47), where he introduced a bill establishing the SMITHSONIAN INSTITUTION. He later served as U.S. minister to Italy (1855–58). A strong advocate of emancipation, he urged an end to slavery in an 1861 letter to ABRAHAM LINCOLN that was said to have influenced the president greatly.

Owen, Wilfred (b. March 18, 1893, Oswetry, Shropshire, Eng.—d. Nov. 4, 1918, France) British poet. Owen was already writing verse before he enlisted in the army in 1915, but the experience of trench warfare brought him to rapid maturity; the poignant poems he wrote after January 1917 are full of anger at the cruelty and waste of war and pity for its victims. A week before the armistice, he died in action at age 25. His single volume of poems, published posthumously, is noted for its experiments in assonance. BENJAMIN BRITTEN's celebrated *War Requiem* (1962) is a setting of Owen's poems.

Owens, Jesse *orig.* **James Cleveland Owens** (b. Sept. 12, 1913, Oakville, Ala., U.S.—d. March 31, 1980, Phoenix, Ariz.) U.S. track-and-field athlete. At Ohio State University in 1935, he broke or equaled four world track records in one day, setting a new long-jump record that would stand for 25 years. In the 1936 Olympics in Berlin he won four gold medals, tying the Olympic record in the 100-m run, breaking the Olympic record in the 200-m run, running the final segment for the world-record-breaking U.S. 400-m relay team, and breaking the listed world record for the long jump. This performance by an African American dramatically foiled ADOLF HITLER's intention to use the games to show Aryan racial superiority. For a time, Owens held alone or shared the world records for all sprint distances recognized by the International Amateur Athletic Federation.

Jesse Owens, 1936.
AP/WIDE WORLD PHOTOS

owl Any BIRD OF PREY in the mostly nocturnal order Strigiformes, including typical owls (family Strigidae) and BARN, bay, and grass owls (Tytonidae). Their virtually silent flight and protective (usually brown) coloration aid in capturing insects, birds, and small mammals. Owls have round, forward-looking eyes, a sharply hooked beak, and acute hearing and vision. They are 5–28 in. (13–70 cm) long. The feathers of some species form a disk framing the face or ear tufts that help locate prey by reflecting sound to the ears. Owls can turn their heads 180°; some species can turn as much as 270°. They nest in buildings, in trees, or on the ground. Typical owls occur worldwide except in Antarctica. See also HORNED OWL; SCREECH OWL; SNOWY OWL.

owlet moth See MILLER

ox Domesticated form of large BOVID (species *Bos taurus*) that once moved in herds across North America and Europe (where they have disappeared) and Asia and Africa (where some still exist in the wild). The docile castrated male is used as a draft animal in many countries. Oxen are used for food in some areas. The term is also applied to a castrated male of any CATTLE breed. See also AUROCHS, YAK.

oxalic \äk-'sa-lik\ **acid** Colourless, crystalline, toxic CARBOXYLIC ACID found in many plants, especially rhubarb, wood sorrel, and spinach. Because it forms soluble CHELATES with iron, some of the iron in these plants is not available nutritionally. However, this property makes it useful for removing blood and rust stains, cleaning metals other than iron, and flushing car radiators. Oxalic acid and its SALTS (oxalates) are used in many chemical processes.

oxalis \äk-'sa-ləs\ Any of about 850 species of small herbaceous plants that make up the genus *Oxalis*, native mostly to southern Africa and tropical and South America. Most members are familiar garden ornamentals. The name (Greek for "acid") reflects the plant's sharp acidic taste. The common wood sorrel (*O. acetosella*) of eastern North America and Britain is a small, stemless plant with cloverlike three-part leaves, whose leaflets fold back and droop at night. The flowers have five white, purple-veined petals. After the fruit splits open, the fleshy coat of the seed curls back elastically, ejecting the true seed.

oxbow lake Small lake located in a former MEANDER loop of a river or stream channel. It is generally formed as a river cuts through a meander neck to shorten its course, blocks off the old channel, and then migrates away from the lake. If only one loop is cut off, the lake is crescent-shaped; if more than one loop is cut off, the lake is serpentine (winding). Eventually, oxbow lakes silt up to form marshes and finally meander scars.

Oxenstierna (af Södermöre) \'ůk-sen-ˌsher-nå**, Axel (Gustafsson), Count** (b. June 16, 1583, Fånö, near Uppsala, Swed.—d. Aug. 28, 1654, Stockholm) Swedish statesman. Born into a noble family, he became a member of the council of state and in 1612 was appointed chancellor by GUSTAV II ADOLF. He worked with the king to stabilize administrative reforms. As a diplomat, he negotiated peace treaties with Denmark (1613) and Poland (1622). In the THIRTY YEARS' WAR, he was appointed governor-general of Prussia (1626) and military commander in Germany (1631). He directed Swedish policy in Germany until 1636, when he returned to Sweden. As a regent during Queen CHRISTINA's minority (1636–44), he effectively ruled the country.

oxeye daisy Garden perennial plant (*Chrysanthemum leucanthemum*) in the COMPOSITE FAMILY. The compound flower has 15–30 white ray flowers surrounding a bright yellow disk flower, about 1–2 in. (2.5–5 cm) across. It grows about 2 ft (60 cm) high and has oblong, notched leaves and long petioles (leafstalks). Native to Europe and Asia, it has become a common wild plant in the U.S. See also DAISY.

Oxford *ancient* **Oxonia** City and administrative district (pop., 2001: 134,248), county seat of OXFORDSHIRE, England. Situated on the River THAMES, the town is best known for the University of OXFORD. First occupied in Saxon times as a fording point, it became a burg, built to defend the northern frontier of WESSEX from Danish attack; it was first mentioned in the Anglo-Saxon Chronicle of AD 912. Little remains of the town's NORMAN period of occupation. Oxford is generally known as the "City of Spires" because of its skyline of Gothic towers and steeples. Most of these 15th–17th-century buildings belong to the university. The city was the Royalist headquarters in the ENGLISH CIVIL WARS. Its modern economy is varied and includes, in addition to educational services, printing and publishing industries and automobile manufacturing.

Oxford, Earl of See Robert HARLEY

Oxford, Edward de Vere, 17th earl of *orig.* **Edward de Vere** (b. April 12, 1550, Castle Hedingham, Essex, Eng.—d. June 24, 1604, Newington, Middlesex) English lyric poet. A brilliantly gifted linguist and one of the most dashing figures of his time, Oxford was also reckless, hot-tempered, and disastrously spendthrift. He was the patron of an acting company, Oxford's Men, and possibly later of the Lord CHAMBERLAIN'S MEN (as hereditary Lord Great Chamberlain of England), as well as of such writers as JOHN LYLY and EDMUND SPENSER. He wrote highly praised poems and plays in his earlier years, though none of the plays are known to have survived. A 1920 book by J. Thomas Looney made Oxford the leading candidate, next to WILLIAM SHAKESPEARE himself, for the authorship of Shakespeare's plays, a theory supported by the coincidence that Oxford's literary output apparently ceased just before Shakespeare's work began to appear. A major difficulty in the Oxfordian theory, however, is his death date (1604), because, according to standard chronology, 14 of Shakespeare's plays, including many of the most important ones, were apparently written after that time. The debate, however, remained lively into the 21st century.

Oxford, Provisions of (1258) Plan of reform accepted by HENRY III of England. On the verge of bankruptcy, Henry asked Parliament for a grant of revenue and agreed in return to a program of reform drafted by a royal commission. Regarded as England's first written constitution, the Provisions placed the government under the direction of the king and a 15-member baronial council, provided for Parliament to meet three times a year, and reformed local administration. They were annulled by the Dictum of Kenilworth (1266).

Oxford, University of Autonomous university at Oxford, Oxfordshire, England. It was founded in the 12th century and modeled on the University of PARIS, with initial faculties of theology, law, medicine, and the liberal arts. Of the earliest colleges, University College was founded in 1249, Balliol c. 1263, and Merton in 1264. Early scholars of note include ROGER BACON, JOHN DUNS SCOTUS, William of OCKHAM, and JOHN WYCLIFFE. In the Renaissance, DESIDERIUS ERASMUS and ST. THOMAS MORE helped enhance its already considerable reputation. By then faculties of physical science, political science, and other fields had been added. The first women's college, Lady Margaret Hall, was established in 1878. There are 32 other colleges and collegial institutions. Oxford houses the BODLEIAN LIBRARY and the Ashmolean Museum of Art and Archaeology. Oxford University Press (1478) is the world's oldest, largest, and most famous university publisher. Oxford has been associated with many of the greatest names in British history.

Oxford English Dictionary, The (OED) Definitive historical DICTIONARY of the English language. It was conceived by London's Philological Society in 1857, and sustained editorial work began in 1879 under JAMES MURRAY. Published in 10 volumes between 1884 and 1928, it first appeared under its current name in 1933. Its definitions are arranged mostly in order of historical occurrence and illustrated with dated quotations from English-language literature and records. Its second edition was published in 20 volumes in 1989.

Oxford movement *or* **Tractarian movement** (1833–45) Movement within the Church of ENGLAND that aimed to emphasize the church's Catholic inheritance as a source of legitimacy and deeper spirituality. Its main intent was to defend the Church of England as a divine institution against the threats of liberal theology, rationalism, and government interference. Though some in the movement (notably JOHN HENRY NEWMAN and HENRY E. MANNING) ended up converting to Catholicism, most did not. Their concern for a higher standard of worship influenced not only the Church of England but also other British Protestant sects. The movement was also instrumental in the establishment of Anglican monasteries and convents.

Oxfordshire \'äks-fərd-ˌshir\ Administrative (pop., 2001: 605,492) and historic county, south-central England. It consists of two upland areas divided by a broad vale. Evidence of inhabitation dates from the PALEOLITHIC, MESOLITHIC, and NEOLITHIC periods. DORCHESTER was an important Roman settlement; subsequent Saxon settlement was concentrated along the THAMES RIVER valley. The county saw action during the ENGLISH CIVIL WARS. Oxfordshire's economy is basically agricultural, with sheep farming and wool production. Cowley, a suburb of the county seat of OXFORD, is the major industrial centre.

oxidation-reduction *or* **redox** Any CHEMICAL REACTION in which ELECTRONS are transferred. Addition of hydrogen or electrons is REDUCTION, and removal of hydrogen or electrons is oxidation (originally applied to combination with OXYGEN but now including transfer of HYDROGEN or electrons). The processes always occur simultaneously: one substance is oxidized by the other, which it reduces. The conditions of the substances before and after are called oxidation states, to which numbers are given and with which calculations can be made. (VALENCE is a similar but not identical concept.) The chemical equation that describes the electron transfer can be written as two separate half reactions that can in theory be carried out in separate compartments of an electrolytic cell (see ELECTROLYSIS), with electrons flowing through a wire connecting the two. Strong oxidizing

© 2006 Encyclopædia Britannica, Inc.

agents include FLUORINE, OZONE, and oxygen itself; strong reducing agents include ALKALI METALS such as SODIUM and LITHIUM.

oxide Any of a large and important class of chemical compounds in which OXYGEN is combined with another ELEMENT. METAL oxides contain a metal CATION and the oxide ANION (O_2^-); they typically react with water to form BASES or with acids to form SALTS. Oxides of nonmetallic elements are volatile compounds in which a COVALENT BOND joins the oxygen and the nonmetal; they react with water to form acids or with bases to form salts. A few substances (e.g., ALUMINUM, ZINC) form amphoteric oxides, which form salts with both acids and bases. Certain organic compounds form oxides in which the oxygen is covalently bonded to an atom of nitrogen (amine oxides), phosphorus (phosphine oxides), or sulfur (sulfoxides) in the organic molecule.

oxide mineral Any naturally occurring inorganic compound with a structure based on close-packed oxygen atoms in which smaller, positively charged metal or other ions occur. Oxide minerals are common in all rock types, whether IGNEOUS, SEDIMENTARY, or METAMORPHIC.

Oxus River See AMU DARYA

oxygen Gaseous chemical ELEMENT, chemical symbol O, atomic number 8. It constitutes 21% (by volume) of air and more than 46% (by weight) of Earth's crust, where it is the most plentiful element. It is a colourless, odourless, tasteless GAS, occurring as the diatomic molecule O_2. In RESPIRATION, it is taken up by animals and some bacteria (and by plants in the dark), which give off CARBON DIOXIDE (CO_2). In photosynthesis, green plants assimilate carbon dioxide in the presence of sunlight and give off oxygen. The small amount of oxygen that dissolves in water is essential for the respiration of fish and other aquatic life. Oxygen takes part in combustion and in corrosion but does not itself burn. It has VALENCE 2 in compounds; the most important is WATER. It forms OXIDES and is part of many other molecules and FUNCTIONAL GROUPS, including NITRATE, SULFATE, PHOSPHATE, and CARBONATE; ALCOHOLS, ALDEHYDES, CARBOXYLIC ACIDS, and KETONES; and PEROXIDES. Obtained for industrial use by DISTILLATION of liquefied air, oxygen is used in steelmaking and other metallurgical processes and in the chemical industry. Medical uses include RESPIRATORY THERAPY, incubators, and inhaled ANESTHETICS. Oxygen is part of all gas mixtures for manned spacecraft, scuba divers, workers in closed environments, and HYPERBARIC CHAMBERS. It is also used in rocket engines as an oxidizer (in liquefied form) and in water and waste treatment processes.

oxygen process, basic See BASIC OXYGEN PROCESS

Oxyrhynchus \ˌäk-si-ˈriŋ-kəs\ Archaeological site, Egypt, on the western bank of the NILE RIVER. Many ancient papyri dating from 250 BC to AD 700 were discovered there in the late 19th and early 20th centuries. The papyri, written mainly in Greek and Latin, contain both religious texts and masterpieces of Greek classical literature. Some of these texts, once considered lost, were by PINDAR and CALLIMACHUS. The modern village of Al-Bahnasā is located on the site.

Oyo empire YORUBA state in present-day southwestern Nigeria that dominated the land between the Volta and Niger rivers in 1650–1750. Two waves of immigrants probably entered the area c. AD 700–1000, and the second wave formed a state at Oyo. This state became preeminent among Yoruba states because of its good trading position, natural resources, and industrious inhabitants. Though at first less powerful than its neighbours, by the end of the 16th century its ruler, Orompoto, had used trade-derived wealth to maintain a trained army. In the 18th century Oyo subjugated the DAHOMEY KINGDOM and had begun trading with European merchants at Dahomey's ports. Oyo's wealth increased, but Abiodun (r. c. 1770–90) neglected the army and the possibilities for territorial expansion, thus weakening central authority for his successor. Soon after 1800 Oyo was captured by FULANI Muslims from Hausaland. See also HAUSA.

European flat oyster (*Ostrea edulis*)
G. TOMSICH—PHOTO RESEARCHERS

oyster Any BIVALVE of two families, Ostreidae (true oysters) or Aviculidae (pearl oysters), found in temperate and warm coastal waters worldwide. Both valves (halves) have a rough, often dirty-gray outer surface and a smooth white inner lining (nacre). The lower valve, which affixes to a surface, is nearly flat. The smaller upper valve is convex and has rougher edges. The oyster filters its food, minute organic particles, from the water. Cultivated as food, oysters are regarded as a delicacy. PEARLS are the accumulation of nacre around a piece of foreign matter.

oyster plant See SALSIFY

oystercatcher Any of about seven species (genus *Haematopus*, family Haematopodidae) of stout-bodied shorebirds inhabiting temperate and tropical seacoasts and inland waters in Europe, Asia, Africa, the Western Hemisphere, and Australia. Oystercatchers are 16–20 in. (40–50 cm) long, with thick pinkish legs; long pointed wings; and a long, flattened, wedge-shaped, orange-red bill. Their plumage varies from black-and-white, including a bold white wing patch, to entirely black. They attack mollusks as the tide ebbs, when the shells are exposed and still partially open.

Oz, Amos *orig.* **Amos Klausner** (b. May 4, 1939, Jerusalem, Israel) Israeli novelist, short-story writer, and essayist. A second-generation Israeli, Oz lived primarily on a kibbutz from the 1950s to the 1980s. He served in the Israeli Army (1957–60, 1967, and 1973) but later became a leading advocate of peace. His symbolic works—including *Where the Jackals Howl, and Other Stories* (1965); *My Michael* (1968), perhaps his best-known novel; and *Black Box* (1987)—reflect the conflicts in Israeli life.

Özal \ō-ˈzäl**, Turgut** (b. Oct. 13, 1927, Malatya, Tur.—d. April 17, 1993, Ankara) Prime minister (1983–89) and president (1989–93) of TURKEY. After studying electrical engineering, he oversaw Turkey's electrification program in the 1950s and '60s. After working as a World Bank economist for most of the 1970s, he was elected prime minister as head of his own Motherland Party in 1983 and was reelected in 1987. In 1989 he persuaded the parliament to make him president, a traditionally nonpolitical position, and used the office to claim for Turkey an important role in the PERSIAN GULF WAR (1990–91).

Ozark Mountains *or* **Ozark Plateau** Heavily forested highlands, south-central U.S. Extending southwest from ST. LOUIS to the ARKANSAS RIVER, they occupy an area of about 50,000 sq mi (130,000 sq km) in Missouri, Arkansas, Illinois, and Kansas. Many of the highest peaks exceed 2,000 ft (600 m). Tourism is one of the region's chief industries. Lake of the OZARKS provides power and recreational facilities. The name Ozark probably derives from the French trading post, Aux Arc, established in the area in the 1700s.

Ozarks, Lake of the Lake, south-central Missouri, U.S. One of the largest man-made lakes in the U.S., it is located in the scenic OZARK MOUNTAINS. It is about 125 mi (200 km) long, with an area of 93 sq mi (242 sq km). It is formed by the Bagnell Dam in the OSAGE RIVER. The area of Lake of the Ozarks State Park has recreational fishing and water sport facilities and is a popular resort destination. Nearby are several limestone caverns.

Ozawa \ō-ˈzä-wə**, Seiji** (b. Sept. 1, 1935, Hoten, Manchukuo) Manchurian-born Japanese-U.S. conductor. After initial conducting experience in Japan and study at Tanglewood in the U.S., he went to Europe to study with HERBERT VON KARAJAN. He became assistant to LEONARD BERNSTEIN at the New York Philharmonic (1961–65), then held posts in Chicago (1964–68), Toronto (1965–69), and San Francisco (1970–76) before becoming music director of the Boston Symphony Orchestra in 1973 (retired 2002). Noted for his energetic style and his sweeping performances of 19th-century Western symphonic works, he also had a distinguished opera-conducting career in Europe.

Ozick \ˈō-zik**, Cynthia** (b. April 17, 1928, New York, N.Y., U.S.) U.S. novelist and short-story writer. She graduated from New York University and received an M.A. from Ohio State University. She wrote often on Jewish themes, and much of her work presents a struggle with the notion that artistic creation can be a hubristic attempt to rival the Creator. Among these works are *Trust* (1966), *Leviathan* (1982), *The Messiah of Stockholm* (1987), *The Shawl* (1990), and *The Puttermesser Papers* (1997). Her essays have been collected in *Art & Ardor* (1983), *Metaphor & Memory* (1989), and *Fame & Folly* (1996).

Ozma, Project Attempt in 1960 to detect RADIO signals generated by hypothetical intelligent beings from planets of other stars. Frank D. Drake (born 1930), director of the search, named the project for the princess of L. FRANK BAUM's imaginary Oz. The search used a special receiver attached to a radio telescope at the U.S. National Radio Astronomy Observatory

© 2006 Encyclopædia Britannica, Inc.

at Green Bank, W.V. Some 150 hours of occasional observation over four months detected no recognizable signals. See also DRAKE EQUATION, SETI.

ozone Pale blue GAS (O_3) that is irritating, explosive, and toxic. Like ordinary OXYGEN gas (O_2), it contains oxygen atoms, but the BONDING of three atoms per molecule gives it distinctive properties. It is formed in electrical discharges and accounts for the distinctive odour of the air after thunderstorms or near electrical equipment. Usually manufactured on the spot by passing an electric discharge through oxygen or air, it is used in water purification, deodorization, bleaching, and various CHEMICAL REACTIONS that require a strong oxidizing agent (see OXIDATION-REDUCTION). Small amounts that occur naturally in the stratospheric OZONE LAYER absorb ULTRAVIOLET (UV) RADIATION that otherwise could severely damage living organisms. Near Earth's surface, ozone contributes to AIR POLLUTION, ozone produced by auto emissions in the presence of sunlight being a deleterious component of SMOG, and also accelerates the deterioration of rubber.

ozone layer *or* **ozonosphere** Region in the upper ATMOSPHERE, about 6–30 mi (10–50 km) high, with significant concentrations of OZONE, formed by the effect of solar ULTRAVIOLET (UV) RADIATION on OXYGEN and also present in trace quantities elsewhere in earth's atmosphere. Ozone strongly absorbs solar UV radiation, causing atmospheric temperature to climb to about 30°F (0°C) at the top of the layer, and preventing much of this radiation from reaching earth's surface, where it would injure many living things. CHLOROFLUOROCARBONS, or CFCs, and some other air pollutants that diffuse into the ozone layer destroy ozone. In the mid-1980s, scientists discovered that a "hole"—an area where the ozone is up to 50% thinner than normal—develops periodically in the ozone layer above Antarctica. This severe regional depletion, explained as a natural seasonal depletion, appears to have been exacerbated by the effects of CFCs, and may have led to an increase in SKIN CANCER caused by UV exposure. Restrictions on the manufacture and use of CFCs and other ozone-destroying pollutants were imposed in 1978.

Ozu \'ō-zù\ **Yasujirō** (b. Dec. 15, 1903, Tokyo, Japan—d. Dec. 12, 1963, Tokyo) Japanese film director. He joined the Shochiku movie studio as a cameraman in 1923 and directed his first film three years later. He originated the genre known as *shomin-geki* ("common-people's drama"), which treated lower-middle-class Japanese family life, with films such as the silent comedies *I Graduated, But…* (1929) and *I Was Born, But…* (1932) and the sound drama *The Toda Brother and His Sisters* (1941). His later films, noted for their detailed character portrayals, pictorial beauty, and quiet, contemplative mood, include *Late Spring* (1949), *Tokyo Story* (1953), *Early Spring* (1956), *Late Autumn* (1960), *The End of Summer* (1961), and *An Autumn Afternoon* (1962). Ozu was considered the most typically Japanese of all directors and received more honours in his own country than did any other director.

P-47 *or* **Thunderbolt** Fighter and fighter-bomber aircraft used by Allied air forces in World War II. A single-seat, single-engine monoplane, it was developed in the U.S. to meet the need for a high-speed long-range fighter. First flown in 1941, it carried eight .50-caliber machine guns, had a maximum bomb load of 2,500 lbs (1,100 kg), and could carry ten 5-in. (127-mm) rockets beneath its wings. It had a maximum speed of 440 mph (700 kph) and a ceiling of 40,000 ft (12,000 m). More P-47s (15,683) were built for the Allied air services than any other fighter.

P-51 *or* **Mustang** Fighter aircraft of World War II. A single seat, single-engine monoplane produced for Britain's RAF, it went into service in 1941 and later was adopted by the U.S. Army Air Force. The original P-51 had four .50-caliber and four .30-caliber machine guns and a camera for photoreconnaissance; its maximum speed was 390 mph (630 kph). The P-51D, a later model, had six .50-caliber machine guns and a maximum speed of 440 mph (700 kph). A superb long-range fighter, it played a significant part in defeating the German Luftwaffe.

p-n junction Electric contact in transistors and related devices between two different types of material called *p*-type and *n*-type semiconductors. These materials are pure semiconductor materials, such as silicon, to which impurities have been added. Materials of *p*-type contain "holes" (vacancies formerly occupied by electrons) that behave like positively charged particles, whereas *n*-type materials contain free electrons. Electric current flows more easily across a *p-n* junction in one direction than in the other. If the positive pole of a battery is connected to the *p*-side of the junction, and the negative pole to the *n*-side, charge flows across the junction. If the battery is connected in the opposite direction, very little charge can flow. The *p-n* junction forms the basis for computer chips, solar cells, and other electronic devices.

Paar, Jack (b. May 1, 1918, Canton, Ohio, U.S.—d. Jan. 27, 2004, Greenwich, Conn.) U.S. television talk-show host. He worked in radio in the late 1940s before hosting his first television show, *Up to Paar*, in 1952. As host of the late-night talk show *Tonight*, renamed *The Jack Paar Show* (1957–62), he established the now-standard format of celebrity interviews, monologues, and variety skits and was noted for his witty conversation, high-strung mannerisms, and mercurial temper. He later hosted the weekly *Jack Paar Program* (1962–65).

Paasikivi \'pä-si-ki-vē**, Juho Kusti** (b. Nov. 27, 1870, Tampere, Fin.—d. Dec. 14, 1956, Helsinki) Finnish statesman. He served in the Finnish parliament (1907–13), as minister of finance (1908–09), and as independent Finland's first prime minister in 1918. After World War I, he was prominent as a banker and businessman. As minister to Sweden (1936–39), he negotiated a treaty to end the Russo-Finnish War (1940). After World War II, he served as Finland's prime minister (1944–46) and later president (1946–56). While accepting the necessity of friendly relations with the Soviet Union, he was uncompromising in his defense of Finnish independence and resisted the growth of communist influence in Finland.

Pabst \'päpst**, G(eorg) W(ilhelm)** (b. Aug. 27, 1885, Raudnice, Bohemia, Austria-Hungary—d. May 29, 1967, Vienna, Austria) German film director. He toured Europe as an actor from age 20 and was directing plays by 1912. He later directed films in Berlin, beginning with *The Treasure* (1923) and continuing with *The Joyless Street* (1925), *Secrets of a Soul* (1926), and *The Love of Jeanne Ney* (1927). His masterpieces, *Pandora's Box* (1929) and *Diary of a Lost Girl* (1929), both starred Louise Brooks. Later films include *Kameradschaft* (1931) and *The Threepenny Opera* (1931). He moved to France in 1933 and to Austria after World War II. His films were among the most artistically successful of the 1920s, marked by social and political concerns and deep psychological insight.

PAC See political action committee

pacemaker Source of rhythmic electrical impulses that trigger heart contractions. In the heart's electrical system, impulses generated at a natural pacemaker are conducted to the atria and ventricles. Heart surgery or certain diseases can interrupt conduction (heart block), requiring use of a temporary or permanent artificial pacemaker. A small electrode attached to an electric generator outside the body is threaded through a vein into the heart. The generator, inserted beneath the skin, produces regular pulses of electric charge to maintain the heartbeat. Permanent pacemakers can also be implanted on the heart's surface.

Pachacamac \pä-'chä-kä-ˌmäk\ Site of a pre-Incan city, southeast of Lima, Peru. It has remains of a temple to the god Pachacamac, a later Incan Temple of the Sun, and the ruins of the surrounding city. The earlier temple and terraced adobe pyramid date from c. 200 BC to AD 600. The city was sacked by Spanish soldiers under Francisco Pizarro c. 1523 and is now occupied by the village of La Mamacoma.

Pachelbel \päk̲-'el-ˌbel,\ *English* \'pä-kəl-ˌbel**, Johann** (baptized Sept. 1, 1653, Nürnberg—d. March 3, 1706, Nürnberg) German composer and organist. Conservative musically, he was friendly with Dietrich Buxtehude and was the teacher of Johann Christoph Bach, who later gave lessons to his younger brother Johann Sebastian Bach. Though he wrote a huge amount of music, of which his organ chorale variations and Magnificat settings are especially remarkable, he is principally known today for a single piece, the extremely popular *Canon in D Major*, which he may not have written.

Pacher \'päk̲-ər**, Michael** (b. c. 1435, County of Tirol—d. August 1498, Salzburg?, Archbishopric of Salzburg) Austrian painter and sculptor. His colossal altarpiece for the Pilgrimage Church of St. Wolfgang in Upper Austria (1479–81) is a masterpiece of late Gothic painting, sculpture, and architecture. The painted panels, with their deep architectural perspective and dramatic foreshortening, indicate a knowledge of Andrea Mantegna. The sculptural portions, with their intricate detail, bright polychrome, and sweeping draperies, show his attachment to northern traditions; and the architectural elements show an extravagant version of the late Gothic style. Pacher was one of the earliest artists to introduce the principles of Renaissance painting into German-speaking regions.

Pachuca *in full* **Pachuca de Soto** City (pop., 2000: 231,602), capital of Hidalgo state, central Mexico. Founded in 1534, it was one of the first settlements in the Viceroyalty of New Spain. It lies in a rich mining area in the Sierra Madre Oriental, roughly 8,000 ft (2,400 m) above sea level. Its silver mines date from the 16th century, when the Mexican process of separating silver from the ore by amalgamation with mercury was perfected there. Industries include smelting works and metallic-ore reduction plants.

Pacific, War of the (1879–83) Conflict involving Chile, Bolivia, and Peru over disputed territory on the mineral-rich Pacific coast. National boundaries in the region were not definitively established prior to the conflict, and in the 1870s Chile controlled nitrate fields claimed by Peru and Bolivia. When demand for nitrates rose, war broke out over the territory. Chile defeated both countries and took control of valuable mining areas in each; Bolivia lost its entire Pacific coast. A 1904 treaty gave Bolivia freedom of transit through Chilean territory, but Bolivia continued to try to escape its landlocked status (see Chaco War). Peru foundered economically for decades after the war. A final accord between Peru and Chile was reached only in 1929 through U.S. mediation.

Pacific Coast Ranges See Coast Ranges

Pacific Islands, Trust Territory of the Former United Nations trusteeship, administered by the U.S. from 1947 to 1986. It consisted of more than 2,000 islands scattered over about 3,000,000 sq mi (7,770,000 sq km) of the tropical western Pacific Ocean, north of the Equator. It covered the region known as Micronesia and comprised three major island groups: the Marianas, the Carolines, and the Marshalls. The seat of government was Saipan in the Northern Mariana Islands. In 1986 the U.S. declared the trust territory agreements no longer in effect. The Federated States of Micronesia and the Republic of the Marshall Islands became sovereign states, and the Northern Mariana Islands became a commonwealth of the U.S. The Republic of Palau became a sovereign state in 1994.

Pacific Ocean Body of salt water extending from the Antarctic region in the south to the Arctic circle in the north and lying between the continents of Asia and Australia on the west and North and South America on the east. It occupies about one-third of the surface of the earth and is by far the largest of the world's oceans. Its area, excluding adjacent seas, is approximately 63,800,000 sq mi (165,250,000 sq km), twice that of the Atlantic Ocean and more than the whole land area of the globe. Its mean depth is 14,040 ft (4,280 m). The western Pacific is noted for its many peripheral seas.

Pacific Security Treaty See ANZUS PACT

Pacification of Ghent See Pacification of GHENT

pacifism \'pa-sə-ˌfi-zəm\ The doctrine that war and violence as a means of settling disputes is morally wrong. The first genuinely pacifist movement was BUDDHISM, whose founder demanded from his followers absolute abstention from any act of violence against their fellow creatures. The ancient Greek conception of pacifism applied to individual conduct rather than to the actions of peoples or kingdoms. The Romans conceived of *pax*, or peace, as a covenant between states or kingdoms that creates a "just" situation based on mutual recognition. This judicial approach was applicable only to the "civilized world," however. Though the spoken words of JESUS as recorded in the New Testament could be interpreted as a kind of pacifism (and in fact were so interpreted by many of his early followers), from the early 3rd century through the Middle Ages the Christian church itself held that armies were necessary to combat nonbelievers or demons. In the 17th and 18th centuries, much pacifist thinking was based on the idea that transferring power from sovereigns to the people would result in peace, because, it was claimed, wars were a product of sovereigns' ambitions and pride. In the 19th and 20th centuries, pacifism inspired widespread interest in general disarmament and in the creation of international organizations for the peaceful resolution of disputes, such as the LEAGUE OF NATIONS and the UNITED NATIONS. Pacifism as a national policy, rather than as a standard of individual conduct, has yet to satisfactorily address the problem of an aggressor that does not possess similar moral scruples. Individual pacifism may lead one to become a CONSCIENTIOUS OBJECTOR. Historically important pacifists include LEO TOLSTOY, MOHANDAS K. GANDHI, and MARTIN LUTHER KING, JR.

Pacino \pə-'chē-nō**, Al(fredo James)** (b. April 25, 1940, New York, N.Y., U.S.) U.S. actor. He began his career as a stage actor, winning Tony Awards for *Does a Tiger Wear a Necktie?* (1969) and later for *The Basic Training of Pavlo Hummel* (1977). He played Michael Corleone in *The Godfather* (1972) and its sequels (1974, 1990). Known for his intense, explosive acting style, he also starred in *Serpico* (1973), *Dog Day Afternoon* (1975), *And Justice for All* (1979), *Scarface* (1983), *Scent of a Woman* (1992, Academy Award), and *Insomnia* (2002).

Pact of Paris See KELLOGG-BRIAND PACT

paddle tennis Game like tennis that is played with a rectangular paddle and a slow-bouncing rubber ball on a small court. Frank P. Beal introduced it on New York playgrounds in the early 1920s. National championship tournaments are still held in the U.S. See also PLATFORM TENNIS.

paddlefish Either of two species (family Polyodontidae) of archaic freshwater fishes with a paddlelike snout, wide mouth, smooth skin, and cartilaginous skeleton. It feeds with mouth gaping open, gill rakers straining plankton from the water. The American paddlefish, or spoonbill (*Polyodon spathula*), is greenish or gray and averages 40 lbs (18 kg); it lives in the open waters of the Mississippi basin. The other known species (*Psephurus gladius*), inhabits the Chang (Yangtze) River basin. The flesh of both species resembles CATFISH; the roe can be made into CAVIAR.

Paderewski \ˌpa-də-'ref-skē**, Ignacy (Jan)** (b. Nov. 18, 1860, Kuryłówka, Podolia province, Russian Poland—d. June 29, 1941, New York, N.Y., U.S.) Polish pianist, composer, and statesman. After teaching at the Warsaw Conservatory (1878–83), when he wrote most of the pieces for which he is remembered (including *Minuet in G*), he studied with THEODOR LESCHETIZKY in Vienna from 1884. His U.S. debut at Carnegie Hall (1891) was followed by a 117-concert North American tour, during which his pianism and dashingly Romantic image brought him a wild popularity. During World War I he worked for Polish independence; in 1919 he served briefly as the first premier of the new state, representing it at the Paris Peace Conference.

Padre \'pä-drē, 'pä-drā\ **Island** Barrier island, southern Texas, U.S. It is 113 mi (182 km) long and up to 3 mi (5 km) wide, lying along the Gulf Coast of Texas. It extends south from CORPUS CHRISTI to Port Isabel and is separated from the mainland by Laguna Madre. It contains a recreational preserve with a large variety of birdlife, excellent fishing, and a broad beach.

Padua \'pa-dyù-wə\ *Italian* **Padova** \'pä-dō-vä\ *ancient* **Patavium** City (pop., 2001 prelim.: 203,350), northern Italy. Legend holds that it was founded by the Trojan hero Antenor. First mentioned in 302 BC, it prospered as a Roman city and was under Lombard rule in the 7th–8th centuries. A leading Italian commune in the 11th–13th centuries, control of Padua then passed to VENICE from 1405 to 1797. Under Austrian rule (1815–66) the city was active in the RISORGIMENTO (movement for Italian independence). Padua was heavily bombed in World War II but was rebuilt. Its historic buildings contain works by many artists, including GIOTTO, TITIAN, DONATELLO, and MANTEGNA. The University of Padua (1222), the second oldest in Italy (after Bologna), had GALILEO among its teachers and DANTE, PETRARCH, and TASSO among its students. Padua's botanical garden (1545) is the oldest in Europe. The city is now a commercial and industrial centre.

Paekche \'pak-ˌchə\ One of three kingdoms into which Korea was divided before AD 660. It is traditionally said to have been founded in 18 BC by the legendary leader Onjo. In the 3rd century AD Paekche emerged as a fully developed kingdom, and by the 4th century it had extended its territory from the southwestern tip of the Korean peninsula to the whole Han River basin in central Korea. By then it was a centralized aristocratic state. Confucianism and Buddhism flourished, and Paekche's visual arts revealed technical maturity and warm human qualities. In the 5th century it was pushed back south by the northern Korean kingdom of KOGURYŎ, and in 660 it fell to an alliance of the southern Korean state of SILLA and the TANG-DYNASTY China.

Paeonia \pē-'ō-nē-ə\ Ancient land, in what is now northern Greece, the Republic of Macedonia, and western Bulgaria. Paeonia originally included the whole Vardar River valley. The Paeonians were weakened by the Persian invasion of 490 BC, and the tribes living along the Strymon River fell under Thracian control. The growth of ancient Macedonia forced the remaining tribes north, and they were defeated by PHILIP II in 358 BC. It became part of the Roman province of Macedonia; by AD 400 the Paeonians had lost their identity and Paeonia was merely a geographic term.

Paestum \'pes-təm, 'pēs-təm\ Ancient city, southern Italy. Located on the Gulf of Salerno (the ancient Bay of Paestum), the city was founded in the 6th century BC by Greek colonists from SYBARIS, who called it Poseidonia. It was taken by the Lucanians, an indigenous Italic people, in the 4th century BC. They ruled until 273 BC, when the city was captured by the Romans. Deserted after its sack by Muslim raiders in AD 871, the abandoned site's remains were discovered in the 18th century. It is known for its three Doric temples and its city walls of travertine blocks.

The Temple of Athena at Paestum
ALINARI/ART RESOURCE, NEW YORK

pagan Traditional designation of a practitioner of classical polytheisms. The early Christians often used the term to refer to non-Christians who worshiped multiple deities. Christian missionaries frequently sought to stamp out pagan practices by building churches on the sites of pagan shrines or by associating Christian holidays with pagan rituals (e.g., linking CHRISTMAS with the celebration of the winter solstice). The term *pagan* was also used to refer to non-Christian philosophers, and in the 20th century it was used to identify members of certain NEW RELIGIOUS MOVEMENTS. See NEO-PAGANISM.

Pagan \pə-'gän\ Village, central Myanmar (Burma). Extending along the left bank of the IRRAWADDY RIVER, southwest of MANDALAY, it was founded c. AD 849 and was the capital of a powerful dynasty from the 11th to the 13th century. It was conquered by the MONGOLS in 1287. As a centre of Buddhist learning, it is a pilgrimage destination and contains Buddhist shrines that have been restored and redecorated and are in current use. Ruins of other shrines

and pagodas cover a wide area. An earthquake in 1975 severely damaged more than half of the important structures and irreparably destroyed many of them. The village also has a school for lacquerware, for which the region is noted.

Paganini \ˌpa-gə-ˈnē-nē**, Niccolò** (b. Oct. 27, 1782, Genoa, Republic of Genoa—d. May 27, 1840, Nice, France) Italian violinist and composer. A prodigy, he joined an orchestra by age nine. He toured Italy (1810–28), renowned as its greatest violin virtuoso. His long-deferred international tour (1830–34) met with sensational success. Paganini's romantic personality and adventures created in his own day the legend of a Mephistophelean figure. He greatly extended violin technique, employing a wide use of harmonics, pizzicato effects, and new methods of fingering and even of tuning. His numerous compositions include *24 Caprices* (1801–07) for solo violin, displaying the novel features of his technique, and six violin concertos.

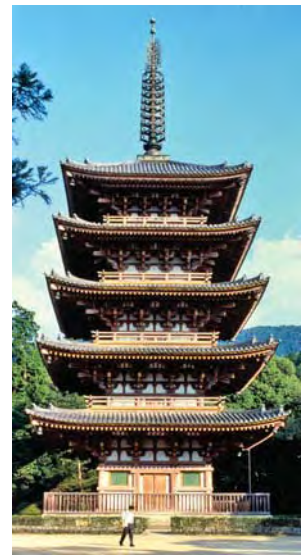
THE GRANGER COLLECTION, NEW YORK CITY

Page, Alan (Cedric) (b. Aug. 7, 1945, Canton, Ohio, U.S.) U.S. gridiron football player. He was an All-America defensive end for Notre Dame. Playing tackle for the Minnesota Vikings (1967–78), he became part of its legendary "Purple People Eaters" front line. In 1971 he became the first defensive player to win the NFL's Most Valuable Player award. He earned a law degree in 1978 and continued playing with the Chicago Bears (to 1981) while engaging in private practice. He never missed a game in his 15-year career. In 1993 he was named to the Minnesota Supreme Court.

Page, Geraldine (b. Nov. 22, 1924, Kirksville, Mo., U.S.—d. June 13, 1987, New York, N.Y.) U.S. actress. She studied drama in Chicago and New York and won fame on Broadway as Alma Winemiller in *Summer and Smoke* (1952; film, 1961). Noted for her intuitiveness and creativity in capturing her often vulnerable, eccentric characters, she starred in *The Rainmaker* (1954–55), *Separate Tables* (1957–58), *Strange Interlude* (1963), and *Agnes of God* (1982). Her films include *Hondo* (1953), *Sweet Bird of Youth* (1962), and *The Trip to Bountiful* (1985, Academy Award). She won Emmy Awards for *A Christmas Memory* (1966) and *The Thanksgiving Visitor* (1968).



pageant \ˈpa-jənt\ Large-scale, spectacular theatrical production or procession. In the Middle Ages, a pageant was the wagon on which religious plays such as MYSTERY PLAYS were performed. Because the plays were associated with ceremony and spectacle, the term came to refer to any extravagant dramatic event or colourful celebration. Pageants often serve to express the shared identity of a community or religious group. Secular pageants include coronations and royal weddings; other modern examples are seen in MARDI GRAS and other carnival processions.

Paget \ˈpa-jət**, Sir James** (b. Jan. 11, 1814, Great Yarmouth, Norfolk, Eng.—d. Dec. 30, 1899, London) British surgeon and physiologist. In 1834 he discovered the parasite that causes trichinosis. He gave excellent descriptions of breast cancer, Paget disease of breast (an inflammatory cancerous condition around the nipple), and PAGET DISEASE OF BONE (1877). He was one of the first to recommend surgical removal of bone marrow tumours instead of amputation of the limb.

Paget disease of bone *or* **osteitis** \ˌäs-tē-ˈīt-əs\ **deformans** Chronic bone disease of middle age. Named for JAMES PAGET, it is characterized by excessive BONE destruction alternating with disordered bone construction (with dense, brittle bones and deformity that can compress internal structures). The long bones, vertebrae, pelvis, and skull are most often affected, more often in men. The risk of cancer, usually osteosarcoma, is high. Increased blood supply to the area of bone destruction may lead to heart or circulatory problems. Calcitonin (which regulates bone growth) and bisphosphonates (which block excessive bone breakdown) are drugs of treatment.

Pago Pago \päŋ-ō-ˈpäŋ-ō, ˈpä-gō-ˈpä-gō\ Town and agglomeration of towns (pop., 2000: 4,278) that form the capital of AMERICAN SAMOA. Located on the shore of a deep inlet on the southern side of Tutuila Island in the South Pacific Ocean, it was selected in 1872 as the site of a U.S. Navy coaling station. An active naval base until 1951, it is now a regular port of call. Its airport, opened in 1964, has stimulated tourist traffic and modernization.

pagoda Towerlike, multistoried structure of stone, brick, or wood, usually associated with a Buddhist temple complex and enshrining sacred relics. The pagoda evolved from the Indian STUPA. The pagoda's crowning ornament is bottle-shaped in Tibet and pyramidal or conical in Myanmar, Thailand, Cambodia, and Laos. In China, Korea, and Japan, a pagoda is a tall tower repeating a basic story unit in diminishing proportions. The stories may be circular, square, or polygonal. The pagoda form is intended mainly as a monument and has very little usable interior space.

MANLEY FEATURES/SHOSTAL ASSOCIATES

Pahang \pä-ˈhaŋ\ **River** River, Malaysia, the longest on the MALAY PENINSULA. It rises in the Main Range and flows south and east to the South CHINA SEA. It is 285 mi (459 km) long and navigable by boats for most of its length. Deforestation in the river's basin has led to heavy flooding during the monsoon season.

Pahari painting \pə-ˈhä-rē\ *or* **Hill painting** Style of miniature painting and book illustration that developed in the independent states of the Himalayan foothills in India c. 1690–1790. Combining the bold intensity of the Basohli school with the delicacy and lyricism of the Kangra school, Pahari painting is closely related to Rajasthani painting. It shares with the Rajput art of the northern Indian plains a preference for depicting legends of the cowherd god KRISHNA.

Pahlavi \ˈpa-lə-ˌvē**, Mohammad Reza Shah** (b. Oct. 26, 1919, Tehrān, Iran—d. July 27, 1980, Cairo, Egypt) Shah of Iran (1941–79), noted for his pro-Western orientation and autocratic rule. After an education in Switzerland, he replaced his father, REZA SHAH PAHLAVI, as ruler when the latter was forced into exile by the British. His rule was marked by a power struggle with his premier, MOHAMMAD MOSADDEQ, who briefly succeeded in deposing him in 1953; covert intervention by British and U.S. intelligence services returned him to the throne the next year. His program of rapid modernization and oil-field development initially brought him popular support, but his autocratic style and suppression of dissent, along with corruption and the unequal distribution of Iran's new oil wealth, increased opposition led by exiled cleric Ayatollah RUHOLLAH KHOMEINI. In 1979 Pahlavi was forced into exile.

Pahlavi, Reza Shah (b. March 16, 1878, Alasht, Qājār Iran—d. July 26, 1944, Johannesburg, S.Af.) Shah of Iran (1926–41). An army officer, he rose through the ranks and in 1921 led a coup that overthrew the QĀJĀR DYNASTY. He sought to bring order and end Iran's political chaos and its domination by Britain and Soviet Russia following World War I (1914–18). He constructed roads, schools, and hospitals, opened a university, and built the Trans-Iranian Railway. He emancipated women, nationalized several economic sectors, and reduced the clergy's power. He often used repressive methods, which eventually cost him his popularity. During World War II (1939–45), fearing that Pahlavi might side with Germany, the U.S. and Britain occupied Iran. The Allies forced him to abdicate (1941) in favour of his son, MOHAMMAD REZA SHAH PAHLAVI.

Paige, Satchel *orig.* **Leroy Robert Paige** (b. July 7, 1906?, Mobile, Ala., U.S.—d. June 8, 1982, Kansas City, Mo.) U.S. baseball

© 2006 Encyclopædia Britannica, Inc.

pitcher. Paige earned legendary fame during his many years pitching in the Negro leagues for a myriad of teams that included the Birmingham Black Barons, the Pittsburgh Crawfords, the Kansas City Monarchs, and the New York Black Yankees. He also barnstormed in exhibition games and played in the Caribbean during the off season. He was about 42 years old when he was finally allowed to enter the major leagues in 1948, shortly after Jackie Robinson broke baseball's race barrier. Joining the Cleveland Indians—the oldest player to make his debut in the major leagues—he helped that team win the World Series in his first season. He retired after the 1953 season. A right-handed, loose-jointed "beanpole," standing 6 ft 4 in. (1.93 m), Paige had considerable pitching speed and a comprehensive mastery of slow-breaking deliveries. He is reputed to have won 2,000 of a total of 2,500 games pitched during his nearly 30-year career. Among Paige's many oft-quoted comments is the admonition "Don't look back, something might be gaining on you."

Satchel Paige, 1942.

Päijänne \'pā-ˌya-ne**, Lake** Lake, southern Finland. It is 75 mi (121 km) long and 14 mi (23 km) wide. The lake contains thousands of islands. The lake system is drained southward to the Gulf of Finland by the Kymi River. The irregular shoreline is heavily forested and supports important timber operations that use the lake for transport. There are numerous villages along the lakeshore and many private villas at the southern end of the lake.

Paik \'pāk, 'pīk**, Nam June** (b. July 20, 1932, Seoul, Korea) Korean-born U.S. sculptor and video and performance artist. He studied music at the Universities of Tokyo and Munich and came to the U.S. in 1964. Inspired by Joseph Beuys and John Cage, he joined the Fluxus group. He is considered the father of video art. His sophisticated video displays, such as *TV Buddha* (1974), an installation with a Buddha contemplating himself on television, were seen as uniquely appropriate to the Information Age, in which fascination with electronic media has replaced spirituality. Prolific in many media, he was honoured with many major retrospectives in the late 20th century.

pain Physical suffering associated with a bodily disorder (such as a disease or injury) and accompanied by mental or emotional distress. Pain, in its simplest form, is a warning mechanism that helps protect an organism by influencing it to withdraw from harmful stimuli (such as a pinprick). In its more complex form, such as in the case of a chronic condition accompanied by depression or anxiety, it can be difficult to isolate and treat. Pain receptors, found in the skin and other tissues, are nerve fibres that react to mechanical, thermal, and chemical stimuli. Pain impulses enter the spinal cord and are transmitted to the brain stem and thalamus. The perception of pain is highly variable among individuals; it is influenced by previous experiences, cultural attitudes (including gender stereotypes), and genetic makeup. Medication, rest, and emotional support are the standard treatments. The most potent pain-relieving drugs are opium and morphine, followed by less-addictive substances and non-narcotic analgesics such as aspirin and ibuprofen.

Paine, Robert Treat (b. March 11, 1731, Boston, Mass.—d. May 11, 1814, Boston, Mass., U.S.) U.S. jurist. A lawyer in his native Boston from 1757, he gained recognition as a prosecuting attorney in the murder trial of the British soldiers involved in the Boston Massacre. He was a member of the Continental Congress and a signer of the Declaration of Independence. He also served as Massachusetts' first attorney general (1777–90) and as a judge in the state supreme court (1790–1804).

Paine, Thomas (b. Jan. 29, 1737, Thetford, Norfolk, Eng.—d. June 8, 1809, New York, N.Y., U.S.) English-American writer and political pamphleteer. After a series of professional failures in England, he met Benjamin Franklin, who advised him to immigrate to America. He arrived in Philadelphia in 1774 and helped edit the *Pennsylvania Magazine*. In January 1776 he wrote *Common Sense*, a 50-page pamphlet eloquently advocating independence; more than 500,000 copies were quickly sold, and it greatly strengthened the colonists' resolve. As a volunteer aide to Gen. Nathanael Greene during the American Revolution he wrote his 16 "Crisis" papers (1776–83), each signed "Common Sense"; the first, beginning "These are the times that try men's souls," was read to the troops at Valley Forge on George Washington's order. In 1787 Paine traveled to England and became involved in debate over the French Revolution; his *The Rights of Man* (1791–92) defended the revolution and espoused republicanism. Viewed as an attack on the monarchy, it was banned, and Paine was declared an outlaw in England. He then went to France, where he was elected to the National Convention (1792–93). After he criticized the Reign of Terror, he was imprisoned by Maximilien Robespierre (1793–94). His *The Age of Reason* (1794, 1796), the first part of which was published while he was still in prison, earned him a reputation as an atheist, though it in fact espouses Deism. He returned to the U.S. in 1802; criticized for his Deist writings and little remembered for his service to the Revolution, he died in poverty.

paint Decorative and protective coating commonly applied to rigid surfaces as a liquid consisting of a pigment suspended in a vehicle, or binder. The vehicle, usually a resin dissolved in a solvent, dries to a tough film, binding the pigment to the surface. Paint was used for pictorial and decorative purposes in the caves of France and Spain as early as 15,000 BC.

paintbrush See Indian paintbrush

Painted Desert Region, north-central Arizona, U.S. It stretches about 150 mi (240 km) from the Grand Canyon to Petrified Forest National Park and has an area of about 7,500 sq mi (19,425 sq km). The name was first used in 1858 by a government explorer to describe the area's brilliantly coloured rock surfaces, exposed by erosion. A large part of the desert lies within Navajo and Hopi Indian reservations. The Navajo peoples use the various sands for their ceremonial sand paintings.

painted lady Either of two species of butterflies in the genus *Vanessa* (family Nymphalidae): *V. cardui* of Africa and Europe or *V. virginiensis* of North and Central America. They have broad, elaborately patterned wings of reddish orange, brown, white, and blue. In spring, vast numbers of *V. cardui* travel thousands of miles across the Mediterranean from Africa to Europe. A few members of the subsequent generation travel south in late summer, but most perish in the northern winter. North American painted ladies travel in spring from northwestern Mexico to the Mojave Desert and sometimes as far as Canada. Their larvae eat plants in the aster family; *V. cardui* larvae eat thistles and stinging nettles.

American painted lady (*Vanessa virginiensis*)
E.S. ROSS

painted turtle Species (*Chrysemys picta*, family Emydidae) of brightly marked North American turtle found from southern Canada to northern Mexico. It has a smooth shell, 4–7 in. (10–18 cm) long, with

red and yellow markings on its relatively flat, black or greenish brown upper shell. It usually lives in quiet, shallow bodies of fresh water, especially those with thickly planted mud bottoms, feeding on plants, small animals, and some carrion. It often basks in large groups on logs and other objects. In many areas it hibernates.

Painter, Theophilus Shickel (b. Aug. 22, 1889, Salem, Va., U.S.—d. Oct. 5, 1969, Fort Stockton, Texas) U.S. zoologist and cell biologist. He received his Ph.D. from Yale in 1913. He was the first to show that the unusually large chromosomes in the salivary glands of *Drosophila* were particularly well suited for studies of genes and chromosomes. In the early 1930s he published a drawing of a section of a *Drosophila* chromosome showing more than 150 bands, which for the first time allowed the precise positions of genes to be determined.

painting Art consisting of representational, imaginative, or abstract designs produced by application of coloured paints to a two-dimensional, prepared, flat surface. The elements of design (i.e., line, colour, tone, texture) are used in various ways to produce sensations of volume, space, movement, and light. The range of media (e.g., tempera, FRESCO, oil, WATERCOLOUR, ink, GOUACHE, encaustic, casein) and the choice of a particular form (e.g., MURAL, easel, panel, MINIATURE, ILLUMINATED MANUSCRIPT, SCROLL, screen, FAN) combine to realize a unique visual image. Painting as an art form dates back to prehistoric cave paintings. The early cultural traditions of tribes, religions, guilds, royal courts, and states controlled the craft, form, imagery, and subject matter of painting and determined its function (e.g., ritualistic, devotional, decorative). Painters were considered skilled artisans rather than creative artists until eventually, in East Asia and Renaissance Europe, the fine artist emerged with the social status of a scholar and courtier. Fine artists signed their work and decided its design and often its subject and imagery. Over time painters have increasingly gained the freedom to invent their own visual language and to experiment with new forms and unconventional materials and techniques. In the early 20th century painters began to experiment with nonrepresentational art in which formal qualities such as line, colour, and form were explored rather than subject matter. Throughout the century styles vacillated between representational and nonrepresentational painting. In the late 20th century some critics forecast the "death of painting" in the face of new media such as video and intallation art, yet talented new artists repeatedly brought painting back to the centre of artistic production.

pair production Formation of an ELECTRON and a POSITRON from high-energy ELECTROMAGNETIC RADIATION traveling through matter, usually in the vicinity of an atomic NUCLEUS. It is a direct conversion of radiant energy into matter in accordance with the equation $E = mc^2$, where E is the amount of energy, m is the mass, and c is the speed of light. It is one of the principal ways in which high-energy GAMMA RAYS are absorbed in matter. The positrons quickly disappear by being reconverted into PHOTONS in the process of ANNIHILATION with other electrons. Pair production may sometimes refer to the formation of other particle/antiparticle pairs as well.

Paisiello \ˌpä-ēz-ˈye-lō**, Giovanni** (b. May 9, 1740, Taranto, Kingdom of Naples—d. June 5, 1816, Naples) Italian composer. Trained in Naples, he served the Russian empress CATHERINE II as chapel master in St. Petersburg (1776–84), where he wrote many short operas. He had his first operatic success in Vienna in 1784 then returned to Naples to become dramatic composer to Ferdinand IV. In 1802 Paisiello was invited by Napoleon to work in Paris, but after two years he returned to Naples, where, despite changes in regime, he retained his court post until 1815. He composed more than 80 operas, including a very popular *Barber of Seville* (1782).

Paisley, Ian (Richard Kyle) (b. April 6, 1926, Armagh, County Armagh, N.Ire.) Protestant leader in Northern Ireland. After being ordained in the Reformed Presbyterian church (1946), he cofounded a new sect, the Free Presbyterian Church of Ulster (1951), which soon grew to more than 30 churches. In the 1960s he became the voice of extreme Protestant opinion in the sectarian strife of Northern Ireland, opposed to any concessions to the Catholics. He led demonstrations throughout Northern Ireland and was repeatedly imprisoned for unlawful assembly. Elected to the House of Commons in 1970, he cofounded the Democratic Unionist Party in 1971 and also organized a paramilitary group of Protestant fighters called the Third Force. In 1998 he opposed the Good Friday Agreement, which called for power sharing between Roman Catholics and Protestants. He won a seat in the new Northern Ireland Assembly that the accord established, though he continued to refuse to participate in negotiations with Sinn Féin, the political wing of the Irish Republican Army.

Paiute \ˈpī-ˌyüt\ Either of two distinct American Indian groups living mostly in California, Nevada, Arizona, and Utah, U.S. Their languages belong to the Numic branch of the UTO-AZTECAN family. Their name for themselves is Numa. The Southern Paiute occupied southern Utah, northwestern Arizona, southern Nevada, and southwestern California. The Northern Paiute occupied east-central California, western Nevada, and eastern Oregon. Both groups were primarily food collectors who subsisted on wild plant foods supplemented by small game. They occupied temporary brush shelters, used rabbit-skin clothing, and made baskets for food gathering. They were organized in loosely knit BANDS. Most Paiute were directed onto reservations in the 19th century; they number some 13,500. See also UTE; WOVOKA.

Pakistan *officially* **Islamic Republic of Pakistan** Country, southern Asia. Area: 307,374 sq mi (796,096 sq km). Population (2005 est.): 153,960,000. Capital: ISLAMABAD. The population is a complex mix of

indigenous peoples who have been affected by successive waves of migrations of Aryans, Persians, Greeks, Pashtuns, Mughals, and Arabs. Languages: Urdu (official), Punjabi, Pashto, Sindhi, Balochi. Religions: Islam (official; predominantly Sunni); also Christianity, Hinduism. Currency: Pakistan rupee. Pakistan may be divided into four regions: the northern mountains, the Balochistan Plateau, the Indus Plain, and the desert areas. The Himalayan and Trans-Himalayan ranges form the great mountain areas of the northernmost part of the country; some of the highest peaks are K2 and NANGA PARBAT. The country has a developing mixed economy based largely on agriculture, light industries, and services. Remittances from Pakistanis working abroad are a major source of foreign exchange. Pakistan is a military-backed constitutional regime with two legislative houses; its chief of state is the president, assisted by the prime minister. The area has been inhabited since the 3rd millennium BC. From the 3rd century BC to the 2nd century AD, it was part of the Mauryan and Kushan kingdoms. The first Muslim conquests were in the 8th century AD. The British EAST INDIA CO. subdued the reigning MUGHAL DYNASTY in 1757. During the period of British colonial rule, what is now (Muslim) Pakistan was part of (Hindu) India. The new state of Pakistan came into existence in 1947 by act of the British Parliament. The KASHMIR region remained a disputed territory between Pakistan and India, with tensions resulting in military clashes and full-scale war in 1965. Civil war between East and West Pakistan in 1971 resulted in independence for Bangladesh (formerly East Pakistan) in 1972. Many Afghan refugees migrated to Pakistan during the Soviet-Afghan war in the 1980s and remained there during the TAL-

© 2006 Encyclopædia Britannica, Inc.

IBAN and post-Taliban periods. Pakistan elected BENAZIR BHUTTO, the first woman to head a modern Islamic state, in 1988. She and her party were ousted in 1990, but she returned to power in 1993–97. Conditions became volatile during that period. Border flare-ups with India continued, and Pakistan conducted tests of nuclear weapons. Political conditions worsened, and the army carried out a coup in 1999.

Pala bronze See EASTERN INDIAN BRONZE

palace Royal residence, and sometimes a seat of government or a religious centre. The word derives from Rome's Palatine Hill, where the emperors built their residences. The earliest known palaces are those of the Egyptian kings at Thebes, with an outer wall enclosing a labyrinth of rooms and courtyards. Other ancient cultures also built vast palaces (e.g., the Assyrian palaces at Nimrūd, Khorsabad, and Nineveh; the Minoan palace at Knossos; and the Persian palaces at Persepolis and Susa). In Rome and Constantinople, palaces reached their peak as centres of power. In Western Europe after the Middle Ages, palaces tended to be single buildings. In Renaissance Italy every prince had his royal palace, usually with an internal court surrounded by an arcade. The court of the Pitti Palace in Florence (1560) is an important example of Mannerist architecture. French palaces include the LOUVRE and VERSAILLES; Spanish palaces include EL ESCORIAL and the ALHAMBRA. In contrast to the typical Western format, East Asian palaces, such as the imperial palaces of Japan and those in Beijing's FORBIDDEN CITY, consist of many buildings (in these cases, low pavilions mostly of highly decorated wood construction) within vast walled gardens.

Palacký \'pä-lats-kē**, František** (b. June 14, 1798, Hodslavice, Moravia, Austrian Empire—d. May 26, 1876, Prague, Bohemia, Austria-Hungary) Czech historian and politician. His *History of Bohemia* (5 vol., 1836–67) made him the founder of modern Czech historiography. Supporting the concept of a federal Austria composed of nationalities with equal rights, he was chairman of the 1848 Prague Slavic congress to promote PAN-SLAVISM. He was a deputy in the Austrian assembly from 1861. His ideas of liberal nationalism later strongly influenced TOMÁŠ MASARYK.

Palamas \ˌpä-lä-'mäs**, Saint Gregory** (b. Nov. 11/14, 1296, Constantinople—d. 1359, Thessalonica, Byzantine Empire) Eastern Orthodox priest. From 1332 he was the chief defender of the school of mysticism known as Hesychasm, which integrated repetitive prayer with bodily postures and controlled breathing. His *Apology for the Holy Hesychasts* (1338) is a justification for mystical experience that involves both soul and body; his *Book of Holiness* (1344) is the fundamental textbook of Byzantine mysticism. He was made bishop of Thessalonica in 1347, and in 1368 he was acclaimed a saint and named Father and Doctor of the Orthodox church.

palate \'pa-lət\ Roof of the MOUTH, separating the oral and nasal cavities. The front two-thirds, the hard palate, is a plate of bone covered by mucous membrane. It gives the tongue a surface against which to make speech sounds and shape food during chewing and keeps pressures in the mouth from closing off the nasal passage. The flexible soft palate behind it is made of muscle and connective tissue and ends in the uvula, a fleshy projection. It rises to block the nasal cavity (see NOSE) and upper PHARYNX off from the mouth and lower pharynx for swallowing or to create a vacuum for drinking. Cleft palate, a CONGENITAL DISORDER involving a gap in the palate, can be corrected surgically.

Palatinate \pə-'la-tᵊn-ət\ *German* **Pfalz** \'pfälts\ Historical region, now part of Germany. The region was once under the jurisdiction of the counts palatine (secular princes), who in the 14th century became ELECTORS of the HOLY ROMAN EMPIRE. In the 16th and 17th centuries the Palatinate was a stronghold of Protestantism. It was divided into two parts: the Lower, or Rhenish, Palatinate, on both sides of the RHINE RIVER in the area south of the MAIN RIVER; and the Upper Palatinate, in northern Bavaria around Amberg and Regensburg. The boundaries of the Palatinate varied with the political and dynastic fortunes of the counts palatine.

Palau \pə-'laù\ *officially* **Republic of Palau** Island country, western Pacific Ocean. Area: 188 sq mi (488 sq km). Population (2005 est.): 21,100. Capital: KOROR (acting); scheduled to move to the island of Babelthuap in 2006. The population is of mixed Malay, Melanesian, Filipino, and Polynesian ancestry. Languages: Palauan, Sonsorolese-Tobian, English (all official). Religion: Christianity (mostly Roman Catholic; also Protestant, other Christians). Currency: U.S. dollar. The islands of the Palau group are fertile, with mangrove swamps along the coasts, backed by savanna and palms rising to rainforests in the hills. The major source of employment is government service. Subsistence farming and fishing are the main occupations in the rural areas. Palau is a republic with two legislative houses; its head of state and government is the president. The islands had been under nominal Spanish ownership when they were sold to Germany in 1899. They were seized by Japan in 1914 and taken by Allied forces in 1944 during World War II. Palau became part of the U.S. Trust Territory of the PACIFIC ISLANDS in 1947 and became a sovereign state in 1994; the U.S. provides economic assistance and maintains a military presence in the islands.

Palawan \pä-'lä-wän\ Island (pop., 2000: 713,539), southwestern Philippines. It is long and narrow and extends northeast to southwest between the South CHINA SEA and the Sulu Sea. It has a mountainous backbone that runs its entire length, with the highest peak at Mount Mantalingajan (6,839 ft [2,085 m]). The capital is Puerto Princesa. The similarity of Palawan's vegetation with that of Borneo is explained by remnants of a Pleistocene Epoch land bridge that connected the two islands. A coastal plain supports most of the population and is the main agricultural area of Palawan. Scattered settlement and shifting agriculture predominate, with rice as the main food crop. Oil drilling off the northern coast began in 1992.

pale District separated from the surrounding country by defined boundaries or set apart by a distinctive administrative and legal system. In imperial Russia from the late 18th century, the Pale of Settlement was the area in which Jews were permitted to live. By the 19th century it included all of Russian Poland, Lithuania, Belarus, Crimea, Bessarabia, and most of Ukraine. It ceased to exist during World War I, when Jews in great numbers fled to the interior, and it was abolished in 1917. The English maintained a pale in Ireland until the entire island was subjugated under ELIZABETH I in the 16th century.

Palembang \ˌpä-lem-'bäŋ\ City (pop., 1995 est.: 1,283,100) and river port, Indonesia. It is located on both banks of the Musi River. It was the capital of a Buddhist kingdom from the 7th to the 14th century AD and was subsequently overthrown by the Hindu MAJAPAHIT EMPIRE. The Dutch EAST INDIA COMPANY established a trading post there and in 1659 built a fort. Palembang was occupied by the Japanese during World War II and was the capital of South Sumatra until that state was included in the Republic of Indonesia in 1950. The port is accessible to ocean traffic and conducts considerable trade with ports on the MALAY PENINSULA and in Thailand and China.

Palenque \pä-'leŋ-kā\ Ruined ancient Mayan city of the Late Classic period (c. AD 600–900) in what is now Chiapas state, Mexico. It is considered the most beautiful of Mayan sites. The Palenque builders designed temple pyramids and palaces with mansard-style roofs and walls embellished with delicate stucco reliefs of rulers, gods, and ceremonies. The principal structure is the palace, a labyrinth of galleries with interior courts and a four-story square tower. The great Temple of the Inscriptions is noted for its hieroglyphics and a vast funerary crypt, filled with jade, that was discovered in 1952.

Paleo-Asiatic languages See PALEO-SIBERIAN LANGUAGES

Paleo \ˌpā-lē-ō\ **-Siberian languages** *or* **Paleo-Asiatic languages** Group of four unrelated language families spoken in northeastern Asia. Believed to have covered much larger areas of Siberia and perhaps Manchuria in the past, they have lost ground to URALIC and ALTAIC languages and more recently to RUSSIAN (see SIBERIAN PEOPLES). Of the Yeniseian languages, the only survivors are Ket, spoken by fewer than 500 people, and the virtually extinct Yug. The two extant Yukaghir languages (which are believed by some specialists to belong to the URALIC LANGUAGES), North, or Tundra, Yukaghir and South, or Kolyma, Yukaghir, together have fewer than 100 speakers. The Chukotko-Kamchatkan (Luorawetlan) family includes Chukchi, with about 10,000 speakers in extreme northeastern Siberia; Koryak, with fewer than 5,000 speakers south of Chukchi; and Itelmen, spoken on the Kamchatka Peninsula by fewer than 100 people. The two Nivkh (Gilyak) varieties, Amur Nivkh and Sakhalin Nivkh, together have fewer than 1,000 speakers.

Paleocene \'pā-lē-ə-ˌsēn\ **Epoch** *or* **Palaeocene Epoch** Earliest division of the TERTIARY PERIOD, from 65 to 54.8 million years ago. It precedes the EOCENE EPOCH and follows the CRETACEOUS PERIOD. The Paleocene was characterized by a generally warming climate, with little or no frost; seasonal variation probably consisted of alternating dry and wet seasons. By the Paleocene the dinosaurs and other reptilian groups that were domi-

© 2006 Encyclopædia Britannica, Inc.

nant during the Cretaceous had disappeared, and the epoch saw the rapid proliferation and evolution of mammals.

paleoclimatology *or* **palaeoclimatology** Scientific study of the extended climatic conditions of past geologic ages. Paleoclimatologists seek to explain climate variations for all parts of the Earth during any given geologic period, beginning with the time of the Earth's formation. The basic research data are drawn mainly from geology and paleobotany; speculative attempts at explanation have come largely from astronomy, atmospheric physics, meteorology, and geophysics.

paleogeography *or* **palaeogeography** Geography of selected portions of the Earth's surface at specific times in the geologic past. The simplest kind of paleogeography is a map showing the locations of ancient lands and seas, but paleogeographic maps may also show the occurrence and distribution of fossil, plant, and animal communities; environments of sedimentation (e.g., deltas, reefs, deserts, or deep-sea basins); areas undergoing uplift and erosion or subsidence and deposition; and major climatic zones.

paleogeology *or* **palaeogeology** Geology of a region at any given time in the distant past. Paleogeologic reconstructions in map form show not only the ancient topography of a region but also the distribution of rocks beneath the surface and such structural features as FAULTS and FOLDS. Maps of this kind help investigators determine deformation events in a region, stream-drainage patterns now buried under layers of sediment, and the extent of ancient oceans and seas. They also provide a useful tool for petroleum geologists, enabling them to identify geologic structures where oil or natural gas may be trapped.

paleohydrology *or* **palaeohydrology** Scientific discipline concerned with hydrologic systems as they existed during previous periods of Earth history. Changing hydrologic conditions are inferred from the evidence of the alteration, deposition, and erosion in rocks. Paleohydrology also deals with the changes in animals and plants through geologic time that have been greatly influenced by hydrologic change.

Paleolithic \ˌpā-lē-ə-'li-thik\ **Period** *or* **Old Stone Age** Ancient technological or cultural stage characterized by the use of rudimentary chipped stone tools. During the Lower Paleolithic (c. 2,500,000–200,000 years ago), simple pebble tools and crude stone choppers were made by the earliest humans. About 700,000 years ago, the first rough hand ax appeared; it was later refined and used with other tools in the ACHEULEAN INDUSTRY. A flake-tool tradition emerged in the Middle Paleolithic, as exemplified by implements of the MOUSTERIAN INDUSTRY. The Upper Paleolithic (40,000–10,000 BC) saw the emergence of more complex, specialized, and diverse regional stone-tool industries, such as the AURIGNACIAN, SOLUTREAN, and MAGDALENIAN. The two principal forms of Paleolithic art are small sculptures—such as the so-called Venus figurines and various carved or shaped animal and other figures—and monumental paintings, incised designs, and reliefs on the walls of caves such as ALTAMIRA (in Spain) and LASCAUX GROTTO (in France). The end of the Paleolithic is marked by the emergence of the settled agricultural villages of the NEOLITHIC PERIOD.

paleomagnetism *or* **palaeomagnetism** *or* **remanent magnetism** Permanent magnetism in rocks, resulting from the orientation of the Earth's magnetic field at the time of rock formation in a past geologic age. It is a source of information for the paleomagnetic studies of POLAR WANDERING and PLATE TECTONICS.

paleontology *or* **palaeontology** Scientific study of life of the geologic past, involving analysis of plant and animal fossils preserved in rocks. It is concerned with all aspects of the biology of ancient life forms: their shape and structure, evolutionary patterns, taxonomic relationships with each other and with modern species, geographic distribution, and interrelationships with the environment. Paleontology has played a key role in reconstructing the Earth's history and has provided evidence to support the theory of evolution. Data from paleontologic studies have also aided petroleum geologists in locating deposits of oil and natural gas, which are frequently associated with the remains of certain ancient life forms.

Paleozoic \ˌpā-lē-ə-'zō-ik\ **Era** *or* **Palaeozoic Era** Major interval of geologic time, c. 543–248 million years ago. From the Greek for "ancient life," it is the first era of the PHANEROZOIC EON and is followed by the MESOZOIC ERA. It is divided into six periods: (from oldest to youngest) the CAMBRIAN, ORDOVICIAN, SILURIAN, DEVONIAN, CARBONIFEROUS, and PERMIAN. During the early Paleozoic, much of North America was covered by a warm, shallow sea with many coral reefs. Fossils from this time include marine invertebrates and primitive fish; the plants were predominantly algae, with some mosses and ferns. During the late Paleozoic, huge, swampy forest regions covered much of the northern continents. Plant and animal life flourished. Amphibians left the oceans to live on land, reptiles evolved as fully terrestrial life forms, and insect life began. Ferns grew to tree size, and precursors of the conifers appeared.

Palermo *ancient* **Panormus** City (pop., 2001: 686,722), seaport, and capital of SICILY. Located on the Bay of Palermo, the city was founded by Phoenician traders in the 8th century BC; it was later a Carthaginian settlement. It was taken by the Romans in 254 BC. Conquered by the Arab troops of the AGHLABID DYNASTY in 831, it flourished as a centre of trade with North Africa. Palermo was thus quite prosperous when it fell to the Norman adventurers ROGER I and ROBERT GUISCARD in 1072. The ensuing era of Norman rule (1072–1194) was Palermo's golden age, particularly after the founding of the Norman kingdom of Sicily in 1130 by ROGER II. In 1194 Germany's Hohenstaufen ruler, FREDERICK II, took over. Palermo was conquered by the French under CHARLES OF ANJOU in 1266, but Angevin oppression was ended in 1282 by a popular uprising called the SICILIAN VESPERS. After 1412 the crown of Sicily was united with that of ARAGON and subsequently with that of Spain. Palermo declined during this long period of Spanish rule. The city was taken by Italian patriot Giuseppe de GARIBALDI in 1860 and made part of the kingdom of Italy. Heavily bombed during World War II, it was captured by Allied forces in 1943. Notable buildings from the Norman and later periods include the cathedral that contains the tombs of Roger II and Frederick II. Palermo is Sicily's chief port, and ship repair is an important industry.

Palestine *biblical* **Canaan** Region, at the eastern end of the MEDITERRANEAN SEA. It extends east to the JORDAN RIVER, north to the border between Israel and Lebanon, west to the Mediterranean, and south to the NEGEV desert, reaching the Gulf of AQABA. The political status and geographic area designated by the term have changed considerably over the course of three millennia. The eastern boundary has been particularly fluid, often understood as lying east of the Jordan and extending at times to the edge of the ARABIAN DESERT. A land of sharp contrasts, Palestine includes the DEAD SEA, the lowest natural point of elevation on Earth, and mountain peaks higher than 2,000 ft (610 m) above sea level. In the 20th and 21st centuries it has been the object of conflicting claims by Jewish and Arab national movements. The region is sacred to Judaism, Christianity, and Islam. Settled since early prehistoric times, mainly by Semitic groups, it was occupied in biblical times by the kingdoms of Israel, JUDAH, and JUDAEA. It was subsequently held by virtually every power of the Middle East, including the Assyrians, Persians, Romans, Byzantines, Crusaders, and Ottomans. It was governed by Britain under a League of Nations mandate from the end of World War I (1914–18) until 1948, when the State of Israel was proclaimed. Armies from Egypt, Transjordan, Syria, and Iraq attacked the next day. They were defeated by the Israeli army. See ISRAEL, JORDAN, WEST BANK, and GAZA STRIP for the later history of the region.

Palestine Liberation Organization (PLO) *Arabic* **Munaẓẓamat al-Taḥrīr al-Filasṭīniyyah** Umbrella political organization representing the Palestinian people in their drive for a Palestinian state. It was formed in 1964 to centralize the leadership of various groups. After the SIX-DAY WAR of 1967, the PLO promoted a distinctively Palestinian agenda. In 1969 YĀSIR ʿARAFĀT, leader of FATAH, the PLO's largest faction, became its chairman. From the late 1960s the PLO engaged in GUERRILLA attacks on Israel from bases in Jordan, from which it was expelled in 1971. PLO headquarters moved to Lebanon. In 1974 ʿArafāt advocated limiting PLO activity to direct attacks against ISRAEL, and the Arab community recognized the PLO as the sole legitimate representative of all Palestinians. It was admitted to the ARAB LEAGUE in 1976. In 1982 Israel invaded Lebanon and expelled PLO forces based there. In 1988 the PLO leadership, then based in Tunis, declared a Palestinian state and the following year elected ʿArafāt its president. It also recognized Israel's right to exist, though several militant factions dissented. In 1993 Israel recognized the PLO by signing an agreement with it granting Palestinian self-rule in parts of the WEST BANK and GAZA STRIP. The PLO became an integral part of the Palestinian National Authority. See also PALESTINE; LEBANESE CIVIL WAR; ḤAMĀS; *INTIFĀḌAH*.

Palestinian Talmud See TALMUD

Palestrina See PRAENESTE

Palestrina \ˌpa-lə-'strē-nə**, Giovanni Pierluigi da** (b. c. 1525, Palestrina, near Rome—d. Feb. 2, 1594, Rome) Italian composer. He sang

© 2006 Encyclopædia Britannica, Inc.

in Rome as a choirboy, then worked as an organist in his nearby hometown of Palestrina. He was appointed director of the Vatican's Cappella Giulia by Pope Julius II in 1551, and he later worked at the other great Roman churches. He worked for the d'Este family in Tivoli for four years but returned to the Cappella Giulia in 1571 and remained there the rest of his life. Pope Gregory XIII commissioned Palestrina to restore the plainchant (a traditional liturgical chant sung in unison) to a more authentic form. The task proved too great, and his editorial work gave way to a flow of creative music, including volumes of masses, motets, and madrigals. After his death, his superbly balanced and serene music was proclaimed as a model for composers in the Roman Catholic church. The modern study of COUNTERPOINT dates from the codification of his practice in the 18th century.

Paley, Grace *orig.* **Grace Goodside** (b. Dec. 11, 1922, New York, N.Y., U.S.) U.S. short-story writer and poet. Paley's first languages were Russian and Yiddish, a circumstance that may have some bearing on her ability to vividly reproduce in her fiction a variety of accents and speech mannerisms. She was active in the opposition to the Vietnam War in the 1960s and continued her political activism after the war ended. Her stories, compassionate and often comic explorations of family and neighbourhood life and of individuals struggling against loneliness, are collected in *The Little Disturbances of Man* (1959), *Enormous Changes at the Last Minute* (1974), and *Later the Same Day* (1985). Her poetry appears in *Leaning Forward* (1985) and *Begin Again* (1992).

Paley, William S(amuel) (b. Sept. 28, 1901, Chicago, Ill., U.S.—d. Oct. 26, 1990, New York, N.Y.) U.S. broadcaster. He worked in his family's cigar business from 1922. His success at increasing sales through radio advertisements sparked his interest in the medium. He invested in a small radio network, Columbia Phonographic Broadcasting System, becoming its president in 1928 and rapidly adding member stations. He built CBS into one of the world's leading radio and television networks, serving as president (1928–46) and chairman of the board (1946–90). He launched CBS News in 1933 and built its outstanding staff, including EDWARD R. MURROW.

Palgrave, Francis Turner (b. Sept. 28, 1824, Great Yarmouth, Norfolk, Eng.—d. Oct. 24, 1897, London) English critic and poet. He spent many years in the civil service's education department and taught poetry at Oxford. His *Golden Treasury of English Songs and Lyrics* (1861), a comprehensive, well-chosen, and carefully arranged lyric anthology, influenced the poetic taste of several generations and was important in popularizing the works of WILLIAM WORDSWORTH.

Pali canon See TRIPITAKA

Pali \'pä-lē\ **language** Middle INDO-ARYAN LANGUAGE of the 5th century BC in which the most essential documents of THERAVADA Buddhism are written. Linguistically, Pali is a homogenization of the northern Middle Indo-Aryan dialects in which the BUDDHA's teachings were orally recorded and transmitted. According to the tradition of Sri Lankan chronicles, the Theravada canon was first written down in the 1st century BC, though its oral transmission continued long afterward. No single script was ever developed for Pali; scribes used scripts of their own languages to copy canonical texts and commentaries (see INDIC WRITING SYSTEMS), and most extant palm-leaf manuscripts of Pali are of relatively recent date.

Palikir \ˌpä-lē-'kir\ Capital (pop., 2000: 6,227) of the Federated States of MICRONESIA. It is located inland on the island of Pohnpei (or Ponape; pop., 2000: 34,486). Nearby is the coastal city of Kolonia (pop., 2000: 5,681), the island's other large town.

Palissy \pä-lē-'sē**, Bernard** (b. 1509, St. Avit, France—d. 1590, Paris) French potter and writer. Known for his decorated rustic ware, a type of EARTHENWARE covered with coloured lead glazes, he was appointed "inventor of rustic pottery to the king and the queen mother" in 1565. His public lectures on natural history, published in 1580, revealed him to be a writer and scientist and a pioneer of the scientific method. A Huguenot, he was imprisoned in 1588 in the Bastille, where he died.

Palladio \pä-'läd-yō**, Andrea** *orig.* **Andrea di Pietro della Gondola** (b. Nov. 30, 1508, Padua, Republic of Venice—d. August 1580, Vicenza) Italian architect. While a young mason, he was noticed by an Italian scholar and soon found himself studying mathematics, music, philosophy, and Classical authors. From 1541 he made several trips to Rome to study ancient ruins. His first palace design, the Palazzo Civena (1540–46), was innovative for its use of an arcaded area behind the main elevation, in imitation of a Roman forum. In his villas, Palladio tried to re-create the Roman villa based on ancient descriptions. His first, Villa Godi at Lonedo (c. 1540–42), contained elements for which he is famous, including symmetrical wings and a walled court. His most widely copied villa was the Villa Rotonda (1550–51), near Vicenza. Palladio was the first to systematize the plan of a house and to use the ancient Greco-Roman temple front as a portico. His reconstruction of the Basilica (town hall) in Vicenza (begun 1549) employs a two-story arcade with a motif that came to be known as Palladian: rounded arches flanked by rectangular openings. His facades for San Francesco della Vigna (c. 1565), San Giorgio Maggiore (begun 1566), and Il Redentore (begun 1576), all in Venice, became prototypes for attaching Classical temple fronts to basilican churches. Though Palladio absorbed contemporary Mannerist motifs, his plans and elevations always retained a repose and order not associated with Mannerist architecture. His *Four Books of Architecture* was possibly the most influential architectural pattern book ever printed. His influence climaxed during the 18th-century Classical Revival; the resulting Palladianism spread through Europe and the U.S.

palladium Metallic chemical ELEMENT, one of the TRANSITION ELEMENTS, chemical symbol Pd, atomic number 46. A precious, silver-white metal that resembles PLATINUM chemically, it is extremely ductile and easily worked and can be beaten into thin leaf. It is an excellent CATALYST for chemical reactions involving HYDROGEN and OXYGEN, such as the HYDROGENATION of unsaturated ORGANIC COMPOUNDS. Because it does not tarnish in air at ordinary temperatures, palladium and its alloys serve as substitutes for platinum in jewelry and in electrical contacts in telecommunications equipment. Small amounts of palladium alloyed with gold yield the best white gold. Palladium is used also in dental alloys. Because hydrogen passes rapidly through the metal at high temperatures, heated palladium tubes impervious to other gases function as semipermeable membranes and are used for hydrogen purification.

palm Any of about 2,800 species of flowering, subtropical trees, shrubs, and vines that make up the family Arecaceae (or Palmae). Many are economically important. Palms furnish food, shelter, clothing, timber, fuel, building materials, fibres, starch, oils, waxes, and wines for local populations in the tropics. Many species have very limited ranges; some grow only on single islands. The fast growth and many by-products of palms make exploitation of the rainforest appealing to agribusiness. The usually tall, unbranched, columnar trunk is crowned by a tuft of large, pleated, fan- or feather-shaped leaves, with often prickly petioles (leafstalks), the bases of which remain after leaves drop, often covering the trunk. Trunk height and diameter, leaf length, and seed size vary greatly. Small flowers are produced in large clusters. Among the most important palms are the sugar palm (*Arenga pinnata*, or *A. saccharifera*), COCONUT PALM, DATE PALM, and cabbage PALMETTO.

Royal palm (*Roystonea regia*).
E.R. DEGGINGER/EB INC.

palm PC Computer small enough to fit in a person's palm. Palm PCs (also called palmtops, handheld computers, or personal data assistants) typically use pens instead of keyboards for data input. They have limited memory and lack built-in peripheral devices (e.g., disk drives and modems), though such devices can be plugged in through peripheral slots. They run a limited set of application programs, such as calendars, address books, and memo pads.

Palm Springs Resort city (pop., 2000: 42,807), southern California, U.S. It is located in the COACHELLA VALLEY. Originally known as Agua Caliente for its hot springs, it was a stagecoach stop by 1872. In 1884 John G. McCallum established the Palm Valley Colony there. Incorporated as a city in 1938, it developed into a glamorous desert resort and residential area, frequented by celebrities, including Hollywood stars. Nearby is JOSHUA TREE NATIONAL PARK.

© 2006 Encyclopædia Britannica, Inc.

Palm Sunday *or* **Passion Sunday** In Christianity, the first day of Holy Week and the Sunday before EASTER, commemorating JESUS' triumphal entry into Jerusalem. It usually includes a procession of members of the congregation carrying palms, representing the palm branches the crowd scattered in front of Jesus as he rode into the city. The liturgy also includes readings recounting the suffering and death of Jesus. Palm Sunday was celebrated in Jerusalem as early as the 4th century and in the West by the 8th century.

Palma (de Mallorca) City (pop., 2001: 333,801), capital of the BALEARIC ISLANDS and of MAJORCA island, Spain. Palma lies on the southwestern coast of Majorca on Palma Bay in the western Mediterranean Sea. Romans conquered Majorca in 123 BC, and it was later ruled by Byzantines and Arabs before being taken by JAMES I of Aragon in 1229. The city's old sections have many notable homes built in the 16th and 18th centuries. Historic buildings include the Gothic cathedral and Bellver Castle. The economy is varied and includes tourism and light manufacturing.

Palma, Arturo Alessandri See ARTURO ALESSANDRI PALMA

Palmas, Las See LAS PALMAS

Palme \'päl-mə**, (Sven) Olof (Joachim)** (b. Jan. 30, 1927, Stockholm, Swed.—d. Feb. 28, 1986, Stockholm) Swedish prime minister (1969–76, 1982–86). After studying in Sweden and the U.S., he was elected to the Swedish parliament (1958) and became a leader of the Swedish Social Democratic Workers' Party. He served in ministerial posts from 1963 and became prime minister in 1969. A strong pacifist, he attacked U.S. policy in the Vietnam War and later acted as a UN special envoy to mediate in the Iran-Iraq War. After his reelection in 1982, he tried to reinstate socialist economic policies in Sweden. He was shot to death by an assassin in 1986; his murder remains unsolved.

Palmer, A(lexander) Mitchell (b. May 4, 1872, Moosehead, Pa., U.S.—d. May 11, 1936, Washington, D.C.) U.S. politician. He served in the U.S. House of Representatives from 1909 to 1915 and helped secure the Democratic Party presidential nomination for WOODROW WILSON in 1912. Appointed U.S. attorney general (1919–21), Palmer used the espionage and sedition acts (1917, 1918) to attack political radicals, dissidents, and aliens in the "Red Scare" period following World War I. The government-led roundup of suspected communists became known as the "Palmer raids." In 1920 he ran unsuccessfully for the presidential nomination of the Democratic Party.

Palmer, Arnold (Daniel) (b. Sept. 10, 1929, Latrobe, Pa., U.S.) U.S. golfer. The son of a greenskeeper, Palmer turned professional in 1954 after winning the U.S. Amateur championship. He was the first player to win the MASTERS TOURNAMENT four times (1958, 1960, 1962, 1964); his other major titles include the U.S. Open (1960) and the British Open (1961–62). From 1954 through 1975 he won 61 tournaments. He won the PGA Senior Open in 1980 and 1981. He was the first golfer to earn $1,000,000 in tournament prize money. His exciting play and amiable personality won him wide popularity among fans, who became known as "Arnie's Army." Palmer was also the first athlete to parlay success on the playing field into lucrative off-the-field contracts, and thus he paved the way for athletes who followed to earn substantial sums from endorsement contracts.

Arnold Palmer, 1984
ARNOLD PALMER ENTERPRISES

Palmer, Samuel (b. Jan. 27, 1805, London, Eng.—d. May 24, 1881, Redhill, Surrey) British painter and etcher. He began exhibiting conventional landscapes at the Royal Academy by 14. After converting to a personal form of High Anglicanism and discovering medieval art, he developed a visionary style, displaying a mystical but precise depiction of nature and an overflowing religious intensity, united by a vivid re-creation of the pastoral conventions. In these works he was encouraged and influenced by WILLIAM BLAKE. As his religious fervour faded after 1830, the precarious balance between realism and vision was lost.

Palmerston (of Palmerston), Henry John Temple, 3rd Viscount *known as* **Lord Palmerston** (b. Oct. 20, 1784, Broadlands, Hampshire, Eng.—d. Oct. 18, 1865, Brocket Hall, Hertfordshire) English politician and prime minister (1855–58, 1859–65). He entered Parliament in 1807 as a TORY and served as secretary at war (1809–28). Associated with the WHIG Party from 1830, he served many years as foreign secretary (1830–34, 1835–41, 1846–51) and supported British interests and liberal causes abroad. He played a key role in establishing the independence of Belgium (1830–31) and Greece (1832) and secured Turkey's integrity against France (1840). Appointed prime minister in 1855, he brought an end to the Crimean War, approved the creation of the independent Kingdom of Italy, and supported a policy of neutrality in the American Civil War. Nicknamed "Pam," he was a symbol of British nationalism and one of Britain's most popular leaders.

palmetto \pal-'me-tō\ *or* **cabbage palmetto** Tree (*Sabal palmetto*) of the PALM family, occurring in the southeastern U.S. and the West Indies. Commonly grown for shade and as ornamentals along avenues, palmettos grow to about 80 ft (24 m) tall and have fan-shaped leaves. The water-resistant trunk is used as wharf piling. Mats and baskets are sometimes made from the leaves, and stiff brushes are made from the stems. The buds are edible. *S. texana*, a similar species, occurs in the southwestern U.S. and in Mexico.

palmistry Reading of an individual's character and DIVINATION of the future by interpreting lines on the palm of the hand. Palmistry may have originated in ancient India, and it was probably from their original Indian home that the traditional fortune-telling of the GYPSIES was derived. It was also practiced in China, Tibet, Persia, Mesopotamia, Egypt, and ancient Greece. In medieval Europe it was used to discover witches, who were thought to have pigmentation spots as signs of a pact with the devil. Though palmistry is still practiced, there is no known scientific basis for it.

Palmyra \pal-'mī-rə\ *biblical* **Tadmor** Ancient city, Syria, northeast of DAMASCUS, at the modern city of Tadmur. Said to have been built by King SOLOMON, it became prominent in the 3rd century BC, when the SELEUCID DYNASTY made the road through Palmyra one of the routes of east-west trade. Under Roman control by the reign of TIBERIUS, it briefly regained autonomy in the 3rd century AD under the Arab queen ZENOBIA. The main military station on the road that linked Damascus to the EUPHRATES RIVER, it was conquered by the Muslims in 634. Inscriptions in the ARAMAIC LANGUAGE supply information on the city's trade with India via the Persian Gulf and with Egypt, Rome, and Syria. Ancient ruins reveal the city's plan.

Temple of Bel, Palmyra, Syria.
H. ROGER-VIOLLET

Palomar Observatory Astronomical OBSERVATORY on Mount Palomar, near San Diego, California, U.S., site of the famous Hale TELESCOPE, a reflecting telescope with a 200-in. (5-m) aperture that has proved instrumental in cosmological research. Built in 1948 and named in honour of George Ellery Hale (1868–1938), it was the largest instrument of its kind for almost 30 years. Founded in 1948 by California Institute of Technology, the observatory was operated jointly with the MOUNT WILSON OBSERVATORY as the Hale Observatories until 1980.

Palomino \ˌpa-lə-'mē-nō\ Colour type of HORSE distinguished by its cream, yellow, or gold coat and a white or silver mane. It is popular in pleasure and parade classes. Palominos may conform to the breed types of several light breeds, including the ARABIAN HORSE and the American QUARTER HORSE.

palsy See CEREBRAL PALSY, PARALYSIS

Pamirs \pə-'mirz\ High mountain region, Central Asia. Located mostly in Tajikistan, it also borders parts of Afghanistan, Pakistan, China, and Kyrgyzstan. It includes many peaks that are higher than 20,000 ft (6,100

© 2006 Encyclopædia Britannica, Inc.

m) in elevation, as well as many glaciers. Its highest point, Imeni Ismail Samani (Communism) Peak, rises in the northwestern part of the range to an elevation of 24,590 ft (7,495 m). The region is sparsely populated, and almost all the inhabitants are Tajiks. It is a central mountain knot from which extend several great ranges, including the Karakorams and Hindu Kush.

Pamlico \'pam-li-ˌkō\ **Sound** Shallow body of water, eastern shore of North Carolina, U.S. It is separated from the Atlantic Ocean by the Outer Banks. It extends 80 mi (130 km) south from Roanoke Island and is 8–30 mi (13–48 km) wide. Numerous waterfowl nest along the coastal waters; there is some commercial fishing, especially for oysters.

Pampas, the Vast, grass-covered plain in South America extending west from the Atlantic coast to the Andean foothills, primarily in Argentina. The Argentine Pampas covers 295,000 sq mi (764,000 sq km) and slopes gradually downward from northwest to southeast. The western portion is dry and largely barren; the humid eastern portion is the nation's economic heart. Herds of wild cattle and horses, introduced by the Spaniards and rounded up by Argentina's famed gauchos, roamed the Pampas until the later 19th century, when the land was fenced into huge *estancias* (ranches). The region is prominent in Argentina's gaucho literature and musical folklore.

pamphlet Unbound printed publication with a paper cover or no cover. Among the first printed materials, pamphlets were widely used in England, France, and Germany from the early 16th century, often for religious or political propaganda; they sometimes rose to the level of literature or philosophical discourse. In North America, pre-Revolutionary War agitation stimulated extensive pamphleteering; foremost among the writers of political pamphlets was Thomas Paine. By the 20th century, the pamphlet was more often used for information than for controversy.

Pamplona *Basque* **Iruña** *ancient* **Pompaelo** City (pop., 2001: 183,964), capital of Navarra, northern Spain. According to tradition, it was founded in 75 BC by Pompey the Great as a military settlement. It was left almost derelict after Moorish and Frankish invasions in the 5th century AD. It was captured from the Moors by Charlemagne in 778 and became the capital of the kingdom of Navarra under Sancho III. In 1512 the armies of King Ferdinand of Aragon-Castile entered Pamplona, and the portion of Navarra south of the Pyrenees was incorporated into Spain. The citadel built by King Philip II of Spain in 1571 made it the most strongly fortified town of the north. In 1841 it became the capital of the new Navarra province. The chief tourist attraction is the Fiesta de San Fermín (honouring its first bishop), which is celebrated with bullfights and the running of the bulls through the city streets. The fiesta is described in Ernest Hemingway's *The Sun Also Rises*.

Pan Greek fertility deity with a half-human, half-animal form. The Romans associated him with Faunus. Pan was usually said to be the son of Hermes. He was often represented as a vigorous and lustful figure with the horns, legs, and ears of a goat; in later art his human parts were more emphasized. Some Christian depictions of the Devil bear a striking resemblance to Pan. Pan haunted the high hills, where he was chiefly concerned with flocks and herds. Like a shepherd, Pan was a piper, and he rested at noon. He could inspire irrational terror in humans, and the word *panic* comes from his name.

pan See playa

Pan-African movement Movement dedicated to establishing independence for African nations and cultivating unity among black people throughout the world. It originated in conferences held in London (1900, 1919, 1921, 1923) and other cities. W.E.B. Du Bois was a principal early leader. The important sixth Pan-African conference (Manchester, 1945) included Jomo Kenyatta and Kwame Nkrumah. The first truly intergovernmental conference was held in Accra, Ghana, in 1958, where Patrice Lumumba was a key speaker. The Pan-Africanist Congress (PAC) was founded by Robert M. Sobukwe and others in South Africa in 1959 as a political alternative to the African National Congress, which was seen as contaminated by non-African influences. The founding of the Organization of African Unity (OAU; now the African Union) by Julius Nyerere and others in 1963 was a milestone, and the OAU soon became the most important Pan-Africanist organization.

Pan American (Sports) Games Quadrennial sports festival. The games, conceived in 1940 as an event for the nations of the Western Hemisphere, were first held in 1951. Patterned after the Olympic Games and sanctioned by the International Olympic Committee, the games are conducted by the Pan American Sports Organization (PASO), or Organización Deportiva Panamericana (ODEPA), headquartered in Mexico City. All major international sports and several more specialized events are included in the regular program. They are held the year preceding the Olympics, in various host cities.

Pan-American Highway International highway system connecting North and South America. Conceived in 1923 as a single route, the road grew to include a number of designated highways in participating countries, including the Inter-American Highway from Nuevo Laredo, Mex., to Panama City, Pan. The whole system, extending from Alaska and Canada to Chile, Argentina, and Brazil, totals nearly 30,000 mi (48,000 km). Only some 240 miles (400 km) in the Panama-Colombia border area remain uncompleted.

Pan-American Union Organization formed in 1890 to promote cooperation among the countries of Latin America and the U.S. It was established (as the International Union of American Republics) at the first Pan-American conference, which was called by U.S. secretary of state James Blaine in order to reach agreements on various common commercial and juridical problems among the countries of the Americas. In 1948 it was reconstituted as the Organization of American States.

Pan American World Airways, Inc. *known as* **Pan Am** Former U.S. airline. It was founded in 1927 by former World War I pilot Juan Trippe, who secured a contract to fly mail between Key West, Fla., and Havana. In 1929 Pan Am established passenger service to the Caribbean and Central America. It inaugurated the first transpacific flights (San Francisco to Manila) in 1936, the first transatlantic flights (New York City to Lisbon) in 1939, and the first round-the-world flights in 1947, and it pioneered commercial jet travel in the 1950s. Its business declined in the 1960s and '70s, and its acquisition of National Airlines in 1980 failed to improve its position. In 1988 a bomb planted aboard a Pan Am 747 caused the airliner to crash near Lockerbie, Scot., killing 270 people. Despite selling its Asian and South Pacific routes to United Airlines and its transatlantic, European, and Middle Eastern routes to Delta Air Lines, it was forced to declare bankruptcy in 1991. In the late 1990s another group bought the rights to the Pan Am name and began operating flights as Pan American Airways.

Pan-Arabism Nationalist notion of cultural and political unity among Arab countries. Its origins lie in the late 19th and early 20th centuries, when increased literacy led to a cultural and literary renaissance among Arabs of the Middle East. This contributed to political agitation and led to the independence of most Arab states from the Ottoman Empire (1918) and from the European powers (by the mid-20th century). An important event was the founding in 1943 of the Baʿth Party, which formed branches in several countries and became the ruling party in Syria and Iraq. Another was the founding of the Arab League in 1945. Pan-Arabism's most charismatic and effective proponent was Egypt's Gamal Abdel Nasser. After Nasser's death, Syria's Ḥāfiẓ al-Assad, Iraq's Ṣaddām Ḥussein, and Libya's Muammar al-Qaddafi tried to assume the mantle of Arab leadership.

Pan-Germanism Movement to politically unify all German-speaking people. The desire for German unification began in the early 19th century and was advanced by Ernst Arndt and other early nationalists. The Pan-German League was organized in 1894 by Ernst Hasse (1846–1908) to heighten German nationalist awareness, especially among German-speaking people outside Germany. The movement, which pressed for German expansion in Europe, gained support after World War I under the Weimar Republic and was actively promoted by Adolf Hitler and the Nazi Party. After Germany's defeat in 1945 and the expulsion of Germans from formerly German areas of eastern Europe, the movement declined.

Pan Gu *or* **P'an Ku** \'pän-'gü\ In Chinese Daoist legend, the first man. He came forth from Chaos (an egg) with two horns, two tusks, and a hairy body. He used his knowledge of yin-yang to separate heaven and earth, set the Sun, Moon, stars, and planets in place, and divide the four seas. He also shaped the earth by chiseling out valleys and stacking up mountains. Another legend says that the universe derived from Pan Gu's gigantic corpse. His eyes became the Sun and Moon, his blood formed rivers, his hair grew into trees and plants, and the human race sprang from parasites that infested his body. In art, he is often shown as a dwarf clothed with leaves.

Pan-Slavism Movement to unite Slav peoples of eastern and central Europe. It began in the early 19th century when Slav intellectuals studied their common cultures. Political goals for Slavic unity increased in 1848, when a Slav congress organized by FRANTIŠEK PALACKÝ met in Prague to press for equal rights under Austrian rule. In the 1860s the movement became popular in Russia, to which Pan-Slavs looked for protection from Turkish and Austro-Hungarian rule; this led Russia and Serbia into wars against the Ottoman Empire in 1876–77. In the 20th century, nationalist rivalries among the Slav peoples prevented their effective collaboration.

Pan-Turkism Political movement of the late 19th and early 20th centuries, which had as its goal the political union of all Turkic-speaking peoples in the OTTOMAN EMPIRE, Russia, China, Iran, and Afghanistan. The movement, which began among the Turks in the Crimea and on the Volga, initially sought to unite the Turks of the Ottoman and Russian empires against growing Russian domination. MUSTAFA KEMAL ATATÜRK, the father of the Republic of Turkey, later de-emphasized Pan-Turkism, encouraging Turkish nationalism only within Turkey. See also Ismail GASPRINSKI; ENVER PASHA; YOUNG TURKS.

Panaji \pä-'nä-jē\ *or* **New Goa** Town (pop., 2001 prelim.: 58,785), seaport, and capital of GOA, western India. It is on the Arabian Sea at the mouth of the Mandavi River. Panaji replaced Old Goa as the residence of the Portuguese viceroy in 1759 and as the capital of Portuguese India in 1843. It contains colonial houses and plazas and is a popular tourist attraction.

Panama *officially* **Republic of Panama** Country, CENTRAL AMERICA. It is bounded by the Caribbean Sea to the north and the Pacific Ocean to the south. Area: 28,973 sq mi (75,040 sq km). Population (2005 est.):

3,140,000. Capital: PANAMA CITY. Most of the people are of mixed heritage (primarily Indian-European and African-European). Languages: Spanish (official), English, indigenous Indian languages. Religion: Christianity (predominantly Roman Catholic; also other Christians). Currency: balboa. Panama consists of three distinct areas: the lowlands ("hot lands"; nearly nine-tenths of the country), the temperate lands, and the highlands ("cold lands"). It has a market economy based on services, mostly transportation, communications, and storage connected with the PANAMA CANAL as well as international banking and tourism. It is a republic with one legislative house; its head of state and government is the president, assisted by vice presidents. The land was inhabited by Indians when the Spanish arrived in 1501. The first successful Spanish settlement was founded by Vasco Núñez de BALBOA in 1511. Panama was part of the Viceroyalty of NEW GRANADA until it declared its independence from Spain in 1821 to join Colombia. In 1903 it revolted against Colombia and was recognized by the U.S., to whom it ceded the CANAL ZONE. The completed canal was opened in 1914; control of the canal passed to a joint U.S.-Panamanian commission in 1979. An invasion by U.S. troops in 1989 overthrew the de facto ruler, Gen. MANUEL NORIEGA. In 1999 the country elected its first female president, Mireya Moscoso, and later that year the canal came under the full control of Panama.

Panama Canal Lock-type canal, Panama. Extending across the Isthmus of Panama, it connects the Atlantic and Pacific oceans. It is about 50 mi (82 km) long from deepwater to deepwater, with an average depth of 43 ft (13 m). The width varies between 500 to 1,000 ft (150 to 300 m). In 1881 a French company began constructing the canal, but the enterprise collapsed in 1889. Under a 1903 treaty Panama granted the U.S. the Panama CANAL ZONE and the rights to build and operate a canal. Work began in 1904; facing enormous obstacles, GEORGE WASHINGTON GOETHALS directed the construction from 1907, and the canal opened on Aug. 15, 1914. The canal enabled ships traveling between the two oceans to avoid the lengthy circumnavigation of South America and was a boon to world commerce. After disputes over sovereignty, a 1977 treaty provided for Panama to take control of the canal by 2000; it did so in 1999. Except for small craft, no vessel can pass through the canal under its own power. Ships are towed by electric locomotives, and it generally takes 15–20 hours to complete the passage (including waiting time). Sets of double locks enable ships to pass in opposite directions simultaneously.

Panama Canal Zone See CANAL ZONE

Panama City City (pop., 2000: 415,964), capital of Panama. Near the Pacific Ocean entrance of the PANAMA CANAL, on the Bay of Panama, the site was originally an Indian fishing village. The old city was founded in 1519 but was completely destroyed by British buccaneer HENRY MORGAN in 1671. It was rebuilt in 1674 just west of the old site. In 1751 the area became part of the Viceroyalty of NEW GRANADA and later part of Colombia. It was the centre of the Panamanian revolt against Colombia in 1903, when it became the capital of Panama. After the canal opened in 1914, the city developed rapidly, becoming the commercial and transportation centre of the country. The economy depends largely on revenue from canal traffic and associated services.

Panathenaea \ˌpan-ˌa-thə-'nē-ə\ In GREEK RELIGION, an Athenian festival of great antiquity. Originally an annual event, it was eventually celebrated every fourth year, probably in deliberate rivalry to the OLYMPIC GAMES. It consisted of the sacrifices and rites proper to the season (mid-August) in the cult of ATHENA, the city's protectress. Representatives of all the dependencies of ATHENS came to the Panathenaea. The great procession, made up of the heroes of the Battle of MARATHON, is the subject of the frieze of the PARTHENON. The participants offered Athena an embroidered robe and sacrificed animals; there were also poetry recitations (later replaced by a musical contest) and athletic competitions.

Panay \pə-'nī\ Island (pop., 2000: 3,643,016), westernmost of the Visayan group, central Philippines. It is surrounded by the Sibuyan, Visayan, and Sulu seas, and the Guimaras Strait separates it from NEGROS island. Roughly triangular in shape, it has an area of 4,446 sq mi (11,515 sq km). A rugged, almost unpopulated mountain range parallels its western coastline. Between the range and a hilly eastern portion, a densely populated, intensely farmed fertile plain extends north to south. The island's chief city is ILOILO.

Panchatantra \ˌpən-chə-'tən-trə\ *Sanskrit* **"Five Treatises" or "Five Chapters"** Collection of Indian beast fables written in Sanskrit that has had extensive circulation throughout the world. The original work, now lost, may have been written down between 100 BC and AD 500. A textbook for instructing three sons of a king, it contained aphorisms that glorify shrewdness and cleverness over altruism. As early as the 11th century one version reached Europe, where it was known as *The Fables of Bidpai* (for the narrator, an Indian sage).

panchayat \pən-'chä-yət\ **raj** In India, government by the village council, or *panchayat*. When India gained its independence, it was stated that the government "should take steps to organize village *panchayat*s." The first *panchayat* was inaugurated in 1959 in Rajasthan, and in 1993 the *panchayat* institution was incorporated into the Indian Constitution. Their members are elected, and one-third of them are required to be women. Scheduled castes (formerly *UNTOUCHABLES*) and tribes are also guar-

© 2006 Encyclopædia Britannica, Inc.

anteed representation in proportion to their population. Today the role and success of the *panchayat*s are still the topic of heated discussion. See also INDIAN NATIONAL CONGRESS.

Panchen Lama \'pän-chən-'lä-mə\ Any of the line of reincarnated LAMAS who head the Tashilhunpo Monastery in TIBET, traditionally second only to the DALAI LAMA in spiritual authority in the dominant sect of TIBETAN BUDDHISM. A Panchen Lama installed by the Chinese Nationalist government in 1949 later became an official under the Chinese communists. He remained in Tibet after the 14th Dalai Lama fled into exile in 1959 but was imprisoned in 1964 after criticizing the government. He was released in the late 1970s and died in 1989. The Dalai Lama and government subsequently chose different successors.

pancreas \'paŋ-krē-əs\ Compound GLAND functioning as both an exocrine (secreting through a duct) and an endocrine (ductless) gland. It continuously secretes pancreatic juice (containing water, bicarbonate, and enzymes needed to digest carbohydrates, fat, and protein) through the pancreatic duct to the DUODENUM. Scattered among the enzyme-producing cells are the ISLETS OF LANGERHANS, which secrete INSULIN and glucagon directly into the bloodstream. Disorders include inflammation (PANCREATITIS), INFECTIONS, TUMOURS, and CYSTS. If more than 80–90% of the pancreas must be removed, the patient will need to take insulin and pancreatic extracts. See also DIABETES MELLITUS; HYPOGLYCEMIA.

pancreatic cancer Malignant TUMOUR of the PANCREAS. Risk factors include smoking, a diet high in fat, exposure to certain industrial products, and diseases such as diabetes and chronic pancreatitis. Pancreatic cancer is more common in men. Symptoms often do not appear until pancreatic cancer is advanced; they include abdominal pain, unexplained weight loss, and difficulty digesting fatty foods. Surgery, radiation therapy, chemotherapy, or some combination of these may be used to treat the disease.

pancreatitis \ˌpaŋ-krē-ə-'tī-təs\ INFLAMMATION of the PANCREAS, associated with alcohol, trauma, or pancreatic-duct obstruction. Activated enzymes escaping into pancreatic tissues cause irritation and inflammation. If it does not subside, bleeding, tissue death and scarring, pus formation, and infection may occur. Symptoms include severe pain (worst when lying on the back), low fever, nausea, and HYPERTENSION. Acute cases are treated by controlling pain, preventing or relieving shock, inhibiting pancreatic-juice secretion (including eliminating oral intake of food), avoiding infection, and replacing lost fluids and salts. Chronic pancreatitis can destroy enough of the pancreas to cause pancreatic-juice deficiency and DIABETES MELLITUS. Treatment may include a low-fat diet, avoiding overeating and alcohol, pancreatic extracts, and INSULIN.

panda *or* **giant panda** Species (*Ailuropoda melanoleuca*, family Ursidae) of white-and-black forest-dwelling CARNIVORE, found in central China, that subsists almost exclusively on bamboo. Because they cannot digest cellulose, wild pandas (of which there are about 1,600) spend as much as 16 hours a day eating up to 40 lb (18 kg) of bamboo leaves, stems, and shoots to obtain needed nutrients. More than 120 individuals live in captivity, mostly in China. Large males may attain 6 ft (1.8 m) in length and weigh more than 220 lb (100 kg); females are usually smaller. Giant pandas live alone except when breeding. They have a slow reproductive cycle and are difficult to breed in captivity.

Giant panda (*Ailuropoda melanoleuca*)
TOM MCHUGH/PHOTO RESEARCHERS

panda, lesser *or* **cat bear** *or* **bear cat** Long-tailed nocturnal raccoonlike carnivore (*Ailurus fulgens*, family Procyonidae) that inhabits high mountain forests in the Himalayas and adjacent eastern Asia. It is 20–26 in. (50–65 cm) long, excluding the 12–20-in. (30–50-cm) bushy, faintly ringed tail. It weighs 6–10 lbs (3–4.5 kg) and has soft, thick, reddish brown fur. The face is white, with a red-brown stripe from the eyes to the mouth. It eats plants, especially bamboo, and fruits and insects. Though an agile climber, it mostly feeds while on the ground.

Pandora In GREEK MYTHOLOGY, the first woman. After PROMETHEUS stole fire from heaven and bestowed it on mortals, ZEUS decided to counteract this blessing and commissioned HEPHAESTUS to fashion a woman out of earth, upon whom the gods bestowed their choicest gifts. After marrying Prometheus's brother, Pandora opened a jar containing all kinds of misery and evil, which escaped and flew out over the earth. In one version, Hope alone remained inside, the lid having been shut before she could escape.

panegyric \ˌpa-nə-'jir-ik\ Eulogistic oration or laudatory discourse. The panegyric originally was a speech delivered at an ancient Greek general assembly (*panegyris*), such as the Olympic and Panathenaic festivals. Speakers frequently advocated Hellenic unity by expounding on the former glories of Greek cities; hence the elaborate and flowery connotations of the term. Later Roman speakers praised and flattered eminent persons, especially emperors, in panegyrics. The form was also used in the European Middle Ages, Renaissance, and Baroque era.

Pangea \pan-'jē-ə\ *or* **Pangaea** Hypothetical protocontinent proposed by ALFRED WEGENER in 1912 as part of his theory of CONTINENTAL DRIFT. Pangea (from Greek: *pangaia*, "all earth") supposedly covered about half the Earth and was completely surrounded by a world ocean called Panthalassa. Late in the TRIASSIC PERIOD (248–206 million years ago), Pangea began to break apart. Its segments, LAURASIA (composed of all the present-day northern continents) and GONDWANA (the present-day southern continents) gradually receded, resulting in the formation of the Atlantic Ocean.

Pangkor Engagement \'päŋ-ˌkȯr\ (1874) Treaty between the British government and Malay chiefs, named for the island where it was signed. In return for British backing in a complicated Perak succession dispute, Raja Abdullah accepted a British resident (adviser) with broad powers at his court, the first step in the establishment of British dominion over the Malay states.

pangolin \'paŋ-gə-lən\ *or* **scaly anteater** Any of about eight species of armoured placental MAMMALS (genus *Manis*, order Pholidota) of tropical Asia and Africa. Scales formed of cemented hairs cover the upper body, legs, and tail. Pangolins are 2–6 ft (60–180 cm) long and weigh 10–60 lb (5–27 kg). They have a conical head, no teeth, a long tongue, short legs, and a long prehensile tail. Some are arboreal; terrestrial species live in burrows. Nocturnal animals, pangolins locate prey, mainly termites, by smell and rip open nests with their front claws. When threatened, the pangolin (Malayan for "rolling over") curls up or emits an odoriferous secretion. See also ANTEATER; ECHIDNA.

panic In economics, a severe financial disturbance, such as widespread bank failures, feverish stock speculation followed by a market crash, or a climate of fear caused by economic crisis or anticipation of such a crisis. The term is applied only to the initial, violent stage of financial upheaval rather than the whole decline in the BUSINESS CYCLE (see DEPRESSION and RECESSION). Until the 19th century, economic fluctuations were largely connected with shortages of goods, market expansion, and speculation (as in the SOUTH SEA BUBBLE). Panics in the industrialized societies of the 19th–20th centuries have reflected the increasing complexity of advanced economies. The Panic of 1857 in the U.S. had its seeds in the railroads' defaulting on their BONDS and in the decline in the value of railroad SECURITIES; its effects were complex, including not only the closing of many banks but also severe unemployment in the U.S. and a money-market panic in Europe. The Panic of 1873, which began with financial crises in Vienna and New York, marked the start of a long-term contraction in the world economy. The most infamous panic began with the U.S. stock-market crash of 1929 (see GREAT DEPRESSION).

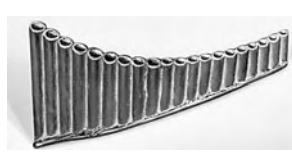
Pankhurst, Emmeline *orig.* **Emmeline Goulden** (b. July 14, 1858, Manchester, Eng.—d. June 14, 1928, London) British feminist. In 1879 she married Richard Pankhurst (1834–98), author of Britain's first

© 2006 Encyclopædia Britannica, Inc.

women's-suffrage bill and the Married Women's Property Acts (1870, 1882). In 1889 she founded the Women's Franchise League, which in 1894 secured for married women the right to vote in local elections. In 1903, after holding municipal offices in Manchester, she founded the Women's Social and Political Union (WSPU). From 1912 she advocated extreme militancy, mainly in the form of arson, and was arrested 12 times in one year. Weeks before her death in 1928, Britain passed a bill to give voting rights to all women. Her daughter Christabel H. Pankhurst (1880–1958)—later Dame Christabel—organized the militant tactics of the WSPU and directed actions that included hunger strikes and huge outdoor rallies. She later became a religious evangelist and moved to the U.S.



Pannini \pän-'nē-nē**, Giovanni Paolo** *or* **Giovanni Paolo Panini** (b. 1691, Piacenza, Duchy of Parma and Piacenza—d. 1765, Rome) Italian painter. After gaining fame for his fresco painting, he specialized in Roman topography and became the foremost artist in that field in the 18th century. His real and imaginary views of ancient Roman ruins embody precise observation and tender nostalgia and combine elements of late classical BAROQUE art with incipient ROMANTICISM. His work was popular both with tourists and his peers: he was admitted to the Académie Française in 1732 and became its professor of perspective.

Pannonia Province, Roman Empire, corresponding to modern western Hungary and parts of eastern Austria, Slovenia, and northern Serbia and Montenegro. The original inhabitants were mainly Illyrians, with some Celts in the western part. Conquered by Rome beginning in 35 BC, the people of Pannonia revolted in AD 6, posing the greatest threat to the empire since HANNIBAL's invasion. Pannonia was split in AD 106, and Pannonia Superior became a centre of the Roman wars under MARCUS AURELIUS. The Romans withdrew from the area after 395.

Panofsky \pə-'nōf-skē**, Erwin** (b. March 30, 1892, Hannover, Ger.—d. March 14, 1968, Princeton, N.J., U.S.) German-born U.S. art historian. A professor at the University of Hamburg (1926–33), he fled Nazi Germany for the U.S. and in 1935 began teaching at Princeton's Institute for Advanced Study. He gained prominence for his studies in iconography, the study of symbols and themes in works of art. His writings are distinguished by their variety of subjects, critical penetration, erudition, and rich allusions to literature, philosophy, and history. Among his major works are the groundbreaking *Studies in Iconology* (1939), *Albrecht Dürer* (1943), and *Early Netherlandish Painting* (1953).

panorama Narrative scene or landscape painted to conform to a curved or flat background, which surrounds or is unrolled before the viewer. Popular in the late 18th and 19th centuries, it was an antecedent of the stereopticon and motion pictures. The true panorama is exhibited on the walls of a large cylinder, and the viewer stands on a platform in the cylinder's centre and turns around to see all points of the horizon. The first panorama, a view of Edinburgh, was executed in 1788 by the Scottish painter Robert Barker (1739–1806). In the mid-19th century the rolled panorama became popular: a painting on canvas was wound between two poles and slowly unrolled behind a frame or revealed in sections.

panpipe *or* **syrinx** Wind instrument consisting of pipes of different lengths made of cane (less often wood, clay, or metal) arranged in a row. It is blown across the top, each pipe producing a different note. The panpipe dates from c. 2000 BC and is found worldwide, especially in eastern Africa, South America, and Melanesia.

Romanian panpipe; in the Horniman Museum, London
COURTESY OF THE HORNIMAN MUSEUM, LONDON

p'ansori *Korean* **"story singing"** A form of sung folk narrative. The form seems to have originated during the reign of Sukchong (1675–1720). Once a narrative performance that incorporated shamanistic chants, *p'ansori* became a vehicle for treating popular customs and everyday life. Six of the original 12 titles were revised by the master *p'ansori* writer Sin Chaehyo, of which five are still performed.

pansy Any of several popular cultivated VIOLETS (genus *Viola*). Pansies have been grown for so long under such diverse conditions with such striking variations in colour and form that their origin is uncertain. Probably the garden pansy (*V. wittrockiana*) is a cultivated form of *V. tricolor*, a weed of European grainfields. Annuals or short-lived perennials, pansies grow 6–12 in. (15–30 cm) tall and have heart-shaped leaves at the base and oblong leaves growing from the stems. Velvety flowers occur in combinations of blue, yellow, and white. The smaller, usually purple, wild pansy is also known as Johnny-jump-up, heartsease, and love-in-idleness.

Pansy (*Viola tricolor*)
KITTY KOHOUT/ROOT RESOURCES

pantheism Doctrine that the universe is God and, conversely, that there is no god apart from the substance, forces, and laws manifested in the universe. Pantheism characterizes many Buddhist and Hindu doctrines and can be seen in such Hindu works as the VEDAS and the BHAGAVADGITA. Numerous Greek philosophers contributed to the foundations of Western pantheism. In the Middle Ages and the Renaissance, the tradition was continued in NEOPLATONISM and Judeo-Christian MYSTICISM. In the 17th century BENEDICT DE SPINOZA formulated the most thoroughly pantheistic philosophical system, arguing that God and Nature are merely two names for one reality.

Pantheon Building in Rome begun 27 BC, probably as an ordinary rectangular Classical temple, and completely rebuilt by HADRIAN (c. AD 118–128). It is remarkable for its size and design; the exact method of construction has never been determined. A circular building of concrete faced with brick, it has a great concrete dome, 142 ft (43 m) in diameter, and a front porch of Corinthian columns with a triangular pediment. The vast space is lit solely by the 27-ft (8-m) oculus at the dome's centre. The interior is lined with coloured marble, and the walls are marked by seven deep recesses screened by pairs of columns.

Pantheon, Rome, begun by Agrippa in 27 BC, completely rebuilt by Hadrian c. AD 118–c. 128.
FREDERICO ARBORIO MELLA

panther See COUGAR, LEOPARD

pantomime See MIME AND PANTOMIME

pantothenic \ˌpan-tə-'the-nik, ˌpan-tə-'thē-nik\ **acid** Organic compound, essential in animal METABOLISM. The nature of the bound form was clarified through the discovery and synthesis (1947–50) of the compound pantetheine, which contains pantothenic acid combined with the compound thioethanolamine. Pantetheine is part of two larger compounds (COENZYME A and acyl-carrier protein) that promote a large number of metabolic reactions essential for the growth and well-being of animals. A dietary deficiency severe enough to lead to clear-cut disease has not been described in humans; however, when a person is severely malnourished, deficiency of the vitamin appears to contribute to the observed weakness and mental depression.

Pánuco River \'pä-nü-ˌkō\ River, central Mexico. Rising in HIDALGO state and flowing northeast into the Gulf of Mexico below TAMPICO, it is about 100 mi (160 km) long and has considerable economic importance. It has served to drain TEXCOCO and other interior lakes via a system of tunnels and channels. Its waters are used to irrigate the fertile La Huasteca lowlands, and its lower course is navigable.

panzer \'pan-zər, 'pänt-sər\ **division** (German *panzer*, "armoured") Self-contained MILITARY UNIT of the German army, built around the capabilities of ARMOURED VEHICLES. In World War II, it consisted of a tank brigade with four battalions; a motorized infantry brigade with four rifle battalions; an artillery regiment; and reconnaissance, antitank, and military-engineering battalions and service units. Germany had six panzer divisions in 1939 and 20 by 1941. It remains the principal offensive element of the German army.

Paoli \'paù-lē**, Pasquale** (b. April 26, 1725, Stretta di Morosaglia, Corsica—d. Feb. 5, 1807, London, Eng.) Corsican patriot. Son of Giacinto Paoli, who led the Corsicans against Genoa in 1735, he lived with his father in exile in Naples (1739–55). On his return, he overcame the Genoese faction and was elected to rule Corsica. He suppressed the vendetta system, substituted order and justice, and instituted national schools. He continued the fight for independence, but after France invaded Corsica in 1769 he fled to England, where he lived until 1790. Recalled to Corsica as military commandant, he expelled the French with British naval support (1794) and offered the island's sovereignty to England. He retired to England in 1795.

Paolo, Giovanni di See Giovanni di Paolo

Pap smear *or* **Papanicolaou** \ˌpäp-ə-'nē-kə-ˌlaù\ **smear** Sample of cells from the vagina and cervix of the uterus for laboratory staining and examination to detect genital herpes and early-stage cancer, especially of the cervix. Developed by the Greek-born U.S. physician George Nicolas Papanicolaou (1883–1962), this technique also can be applied to cells obtained from other surfaces.

papacy \'pā-pə-sē\ System of central government of the Roman Catholic church. Bishops led the early church, the bishop of Rome being accorded special respect by the end of the 1st century AD in part because of the belief that St. Peter was the first bishop of that city. St. Cyprian challenged that position of honour in the 3rd century, and in the 4th–5th century the power of the see of Constantinople rose to challenge that of Rome; the rivalry would culminate in the Schism of 1054 between the Eastern and Western churches. After the collapse of the Roman Empire, the papacy found protection under the wing of Charlemagne and his successors; in the 9th–10th century the German emperors controlled it. In 1059 Pope Nicholas II responded by vesting the right to name a new pope exclusively with the College of Cardinals. To establish the papacy's supremacy in Christian society, Gregory VII excommunicated Henry IV of Germany for disobedience to papal commands and decreed that civil rulers could not invest churchmen with temporal power (see Investiture Controversy). In the next centuries, the papacy developed into one of the most important and influential institutions in Europe, and Urban II, Innocent III, and Gregory IX were among the most significant popes of the period. The worldliness and corruption of the papal court that emerged at the same time and the "Babylonian Captivity" of the papacy at Avignon (see Avignon papacy) led to the Western Schism and eventually to the Reformation. The Council of Trent inaugurated the Counter-Reformation. In the 19th century the papacy lost its remaining temporal powers when the Papal States were incorporated into the new Kingdom of Italy. It maintained a conservative religious position, proclaiming infallibility in doctrinal matters and espousing the idea that the pope is the absolute ruler of the church. The Second Vatican Council gave the bishops, clergy, and laity more voice. See also Roman Catholicism.

Papago \'pä-pə-ˌgō\ *or* **Tohono O'odham** North American Indian people linving mostly in a region straddling the U.S.-Mexico border. Their language belongs to the Uto-Aztecan language stock. They rejected the name Papago, from a Piman word *papahvi-o-otam* meaning "bean eaters," in the 1980s; they call themselves Tohono O'odham, meaning "Desert People." Closely related to the Pima, they probably descend from ancient Hohokam peoples. On their traditional territory, vast stretches of desert regions of Arizona, U.S., and northern Sonora, Mex., the Papago practiced food gathering and flash-flood farming. Because of the wide dispersal of their fields, their largest viable political unit was a group of temporarily related villages. They had less contact with whites than other Indian groups and have retained elements of their traditional culture. They number some 15,000.

Papal Curia See Roman Curia

papal infallibility In Roman Catholicism, the doctrine that the pope, acting as supreme teacher and under certain conditions, as when he speaks *ex cathedra* ("from the chair"), cannot err when he teaches in matters of faith or morals. It is based on the belief that the church, entrusted with the teaching mission of Jesus, will be guided by the Holy Spirit in remaining faithful to that teaching. The First Vatican Council (1869–70) stated the conditions under which a pope may be said to have spoken infallibly: he must intend to demand irrevocable assent from the entire church in some aspect of faith or morals. The doctrine remains a major obstacle to ecumenical endeavours and is the subject of controversy even among Roman Catholic theologians.

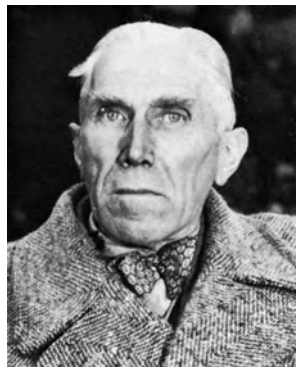
Papal Inquisition See Inquisition

Papal States *Italian* **Stati Pontifici** \'stä-tē-pōn-'tē-fē-chē\ Territories of central Italy over which the pope had sovereignty from 756 to 1870. The extent of the territory and the degree of papal control varied over the centuries. As early as the 4th century, the popes had acquired considerable property around Rome (called the Patrimony of St. Peter). From the 5th century, with the breakdown of Roman imperial authority in the West, the popes' influence in central Italy increased as the people of the area relied on them for protection against the barbarian invasions. When the Lombards threatened to take over the whole peninsula in the 750s, Pope Stephen II (or III) appealed for aid to the Frankish ruler Pippin III (the Short). On intervening, Pippin "restored" the lands of central Italy to the Roman see, ignoring the claim of the Byzantine (Eastern Roman) Empire to sovereignty there. This Donation of Pippin (754) provided the basis for the papal claim to temporal power. More land was gained when the papacy acquired the duchy of Benevento in 1077, and Popes Innocent III and Julius II further expanded the papal domain. The rise of communes and rule by local families weakened papal authority in the towns, and by the 16th century the papal territory was one of a number of petty Italian states. They were an obstacle to Italian unity until 1870, when Rome was taken by Italian forces and became the capital of Italy. In 1929 the Lateran Treaty settled the pope's relation to the Italian state and set up an independent city-state (see Vatican City).

Papandreou \ˌpä-pän-'drā-ü**, Andreas (Georgios)** (b. Feb. 5, 1919, Chios, Greece—d. June 23, 1996, Ekáli, near Athens) Greek educator and prime minister (1981–89, 1993–96). Son of Georgios Papandreou, he taught at the University of California, Berkeley (1955–63), then returned to Greece when his father became premier (1963) and was elected to the Greek parliament. After the military coup in 1967 he went into exile. He returned in 1974 to form the left-wing Panhellenic Socialist Movement (Pasok). The party gained a majority in 1981, and Papandreou became premier. He promoted generous social-welfare programs, but his government was weakened by financial scandals and mounting budget deficits, and he resigned in 1989 but remained the leader of Pasok. He again became prime minister in 1993, but ill health forced him to retire in 1996.

Papandreou, Georgios (b. Feb. 13, 1888, Kaléntzi, Greece—d. Nov. 1, 1968, Athens) Greek prime minister (1944, 1963, 1964–65). He began his political career as a liberal in 1915 and served as minister of education (1929–33). In 1935 he founded the Democratic Socialist Party, then went into exile. He briefly headed a coalition government in 1944, then held ministerial posts (1946–52). He merged his party with the Liberal Party and formed the Centre Union in 1961. As prime minister in 1964 he introduced far-reaching social reforms, but he was dismissed by the king in 1965. After the military coup in 1967, he was jailed briefly with his son, Andreas Papandreou.

papaw *or* **pawpaw** \'pä-ˌpó\ Deciduous tree or shrub (*Asimina triloba*) of the custard apple family, native to the eastern and midwestern U.S. It can grow to 40 ft (12 m) tall and has pointed, broadly oblong, drooping leaves up to 12 in. (30 cm) long. The purple flowers bloom with a foul odour before the leaves emerge in spring. The edible fruit looks like a stubby banana; its skin turns black as it ripens. Handling papaw fruits produces a skin reaction in allergic individuals. The name is also sometimes applied to the papaya.



papaya \pə-'pī-ə\ Large palmlike plant (*Carica papaya*; family Caricaceae), cultivated throughout the tropics and warm subtropics, and its succulent juicy fruit. A popular breakfast fruit in many countries, it is also used in salads, pies, sherbets, juices, and confections. The juice of the unripe fruit contain an enzyme that is useful in various remedies for indigestion and in meat tenderizers.

Papeete \ˌpä-pā-'ā-tā\ Seaport (pop., 1996: 25,353), capital of French Polynesia. It is located on the northwestern coast of Tahiti. A tropical city with tall palms and exotic flowers, it is one of the largest urban and commercial centres in the South Pacific. By 1829 its excellent harbour made it a place of trade and a port of call for whalers. In 1880 it was annexed by the French, and it became a commune in 1890. It is a major tourist base and a centre for Pacific Rim trade.

Papen \'pä-pən**, Franz von** (b. Oct. 29, 1879, Werl, Ger.—d. May 2, 1969, Obersasbach, W.Ger.) German politician. He served as military attaché in Washington, D.C. (1913–15), but was recalled on espionage

© 2006 Encyclopædia Britannica, Inc.

charges. A monarchist member of the German Reichstag (1921–32), he was chosen chancellor in 1932, but he was soon ousted by Kurt von Schleicher. In revenge, Papen persuaded Paul von Hindenburg to appoint Adolf Hitler as chancellor and himself as vice chancellor. Papen resigned in 1934 when he was unable to restrain the Nazis' push for power. As ambassador to Austria (1934–38), he worked for Austria's annexation to Germany. He was ambassador to Turkey (1939–44). Arrested in 1945, he was tried and acquitted at the Nürnberg trials; sentenced to prison by a German court as a Nazi, he was released on appeal in 1949.

Papen
CAMERA PRESS

paper Matted or felted sheet, usually made of cellulose fibres, formed on a wire screen from water suspension. Source materials include wood pulp, rags, and recycled paper. The fibres are separated (by processes that may be mechanical, chemical, or both) and wetted to produce paper pulp, or stock. The pulp is filtered on a woven screen to form a sheet of fibre, which is pressed and compacted to squeeze out most of the water. The remaining water is removed by evaporation, and the dry sheet is further compressed and often (depending on the intended use) coated or infused with other substances. Types of paper in common use include bond paper, book paper, bristol (or bristol board), groundwood and newsprint, kraft paper, paperboard, and sanitary paper (for towels, napkins, etc.). See also calendering; Fourdrinier machine; kraft process.

paper birch Ornamental, shade, and timber tree (*Betula papyrifera*) of the birch family, native to northern and central North America. Also called canoe birch, silver birch, or white birch, it is one of the best-known birches. The smooth, varicolored or white bark of young trees peels horizontally in thin sheets, which once were used as writing surfaces as well as for roofing, canoes, and shoes. The water-impervious bark, which burns even when wet, is a boon to campers and hikers.

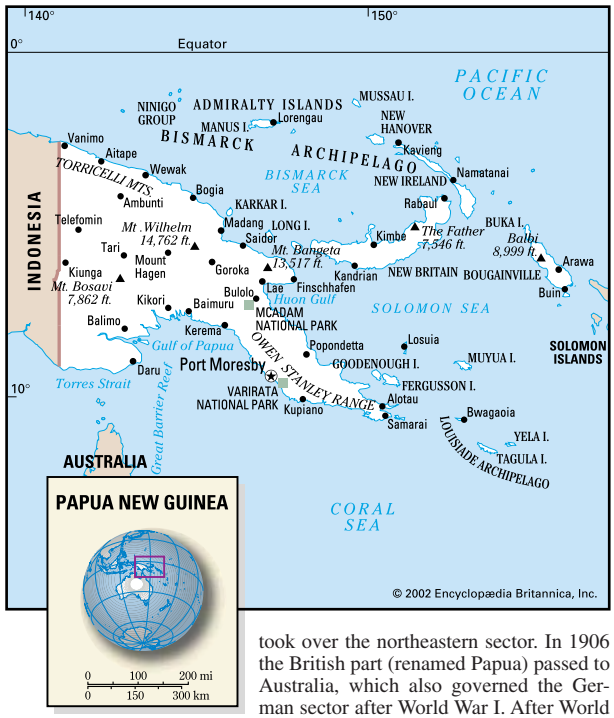
paper chromatography (PC) Type of chromatography using filter paper or other special paper as the stationary phase. Spots of sample and reference materials are applied, usually as liquids, near one edge (or corner, for two-dimensional PC) of the paper. The edge of the paper is dipped in a solvent, which travels along it by capillarity, moving the components of the sample at rates depending on their relative solubilities in the solvent. In two-dimensional PC, the paper is then turned 90° and the new edge dipped in a different solvent. The components of the sample mixture, visible as separated spots, are identified by comparing the distances they have traveled with those of the known reference materials. PC is especially useful for complex mixtures of amino acids, peptides, carbohydrates, steroids, and many other organic compounds and inorganic ions.

paper folding *Japanese* **origami** Art of folding objects out of paper without cutting, pasting, or decorating. Its early history is unknown, but it seems to have developed from the older art of folding cloth. Origami has reached its greatest development in Japan, with hundreds of traditional folds and an extensive literature dealing with the art. There are two types of Japanese folds: figures used in ceremonial etiquette, and objects such as animals, flowers, furniture, and human figures. Some objects have amusing action features; best known is the bird that flaps its wings when its tail is pulled. Paper folding has also flourished in Spain, South America, and Germany.

Paphlagonia Ancient district, northern Anatolia, on the Black Sea. A mountainous country, one of the oldest in Anatolia, it submitted to Alexander the Great in 333 BC. In the 3rd–2nd century BC it was gradually absorbed by the Pontic kingdom on its eastern border. In 65 BC the coastal districts, including the capital, Sinope, were attached to Roman Bithynia. The area was incorporated into the Roman province of Galatia in c. 6 BC; the interior regions were left under native rulers. It was part of the Byzantine Empire, and all but its coastal regions were lost to invading Turkish peoples after the Battle of Manzikert (1071).

papillomavirus \ˌpa-pə-ˈlō-mə-ˌvī-rəs\ Any of a group of viruses that cause warts and other harmless tumours in humans. More than 100 distinct types are known. Different types are responsible for warts of the hands, plantar warts (of the feet), and throat warts. Genital warts are caused by other types, which are spread by sexual intercourse. Some types of papillomaviruses that cause genital infections have been linked with various cancerous tumours, especially cervical cancers; their presence can be detected through a Pap smear.

papillon \ˌpä-pē-ˈyōⁿ\ Breed of toy dog known from the 16th century, when it was called a dwarf spaniel. A favorite of Marie-Antoinette, it appeared in paintings by Old Masters. It acquired its name (French for "butterfly") in the late 19th century, when a variety with large, flaring ears became fashionable. Another variety has drooping ears. A slender, graceful dog with a plumed tail, it stands 11 in. (28 cm) or less and weighs up to 11 lbs (5 kg). The soft, full coat is usually white, with darker patches.



Papineau \pä-pē-ˈnō**, Louis Joseph** (b. Oct. 7, 1786, Montreal, Que.—d. Sept. 23, 1871, Montebello, Que., Can.) Canadian politician. He was elected to the legislative assembly of Lower Canada (now Quebec) in 1808 and became its speaker in 1815. A leader of the French-Canadian Party, he opposed the British-dominated government of Lower Canada. In 1834 he helped draft the 92 Resolutions, a statement of French-Canadian demands and grievances. When the British governor rejected the resolutions, hostilities broke out. Papineau escaped to the U.S. and then to France, where he lived from 1839 to 1844. He returned to Canada under an amnesty in 1844 and served in the Canadian House of Commons from 1848 to 1854, though he never regained his leadership of the French-Canadians.

Papp, Joseph *orig.* **Joseph Papirofsky** (b. June 22, 1921, Brooklyn, N.Y., U.S.—d. Oct. 31, 1991, New York, N.Y.) U.S. theatrical producer and director. He studied acting and directing and worked as a stage manager for CBS television. In 1954 he founded the New York Shakespeare Festival, which gave free performances of Shakespeare's plays in city parks. He produced and directed most of the plays; in 1962 the Delacorte Theatre in Central Park was built as the company's permanent home. In 1967 he founded the New York Shakespeare Festival Public Theatre, which concentrated on contemporary and experimental dramas. Several productions traveled to Broadway, including *Hair* (1967) and *A Chorus Line* (1975). Papp remained one of Off-Broadway's most active producers into the 1980s. He served as artistic director of the Shakespeare Festival and the Public Theatre until his death.

Papua *formerly* **Irian Jaya** Province (pop., 2000 prelim.: 2,220,934), Indonesia. It includes the western half of the island of New Guinea and its offshore islands and the Schouten and Raja Ampat island groups. The Maoke Mountains rise to 16,503 ft (5,030 m) at Puncak Jaya. First sighted by the Portuguese in 1511, Papua was claimed by the Dutch in 1828. It was transferred to Indonesia in 1963 and was made a province in 1969, with its capital at Jayapura. Rebels led a separatist movement there in the late 1990s, and Papua achieved greater autonomy in 2001.

Papua New Guinea \ˈpa-pyù-wə...ˈgi-nē\ *officially* **Independent State of Papua New Guinea** Island country, southwestern Pacific Ocean. Area: 178,704 sq mi (462,840 sq km). Population (2005 est.): 5,887,000. Capital: Port Moresby. Most of the people are Papuan (four-fifths) and Melanesian; ethnic minorities are Polynesian, Chinese, and European. Languages: English (official), Tok Pisin, Motu, indigenous languages. Religions: Christianity (Protestant, Roman Catholic); also traditional beliefs. Currency: kina. The island of New Guinea constitutes about seven-eighths of the total land area of Papua New Guinea; the country also includes Bougainville Island and the Bismarck Archipelago. The New Guinea terrain ranges from swampy lowland plains in the south and north to high central mountains (the highlands) in the northwest and southeast. Much of the land is covered with tropical rainforest. Some of the outlying islands are volcanic. The country has a developing mixed economy based largely on subsistence agriculture and the export of minerals. It is a constitutional monarchy with one legislative house; its chief of state is the British monarch represented by the governor-general, and the head of government is the prime minister. The area has been inhabited since prehistoric times, and farming has been practiced since c. 7000 BC. The Portuguese sighted the coast in 1511, and the first European landing was about 1526–27. The first European colony was founded in 1793 by the British. In 1828 the Dutch claimed the western half as part of the Dutch East Indies. In 1884 Britain annexed the southeastern part and Germany

© 2006 Encyclopædia Britannica, Inc.

took over the northeastern sector. In 1906 the British part (renamed Papua) passed to Australia, which also governed the German sector after World War I. After World War II, Australia governed both sectors as the Territory of Papua and New Guinea. Dutch New Guinea was annexed to Indonesia in 1969. Papua New Guinea achieved independence in 1975 and joined the British COMMONWEALTH. By the mid-1990s the government of Papua New Guinea was seeking to resolve a long-standing conflict with Bougainville independence fighters, and in 2001 the two sides agreed on a peace treaty; Bougainville became an autonomous region in 2005.

Papuan \'pa-pyə-wən\ **languages** Group of about 750 languages spoken by indigenous peoples of New Guinea and parts of some neighbouring islands, including Alor, Bougainville, Halmahera, New Britain, New Ireland, and Timor. Spoken by perhaps five million people, Papuan languages belong to about 60 families, the higher genetic relationships of which are still uncertain. This diversity, conjoined with the numerous AUSTRONESIAN LANGUAGES spoken on smaller parts of New Guinea and on adjacent islands, makes the region the most linguistically heterogeneous area of the world. The vast majority of Papuan languages have fewer than 100,000 speakers; among those with more are Chimbu and Enga, spoken in the highlands of Papua New Guinea.

papyrus \pə-'pī-rəs\ Writing material of ancient times and the plant from which it comes, *Cyperus papyrus* (SEDGE FAMILY), also called paper plant. This grasslike aquatic plant has woody, bluntly triangular stems and grows to about 15 ft (4.6 m) high in quietly flowing water up to 3 ft (90 cm) deep. The ancient Egyptians used the stem of the plant to make sails, cloth, mats, cords, and principally paper. Paper made from papyrus was the chief writing material in ancient Egypt, Greece, and Rome. In the 8th–9th century AD, other plant fibres replaced papyrus in the manufacture of paper. The plant is now often used as a pool ornamental in warm areas or in conservatories.

Pará \pä-'rä\ **River** Channel of the AMAZON RIVER. It passes to the south and east of MARAJÓ ISLAND, in northeastern Pará state, northern Brazil, and is about 200 mi (320 km) long and 40 mi (64 km) wide at its mouth. It carries a small part of the discharge of the Amazon east and north to the Atlantic Ocean, and its entire length is navigable.

parabola \pə-'ra-bə-lə\ Open curve, one of the CONIC SECTIONS. It results when a right circular cone intersects a plane that is parallel to an edge of the cone. It is also the path of a point moving so that its distance from a fixed line (directrix) is always equal to its distance from a fixed point (focus). In ANALYTIC GEOMETRY its equation is $y = ax^2 + bx + c$ (a second-degree, or quadratic, POLYNOMIAL FUNCTION). Such a curve has the useful property that any line parallel to its axis of SYMMETRY reflects through its focus, and vice versa. Rotating a parabola about its axis produces a surface (paraboloid) with the same reflection property, making it an ideal shape for satellite dishes and reflectors in headlights. Parabolas occur naturally as the paths of projectiles. The shape is also seen in the design of bridges and arches.

Paracel \ˌpar-ə-'sel\ **Islands** *Chinese* **Xisha Qundao** *or* **Hsi-sha Ch'ün-tao** \'shē-ˌshä-'chün-'daù\ *Vietnamese* **Quan Dao Hoang Sa** \'kwän-'daù-'hwäŋ-'sä\ Group of about 130 small coral islands and reefs, South CHINA SEA, east of central Vietnam and southeast of HAINAN Island, China. The low, barren islands, none of which exceeds 1 sq mi (2.5 sq km) in area, lack fresh water, and there are no permanent human residents. In 1932 the islands were claimed by FRENCH INDOCHINA, and Japan occupied some of them during World War II. China, Taiwan, and Vietnam all claim them. In 1974 China assumed control, and they have remained a matter of contention.

Paracelsus \ˌpar-ə-'sel-səs\ *orig.* **Philippus Aureolus Theophrastus Bombastus von Hohenheim** (b. Nov. 11 or Dec. 17, 1493, Einsiedeln, Switz.—d. Sept. 24, 1541, Salzburg, Archbishopric of Salzburg) German-born Swiss physician and alchemist. He claimed to have received his doctoral degree at the University of Ferrara. He adopted the name "para-Celsus"—meaning "beyond CELSUS" (the Roman authority on medicine)—and wandered throughout Europe and the Middle East, studying with alchemists. He valued the common sense of common people more than the dry teachings of ARISTOTLE, GALEN, and AVICENNA and stressed nature's healing power. All were welcome at his lectures (which he gave in German, not Latin) at the University of Basel, but such broadmindedness scandalized the authorities, and eventually he was forced to flee the city. His written works include *Great Surgery Book* (1536). He anticipated by centuries the treatment of syphilis by mercury compounds, the realization that inhaled dust causes miners' SILICOSIS, and HOMEOPATHY, and he was the first to connect GOITRE with minerals in drinking water.

parachute Umbrella-like device for slowing the descent of a body falling through the atmosphere. Separate panels sewn together form a canopy attached by suspension lines to a harness worn by the user. Originally designed to provide a safe escape from a disabled aircraft, parachutes are also used for dropping supplies and for slowing returning space capsules. The parachute was conceived by the 14th century, but practical demonstrations began only in the 1780s in France, leading in 1797 to a 3,200-ft (1,000-m) exhibition jump from a balloon by André-Jacques Garnerin (1769–1823); in 1802 he made a jump of 8,000 ft (2,400 m). Early parachute material was canvas, which was later replaced by silk and then nylon. See also SKYDIVING.

Paraclete See HOLY SPIRIT

paradox Apparently self-contradictory statement whose underlying meaning is revealed only by careful scrutiny. Its purpose is to arrest attention and provoke fresh thought, as in the statement "Less is more." In poetry, paradox functions as a device encompassing the tensions of error and truth simultaneously, not necessarily by startling juxtapositions but by subtle and continuous qualifications of the ordinary meanings of words. When a paradox is compressed into two words, as in "living death," it is called an oxymoron.

paradoxes of Zeno \'zē-ˌnō\ Arguments by which ZENO OF ELEA upheld the doctrine of PARMENIDES that real Being is unique and unchanging. Zeno's arguments were aimed at discrediting the beliefs in plurality and motion that were inconsistent with Parmenides' doctrine. His best-known arguments are those against the reality of motion. One argument begins from the fact that a body in motion can reach a given point only after having traversed half the distance. But before traversing half, it must traverse half of this half, and so on ad infinitum; consequently, the goal can never be reached.

paraffin Paraffin WAX, a mixture of organic compounds traditionally derived from PETROLEUM but also obtained synthetically. It usually consists of alkane hydrocarbons (also called paraffins) and is used for coating and sealing, for candles, and in floor waxes, lubricants, waterproofing agents, and cosmetics. See also ALKANE.

© 2006 Encyclopædia Britannica, Inc.

ela, it has a low elevation, infertile soil, and a sparse population. It became important in the 1950s and '60s with the development of the petroleum industry. Pipelines lead from the oil fields to the large refineries on the western side of the peninsula, which is accessible to deep-draft tankers.

Paraguay \ˌpä-rä-'gwī,\ *English* \'par-ə-ˌgwā\ *officially* **Republic of Paraguay** Country, south-central South America. Area: 157,048 sq mi (406,752 sq km). Population (2005 est.): 5,905,000. Capital: Asunción.

Most Paraguayans are mestizos; there are much smaller groups of American Indians and people of African, European, and Asian ancestry. Languages: Spanish and Guaraní (both official). Religion: Christianity (predominantly Roman Catholic; also Protestant). Currency: guaraní. Paraguay is a landlocked country of plains and swampland. The Paraguay River, flowing from north to south, divides the country into two geographic regions: the eastern region, which is an extension of the Brazilian Plateau; and the western region, which forms the northern part of the Gran Chaco plains. Paraguay has a developing market economy that is based largely on agriculture, trade, and light industries. It is a republic with two legislative houses; its head of state and government is the president. Seminomadic tribes speaking Guaraní were in the area long before it was settled by Spain in the 16th–17th century. Paraguay was part of the Viceroyalty of the Río de la Plata until it became independent in 1811. It suffered from dictatorial governments in the 19th century and was devastated by the War of the Triple Alliance (1864, 1865–70), which it fought against Brazil, Argentina, and Uruguay. The Chaco War (1932–35), with Bolivia over territorial rights in the Gran Chaco, was settled primarily in Paraguay's favour by the peace treaty of 1938. Military governments, including that of Alfredo Stroessner, predominated from the mid-20th century until a civilian president, Juan Carlos Wasmosy, was elected in 1993. The country suffered from a financial crisis beginning in the late 1990s.

Paraguay River River, South America. The fifth largest river in South America, it is 1,584 mi (2,550 km) long and the principal tributary of the Paraná River. Rising in the Mato Grosso region of Brazil about 980 ft (300 m) above sea level, it crosses Paraguay to its confluence with the Paraná near the Argentine border. The Gran Chaco plain extends west from the river.

Paraguayan War See War of the Triple Alliance

Paraíba do Sul \ˌpä-rä-'ē-bə-dü-'sül\ **River** River, eastern Brazil. It is formed by the confluence of the Paraitinga and Paraibuna rivers east of São Paulo; it flows east-northeastward and forms part of the border between Minas Gerais and Rio de Janeiro states before emptying into the Atlantic Ocean after a course of about 700 mi (1,100 km). Its lower course is navigable, and it plays a vital role in Brazil's social and economic life.

parakeet Any of 115 species in 30 genera (subfamily Psittacinae) of small, slender seed-eating parrots with a long, tapering tail. Parakeets are found worldwide in warm regions. They typically form large flocks. Most species lay four to eight eggs in a tree hole. The most popular caged parakeet is the budgerigar (*Melopsittacus undulatus*), mistakenly called lovebird; about 8 in. (19 cm) long, it may be any colour but usually has cheek spots and close barring on the upper parts.

Budgerigar (*Melopsittacus undulatus*), a popular parakeet.
BRUCE COLEMAN LTD.

parallax \'par-ə-laks\ Difference in the direction of a celestial object as seen by observers from two widely separated points, a measurement used to find a body's distance. The two positions of the observers and that of the object form a triangle; its apex angle (at the object) is twice the parallax, which becomes smaller with increasing distance. Observations for calculating the Sun's parallax can be made simultaneously from two different places on Earth's surface; that value reaches a maximum of 8.794 seconds of arc for observers at points separated by Earth's diameter. Observing the difference in an object's position as seen from Earth at points six months apart in its orbit (stellar, or annual, parallax) allows measurements of distances (e.g., of stars) too large to be made from two places on Earth's surface. The nearest star system, Alpha Centauri, has a stellar parallax of 0.76 second of arc. Highly precise parallaxes, and thus the positions, of more than 100,000 stars in the Sun's vicinity were determined from data collected by the European Space Agency's Hipparcos satellite (launched 1989).

parallel bars Event in men's gymnastics in which a pair of wooden bars supported horizontally above the floor at the same height is used to perform acrobatic feats. Competitors combine swings and vaults with stationary positions requiring strength and balance, though swings and vaults must predominate. It has been included as an Olympic gymnastics event since the modern games began in 1896. See also uneven parallel bars.

Paul Hamm (U.S.) competes on the parallel bars during the 2004 Olympic Games in Athens.
EZRA SHAW/GETTY IMAGES

parallel evolution Evolution of geographically separated groups in such a way that they show physical resemblances. A notable example is the similarity between the marsupial mammals of Australia and placental mammals elsewhere, which have arrived at remarkably similar forms through the separate courses of their evolution.

parallel postulate One of the five postulates, or axioms, of Euclid underpinning Euclidean geometry. It states that through any given point not on a line there passes exactly one line parallel to that line in the same plane. Unlike Euclid's other four postulates, it never seemed entirely self-evident, as attested by efforts to prove it through the centuries. The uniqueness of Euclidean geometry, and the absolute identification of mathematics with reality, was broken in the 19th century when Nikolay Lobachevsky and János Bolyai (1802–60) independently discovered that altering the parallel postulate resulted in perfectly consistent non-Euclidean geometries.

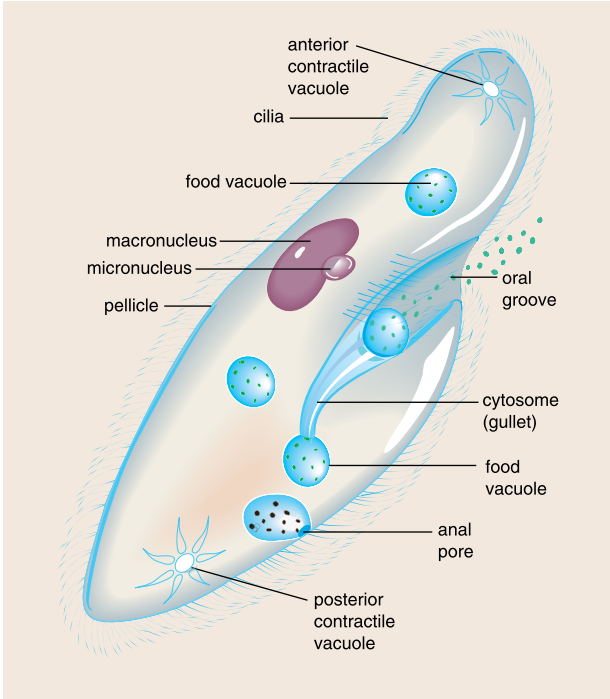
paralysis *or* **palsy** Loss or impairment of voluntary use of one or more muscles. It may be flaccid (with loss of muscle tone) or spastic (stiff). Hemiplegia (one-sided paralysis) is usually caused by stroke or brain tumour on the opposite side. Diplegia (two-sided paralysis, as in cerebral palsy) results from generalized brain disease. Spinal-cord damage (from

© 2006 Encyclopædia Britannica, Inc.

bone or joint disease, FRACTURE, or tumour affecting the vertebrae; inflammatory and degenerative diseases; or PERNICIOUS ANEMIA) paralyzes the body at and below the level of the damage (paraplegia if the legs and lower body only; quadriplegia if arms and legs). POLIOMYELITIS and polyneuritis (NEURITIS of multiple nerves) result in paralysis with muscle wasting. Bell palsy (a type of neuritis) paralyzes the muscles of one side of the face. MUSCULAR DYSTROPHY causes paralysis by attacking muscle. Metabolic causes include MYASTHENIA GRAVIS. Paralysis may also have psychiatric causes (see HYSTERIA).

paramagnetism Kind of MAGNETISM that occurs in materials weakly attracted by a strong magnet. Compounds containing iron, palladium, platinum, and the rare-earth elements exhibit strong paramagnetism because they have atoms with some incomplete inner ELECTRON shells. Their unpaired electrons make the atoms behave like tiny permanent magnets that align with and strengthen an applied MAGNETIC FIELD. As the temperature rises, strong paramagnetism decreases because of the greater random motion of the atoms. Weak paramagnetism, found in many solid metallic elements, is independent of temperature.

Paramaribo \ˌpä-rä-ˈmä-rē-bō\ City (pop., 1999 est.: 233,000), seaport, and capital of Suriname. Located on the SURINAME RIVER near the Atlantic Ocean, it was originally an Indian village before becoming a French settlement (c. 1640). In 1651 it became a British colony but was ceded to the Dutch in 1667. It is built on a shingle reef that stands 16 ft (5 m) above the river at low tide. Much of the distinctive Dutch colonial architecture and a canal system remain. Since 1945 the city has grown considerably because of tourism and industries.



paramecium \ˌpar-ə-ˈmē-sē-əm\ Any of the free-living, single-celled PROTOZOANS that make up the genus *Paramecium*. Most are about the size of the period at the end of this sentence. They vary in shape and are surrounded by a rigid protein layer (pellicle) covered with hundreds of cilia that beat rhythmically to propel them and to direct bacteria and other food particles into their oral groove. Food particles are collected into food VACUOLES, where digestion takes place. Two (occasionally three) contractile vacuoles close to the surface near the ends of the cell expand and contract as they discharge metabolic wastes and excess fluid. Paramecia have two kinds of nuclei: a large macronucleus (the centre of all metabolic activities) and at least one small micronucleus (which stores the genetic material necessary for sexual reproduction). See illustration opposite.

Paramount Communications Media and communications corporation. It was founded (as Paramount Pictures Corp.) by W. W. Hodkinson in 1914 as a film distributor. It became a motion-picture company two years later and won attention with stars such as MARY PICKFORD, GLORIA SWANSON, and RUDOLPH VALENTINO. In the late 1920s and 1930s the studio added CLAUDETTE COLBERT, Gary COOPER, and MARLENE DIETRICH to its roster. Forced to declare bankruptcy after its chain of theaters suffered losses during the transition to sound, the company was reorganized two years later as Paramount Pictures, Inc. Among its successes of the 1940s and '50s were the films of PRESTON STURGES and BILLY WILDER. In 1966 Gulf & Western Industries took control of Paramount, and the new company later changed its name to Paramount Communications. In 1994 it was acquired by Viacom Inc., which in 2000 merged with CBS.

Paraná \ˌpä-rä-ˈnä\ **River** River, South America. It is the continent's second longest river (after the AMAZON RIVER) and rises on the plateau of southeast-central Brazil. It flows generally south 3,032 mi (4,880 km) to join the URUGUAY RIVER and form the Río de la PLATA estuary on the Atlantic Ocean. Its drainage basin includes most of southeastern Brazil, Paraguay, eastern Bolivia, and northern Argentina. From its origin at the confluence of the Grande and Paranaíba rivers to its junction with the PARAGUAY RIVER, it is known as the Alto (Upper) Paraná. Completion of the Itaipú Dam between Paraguay and Brazil in the 1980s submerged the massive Guaíra Falls and created a large reservoir.

paranoia Mental disorder characterized by delusions of persecution or grandeur, usually without HALLUCINATIONS. Paranoia was formerly classified as a distinct PSYCHOSIS but is now generally treated as one of several varieties of SCHIZOPHRENIA or, in milder cases, of PERSONALITY DISORDER. The paranoid person generally suffers from exaggerated self-reference, a tendency to construe independent events and acts as pertaining to him- or herself.

parapsychology \ˌpar-ə-ˌsī-ˈkä-lə-jē\ Discipline concerned with investigating events that cannot be accounted for by natural law and knowledge that cannot have been obtained through the usual sensory abilities. Parapsychology studies the cognitive phenomena often called EXTRASENSORY PERCEPTION, in which a person acquires knowledge of other people's thoughts or of future events through channels apparently beyond the five senses. It also examines physical phenomena such as the levitation of objects and the bending of metal through psychokinesis. Though belief in such phenomena may be traced to earliest times, parapsychology as a subject of serious research originated in the late 19th century, partly in reaction to the growth of the spiritualist movement. The Society of Psychical Research was established in London in 1882, and similar societies were later founded in the U.S. and in many European countries. In the 20th century research into parapsychology was also conducted at some universities, notably at Duke University under J. B. Rhine.

General features of a paramecium.
© MERRIAM-WEBSTER INC.

parasitism \ˈpar-ə-sə-ˌti-zəm\ Relationship between two species in which one benefits at the expense of the other. Ectoparasites live on the body surface of the host; endoparasites live in their hosts' organs, tissues, or cells and often rely on a third organism (the carrier, or vector) to transmit them to the host. The CUCKOO and COWBIRD practice brood parasitism, laying eggs in other birds' nests to be raised by the foster parents. In social parasitism, one type of animal parasitizes animals of the same type (e.g., one ant species on different ant species). Hyperparasitism occurs when parasites are parasitized (e.g., PROTOZOANS hyperparasitize a flea on a dog). See also PREDATION.

parathyroid gland Endocrine GLAND, two to eight of which are embedded in each side of the THYROID GLAND. It secretes parathyroid HORMONE, which regulates blood calcium and phosphorus levels. When calcium in body fluids drops, increased hormone secretion releases calcium from BONE into the bloodstream (see CALCIUM DEFICIENCY). The hormone also increases excretion of phosphate in the urine, lowering blood concentrations, and may play a role in magnesium metabolism. When thyroid removal is required, the parathyroid glands must be separated out and left in place. See also ENDOCRINE SYSTEM.

parchment Processed skins of certain animals (chiefly sheep, goats, and calves) that have been prepared for the purpose of writing on them. Parchment was probably invented in Greece in the 2nd century BC. Skins had been used for writing material even earlier (c. 2400 BC), but the new, more thorough method of cleaning, stretching, and scraping made possible the use of both sides of a manuscript leaf, leading to the replace-

© 2006 Encyclopædia Britannica, Inc.

ment of the rolled manuscript by the bound book (CODEX). Especially fine parchment is known as vellum. In modern usage, the terms "parchment" and "vellum" are sometimes used for a type of high-quality paper.

pardo *Spanish* **"brown"** In Venezuela, a person of mixed African, European, and Indian ancestry. In the colonial period, *pardos*, like all nonwhites, were kept in a state of servitude, with no hope of gaining wealth or political power. Nevertheless, most *pardos* remained royalists during much of the war for independence because they relied on Spain for protection in their conflicts with the Venezuelan-born whites, toward whom the European Spaniards took a superior attitude. In Brazil a *pardo* is a person of mixed European and African descent.

pardon In law, release from guilt or remission of punishment. The power to pardon is generally exercised by the state's chief executive officer. A pardon may be full or conditional. A conditional pardon imposes a lesser punishment or some other obligation. Some states still bar pardoned offenders from holding public office or obtaining professional licenses.

Paré \pä-'rā**, Ambroise** (b. 1510, Bourg-Hersent, France—d. Dec. 20, 1590, Paris) French physician and surgeon. Employed as an army surgeon in 1537, Paré preferred measures less drastic than those of other surgeons at the time (whose techniques included castration in hernia surgery and searing large arteries with hot irons during amputation) and operated only when necessary. He introduced the implantation of gold and silver teeth, artificial limbs, and artificial eyes (see PROSTHESIS) and invented many instruments, popularized the truss for hernias, and first suggested that syphilis caused aneurysms. He published books on a wide variety of medical matters; his surgical works were especially influential.

Pareto \pä-'re-tō**, Vilfredo** (b. July 15, 1848, Paris, France—d. Aug. 19, 1923, Geneva, Switz.) Italian economist and sociologist. Educated at the University of Turin, he worked as an engineer and later served as a director of a large Italian railway. He taught at the University of Lausanne from 1893. His law of income distribution used a complex mathematical formula to trace historical patterns in the distribution of wealth. In 1906 he laid the foundation of modern WELFARE ECONOMICS with his Pareto Optimum, which stated that a society's resources are not optimally allocated as long as it is possible to make at least one person better off while keeping others as well off as before.

Parhae \'pò-'hī\ *Chinese* **Pohai** \'pò-'hī\ State established in the 8th century AD in northern Manchuria and northern Korea. Founded by a former Korean general, Tae Cho-yang, it was considered a successor state to KOGURYŎ, which had occupied much of the same territory before its conquest by SILLA in 668. Like Silla, Parhae was a tributary state of TANG DYNASTY China. It traded with the nomadic tribes of the north and with China and Japan. Parhae was conquered in 926 by the Khitan tribes almost 20 years after their creation of the LIAO DYNASTY on China's northern borders.

pari-mutuel \ˌpar-i-'myü-chə-wəl\ Betting pool in which those who bet on competitors finishing in the first three places share the total amount bet minus a percentage for the management. First introduced in France c. 1870, it soon became one of the most popular methods of betting on horse races internationally. Today computers calculate betting pools and current odds on each horse and flash the figures to the public at regular intervals. The system is used largely for off-track betting. Pari-mutuel betting is also practiced in dog racing and JAI ALAI.

Paria \pə-'rē-ə**, Gulf of** Inlet of the Caribbean Sea, between Venezuela and Trinidad. Extending about 100 mi (160 km) from east to west and 40 mi (65 km) from north to south, it is linked with the Caribbean to the north and the Atlantic Ocean to the south. Its ports, including PORT-OF-SPAIN, Trinidad, handle shipments of petroleum, iron ore, and agricultural products. In 1498, on his third voyage to the Western Hemisphere, CHRISTOPHER COLUMBUS probably first sighted South America when he sailed into the gulf.

Parícutin \pä-'rē-kü-ˌtēn\ Volcano, western Michoacán state, west-central Mexico. It is about 9,210 ft (2,808 m) high and is one of the youngest volcanoes on Earth. It began to erupt in an open field in 1943 and buried the village of Parícutin. The eruption finally ceased in 1952.

Parilia \pə-'ri-lē-ə\ Ancient Roman festival celebrated annually on April 21 in honor of the goddess Pales, protector of flocks and herds. It was celebrated first by the early kings of Rome and later by the PONTIFEX MAXIMUS. The VESTAL VIRGINS opened the festival by distributing straw and the ashes and blood of sacrificed animals. Ritual cleaning, anointing, and adornment of herds and stalls followed. The celebrants jumped over a bonfire three times to complete the rite of purification.

Paris In GREEK MYTHOLOGY, a son of King PRIAM of TROY and his wife, HECUBA. An evil portent prompted his parents to abandon him as an infant. Unknown to them, he was raised as a shepherd, and as a young man he was received home again after winning a boxing contest against Priam's other sons. ZEUS chose him to determine which of three goddesses was most beautiful—HERA, ATHENA, or APHRODITE. In the famous "judgment of Paris," he chose Aphrodite because she offered to help him win the most beautiful woman alive. His seduction of HELEN was the cause of the TROJAN WAR. Near the end of the war, Paris shot the arrow that killed ACHILLES and soon afterward was himself killed.

Paris City (pop., 1999: 2,125,246; metro. area, 9,644,507), river port, capital of France. It is now located on both banks of the SEINE RIVER. The original settlement from which Paris evolved, Lutetia, was in existence by the late 3rd century BC on an island in the Seine. Lutetia was captured and fortified by the Romans in 52 BC. During the 1st century AD the city spread to the left bank of the Seine. By the early 4th century it was known as Paris. It withstood several Viking sieges (885–87) and became the capital of France in 987, when HUGH CAPET, the count of Paris, became king. The city was improved during the reign of PHILIP II, who formally recognized the University of PARIS c. 1200. In the 14th–15th centuries its development was hindered by the BLACK DEATH and the HUNDRED YEARS' WAR. In the 17th–18th centuries it was improved and beautified. Leading events of the FRENCH REVOLUTION took place in Paris (1789–99). NAPOLEON III commissioned GEORGES-EUGÈNE HAUSSMANN to modernize the city's infrastructure and add several new bridges over the Seine. The city was the site of the PARIS PEACE CONFERENCE, which ended WORLD WAR I. During World War II Paris was occupied by German troops. It is now the financial, commercial, transportation, artistic, and intellectual centre of France. The city's many attractions include the EIFFEL TOWER, NOTRE-DAME DE PARIS, the LOUVRE, the Panthéon, POMPIDOU CENTRE, and the PARIS OPERA, as well as boulevards, public parks, and gardens.

Paris, Congress of (1856) Conference in Paris to produce the treaty that ended the CRIMEAN WAR. The treaty was signed between Russia on one side and France, Britain, Sardinia-Piedmont, and Turkey on the other. It guaranteed the independence and territorial integrity of Turkey. Russia was forced to surrender Bessarabia to Moldavia, warships of all nations were barred from the Black Sea, and the Danube River was opened to shipping of all countries. The congress also adopted the first codified law of the sea, which banned privateering and defined a legal naval blockade.

Paris, Treaty of (1229) Treaty by which RAYMOND VII of Toulouse conceded defeat to LOUIS IX of France after the ALBIGENSIAN CRUSADE. It arranged the marriage of Raymond's daughter and Louis's brother and provided for the eventual return of LANGUEDOC to the crown, thus destroying the independence of the princes of the south.

Paris, Treaty of (1259) Peace treaty signed by HENRY III of England and LOUIS IX of France. It allowed the English to keep Aquitaine and nearby territories but obliged Henry to acknowledge himself the vassal of the French king. The agreement kept peace between England and France until the outbreak of the HUNDRED YEARS' WAR in 1337.

Paris, Treaty of (1763) Treaty concluding the SEVEN YEARS' WAR (including the FRENCH AND INDIAN WAR). It was signed by Britain and Hanover on one side and France and Spain on the other. France renounced to Britain the mainland of North America east of the Mississippi, its conquests in India since 1749, and four West Indian islands. Britain restored to France four other West Indian islands and the West African colony of Gorée (Senegal). In return for recovering Havana and Manila, Spain ceded Florida to Britain and received Louisiana from the French.

Paris, Treaty of (1814) Treaty signed in Paris that ended the NAPOLEONIC WARS between France and the Allies (Austria, Britain, Prussia, Russia, Spain, Sweden, and Portugal). The terms were generous to France, since NAPOLEON had abdicated and the Bourbon dynasty was restored. France was allowed to retain its boundaries of 1792 and ceded only several islands to Britain. Other terms were left to be discussed later.

Paris, Treaty of (1815) Second treaty between France and the Allies, following NAPOLEON's HUNDRED DAYS and final defeat. It was harsher than the first Treaty of PARIS (1814). France was required to return to its borders of 1790 and was stripped of the Saar and Savoy regions; it was also

© 2006 Encyclopædia Britannica, Inc.

obliged to pay an indemnity of 700 million francs and to support a 150,000-man army of occupation for three to five years.

Paris, University of Second oldest European university (after the University of Bologna), founded c. 1170 in France. It grew out of the cathedral schools of Notre-Dame and, with papal support, soon became a great centre of Christian orthodox teaching. In the medieval period its professors included St. Bonaventure, Albertus Magnus, and Thomas Aquinas. Its most celebrated early college was the Sorbonne, founded c. 1257. The university declined somewhat under the impact of the Reformation and Counter-Reformation. With the French Revolution and Napoleon's reforms, teaching became more independent of religion and politics. By the mid-20th century the university had again become a preeminent scientific and intellectual centre. In May 1968 a Sorbonne student protest grew into a serious national crisis. This led to decentralizing reforms, the old university being replaced in 1970 by a system in Paris and its suburbs called the Universities of Paris I–XIII.

Paris Commune *or* **Commune of Paris** (March 18–May 28, 1871) Insurrection of Paris against the French government. After France's defeat in the Franco-Prussian War and the collapse of the Second Empire, the republican Parisians feared that the conservative majority in the National Assembly would restore the monarchy. On March 18 the National Guard in Paris resisted orders to disarm, and after municipal elections were won by the revolutionaries, they formed the Commune government. Factions included the so-called Jacobins, who wanted the Paris Commune to control the revolution (as its namesake had in the French Revolution); the Proudhonists, socialist followers of Pierre-Joseph Proudhon who supported a federation of communes; and the Blanquistes, socialist followers of Auguste Blanqui who demanded violent action. Government forces quickly suppressed communes elsewhere in France, then entered Paris on May 21. In a week of fierce fighting, they crushed the Communards, who had set up barricades in the streets and burned public buildings, including the Tuileries Palace. About 20,000 insurrectionists and 750 government troops were killed. In the aftermath, the government took harsh repressive action; 38,000 suspects were arrested and more than 7,000 were deported.

Paris-Match \pà-rē-'màch\ Weekly pictorial magazine published in France since 1949 as the successor to *L'Illustration* (1843–1944). A popular news and current-events magazine aimed at the middle class, it features picture-stories on such subjects as public affairs, entertainment, fashion, and consumer products. Its format resembles that of *Life*, and it is similarly noted for topicality and outstanding photography. Under the ownership of Jean Prouvost (d. 1978), it achieved prestige and financial success. It is now published by Hachette Filipacchi Médias, one of the world's largest magazine publishers.

Paris Opéra *or* **Opéra Garnier** \ō-per-'ä-gȧrn-'yā\ *also* **Théâtre Nationale de L'Opéra** Opera house in Paris designed by Charles Garnier (1825–98). The extraordinarily lavish building, considered one of the masterpieces of the Second Empire (Beaux-Arts style), was begun in 1861 and opened in 1875. The floor plan is as elaborate as the exterior. The interior features generous circulation space, including a grand staircase and numerous richly decorated galleries, foyers, and corridors. The designation also applies to the opera company in Paris that for more than two centuries was the chief performer of serious operas and musical dramas in the French language. One of the most venerable operatic institutions in the world, it occupied Garnier's building until 1990.

Paris Peace Conference (1919–20) Meeting that inaugurated the international settlement after World War I. It opened on Jan. 12, 1919, with representatives from more than 30 countries. The principal delegates were France's Georges Clemenceau, Britain's David Lloyd George, the U.S.'s Woodrow Wilson, and Italy's Vittorio Emanuele Orlando, who with their foreign ministers formed a Supreme Council. Commissions were appointed to study specific financial and territorial questions, including reparations. The major products of the conference were the League of Nations; the Treaty of Versailles, presented to Germany; the Treaty of Saint-Germain, presented to Austria; and the Treaty of Neuilly, presented to Bulgaria. The inauguration of the League of Nations on Jan. 16, 1920, brought the conference to a close. Treaties were subsequently concluded with Hungary (Treaty of Trianon, 1920) and Turkey (Treaties of Sèvres, 1920, and Lausanne, 1923).

parity In economics, equality in price, rate of exchange, purchasing power, or wages. In international exchange, parity exists when the exchange rate between two currencies makes the purchasing power of both currencies equal. Adjustments to maintain parity can occur in the marketplace as prices change in response to supply and demand, or through the intervention of national governments or international agencies such as the International Monetary Fund. In U.S. agricultural economics, the term parity is used for a system of regulating the prices of farm commodities, usually by government price supports and production quotas, to guarantee farmers the purchasing power they had in a past base period. Parity is also used in personnel administration to establish equitable wage rates for various classes of employees.

parity In physics, a property related to the symmetry of the wave function representing a system of fundamental particles. It plays an important role in quantum mechanics in the description of a physical system. Parity transformation replaces a system with a type of mirror image in which the spatial coordinates describing the system are inverted, so that the coordinates x, y, and z are replaced with $-x$, $-y$, and $-z$. If a system is identical to the original system after parity transformation, its parity is even. If the image is the negative of the original, its parity is odd. In either case, the physical observables of the system remain unchanged. In 1957 Chien-Shiung Wu (1912–1997) and coworkers made the surprising discovery that beta decay reactions do not conserve parity; in other words, the inverted image of the process does not exist in nature. This is a general property of the weak force.

park Large outdoor area set aside for recreation. The earliest parks were hunting grounds of the Persian kings; such reserves became shaped by riding paths and shelters. A second type of park derived from the open-air meeting places of Greece, where the functions of an area for exercise, social concourse, and athletes' training ground were combined with elements of a sculpture gallery and religious centre. Parks of post-Renaissance times featured extensive woods, raised galleries, and often elaborate aviaries and cages for wild animals. What often differentiates present-day parks from parks of the past is their accommodation for active recreation; facilities may include outdoor theatres, zoos, concert shells, concessions for dining and dancing, amusement areas, boating areas, and areas for sports. See also national park.

Park, Mungo (b. Sept. 10, 1771, Fowlshiels, Selkirk, Scot.—d. c. January 1806, near Bussa on the Niger River) Scottish explorer of the Niger River. A trained surgeon, Park had traveled to the East Indies before being chosen by the African Association to head an expedition to find the source of the Niger River (1795–97). He lost most of his crew and supplies, was imprisoned and tortured for four months by hostile Arabs, and suffered severe illness, reaching Ségou (now in Mali) but not the river's source. His *Travels in the Interior Districts of Africa* (1797) became a great popular success. On a second expedition (1805–06) he reached Bamako, but he was killed on the return trip.

Park, Robert E(zra) (b. Feb. 14, 1864, Harveyville, Pa., U.S.—d. Feb. 7, 1944, Nashville, Tenn.) U.S. sociologist. After 11 years as a newspaper reporter, Park attended various universities and studied with scholars such as John Dewey, William James, Josiah Royce, and Georg Simmel. He then worked for Booker T. Washington and later taught at the University of Chicago—where he was a leading figure in the "Chicago school" of sociology, characterized by empirical research and the use of human ecology models—and at Fisk University. He is noted for his work on ethnic groups, particularly African Americans, and on human ecology, a term he has been credited with coining. Park wrote *Introduction to the Science of Sociology* (1921) and *The City* (1925) with Ernest W. Burgess; *Race and Culture* (1950) and *Human Communities* (1952) were published posthumously.

Parker, Alton B(rooks) (b. May 14, 1852, Cortland, N.Y., U.S.—d. May 10, 1926, New York, N.Y.) U.S. jurist. He practiced law in Kingston, N.Y., and was elected surrogate of Ulster county in 1877 and 1883. He was appointed to the New York Supreme Court in 1885, the state Appeals Court in 1889, and the appellate division of the state Supreme Court in 1896. From 1898 to 1904 he was chief justice of the New York court of appeals. On the bench, he was noted for upholding the rights of labour. As the Democratic Party presidential candidate in 1904, he represented the eastern, pro-gold-standard wing of the party. Soundly defeated by Pres. Theodore Roosevelt, he resumed his law practice.

Parker, Charlie *orig.* **Charles Christopher Parker, Jr.** (b. Aug. 29, 1920, Kansas City, Kan., U.S.—d. March 12, 1955, New York, N.Y.) U.S. saxophonist and composer. He played with Jay McShann's big band (1940–42) and those of Earl Hines (1942–44) and Billy Eckstine (1944) before leading his own small groups in New York City. (A nickname

© 2006 Encyclopædia Britannica, Inc.

acquired in the early 1940s, Yardbird, was shortened to Bird and used throughout his career.) Parker frequently worked with Dizzy Gillespie in the mid-1940s, making a series of small-group recordings that heralded the arrival of bebop as a mature outgrowth of the improvisation of the late swing era. His direct, cutting tone and unprecedented dexterity on the alto saxophone made rapid tempos and fast flurries of notes trademarks of bebop, and his complex, subtle harmonic understanding brought an altogether new sound to the music. Easily the most influential jazz musician of his generation, Parker suffered chronic drug addiction, and his early death contributed to making him a tragic legend.

Charlie Parker, 1949.
AP/WIDE WORLD PHOTOS

Parker, Dorothy *orig.* **Dorothy Rothschild** (b. Aug. 22, 1893, West End, near Long Beach, N.J., U.S.—d. June 7, 1967, New York, N.Y.) U.S. short-story writer and poet. She grew up in affluence in New York City. She was a drama critic for *Vanity Fair* and wrote book reviews for *The New Yorker* (1927–33). Her poetry volumes include *Enough Rope* (1926) and *Death and Taxes* (1931). Her short stories were collected in *Laments for the Living* (1930) and *After Such Pleasures* (1933). She also worked as a film writer, reported on the Spanish Civil War, and collaborated on several plays. A member of the Algonquin Round Table, she is chiefly remembered for her wit.

Dorothy Parker, 1939.
CULVER PICTURES

Parkinson, C(yril) Northcote (b. July 30, 1909, Barnard Castle, Durham, Eng.—d. March 9, 1993, Canterbury, Kent) British historian and writer. He received a Ph.D. from Kings College, London, and later taught at various schools in England and Malaya. He is most famous for his 1955 formulation of the satiric "Parkinson's Law," which stated that "Work expands to fill the time available for its completion." In *The Law and the Profits* (1960) he discussed a second law, "Expenditure rises to meet income."

parkinsonism Neurological disorder causing progressive loss of control of movement. It was first described in 1817 by British physician James Parkinson (1755–1824). The cause of primary parkinsonism, or Parkinson disease, is unknown. The mean age of onset is about 57, but juvenile parkinsonism is also known. Neurons in the brain that normally produce dopamine deteriorate. When 60–80% are destroyed, signals suppressing unintended movement are disrupted and symptoms appear, including tremor at rest, muscle rigidity, trouble in starting movements, and loss of balance. Known causes include sleeping sickness; certain poisons; repeated blows to the head, as in boxing; and the drug MPTP. Environmental toxins or genetic susceptibility may account for some cases. Drug therapy requires careful scheduling and combinations to delay development of tolerance and side effects. Surgical pallidotomy (destruction of the globus pallidus, a brain structure involved in motor control) and transplantation of fetal dopamine-producing tissue remain experimental.

Parkman, Francis (b. Sept. 16, 1823, Boston, Mass., U.S.—d. Nov. 8, 1893, Jamaica Plain, Mass.) U.S. historian. Parkman graduated from Harvard University before embarking in 1846 on a journey to the West that resulted in *The California and Oregon Trail* (1849). He is noted for his seven-part history *France and England in North America*, covering the colonial period from the beginnings to 1763; its volumes include *Pioneers of France in the New World* (1865); *Montcalm and Wolfe* (1884), which demonstrates how biography can penetrate the spirit of an age; and *A Half-Century of Conflict* (1892), which exemplifies his literary artistry.

Parks, Gordon (b. Nov. 30, 1912, Fort Scott, Kan., U.S.—d. March 7, 2006, New York, N.Y.) U.S. writer, photographer, and film director. As the first African American staff photographer for *Life* (1948–72), Parks became known for his portrayals of ghetto life, black nationalists, and the civil rights movement. His first work of fiction was *The Learning Tree* (1963), a novel about a black adolescent in Kansas in the 1920s. He combined poetry and photography in collections such as *A Poet and His Camera* (1968) and *Glimpses Toward Infinity* (1996). In 1968 he became the first African American to direct a major motion picture with his film adaptation of *The Learning Tree*. He later directed *Shaft* (1971), which helped give rise to the genre of African American action films known as "blaxploitation." Parks also composed music.

Parks, Rosa *orig.* **Rosa Louise McCauley** (b. Feb. 4, 1913, Tuskegee, Ala., U.S.—d. Oct. 24, 2005, Detroit, Mich.) U.S. civil rights activist. She worked as a seamstress in Montgomery, Ala., where she joined the NAACP in 1943. In 1955 she was arrested after refusing to give her seat on a public bus to a white man. The resultant boycott of the city's bus system, organized by Martin Luther King, Jr., and others, brought the civil rights movement to new prominence. In 1957 Parks moved to Detroit, where she was a staff assistant (1965–88) to U.S. Rep. John Conyers. She was awarded the Congressional Gold Medal in 1999.

Parlement \'pär-lə-mənt\ Supreme court under the ancien régime in France. It developed out of the *curia regis* ("king's court") in which the Capetian kings convened their chief vassals and prelates to consider feudal and political issues. By the mid-13th century this judicial institution was known as Parlement and served as a court of appeals against the judgments of royal officials. Later Parlements also reviewed the king's edicts to determine whether they were just and lawful. The chief Parlement was located in Paris, and others were established in the provinces. The Parlements were abolished in the French Revolution.

Parliament Legislative assembly of Britain and of other governments modeled after it. The British Parliament consists of the monarch, the House of Lords, and the House of Commons, and traces its roots to the union (c. 1300) of the Great Council and the King's Court, two bodies that treated with and advised the king. In the 14th century, Parliament was split into two houses, with the lords spiritual and temporal (i.e., not only the nobility but also high officials of the church) debating in one and the knights and burgesses in the other. In the 14th century Parliament also began to present petitions ("bills") to the king, which with his assent would become law. Robert Walpole was the first party leader to head the government as prime minister (1721–42). See also parliamentary democracy.

Parliament, Canadian Legislature of Canada, created by the British North America Act. The 301 members of its House of Commons are elected for maximum terms of five years from the provinces on the principle of representation by population. The 105 members of its Senate are appointed by Canada's governor-general from the regions of Canada and serve until age 75. The parliament has authority over the armed forces, regulates trade and commerce, levies taxes, and is in charge of banking, credit, currency and bankruptcy, criminal law, postal services, fisheries, patents and copyrights, the census, navigation and shipping, railways, canals, and telegraphs. It also retains powers not specifically assigned to provincial legislatures. The leader of the party winning the most seats in a general election becomes prime minister and is called on by the governor-general to form a government. He generally chooses elected party colleagues to form the cabinet. The party winning the second-largest number of seats in the House becomes the official opposition party.

Parliament Act of 1911 Act passed in the British Parliament that deprived the House of Lords of its absolute power of veto on legislation. Proposed by a Liberal majority in the House of Commons, the act stated that any bill passed unchanged by the Commons in three separate sessions over two years could be presented for the royal assent (necessary for a bill to become law) without the Lords' consent. By subordinating the Lords to the Commons, the act was seen as another step in making the British Constitution more democratic.

parliamentary democracy Democratic form of government in which the party (or a coalition of parties) with the greatest representation

© 2006 Encyclopædia Britannica, Inc.

in the parliament (legislature) forms the government, its leader becoming PRIME MINISTER or CHANCELLOR. Executive functions are exercised by members of the parliament appointed by the prime minister to the CABINET. The parties in the minority serve in opposition to the majority and have the duty to challenge it regularly. The prime minister may be removed from power whenever he loses the confidence of a majority of the ruling party or of the parliament. Parliamentary democracy originated in Britain (see PARLIAMENT) and was adopted in several of its former colonies.

parliamentary procedure *or* **rules of order** Generally accepted rules, precedents, and practices used in the governance of deliberative assemblies. They are intended to maintain decorum, ascertain the will of the majority, preserve the rights of the minority, and facilitate the orderly transaction of business. Rules of parliamentary procedure originated in Britain in the 16th and 17th centuries and were subsequently adopted by legislatures around the world. *Robert's Rules of Order*, codified in 1876 by U.S. Gen. Henry M. Robert (1837–1923) and regularly refined and enlarged, is the standard set of rules used by legislatures in the U.S.

Parma City (pop, 2001 prelim.: 156,172), EMILIA-ROMAGNA region, northern Italy. Located on the Parma River, the site was founded by the Romans in 183 BC; it became an episcopal see in the 4th century AD. Parma was destroyed by the Ostrogoths under THEODORIC I but was rebuilt in the Middle Ages. Made part of the duchy of Parma and Piacenza in 1545, it was held by the FARNESE FAMILY and later passed to the Austrians. In 1815 Napoleon gave the city to his second consort, MARIE-LOUISE. In 1861 it became part of united Italy. It was badly damaged during World War II but was rebuilt. It is the commercial centre of an agricultural region and is famous for its Parmesan cheese. Sites of interest include the 12th-century Romanesque cathedral, the 13th-century baptistery, and the university (founded in the 11th century).

Parmenides \pär-'men-ə-ˌdēz\ (b. c. 515 BC) Greek philosopher, leader of the ELEATICS. His general teaching has been reconstructed from the few surviving fragments of his lengthy verse composition *On Nature*. He held that the multiplicity of existing things, their changing forms and motion, are but an appearance of a single eternal reality, "Being." This doctrine, which was formulated as the principle that "all is one," entails that all claims of change or of non-Being are illogical. Because of his method of basing claims about appearances on a logical concept of Being, he is considered a founder of METAPHYSICS. PLATO's dialogue *Parmenides* discusses his thought.

Parmigianino \ˌpär-mi-jä-'nē-nō\ *orig.* **Girolamo Francesco Maria Mazzola** (b. Jan. 11, 1503, Parma, Duchy of Milan—d. Aug. 24, 1540, Casalmaggiore, Cremona) Italian painter and etcher. He painted some of his early frescoes for San Giovanni Evangelista; they were influenced by CORREGGIO, who had recently worked in the same church. His originality is seen in his *Self-Portrait in a Convex Mirror* (1524). His *Madonna of the Long Neck* (1534) is typical of his later work, which is characterized by ambiguity of spatial composition, elongation of the human figure, and the pursuit of a rhythmical, sensuous beauty beyond nature. Among the most remarkable portrait painters of his age, he was one of the first artists to develop the elegant and sophisticated version of MANNERISM that influenced the next generation of painters and was one of the first Italian artists to practice etching.

Parnaíba \ˌpär-nä-'ē-bə\ **River** River, northeastern Brazil. It rises in the Tabatinga Mountains and flows northeast for 1,056 mi (1,700 km) to empty into the Atlantic Ocean, forming a delta at its mouth. The river has great economic importance. It is navigable by shallow-draft vessels from its mouth at least as far south as the junction of the Canindé River. The port of Parnaíba, located near the river's mouth, is a commercial centre.

Parnassian \pär-'na-sē-ən\ Members of a French school of poetry of the second half of the 19th century that was headed by Charles-Marie-Rene Leconte de Lisle (1818–94) and THÉOPHILE GAUTIER. The Parnassians stressed restraint, objectivity, technical perfection, and precise description as a reaction against the emotionalism and verbal excess of ROMANTICISM. Their name came from the anthology to which they contributed, *Le Parnasse contemporain* (1866, 1871, 1876). Their influence was evident in movements such as MODERNISMO and led to experimentation in metres and verse forms and the revival of the SONNET.

Parnassus \pär-'na-səs**, Mt.** Mountain in central Greece. Located in the Pindus range, it rises to a height of 8,061 ft (2,457 m). In the ancient world it was sacred to APOLLO and the Corycian nymphs, probably because of its proximity to DELPHI and its oracle. For Roman poets the Castalian spring on Parnassus was a source of inspiration, and the mountain was regarded as the home of the MUSES.

Parnell \pär-'nel**, Charles Stewart** (b. June 27, 1846, Avondale, County Wicklow, Ire.—d. Oct. 6, 1891, Brighton, Sussex, Eng.) Irish nationalist leader. After an education at the University of Cambridge, he returned to Ireland and served in the British Parliament (1875–91), introducing obstructionist legislative tactics to call attention to Ireland's needs. In 1877 he became president of the Home Rule Confederation. He was jailed for making violent speeches against the new land act (1881–82), then released to curb an increase in terrorist acts. Reaction against the PHOENIX PARK MURDERS enabled him to unite factions in Ireland to win support for parliamentary measures, such as WILLIAM E. GLADSTONE's HOME RULE proposals. He remained popular in Ireland until he was named in the divorce suit of his mistress, Katherine O'Shea (1890).

parochial education Education offered institutionally by a religious group. The curriculum usually includes both religious and general studies. In the U.S. and Canada, parochial education has referred primarily to elementary and secondary schools maintained by Roman Catholic parishes, but it can also apply to schools operated by Protestant, Jewish, Muslim, and Buddhist organizations, among others.

parody In literature, a work in which the style of an author is closely imitated for comic effect or in ridicule. Differing from both BURLESQUE (by the depth of its technical penetration) and travesty (which treats dignified subjects in a trivial manner), parody mercilessly exposes the tricks of manner and thought of its victim and therefore cannot be written without a thorough appreciation of the work it ridicules. Examples date from as early as ancient Greece and occur in nearly all literatures and all periods.

parole Supervised conditional liberty from prison granted prior to the expiration of a prisoner's sentence. Modern use of parole stems from a change in penal philosophy to emphasize rehabilitation rather than retribution. In some jurisdictions, those convicted of certain crimes (e.g., rape or murder) are not eligible for parole. Conditions of parole vary, but in all cases their violation may constitute grounds for reincarceration. Parole supervision ranges from little more than a periodic police check to intensive supervision by trained personnel. See also PROBATION.

Parr, Catherine See CATHERINE Parr

Parra, Nicanor (b. Sept. 5, 1914, San Fabian, Chile) Chilean poet. A student of mathematics and physics, Parra began teaching theoretical physics at the University of Chile in 1952. One of the most important Latin American poets of the 20th century, he is known for originating so-called antipoetry (poetry that opposes traditional poetic techniques or styles). In *Poems and Antipoems* (1954), he sought to make poetry accessible to the masses by treating everyday problems of a grotesque world in clear language with black humour and ironic vision. In later works he experimented with language, and he continued to use antipoetic techniques.

Parrhasius \pə-'rā-zhəs\ *or* **Parrhasios** (fl. 5th century BC, Athens, Greece) Greek painter. He was praised by ancient critics as a master of outline drawing. He apparently succeeded in portraying various psychological states in his depictions of the face. Many of his drawings on wood and parchment were preserved and highly valued by later painters for purposes of study. His picture of Theseus adorned the Capitol in Rome; other works were chiefly mythological groups. No works or copies survive.

Parrish \'par-ish**, (Frederick) Maxfield** (b. July 25, 1870, Philadelphia, Pa., U.S.—d. March 10, 1966, Plainfield, N.H.) U.S. illustrator and painter. Trained at the Pennsylvania Academy of the Fine Arts and Drexel Institute of Art, he was the highest-paid commercial artist and muralist in the U.S. by the 1920s. He is best known for his depictions of fantasy landscapes populated by attractive young women. He used meticulously defined outlines and intricately detailed natural backgrounds; his unusual colours, especially the luminous "Parrish blue," give his pictures a dreamlike quality. Though his popularity declined in the late 1930s, appreciation of his work revived in the 1960s and '70s.

parrot Any of the 333 species of birds in the family Psittacidae. About 220 species of true parrots (subfamily Psittacinae) are found worldwide in warm regions (see PARAKEET). Many are brilliantly coloured. They have a blunt tongue and eat seeds, buds, and some fruit and insects. Their vocal

© 2006 Encyclopædia Britannica, Inc.

apparatus permits many species to mimic human speech with great accuracy. The African gray parrot (*Psittacus erithacus*), intelligent and a particularly good talker, is about 13 in. (33 cm) long and is gray except for a red tail and white face; it lives up to 80 years. The 31 species of Amazon parrots (genus *Amazona*), also good mimics, are 10–16 in. (25–40 cm) long and predominantly green. Four other subfamilies are found chiefly around New Zealand and Australia, as are the COCKATOOS and COCKATIEL (family Cacatuidae); these are often considered parrots as well because they are classified with Psittacidae in the order Psittaciformes. See also KEA; LOVEBIRD; MACAW.

Rainbow lorikeet (*Trichoglossus haematodus*).
BRUCE COLEMAN LTD.

parrot fish Any of about 80 species (family Scaridae) of slender, blunt-headed, deep-bodied fishes found on tropical reefs. They are often brightly coloured and have large scales. The fused teeth form a "beak" used to scrape algae and the soft part of coral from reefs. Platelike teeth in the throat grind the ingested food and bits of coral. Some species grow to 4 ft (1.2 m) long and weigh 45 lb (20 kg). The Indo-Pacific surf, or rivulated, parrot fish (*Callyodon fasciatus*) grows to 18 in. (46 cm) or more. The queen parrot fish (*Scarus vetula*) is an Atlantic species.

Parrot fish (*Calotomus*).
DOUGLAS FAULKNER

parsec Unit of measure used by astronomers to express distances to stars and galaxies. It is the distance at which the radius of Earth's orbit would subtend an angle of one second of arc, so an object one parsec away would have a PARALLAX of one second. An object's distance in parsecs is the reciprocal of its parallax in seconds of arc. For example, ALPHA CENTAURI, with a parallax of 0.76 second, is 1.33 parsecs from the Sun and Earth. One parsec equals 3.26 light-years, or 19.2 trillion mi (30.9 trillion km).

Parshvanatha \'pärsh-və-'nä-tə\ (fl. 8th century BC) In JAINISM, the 23rd TIRTHANKARA, or saint, of the present age. He founded a religious order and formulated four vows binding on its members (not to kill, steal, lie, or own property; a vow of celibacy was added later by MAHAVIRA). According to legend, Parshvanatha once saved a family of serpents trapped in a log in an ascetic's fire. One of the snakes, later reborn as Dharana, the lord of the underworld kingdom of NAGAS (snakes), sheltered Parshvanatha from a storm sent by an enemy demon. In sculpture and painting Parshvanatha is depicted with a canopy of snake hoods over his head.

Parsi *or* **Parsee** Zoroastrian of India. The Parsis, whose name means "Persians," are descended from Persian Zoroastrians who immigrated to India to escape persecution by Muslims. The migration occurred sometime between the 8th and 10th century. The Parsis settled in Gujarat and became a farming community. When the British EAST INDIA CO. took control of the region around Bombay (now Mumbai) in the late 17th century and established religious freedom, many Parsis moved there, and by the 19th century they had become a wealthy merchant class. The Parsis still live chiefly in the Mumbai area, though other Parsi communities exist in Bangalore, India, and Karachi, Pakistan. See also ZOROASTRIANISM AND PARSIISM.

Parsiism See ZOROASTRIANISM AND PARSIISM

parsley Hardy biennial herb (*Petroselinum crispum*) of the family Apiaceae, or Umbelliferae, native to Mediterranean lands. The compound leaves are used in cooking. The family Apiaceae, sometimes called the parsley family, contains 300–400 genera of plants found in a wide variety of habitats, mostly in northern temperate regions. Most are aromatic herbs with feathery leaves. The flowers are often arranged in a conspicuous umbel (a flat-topped cluster). Many species are poisonous, including POISON HEMLOCK. Popular members of the family include CARROT, CELERY, PARSNIP, and FENNEL. Species used as herbs and spices include ANISE, DILL, CORIANDER, CARAWAY, and cumin (*Cuminum cyminum*).

parsnip Plant (*Pastinaca sativa*) of the PARSLEY family, cultivated for its large, tapering, fleshy, edible white root, which has a distinctive, sweet flavour and is usually served as a cooked vegetable. At the end of summer the solids of the root consist largely of starch, but a period of low temperature changes much of the starch to sugar. The root is hardy and not damaged by hard freezing of the soil. Native to Britain, Europe, and temperate Asia, the parsnip has become extensively naturalized in North America.

Parsnip (*Pastinaca sativa*).
G.R. ROBERTS

Parsons, Sir Charles Algernon (b. June 13, 1854, London, Eng.—d. Feb. 11, 1931, Kingston Harbour, Jam.) British mechanical engineer. He began work at the Armstrong engineering works in Newcastle upon Tyne in 1877 and formed his own company to manufacture turbines and other heavy machinery in 1889. He developed the multiple-stage turbine in 1884 and had introduced it in power plants to generate electricity by 1891. Modern steam and nuclear power plants still use turbines of this type to turn their generators. He demonstrated his marine turbine in *Turbinia*, a vessel that attained a speed of over 34 knots in 1897; Parsons turbines made high-speed ocean liners possible.

Parsons, Elsie Clews *orig.* **Elsie Worthington Clews** (b. Nov. 27, 1875, New York, N.Y., U.S.—d. Dec. 19, 1941, New York City) U.S. sociologist, anthropologist, and folklorist. She was trained in sociology. Her early works, advocating women's rights, included *The Family* (1906) and *The Old-Fashioned Woman* (1913). She later turned to anthropology under the influence of FRANZ BOAS and ALFRED L. KROEBER. Her *Pueblo Indian Religion* (1936) and *Mitla* (1936) remain standard studies of Pueblo and Zapotec Indian cultures. She also produced notable collections of West Indian and African American folklore.

Parsons, Talcott (b. Dec. 13, 1902, Colorado Springs, Colo., U.S.—d. May 8, 1979, Munich, W.Ger.) U.S. sociologist. Parsons taught at Harvard University from 1927 to 1973. He advocated a structural-functional analysis, a study of the ways that interrelated and interacting units forming the structures of a social system contribute to the system's development and maintenance. He was largely responsible for introducing the work of ÉMILE DURKHEIM and MAX WEBER to American sociologists. His major work is *The Structure of Social Action* (1937). See also FUNCTIONALISM.

Parson's Cause Dispute involving English clergy in colonial Virginia over payment of salaries. When the British vetoed colonial laws that substituted currency for tobacco as payment for clerical salaries (1759), the clergy sued for back pay. In the most publicized case (1763), PATRICK HENRY defended a colonial parish against a suit by a clergyman, citing interference by the British and convincing a jury to return only one penny in damages. The clergy soon gave up their protest.

Pärt, Arvo (b. Sept. 11, 1935, Paide, Est.) Estonian composer. After years of experimentation, he began in the late 1970s to produce his own distinctive music. A devoutly Orthodox Christian, he developed a style based on the slow modulation of sounds such as those produced by bells and pure voice tones, a technique reminiscent of the medieval NOTRE-DAME SCHOOL and the sacred music of Eastern Orthodoxy. His major works include the violin concerto *Tabula Rasa* (1977), *Cantus in Memory of Benjamin Britten* (1977), *Magnificat-Antiphones* (1988), and *The Beatitudes* (1991).

Partch, Harry (b. June 24, 1901, Oakland, Calif., U.S.—d. Sept. 3, 1974, San Diego, Calif.) U.S. composer and instrument maker. He grew up in Arizona and was largely self-taught musically. During the Great Depression, he traveled as a hobo, conceiving many of his musical ideas while doing so. About 1930 he began building original percussion and string instruments, tunable to 43 divisions of the octave. His works often involve theatrical elements, reflecting his interest in African, Japanese, and Native American ritual. They include *Barstow—8 Hitchhiker Inscrip-*

© 2006 Encyclopædia Britannica, Inc.

tions from a Highway Railing at Barstow, California (1941), *US Highball* (1943), and *And on the Seventh Day Petals Fell on Petaluma* (1966).

parterre \pär-'ter\ Division of garden beds in an ornamental pattern. The parterre grew out of the knot garden, a medieval form of bed in which various plant types were separated from each other by hedges. In the 16th century, the hedges were replaced by wooden or leaden shapes or by lines of shells or coal, and the areas between were filled with colored sand or stone chips. The naturalistic English garden of the 18th century displaced the elaborate parterre.

Parthenon \'pär-thə-ˌnän\ Chief temple of ATHENA on the ACROPOLIS at Athens. Built 447–432 BC by Ictinus and Callicrates under Pericles, it is considered the culmination of the Doric ORDER. Though the white marble temple has suffered damage over the centuries, including the loss of most of its sculpture, its basic structure remains intact. The colonnade supports an entablature consisting of a plain architrave, a frieze of alternating triglyphs (grooved blocks) and metopes (plain blocks with relief sculpture) and, at the two ends, a triangular pediment. The colonnade consists of eight columns on the ends and 17 on the sides, enclosing a cella; the interior originally held a great gold-and-ivory statue by PHIDIAS. Such architectural devices as entasis of the columns and an upward curvature of the base are used to correct optical illusions. Its sculpture rivaled its architecture. The pediment sculptures represent the birth of Athena and her battle with Poseidon; a continuous frieze shows the annual Panathenaic procession of citizens honoring Athena. The entire work is a marvel of harmony and clarity. See also ELGIN MARBLES.

Parthenon, on the Acropolis, Athens, by Ictinus and Callicrates, 447–432 BC
ALISON FRANTZ

Parthia Ancient land, southwestern Asia. Corresponding roughly to modern northeastern Iran, it formed a province of the Persian ACHAEMENIAN DYNASTY and later of the empire of ALEXANDER THE GREAT. After the dissolution of the SELEUCID DYNASTY c. 250 BC, a new Parthian kingdom was founded by Arsaces. The ARSACID DYNASTY ruled until it was overthrown by the SĀSĀNIAN DYNASTY c. AD 226. At its height in the early 1st century BC, it was known as the Parthian empire and included the area between the EUPHRATES and INDUS rivers and between the AMU DARYA and the Arabian Sea. It was weakened by internal disorder and by conflict with Rome in the 1st century BC. One of its later capitals was HECATOMPYLOS. The ruins of CTESIPHON, another major Parthian city, are in modern Iraq, near Baghdad. The Parthians were famous as horsemen and archers.

Parti Québécois \pär-tē-kā-be-'kwä\ Provincial Canadian political party founded in 1968 by RENÉ LÉVESQUE and other French-Canadian separatists in the province of Quebec. In the 1976 provincial election it won a majority in the Quebec assembly, which then decreed French as the province's only official language of government and business. After a separatist referendum on independence failed (1980), the party lost membership. The party revived in the 1990s, winning the provincial election in 1994. In 1995 the party held another referendum on secession, which was narrowly defeated.

partial derivative In DIFFERENTIAL CALCULUS, the DERIVATIVE of a function of several VARIABLES with respect to change in just one of its variables. Partial derivatives are useful in analyzing surfaces for MAXIMUM and MINIMUM points and give rise to PARTIAL DIFFERENTIAL EQUATIONS. As with ordinary derivatives, a first partial derivative represents a rate of change or a SLOPE of a TANGENT LINE. For a three-dimensional surface, two first partial derivatives represent the slope in each of two perpendicular directions. Second, third, and higher partial derivatives give more information about how the function changes at any point.

partial differential equation In mathematics, an equation that contains PARTIAL DERIVATIVES, expressing a process of change that depends on more than one independent variable. It can be read as a statement about how a process evolves without specifying the formula defining the process. Given the initial state of the process (such as its size at time zero) and a description of how it is changing (i.e., the partial differential equation), its defining formula can be found by various methods, most based on INTEGRATION. Important partial differential equations include the heat equation, the wave equation, and LAPLACE'S EQUATION, which are central to MATHEMATICAL PHYSICS.

particle accelerator Device that accelerates a beam of fast-moving, electrically charged atoms (IONS) or SUBATOMIC PARTICLES. Accelerators are used to study the structure of atomic nuclei (see ATOM) and the nature of subatomic particles and their FUNDAMENTAL INTERACTIONS. At speeds close to that of light, particles collide with and disrupt atomic nuclei and subatomic particles, allowing physicists to study nuclear components and to make new kinds of subatomic particles. The CYCLOTRON accelerates positively charged particles, while the betatron accelerates negatively charged ELECTRONS. SYNCHROTRONS and LINEAR ACCELERATORS are used either with positively charged particles or electrons. Accelerators are also used for radioisotope production, cancer therapy, biological sterilization, and one form of radiocarbon dating.

particle physics *or* **high-energy physics** Study of the fundamental SUBATOMIC PARTICLES, including both MATTER (and ANTIMATTER) and the carrier particles of the FUNDAMENTAL INTERACTIONS as described by QUANTUM FIELD THEORY. Particle physics is concerned with structure and forces at this level of existence and below. Fundamental particles possess properties such as ELECTRIC CHARGE, SPIN, MASS, MAGNETISM, and other complex characteristics, but are regarded as pointlike. All theories in particle physics involve QUANTUM MECHANICS, in which symmetry is of primary importance. See also ELECTROWEAK THEORY, LEPTON, MESON, QUANTUM CHROMODYNAMICS, QUARK.

parting In METALLURGY, the separation of GOLD and SILVER by chemical or electrochemical means. Gold and silver are often extracted together from the same ores or recovered as by-products from the extraction of other metals. A solid mixture of the two, known as bullion or doré, can be parted by boiling in nitric acid. The silver is dissolved as SILVER NITRATE, leaving a gold residue that is filtered off and washed; silver is precipitated out of solution by adding ferrous sulfate. This is the traditional method used in ASSAYING the content of gold and silver samples.

partnership Association of two or more persons or entities that conduct a business for profit as co-owners. Except in the case of the LIMITED LIABILITY partnership, which shares with the corporation the characteristic of being treated as a single entity whose members have limited personal liability, a partnership is traditionally viewed as an association of individuals rather than an entity with a separate and independent existence. A partnership cannot exist beyond the lives of the partners. The partners are taxed as individuals and are personally liable for TORTS and contractual obligations. Each is viewed as the agent of the others, and traditionally all are jointly and severally liable for the tortious acts of any partner.

partridge Any of certain species of Old World game bird in the family Phasianidae. The European gray partridge (*Perdix perdix*), introduced into North America, has a reddish face and tail, gray breast, barred sides, and a dark U shape on the belly. Males may be 12 in. (30 cm) long. The hen lays about 15 eggs in a grassy cup in grainfields or hedges. Family groups (coveys) forage for seeds and insects. The five Asian and 35 African species of francolins (genus *Francolinus*) have leg spurs and are 10–16 in. (25–40 cm) long. The snow partridge (*Lerwa lerwa*) inhabits high Asian mountains. Partridges are larger than QUAIL and have a stronger bill and feet. GROUSE and BOBWHITES are often erroneously called partridge.

parturition *or* **birth** *or* **childbirth** *or* **labour** *or* **delivery** Process of bringing forth a child from the UTERUS, ending PREGNANCY. It has three stages. In dilation, uterine contractions lasting about 40 seconds begin 20–30 minutes apart and progress to severe labour pains about every 3 minutes. The opening of the cervix widens as contractions push the FETUS. Dilation averages 13–14 hours in first-time mothers, less if a woman has

© 2006 Encyclopædia Britannica, Inc.

had previous babies. When the cervix dilates fully, expulsion begins. The "water" (amniotic sac) breaks (if it has not already), and the woman may actively push. Expulsion lasts 1–2 hours or less. Normally, the baby's head emerges first; other positions make birth more difficult and risky. In the third stage, the PLACENTA is expelled, usually within 15 minutes. Within six to eight weeks, the mother's REPRODUCTIVE SYSTEM returns to nearly the prepregnancy state. See also CESAREAN SECTION; LACTATION; MIDWIFERY; MISCARRIAGE; NATURAL CHILDBIRTH; OBSTETRICS AND GYNECOLOGY; PREMATURE BIRTH.

Party of God See HEZBOLLAH

party system Political system in which individuals who share a common set of political beliefs organize themselves into parties to compete in elections for the right to govern. Single-party systems are found in countries that do not allow genuine political conflict. Multiparty and two-party systems represent means of organizing political conflict within pluralistic societies and are thus indicative of democracy. Multiparty systems allow for greater representation of minority viewpoints; since the coalitions that minority parties must often form with other minority parties to achieve a governing majority are often fragile, such systems may be marked by instability. See also ELECTORAL SYSTEM.

Parvati \'pär-və-ˌtē\ Wife of the Hindu god SHIVA. Parvati is the benevolent aspect of Shakti, the Hindu supreme goddess (see SHAKTISM). According to the traditional account of her marriage, she won Shiva's notice only after severe ascetic discipline. The couple had two children, the elephant-headed GANESHA and the six-headed Skanda. In sculpture Parvati is always depicted as a mature and beautiful woman. The sacred TANTRAS are framed as a discussion between Parvati and Shiva.

Parvati, bronze image, early Cola period, 10th century AD; in the Freer Gallery of Art, Washington, D.C.

Pas de Calais See Strait of DOVER

pas de deux \pä-də-'dœ\ *French* **"step for two"** Dance for two performers. A characteristic part of classical BALLET, it includes an adagio, or slow dance, by the ballerina and her partner; solo variations by the male dancer and then the ballerina; and a coda, or conclusion, with both partners dancing together to display their virtuosity. Celebrated pas de deux occur in *Sleeping Beauty*, *Swan Lake*, and *Giselle*.

Pasadena City (pop., 2000: 133,936), southwestern California, U.S., at the base of the SAN GABRIEL MOUNTAINS. Founded in 1874, it was incorporated as a city in 1886. It grew as a winter resort and citrus centre after the construction of the Santa Fe Railway and the freeway system that link it to LOS ANGELES to the southwest. It is a centre of scientific research, based on the CALIFORNIA INSTITUTE OF TECHNOLOGY and its Jet Propulsion Laboratory. It is the site of the annual college football ROSE BOWL and the New Year's Day Tournament of Roses, a flower festival begun in 1890.

Pasadena City (pop., 2000: 141,674), southeastern Texas, U.S., east of HOUSTON. Founded in 1895, it was incorporated in 1929. After World War II the city grew rapidly, stimulated by nearby industrial development, especially in petrochemicals and aerospace. Northeast of the city is the site of the 1836 capture of Mexican Gen. ANTONIO SANTA ANNA after the Battle of San Jacinto.

Pasargadae \pə-'sär-gə-ˌdē\ Ancient Persian city, near modern SHĪRĀZ, Iran. It was the capital of CYRUS II, founder of the ACHAEMENIAN DYNASTY. He was said to have founded the city on the site of his victory over the last king of the Medes (c. 550 BC). The city was surrendered to ALEXANDER THE GREAT in 330 BC. It was known for the majestic simplicity of its architecture; its ruins include the bases of several large buildings and the nearly intact tomb of Cyrus.

Pascal \pas-'kal\ Computer PROGRAMMING LANGUAGE named for BLAISE PASCAL and based partly on ALGOL. It was developed by Niklaus Wirth of Zurich's Federal Institute of Technology in the late 1960s as an educational tool for systematic teaching of programming, with fast, reliable COMPILERS. It was made available to the public in 1974 and was used by many universities for the next 15 years. Pascal strongly influenced languages developed later, such as ADA. Complex DATA STRUCTURES and ALGORITHMS can be described concisely by Pascal, and its programs are easy to read and debug.

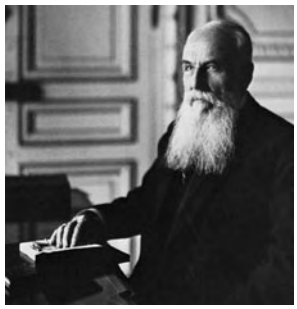
pascal Unit of PRESSURE, abbreviated Pa, in the INTERNATIONAL SYSTEM of Units. Named for BLAISE PASCAL, the unit is a pressure of one NEWTON per square meter (1 N/m^2). It is inconveniently small for many purposes, and the kilopascal (kPa), 1,000 N/m^2, is more commonly used in engineering work (1 lb per sq in. equals 6.895 kPa).

Pascal \pas-'kal**, Blaise** (b. June 19, 1623, Clermont-Ferrand, France—d. Aug. 19, 1662, Paris) French mathematician, physicist, and religious philosopher. The son of a mathematician, he was a child prodigy, earning the envy of RENÉ DESCARTES with an essay he wrote on conic sections in 1640. In the 1640s and '50s he made contributions to physics (formulating PASCAL'S LAW) and mathematics (working on the arithmetic triangle, inventing a calculating machine, and contributing to the advance of differential calculus). For work done in his early years, he is regarded as the founder of the modern theory of probability. At the same time, he became increasingly involved with JANSENISM. *Les Provinciales* were a series of letters defending Jansenism and attacking the JESUITS. His great work of Christian apologetics, *Apologie de la religion chrétienne,* was never finished, but he put together most of his notes and fragments between 1657 and 1658; these were published posthumously as *Pensées* (1670). He returned to scientific work, contributing to the *Élements de géométrie* and publishing his findings on cycloid curves, but he soon returned to devotional life and spent his last years helping the poor. The PASCAL was named in his honour. See also PASCAL'S WAGER.

Pascal's law *or* **Pascal's principle** In FLUID MECHANICS, the statement that in a fluid at rest in a closed container, a PRESSURE change in one part is transmitted without loss to every portion of the fluid and to the walls of the container. The principle was first stated by BLAISE PASCAL, who also discovered that the pressure at a point in a fluid at rest is the same in all directions, and that the pressure would be the same on all planes passing through a specific point.

Pascal's wager Practical argument for belief in God formulated by BLAISE PASCAL. In his *Pensées* (1657–58), Pascal posed the following argument to show that belief in the Christian religion is rational: If the Christian God does not exist, the agnostic loses little by believing in him and gains correspondingly little by not believing. If the Christian God does exist, the agnostic gains eternal life by believing in him and loses an infinite good by not believing. WILLIAM JAMES objected to the argument that it supported belief in any religion that promised an eternal afterlife. Others have objected that though the argument does give one a reason for believing in the Christian God, it does not make that belief "rational" in the proper sense.

Paschal \pas-'kal\ **II** *orig.* **Raniero** (b. Bieda di Galeata, near Ravenna—d. Jan. 21, 1118) Pope (1099–1118). He fostered the First CRUSADE and favoured Gregorian reforms, but his pontificate was dominated by the INVESTITURE CONTROVERSY. Paschal came to terms on the issue of lay investiture with HENRY I of England and Philip I of France (1107). His negotiations with Emperors HENRY IV and Henry V were unsuccessful, and he was imprisoned by Henry V (1111). While a prisoner, he agreed to royal investiture of bishops and crowned Henry emperor, but a church council declared his concessions invalid, and the archbishop of Vienne excommunicated the emperor.



Pascin \pȧs-'kaⁿ**, Jules** *orig.* **Julius Pincas** (b. March 31, 1885, Vidin, Bulg.—d. June 1, 1930, Paris, France) Bulgarian painter. He traveled widely and lived in Austria and Germany, producing drawings for satirical journals, before moving to Paris in 1905. He moved to New York City during World War I and became a U.S. citizen but returned to Paris in 1920 and became associated with other Jewish artists, including MARC CHAGALL, AMEDEO MODIGLIANI, and CHAIM SOUTINE. His most notable works

© 2006 Encyclopædia Britannica, Inc.

are thinly painted, delicately toned, ironic studies of women; he also painted portraits and a series of large-scale biblical and mythological scenes. Though financially successful, he was emotionally unstable; he hanged himself at 45.

Pashtun \ˌpäsh-ˈtün\ Any member of a Pashto-speaking people of southeastern Afghanistan and northwestern Pakistan. The Pashtun, who number about 7.5 million in Afghanistan and 14 million in Pakistan, constitute the majority of the population of Afghanistan. Their origins are unclear: Pashtun tradition asserts that they are descended from Afghana, grandson of King Saul of Israel, but most scholars believe that they arose from an intermingling of ancient Aryans from the north or west with subsequent invaders. Each Pashtun tribe is divided into clans, subclans, and patriarchal families. Disputes among the Pashtun over property, women, and personal injury often result in blood feuds between families and whole clans. Most tribal people are sedentary farmers; some are migratory herders and caravaners. Large numbers of the Pashtun have always been attracted to military service.

Pašić \ˈpä-shēᵏ,\ *English* \ˈpä-shich**, Nikola** (b. Dec. 31, 1845, Zaječar, Serbia—d. Dec. 10, 1926, Belgrade) Serbian and Yugoslav statesman. The editor of a socialist newspaper in Serbia, he was elected in 1878 to the legislature, where he opposed the authoritarian monarchy and advocated a parliamentary democracy. In 1881 he helped found the Radical Party, but he was forced to flee to Bulgaria in 1883. Returning to Serbia in 1889 under a new king, he served as premier (1891–92) and as ambassador to Russia (1893–94). Forced into exile again because of his political radicalism (1899–1903), he returned to support the Karadjordjević dynasty and King Peter I. As leader of the Radical Party, he served as premier of Serbia during most of the period (1904–18), then helped create the new Kingdom of Serbs, Croats, and Slovenes (later Yugoslavia). As premier (1921–26), he pushed for a unitary constitution that confirmed Serbia's dominance despite opposition from the historically separate regions.

Pašić.

Pasionaria, La See Dolores Ibárruri

Pasolini \ˌpä-sō-ˈlē-nē**, Pier Paolo** (b. March 5, 1922, Bologna, Italy—d. Nov. 2, 1975, Ostia, near Rome) Italian film director, poet, and novelist. He wrote novels about Rome's slum life as well as a significant body of poetry. Pasolini became a screenwriter in the mid-1950s, collaborating most notably on Federico Fellini's *Nights of Cabiria* (1956). His directorial debut, *Accattone* (1961), was based on his novel *A Violent Life* (1959). His best-known film, stylistically unorthodox and implicitly radical, is perhaps *The Gospel According to Saint Matthew* (1964). Later films include *Oedipus Rex* (1967), *Teorema* (1968), *Medea* (1969), *The Canterbury Tales* (1972), and *The Arabian Nights* (1974), which won a special jury prize at Cannes. His use of eroticism, violence, and depravity were criticized by Italian religious authorities.

pasqueflower See anemone

passage, rite of Any of numerous ceremonial events, existing in all societies, that mark the passage of an individual from one social or religious status to another. The term was coined by the French anthropologist Arnold van Gennep (1873–1957) in 1909. Many of the most important rites are connected with the biological stages of life—birth, maturity, reproduction, and death. Other rites celebrate changes that are wholly cultural, such as initiation into special societies. In modern societies, graduation from school is a rite of passage. Scholars often interpret rites of passage as mechanisms by which society confronts and incorporates change without disrupting the equilibrium necessary to social order. See also secret society.

Passamaquoddy Bay Inlet of the Bay of Fundy, between southwestern New Brunswick, Canada, and southeastern Maine, U.S., at the mouth of the St. Croix River. Deer Island and Campobello Island are in its southern part. It has an immense tidal flow, with about 70 billion cu ft (2 billion cu m) entering and leaving twice daily on the turn of the tide.

passenger pigeon Extinct species (*Ectopistes migratorius*) of pigeon (subfamily Columbinae, family Columbidae). Passenger pigeons were about 13 in. (32 cm) long and had a long pointed tail; the male was pinkish, with a blue-gray head. Billions inhabited eastern North America in the early 19th century; migrating flocks darkened the skies for days at a time. Gunners began to slaughter them in huge numbers for shipping by railway carloads for sale in city meat markets. Martha, the last known passenger pigeon, died in 1914 in the Cincinnati Zoo. The bird's extinction was largely responsible for ending the marketing of game birds and gave major impetus to the conservation movement.

Passenger pigeon, mounted (*Ectopistes migratorius*)
BILL REASONS—THE NATIONAL AUDUBON SOCIETY COLLECTION/PHOTO RESEARCHERS

passerine Any perching bird. All passerines belong to the largest order of birds, Passeriformes, and have feet specialized for holding onto a horizontal branch (perching). The passerine foot has three forward-directed toes and one backward-directed toe. Most passerines have moderately curved, sharp claws. Some ground-dwelling species (e.g., larks, pipits) have flatter, longer feet. Species that spend much time airborne (e.g., swallows) have small, weak feet. Species that cling and climb (e.g., nuthatches) have strong, sharp, curved claws. Passerines include about 4,000 species of oscines (songbirds; suborder Passere, or Oscines) and 1,100 species of suboscines (suborders Eurylaimi, called broadbills; Tyranni, including flycatchers; and Menurae, including lyrebirds). Suboscines lack the syrinx of the songbirds or have only a poorly developed one, but some can utter complex vocalizations. All passerines are land birds, abundant worldwide except in Antarctica. Most are insectivorous, solitary nesters that build a cup-shaped open nest.

Passion Musical setting of the suffering and crucifixion of Christ. The early Passion consisted entirely of plainchant. Liturgical enactments of Christ's Passion date from the early Middle Ages, the characters' parts being sung by individual celebrants and the crowd's role by the congregation. Polyphonic Passions began appearing in the 15th century. In the German tradition exemplified by Heinrich Schütz, the Passion closely resembles the dramatic oratorio, with solo arias and other ensembles contrasting with choral sections; the alternative motet-style Passion lacked solo sections and avoided dramatic oppositions. After the 18th century, Passions ceased to be widely composed.

Passion play Religious drama of medieval origin dealing with the suffering, death, and resurrection of Jesus. Early Passion plays were written in Latin and consisted of Gospel readings alternating with poetic descriptions of the events of Christ's Passion (i.e., his sufferings between the Last Supper and his death). Use of the vernacular for these poetic passages led to the development of independent vernacular plays. By the 16th century many of the plays had been overtaken by secular influences and had become mere popular entertainments. Some survived into the 21st century, most notably the one performed by local villagers every 10 years at Oberammergau, Ger. See also liturgical drama; miracle play; mystery play.

passionflower family Family Passifloraceae, composed of about 600 species of herbaceous or woody vines, shrubs, and trees in 20 genera. Members of this family grow mostly in warm regions. Many species produce edible fruits. Members of the largest genus, *Passiflora*, are highly prized for their showy, unusual flowers. A pedestal-like structure in the centre of the flower carries the reproductive parts of both sexes. The passionflower blossom is often used to symbolize events in the last hours (Passion) of Jesus, which accounts for the name of the group.

passive resistance See civil disobedience, satyagraha

Passover In Judaism, the holiday commemorating the liberation of the Hebrews from slavery in Egypt. Before sending a plague to destroy the firstborn of the Egyptians, God instructed Moses to tell the Israelites to place a special mark above their doors as a signal for the angel of death to pass over (i.e., spare the residents). The festival of Passover begins on the 15th and ends on the 22nd (in Israel, the 21st) day of the month of Nisan (March or April). During Passover only unleavened bread may be

© 2006 Encyclopædia Britannica, Inc.

eaten, symbolizing the Hebrews' suffering in bondage and the haste with which they left Egypt. On the first night of Passover, a SEDER is held, and the HAGGADAH is read aloud.

passport Document issued by a national government identifying a traveler as a citizen with a right to protection while abroad and a right to return to the country of citizenship. It is normally a small booklet containing a description and photograph of the bearer. Most nations require entering travelers to obtain a visa, an endorsement on the passport showing that the proper authorities have examined it and permitting the bearer to enter the country and remain for a specified period.

pasta Any of several starchy food pastes (*pasta alimentaria*) made from semolina, the purified middlings (endosperm) of a hard WHEAT called durum. Pasta is traditionally associated with Italian cuisine, though it may have entered Europe from Asia during the Mongol invasions of the 13th century. In making pasta, semolina dough is rolled out and sliced or compacted and forced through perforated plates (dies) that form it into the desired shape. It is produced in the form of sheets, ribbons, cords, tubes, and other shapes, each with its own name (e.g., spaghetti, macaroni). The formed dough is then dried under controlled conditions. Pasta is boiled and topped with a sauce or combined with other foods before serving.

pastel Drawing medium consisting of fragile, finger-size crayons called pastels, made of powdered pigments combined with a minimum of nongreasy binder (usually gum tragacanth or, from the mid-20th century, methyl cellulose). Because pigment applied with pastel does not change in colour value, the final effect can be seen immediately. Pastel remains on the surface of the paper and thus can be easily obliterated unless protected by glass or a fixative spray of glue size or gum solution. When pastel is applied in short strokes or linearly, it is usually classed as drawing; when it is rubbed, smeared, and blended to achieve painterly effects, it is often regarded as a painting medium.

Pasternak, Boris (Leonidovich) (b. Feb. 10, 1890, Moscow, Russia—d. May 30, 1960, Peredelkino, near Moscow) Russian poet and prose writer. He studied music and philosophy and after the Russian Revolution of 1917 worked in the library of the Soviet commissariat of education. His early poetry, though avant-garde, was successful, but in the 1930s a gap widened between his work and officially approved literary modes, and he supported himself by doing translations. The novel *Doctor Zhivago* (1957; film, 1965), an epic of wandering, spiritual isolation, and love amid the harshness of the revolution and its aftermath, was a best-seller in the West but until 1987 circulated only in secrecy in the Soviet Union. Pasternak was awarded the Nobel Prize for Literature in 1958, but he was forced to decline it because of Soviet opposition to his work.

Pasteur \pas-'tər**, Louis** (b. Dec. 27, 1822, Dole, France—d. Sept. 28, 1895, Saint-Cloud, near Paris) French chemist and microbiologist. Early in his career, after studies at the École Normale Supérieure, he researched the effects of polarized light on chemical compounds. In 1857 he became director of scientific studies at the École. His studies of FERMENTATION of alcohol and milk (souring) showed that yeast could reproduce without free oxygen (the Pasteur effect); he deduced that fermentation and food spoilage were due to the activity of microorganisms and could be prevented by excluding or destroying them. His work overturned the concept of spontaneous generation (life arising from nonliving matter) and led to heat PASTEURIZATION, allowing vinegar, wine, and beer to be produced and transported without spoiling. He saved the French silk industry by his work on silkworm diseases. In 1881 he perfected a way to isolate and weaken germs, and he went on to develop VACCINES against anthrax in sheep and cholera in chickens, following EDWARD JENNER's example. He turned his attention to researching rabies, and in 1885 his inoculating with a weakened virus saved the life of a boy bitten by a rabid dog. In 1888 he founded the Pasteur Institute for rabies research, prevention, and treatment.

Pasteurella \ˌpas-chə-'rel-ə\ Genus (named after LOUIS PASTEUR) of rod-shaped BACTERIA that cause several serious diseases in domestic animals and milder infections in humans. Members are gram-negative (see GRAM STAIN), do not move, and do not require oxygen. The widespread infections they cause, referred to by the general term *pasteurelloses*, are transmitted by direct contact and, in some cases, by ticks and fleas. Control by vaccine is variable, as is treatment with penicillin and other antibiotics.

pasteurization Partial STERILIZATION of a substance, especially MILK or other beverages, by using heat to destroy microorganisms while leaving its chemical makeup unaltered. The process is named for LOUIS PASTEUR, its originator. Pasteurization of milk requires temperatures of about 145 °F (63 °C) for about 30 minutes, or higher temperatures for shorter periods. The treatment destroys any disease-causing organisms (principally *Mycobacterium tuberculosis*) as well as organisms that cause spoilage. See also FOOD PRESERVATION.

Pastor, Tony *orig.* **Antonio Pastor** (b. May 28, 1837, New York, N.Y., U.S.—d. Aug. 26, 1908, Elmhurst, N.Y.) U.S. impresario and comic singer. He appeared at P.T. BARNUM's American Museum as a child prodigy and first performed in a variety show in 1861. After managing a series of New York City theatres, he opened the Fourteenth Street Theatre in 1881. Though variety shows of the time featured coarse humour and were considered unsuitable for ladies, he advertised his theatre as "the first specialty and vaudeville theatre of America, catering to polite tastes." His unexpected success spurred other theatre managers to follow suit and led to the creation of VAUDEVILLE. See also MUSIC HALL AND VARIETY THEATRE.

Tony Pastor
CULVER PICTURES

pastoral \ˌpas-tə-'räl\ Literary work dealing in a usually artificial manner with shepherds or rural life, typically contrasting the innocence and serenity of the simple life with the misery and corruption of city or court life. The characters are often the vehicles for the author's moral, social, or literary views. The poet and his friends are often presented as shepherds and shepherdesses; two or more shepherds sometimes contend in "singing matches." The conventions of pastoral poetry were largely established by THEOCRITUS, whose bucolics are its earliest examples. VIRGIL's *Eclogues* were influential as well, as was EDMUND SPENSER's *Shepheardes Calender* in the Renaissance. The idea of pastoral as meaning a simpler world that somehow mirrors a more complex one also appears in novelists as different as FYODOR DOSTOYEVSKY, LEWIS CARROLL, and WILLIAM FAULKNER. See also ECLOGUE.

Pastoureaux \ˌpas-tȯr-'ō\ (French: "shepherds") Participants in two outbreaks of mob violence in medieval France. The first Pastoureaux were peasants in northeastern France aroused by news in 1251 of the reverses suffered by King LOUIS IX while on his CRUSADE. Accusing the nobles, clergy, and bourgeoisie of indifference to the king's fate, they began pillaging churches and towns and attacking clerics, the rich, and Jews. The second Pastoureaux converged on Paris in 1320 to punish Philip V for failing to undertake a Crusade he had called. They sacked the city, opened the prisons, and marched into the countryside, where they carried out pogroms against Jews and lepers before being suppressed.

Pasupata \'pä-shů-ˌpə-tə, ˌpä-shů-'pə-tə\ Early Hindu sect that worshiped SHIVA as the supreme deity. Numerous subsects flourished in northern and northwestern India until at least the 12th century and spread to Java and Cambodia. Pasupata teachings were believed to have originated with Shiva himself, reincarnated as the teacher Lakulin. The sect's rise is dated roughly between the 2nd century BC and the 2nd century AD. The ascetic practices adopted by the Pasupatas included smearing their bodies thrice-daily with ashes. Out of Pasupata doctrine developed two extreme schools, KAPALIKA AND KALAMUKHA, as well as one moderate sect, SHAIVISM.

Patagonia Semiarid scrub plateau, southern Argentina. It is the largest desert region in the Americas, with an area of about 260,000 sq mi (673,000 sq km). Its approximate boundaries are the COLORADO RIVER in the north, the Atlantic Ocean in the east, the Strait of Magellan in the south, and the ANDES MOUNTAINS in the west. A region of vast and virtually treeless plains, it has a variety of wildlife, including llamas, pumas, and eagles. Natural resources include petroleum, iron ore, copper, uranium, and manganese.

Patarine *or* **Patarene** \'pa-tə-rən\ Member of a group of craftsmen, tradesmen, and peasants, as well as some members of the clergy, that appeared in Milan c. 1058 to call for reform of the church. Named for the Pataria, the ragpickers' quarter of Milan where they assembled, the Patar-

© 2006 Encyclopædia Britannica, Inc.

ines attacked SIMONY and clerical concubinage and marriage and opposed the clergy's moral corruption. They also encouraged greater participation by the laity in religious life and drew support from the Gregorian Reform popes, including Alexander II and GREGORY VII. The Patarines formed part of the broader movement for church reform in the 11th century, and the resignation of their rival, the archbishop of Milan, led to a schism in the city that would help bring about the INVESTITURE CONTROVERSY. In the later 12th century, the name Patarine was used as a general label for all heretics, particularly the CATHARI.

patch test Controlled application of biological or chemical substances to the skin to test for ALLERGY. Small amounts of diluted test substances applied under a patch of cloth or soft paper and an impermeable membrane are left in place for 48 hours, and the skin reaction is then examined and scored from 0 (none) to 4+ (severe blistering and redness).

Patel \pə-'tāl**, Vallabhbhai (Jhaverbhai)** *known as* **Sardar Patel** (b. Oct. 31, 1875, Nadiad, Gujarat, India—d. Dec. 15, 1950, Bombay) Indian statesman. Educated in India, he set up his own law office in 1900 and later studied law in Britain; he did not become involved in politics until 1917. Like MOHANDAS K. GANDHI (and unlike JAWAHARLAL NEHRU), he advocated dominion status within the British Commonwealth rather than independence for India. He opposed armed struggle on practical rather than moral grounds, and he was not interested in Hindu-Muslim unity. Patel was repeatedly a candidate for the presidency of the Indian National Congress, but his uncompromising attitude toward the Indian Muslims cost him Gandhi's support and, ultimately, the presidency. After Indian independence (1947), he held several cabinet positions. He is remembered for achieving the peaceful integration of the princely Indian states into the Indian union and the political unification of India.

Patenier, Joachim de See JOACHIM PATINIR

patent Government grant to an inventor of the exclusive right to make, use, or sell an invention, usually for a specified term. It may be granted for a process or method that is new, useful, and not obvious, or for a new use of a known process, machine, or composition of matter or material, including asexually reproduced plants and genetically engineered organisms. It may also be granted for any new, original, and ornamental design for an article of manufacture. The first recorded patent for an industrial invention was granted in 1421 in Florence to the architect and engineer FILIPPO BRUNELLESCHI. Until recently there were wide variations in the patent systems implemented by different countries. The duration of patents recognized generally ranged from 16 to 20 years. In some countries (e.g., France), some patents were given shorter terms because the inventions had an overall general usefulness. In communist countries (e.g., the Soviet Union), patents per se were not recognized; instead, certificates were issued to inventors to ensure that they received some form of compensation for their work. The agreement establishing the WORLD TRADE ORGANIZATION in the 1990s specifies a minimum set of exclusive rights that all patentees must be accorded and mandates a minimum patent term of 20 years from the date an application is filed. Patents are considered personal property and may be sold, assigned, or otherwise transferred.

Pater \'pā-tər**, Walter (Horatio)** (b. Aug. 4, 1839, Shadwell, London, Eng.—d. July 30, 1894, Oxford, Oxfordshire) English critic, essayist, and humanist. Elected a fellow at the University of Oxford in 1864, Pater made his reputation as a scholar and aesthete with essays collected in *Studies in the History of the Renaissance* (1873). Written in a delicate, fastidious style, the essays introduced his influential advocacy of "art for art's sake," which contrasted with the prevailing emphasis on art's moral or educational values and became a cardinal doctrine of AESTHETICISM. *Marius the Epicurean* (1885), a philosophical romance on the ideal life, is his most substantial work.

Paterson City (pop., 2000: 149,222), northeastern New Jersey, U.S. It is located on the Passaic River, north of NEWARK, N.J. It was founded in 1791 as an industrial settlement by advocates of U.S. industrial independence from Europe. The successful enterprise, begun by ALEXANDER HAMILTON, was known as the Society for Establishing Useful Manufactures. In the 19th century it was a centre of cotton textile production, the silk industry, and locomotive manufacturing. It received a city charter in 1851 and was the scene of many labour disputes. By the 20th century its industries were widely diversified.

Paterson, William (b. Dec. 24, 1745, County Antrim, Ire.—d. Sept. 9, 1806, Albany, N.Y., U.S.) Irish-born U.S. jurist. He immigrated with his family to New Jersey in 1747. He was the state's attorney general from 1776 to 1783. At the CONSTITUTIONAL CONVENTION he played a leading role in the opposition of the small states to representation according to population in the federal legislature, submitting the New Jersey (or small-state) Plan, which called for an equal vote for all states, to counter the Virginia (or large-state) Plan, which favoured larger states. He secured ratification of the CONSTITUTION OF THE UNITED STATES in New Jersey and was elected one of the state's first U.S. senators (1789–90). He served as governor of New Jersey from 1790 to 1793 and as a justice of the U.S. Supreme Court from 1793 to 1806.

Pathan See PASHTUN

Pathé \pä-'tā,\ *English* \pa-'thā**, Charles** (b. Dec. 25, 1863, Paris, France—d. Dec. 26, 1957, Monte-Carlo, Mon.) French film executive. In 1896 he and his brother Émile founded Pathé Frères, which distributed THOMAS ALVA EDISON's Kinetoscope viewing device to French theatres. The firm entered film production using the camera developed by the LUMIÈRE brothers. Pathé Frères filmed numerous short subjects, the majority of which are sensational criminal adventures, melodramatic love stories, and comic anecdotes. In 1909 Pathé produced his first "long film," *Les Misérables*, a four-reel screen version of the novel by Victor Hugo, and launched the *Pathé Gazette*, an internationally popular newsreel that ran until 1956. In 1914 Pathé Frères released the first episodes of *The Perils of Pauline*, one of the earliest screen SERIALS. With facilities throughout the world, Pathé Frères dominated the film market in the early 20th century, and it remained a film distributor after Charles's retirement in 1929.

pathology Medical specialty dealing with causes of disease and structural and functional changes in abnormal conditions. As AUTOPSIES, initially prohibited for religious reasons, became more accepted in the late Middle Ages, people learned more about the causes of death. In 1761 Giovanni Battista Morgagni (1682–1771) published the first book to locate disease in individual organs. In the mid-19th century the humoral theories of infection were replaced first by cell-based theories (see RUDOLF VIRCHOW) and then by the bacteriologic theories of ROBERT KOCH and LOUIS PASTEUR. Today pathologists work mostly in the laboratory and consult with a patient's physician after examining specimens including surgically removed body parts, blood and other fluids, urine, feces, and discharges. Culturing of infectious organisms, staining, fibre-optic endoscopy, and electron microscopy have greatly expanded the information available to the pathologist.

patina See DESERT VARNISH

Patinir \ˌpä-tə-'nir**, Joachim (de)** *or* **Joachim de Patinier** *or* **Joachim de Patenier** \ˌpä-tə-'nēr\ (b. c. 1485, Bouvignes, Namur—d. Oct. 5, 1524, Antwerp) Netherlandish painter. Nothing is known of his early life, but his work reflects knowledge of the paintings of GERARD DAVID. He is the first Western artist known to have specialized in landscape painting, though his work has a nominal religious subject and he never painted pure landscapes. His novelty lay in the fact that the religious motif in such works as *Flight into Egypt* (1515–20) was overshadowed by the phenomena of the natural world. He apparently made a practice of supplying landscape settings for figure compositions painted by other Flemish masters. His landscapes combine realistic detail with a sense of fantasy that suggests his familiarity with the works of HIËRONYMUS BOSCH.

patio In Spanish and Latin American architecture, a courtyard open to the sky within a building. A Spanish development of the Roman ATRIUM, it is comparable to the Italian *cortile* but provides more seclusion, possibly due to Moorish custom. The patio of the contemporary U.S. house is a paved outdoor area adjoining or partially enclosed by the building and often used for outdoor dining.

patio process *or* **Mexican process** Method of isolating SILVER from its ORE, apparently dating from pre-Columbian times. The ore was crushed and ground by mule power in ARRASTRAS, reducing it to a fine mud. This was then spread over a courtyard or patio, sprinkled with MERCURY, salt, and copper sulfate, and mixed by driving mules over it. Chemical reactions caused the silver to dissolve in the mercury. When the amalgamation was complete, the material was agitated with water in large tubs and the mud run off. The AMALGAM at the bottom was collected and heated to drive off the mercury. Used for much of the world's silver production for 350 years, the process was replaced by the CYANIDE PROCESS early in the 20th century.

Patna \'pət-nə\ City (pop., 2001 prelim.: 1,376,950), capital of BIHAR state, northeastern India, on the GANGES RIVER. It was founded in the 5th century BC as Pataliputra and was the capital of MAGADHA until the 1st century BC. It was ruled later by the MAURYAN EMPIRE. A centre of learning, it became the GUPTA DYNASTY's capital in the 4th century AD but declined and was deserted by the 7th century. Revived as Patna in 1541 by an Afghan ruler, it became prosperous under the MUGHAL DYNASTY and passed to the British in 1765. Extensive archaeological excavations have been made in its vicinity.

Paton, Alan (Stewart) (b. Jan. 11, 1903, Pietermaritzburg, Natal, S.Af.—d. April 12, 1988, near Durban) South African writer and political activist. While principal of a reformatory housing black youths, Paton introduced controversial progressive reforms and wrote his best-known work, the novel *Cry, the Beloved Country* (1948), focusing international attention on the issue of APARTHEID. To offer a nonracial alternative to apartheid, he helped found the Liberal Party of South Africa in 1953 and led the organization until it was banned in 1968. His other works include the novel *Too Late the Phalarope* (1953) and the biographies *Hofmeyr* (1964) and *Apartheid and the Archbishop* (1973).

Paton, 1961
UPI

patria potestas \'pä-trē-ə-pō-'tes-ˌtäs\ *Latin* **"power of the father"** In Roman family law, the power that the male head of a family (*paterfamilias*) exercised over his descendants in the male line and over adopted children. Originally this power was absolute and included the power of life and death; a *paterfamilias* could acknowledge, banish, kill, or disown a child. He could free his male descendants from this obligation or turn over his daughter and all her inheritance to the power of her husband. By the end of the republic (from about the 1st century BC), a father could inflict only light punishment and his sons could keep what they earned.

patriarch Title applied to OLD TESTAMENT leaders such as METHUSELAH, ABRAHAM, Isaac, and JACOB. It was once given also to some Roman Catholic BISHOPS who wielded great authority. It is still used in EASTERN ORTHODOXY, which now has nine patriarchates: Constantinople, Alexandria, Antioch, Jerusalem, Moscow, Georgia, Serbia, Romania, and Bulgaria.

patrician In ancient Rome, any member of a group of citizen families who, in contrast to the PLEBEIANS, formed a privileged nobility. They attempted to hold on to magistracies, priesthoods, and legal and religious knowledge, and the great civil struggle of the ROMAN REPUBLIC was the effort of the plebeians to achieve equality and break the patrician monopoly. Gradually the patricians lost their monopoly—except in a few areas, such as selected priesthoods and the office of interrex—and in the late republic (1st century BC) the distinction lost political importance. After 27 BC, patrician rank was necessary for ascent to the imperial throne. After Constantine's reign (AD 337), the term became an honorary title with no particular power.

Patrick, Saint (fl. 5th century; feast day March 17) Patron saint of Ireland. Born in Britain of a Romanized family, he was captured at age 16 by Irish raiders and carried into slavery in Ireland. He spent six years as a herdsman before escaping from his master and being reunited with his family in Britain. Called in a dream to bring Christianity to the Irish, he returned to Ireland and journeyed far and wide, baptizing chiefs and kings and converting whole clans. One popular legend says that he explained the notion of the Holy Trinity using the shamrock, now the national flower of Ireland. He is also said to have rid Ireland of snakes.

patristic literature Body of literature that comprises those works (excluding the New Testament) written by Christians before the 8th century. It refers to the works of the Church Fathers. Most patristic literature is in Greek or Latin, but much survives in Syriac and other Middle Eastern languages. The works of the Apostolic Fathers contain the earliest patristic literature. By the mid-2nd century, Christians wrote to justify their faith to the Roman government and to refute GNOSTICISM. In the 4th and 5th centuries, AUGUSTINE of Hippo and others laid the foundation for much of medieval and modern Christian thought. Significant patristic authors include JUSTIN Martyr, ORIGEN, TERTULLIAN, EUSEBIUS OF CAESAREA, ATHANASIUS, BASIL THE GREAT, St. GREGORY OF NYSSA, GREGORY OF NAZIANZUS, John CHRYSOSTOM, AMBROSE, Ephraem Syrus (306?–373), St. JEROME, THEODORE OF MOPSUESTIA, St. CYRIL OF ALEXANDRIA (c. 375–444), St. Maximus the Confessor (c. 580–662), and Pope GREGORY I.

patron saint Saint to whose protection and intercession a person, society, church, place, profession, or activity is dedicated. The choice is usually made on the basis of some real or presumed relationship (e.g., St. PATRICK is the patron saint of Ireland because he is credited with introducing Christianity there).

patronage system See SPOILS SYSTEM

pattern recognition In computer science, the imposition of identity on input data, such as speech, images, or a stream of text, by the recognition and delineation of patterns it contains and their relationships. Stages in pattern recognition may involve measurement of the object to identify distinguishing attributes, extraction of features for the defining attributes, and comparison with known patterns to determine a match or mismatch. Pattern recognition has extensive application in astronomy, medicine, robotics, and remote sensing by satellites. See also SPEECH RECOGNITION.

patternmaking In materials processing, the first step in CASTING and molding processes, the making of an accurate model of the part, somewhat oversize to allow for shrinkage of the cast material as it cools. Foundry workers then make a MOLD from the pattern, introduce the liquid into the mold, and remove the hardened part from the mold. The processing of materials in liquid form is commonly known as casting when it involves metals, glass, and ceramics; it is called molding when it involves plastics and some other nonmetallic materials. Patternmaking is a highly skilled trade learned by apprenticeship.

Patterson, Floyd (b. Jan. 4, 1935, Waco, N.C., U.S.) U.S. boxer. Patterson grew up in Brooklyn, N.Y. As a middleweight amateur fighter, he won the N.Y. Golden Gloves championship in 1951 and '52 and won an Olympic gold medal in 1952. As a professional, he moved up to heavyweight and in 1956 succeeded ROCKY MARCIANO as world heavyweight champion by knocking out ARCHIE MOORE. He lost the title to Ingemar Johansson in 1959, regained it in 1960 (becoming the first to hold the heavyweight championship twice), and lost it again in 1962 to Sonny Liston.

Patton, George S(mith) (b. Nov. 11, 1885, San Gabriel, Calif., U.S.—d. Dec. 21, 1945, Heidelberg, Ger.) U.S. army officer. He graduated from West Point and fought in World War I with the newly formed tank corps. He was later promoted to major general and given command of the 2nd Armored Division (1940). In World War II he led military operations in Morocco (1942) and Sicily (1943) and then commanded the 3rd Army in its sweep across northern France (1944) into Germany (1945). His strategy of bold and highly mobile operations in tank warfare, coupled with his strict, highly disciplined leadership, earned him his troops' respect and the nickname "Old Blood-and-Guts." Criticized for striking a hospitalized soldier he suspected of malingering, he later publicly apologized. He died in a car crash in Germany. See also Battle of the BULGE.

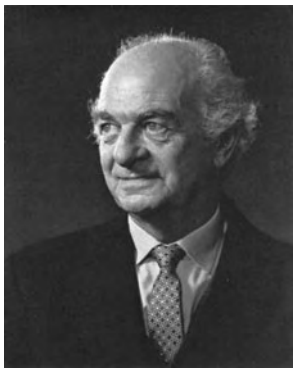
Paul *Russian* **Pavel Petrovich** (b. Oct. 1, 1754, St. Petersburg, Russia—d. March 23, 1801, St. Petersburg) Tsar of Russia (1796–1801). He was the son of PETER III and CATHERINE II, whom he succeeded as emperor in 1796. He reversed many of Catherine's policies, strengthened the autocracy, and established the law of succession within the male line of the ROMANOV DYNASTY. He provoked the hostility of the nobles and the army with his tyrannical rule and capricious foreign policy, which drew Russia into war with France. In a plot by the nobles to depose him and place his son Alexander (later ALEXANDER I) on the throne, Paul was assassinated.

Paul III *orig.* **Alessandro Farnese** (b. Feb. 29, 1468, Canino, Papal States—d. Nov. 10, 1549, Rome) Pope (1534–49). The son of a noble Tuscan family, he was made a cardinal-deacon in 1493 and served as bishop in Parma and Ostia before being named dean of the College of Cardinals by Pope LEO X. Ordained a priest in 1519, he was unanimously elected pope in 1534. Though loose in morals in earlier years (he had three sons and a daughter), he became an efficient promoter of reform, convening the Council of TRENT in 1545 and initiating the COUNTER-REFORMATION. He also supported the newly founded JESUITS and was a patron of the arts, the last in the tradition of the RENAISSANCE popes.

© 2006 Encyclopædia Britannica, Inc.

Paul VI *orig.* **Giovanni Battista Montini** (b. Sept. 26, 1897, Concesio, near Brescia, Italy—d. Aug. 6, 1978, Castel Gandolfo) Pope (1963–78). Educated at Brescia and ordained in 1920, he continued his studies in Rome, earning degrees in civil and canon law. He was a church diplomat for much of his career, until he was named archbishop of Milan in 1954. He became a cardinal in 1958, and in 1963 he was elected pope. Paul VI presided over the final sessions of the Second VATICAN COUNCIL and appointed commissions to carry out its reforms, including revisions in the MASS. He also relaxed rules on fasting, removed a number of questionable saints from the church's calendar, and enforced conservative positions on birth control and clerical celibacy. He promoted ECUMENISM and was the first pope to travel widely, visiting Israel, India, Asia, and Latin America.

Paul, Les *orig.* **Lester Polfus** (b. June 9, 1915, Waukesha, Wis., U.S.) U.S. guitarist and inventor. He played many styles of popular music, initially country but later jazz, and in the 1940s he was a sideman for NAT KING COLE and BING CROSBY. He invented the first solid-body electric guitar and was instrumental in developing modern multitrack recording. His overdubbed, sped-up recordings from the late 1940s and early 1950s—including "Brazil" (1948), "Nola" (1950), and "How High the Moon" (1951), often with his wife, Mary Ford (1924–77) singing multiple harmony parts—demonstrated the potential of tape. He continued to perform occasionally into his 80s.



Paul, Lewis (d. April 1759, Kensington, Middlesex, Eng.) British inventor. Working with JOHN WYATT from about 1730, he developed the first power spinning machine (see DRAWING FRAME), which they patented in 1738. It operated by drawing cotton or wool through pairs of successively faster rollers. It was eventually replaced by RICHARD ARKWRIGHT's water frame. Paul also patented a CARDING MACHINE in 1748.

Paul, Saint *orig.* **Saul** (b. AD 10?, Tarsus in Cilicia—d. 67?, Rome) Early Christian missionary and theologian, known as the Apostle to the Gentiles. Born a Jew in TARSUS, Asia Minor, he was trained as a rabbi but earned his living as a tentmaker. A zealous PHARISEE, he persecuted the first Christians until a vision of JESUS, experienced while on the road to Damascus, converted him to Christianity. Three years later he met St. PETER and Jesus' brother James and was henceforth recognized as the 13th Apostle. From his base in Antioch, he traveled widely, preaching to the Gentiles. By asserting that non-Jewish disciples of Christ did not have to observe Jewish law, he helped to establish Christianity as a separate religion rather than a Jewish sect. On a journey to Jerusalem, he aroused such hostility among the Jews that a mob gathered, and he was arrested and imprisoned for two years. The circumstances of his death are unknown. Paul's ministry and religious views are known largely from his letters, or epistles, collected in the NEW TESTAMENT, which are the first Christian theological writing and the source of much Christian doctrine. It was due to Paul more than anyone else that Christianity became a world religion.

Pauli, Wolfgang (b. April 25, 1900, Vienna, Austria—d. Dec. 15, 1958, Zürich, Switz.) Austrian-born U.S. physicist. At the age of 20, he wrote a 200-page encyclopaedia article on the theory of relativity. He taught physics in Zürich (1928–40) and later at the Institute for Advanced Study in Princeton, N.J. In 1924 he proposed that a spin quantum number, +½ or –½, is necessary to specify electron energy states. In 1930 he proposed that the energy and momentum apparently lost when an electron is emitted from an atomic nucleus in beta decay is carried away by an almost massless, uncharged, and difficult-to-detect particle (the NEUTRINO). He was awarded a 1945 Nobel Prize for his 1925 discovery of the PAULI EXCLUSION PRINCIPLE.

Pauli exclusion principle Assertion proposed by WOLFGANG PAULI that no two ELECTRONS in an ATOM can be in the same state or configuration at the same time. It accounts for the observed patterns of light emission from atoms. The principle has since been generalized to include the whole class of particles called FERMIONS. The SPIN of such particles is always an odd whole-number multiple of ½. For example, electrons have spin ½, and can occupy two distinct states with opposite spin directions. The Pauli exclusion principle indicates, therefore, that only two electrons are allowed in each atomic energy state, leading to the successive buildup of ORBITALS around the NUCLEUS. This prevents matter from collapsing to an extremely dense state.

Pauling, Linus (Carl) (b. Feb. 28, 1901, Portland, Ore., U.S.—d. Aug. 19, 1994, Big Sur, Calif.) U.S. chemist. He received his doctorate from the California Institute of Technology and became a professor there in 1931. He was one of the first researchers to apply quantum mechanics to the study of molecular structures; to calculate interatomic distances and the angles between chemical bonds (see BONDING), he effectively used X-RAY DIFFRACTION, electron diffraction, magnetic effects, and the heat of REACTION. His book *The Nature of the Chemical Bond, and the Structure of Molecules and Crystals* (1939) became one of the century's most influential chemistry texts. He was the first recipient of the American Chemical Society's Langmuir Prize (1931) and later the first recipient of its Lewis medal (1951), and in 1954 he received the Nobel Prize for Chemistry. In 1962 his efforts on behalf of control of NUCLEAR WEAPONS and against nuclear testing brought him the Nobel Peace Prize, making him the first recipient of two unshared Nobel Prizes. In later years he devoted himself to the study of the prevention and treatment of illness by taking high doses of vitamins and minerals, particularly VITAMIN C.

Paulus \'paů-ləs**, Friedrich** (b. Sept. 23, 1890, Breitenau, Ger.—d. Feb. 1, 1957, Dresden, E.Ger.) German general in World War II. He became deputy chief of the German General Staff in World War II and commanded the German 6th Army in the Soviet Union. He was defeated in the Battle of STALINGRAD in 1943, and the surrender of his army of 300,000 men ended Germany's offensive in Russia. While a prisoner, Paulus agitated against ADOLF HITLER among the other German prisoners of war and later testified at the NÜRNBERG TRIALS. After his release from prison (1953), he settled in East Germany.

Pausanias \pȯ-'sā-nē-əs\ (fl. AD 143–176) Greek traveler and geographer. His *Description of Greece* is an invaluable guide to ancient ruins. He describes the religious art and architecture of OLYMPIA and DELPHI, the pictures and inscriptions at ATHENS, the statue of Athena on the ACROPOLIS, and (outside the city) the monuments of famous men and of Athenians fallen in battle. According to JAMES GEORGE FRAZER, without Pausanias the ruins of Greece would be "a labyrinth without a clue, a riddle without an answer."

pavane \pə-'vän\ Stately court dance introduced from southern Europe into England in the 16th century. The dance, consisting of forward and backward steps to music in duple time, was originally used to open ceremonial balls; later its steps became livelier and it came to be paired with the quick galliard in triple time.

Pavane, "The Dance in the Garden" illumination from the *Roman de la rose*, Toulouse, early 16th century; in the British Library (Harley MS 4425, fol. 14v)
REPRODUCED BY PERMISSION OF THE BRITISH LIBRARY

Pavarotti, Luciano (b. Oct. 12, 1935, Modena, Italy) Italian tenor. He started out as a schoolteacher, beginning his vocal training only in his 20s. He made his professional debut in 1961, then debuted at La Scala in 1965 and at the Metropolitan Opera in 1968. He retained the beautiful tone and thrilling high notes that his audiences loved into his 60s, nurturing his broad appeal by recording many light pieces in addition to the traditional Italian repertoire in which he specialized. The most famous male classical singer of the late 20th century, he came to personify the Italian tenor worldwide.

pavement Durable surfacing of a road, path, court, patio, plaza, airstrip, or other such area. The Romans, the greatest road builders of the ancient world, built their roads of stone and concrete. By AD 75 several methods of road construction were known in India, including brick and stone slab pavements, and street paving was common in towns. Smaller

© 2006 Encyclopædia Britannica, Inc.

cobblestones began to be used for European paving in the late Middle Ages. The 18th–19th century saw the development of pavement systems (e.g., MACADAM) that used light road surfaces of broken or crushed stone. Modern flexible pavements contain sand and gravel or crushed stone compacted with a bituminous binder (e.g., asphalt or tar); such a pavement has enough plasticity to absorb shock. Rigid pavements are made of concrete, composed of coarse and fine aggregate and portland cement, and usually reinforced with steel rod or mesh.

Pavese \pä-'vā-sā**, Cesare** (b. Sept. 9, 1908, Santo Stefano Belbo, Italy—d. Aug. 27, 1950, Turin) Italian poet, critic, novelist, and translator. Pavese founded, and was long an editor with, the publishing house of Einaudi. Denied a creative outlet by fascist control of literature, he did translations in the 1930s and '40s that introduced many modern U.S. and English writers to Italy. Much of his own work appeared between the end of World War II and his death by suicide at age 41; some was published posthumously. His best works include *Dialogues with Leucò* (1947), poetic conversations on the human condition; the novel *The Moon and the Bonfire* (1950); and the journal *This Business of Living* (1952).

Pavia \pä-'vē-ə\ *ancient* **Ticinum** City (pop., 2001 prelim.: 71,074), LOMBARDY, northern Italy. Located on the TICINO RIVER, the site was originally a settlement of the Papiria tribe; it was conquered by Rome c. 220 BC. Pillaged by ATTILA and ODOACER in the 5th century AD, it became a centre of Gothic resistance against the Byzantine Empire. Ruled by the Visconti family (see GIAN GALEAZZO VISCONTI) from c. 1359, it became a leading Italian city-state. In 1525 it was the scene of a decisive victory by the Holy Roman emperor CHARLES V over the French under FRANCIS I, who was captured. It was active in the RISORGIMENTO and joined the Kingdom of Italy in 1859. It still retains the ancient plan of the Roman fortified town, and medieval structures remain. The University of Pavia (founded 1361) is linked with the ancient law school, which dates to 825. Pavia is a centre of communications, agriculture, and industry.

Pavlov \'päv-ˌlȯf**, Ivan (Petrovich)** (b. Sept. 26, 1849, Ryazan, Russia—d. Feb. 27, 1936, Leningrad) Russian physiologist. He is known chiefly for the concept of the conditioned reflex. In his classic experiment, he found that a hungry dog trained to associate the sound of a bell with food salivated at the sound even in the absence of food. He expanded on CHARLES SHERRINGTON's explanation of the spinal reflex. He also tried to apply his laws to human psychoses and language function. His ability to reduce a complex situation to a simple experiment and his pioneering studies relating human behaviour to the nervous system laid the basis for the scientific analysis of behaviour. After the Russian Revolution, he became an outspoken opponent of the communist government. He won a 1904 Nobel Prize for his work on digestive secretions.

Pavlova \'pav-lə-və**, Anna (Pavlovna)** (b. Feb. 12, 1881, St. Petersburg, Russia—d. Jan. 23, 1931, The Hague, Neth.) Russian ballet dancer. She studied at the Imperial Ballet School from 1891 and joined the MARIINSKY THEATRE company in 1899, becoming prima ballerina in 1906. In 1913 she left Russia to tour with her own company, which showcased her outstanding performances in classical ballets such as *Giselle*; the most famous numbers were a succession of short solos such as *The Dying Swan*, choreographed for her by MICHEL FOKINE. Her tours took ballet to audiences in many countries for the first time and did much to popularize ballet worldwide.

Anna Pavlova.
CULVER PICTURES

pawnbroking Business of advancing loans to customers who have pledged household goods or personal belongings as security. The pawnbroker's trade is one of the oldest known, having existed 2,000–3,000 years ago in China, as well as in ancient Greece and Rome. Pawnbroking was common in medieval Europe despite laws against USURY. Private pawnbrokers were usually those exempt from the laws, notably the Jews. In 1462 the FRANCISCANS set up the *montes pietatis*, which granted interest-free loans to the poor, though they were later forced to charge interest to prevent premature exhaustion of their funds. Public pawnshops existed briefly in the Middle Ages but were reestablished in the 18th century to free debtors from the high interest rates of private pawnshops. Most European countries now maintain public pawnshops; in the U.S. only private pawnshops exist. Social-welfare programs and increased access to easy CREDIT has led to a decline in pawnbroking's importance. See also INTEREST, CONSUMER CREDIT, CREDIT CARD.

Pawnee \pȯ-'nē\ North American PLAINS INDIAN people living mainly in Oklahoma, U.S. Their language belongs to the Caddoan language stock, and their name is derived from the Caddoan word meaning "horn," a reference to their unique hairstyle. They once lived along the Platte River in what is now Nebraska. The Pawnee tribe comprised four relatively independent BANDS, each divided into villages. They lived in large, dome-shaped, earth-covered lodges but used TEPEES on buffalo hunts. Women raised corn, squash, and beans, and they harvested a grain similar to WILD RICE. Chiefs, priests, and shamans constituted the dominant class. Pawnee religion centred on a variety of deities, including the supreme being Tirawa, the sun god, and morning and evening stars. The Pawnee had military societies, and many Pawnee served as scouts for the U.S. armies of the frontier. Pawnee lands were ceded to the U.S. in the mid-19th century, and most Pawnee were relocated to a reservation in Oklahoma. They number about 2,500.

pawpaw See PAPAW

Pax Romana \'paks-rō-'ma-nə, 'päks-rō-'mä-nə\ *Latin* **"Roman Peace"** State of comparative tranquility throughout the Mediterranean world from the reign of AUGUSTUS (27 BC–AD 14) to that of MARCUS AURELIUS (AD 161–180). The concord also included North Africa and Persia. The empire protected and governed provinces, each of which legislated and administered its own laws while accepting Roman taxation and military control. It was the Pax Romana that ensured the survival and eventual transmission of the classical Greek and Roman heritage.

Paxton Boys uprising (1763) Attack by Pennsylvania frontiersmen on an Indian settlement during the Pontiac Indian uprising. After 57 drunken rangers from Paxton, Pa., slaughtered 20 innocent and defenseless Conestoga Indians near Lancaster, Pa., the colonial governor ordered the arrest of those involved. Because local residents were sympathetic to the "Paxton Boys," no prosecutions were undertaken. Instead, angered by appropriations insufficient to defend the western frontier, more than 600 armed frontiersmen marched on Philadelphia in 1764. They were met by leading Philadelphians, including BENJAMIN FRANKLIN, who promised the men a hearing.

payments, balance of See BALANCE OF PAYMENTS

Payton, Walter (Jerry) (b. July 25, 1954, Columbia, Miss., U.S.—d. Nov. 1, 1999, Barrington, Ill.) U.S. football player. He played football at Jackson State University and from 1975 to 1987 was a member of the NFL Chicago Bears. He retired as the all-time leader for combined yardage (rushing, kick returning, and pass receiving; 21,803 yds), seasons with 1,000 or more yards rushing (10), and rushing yardage (16,726). In 2002 his career rushing record was broken by EMMITT SMITH and his combined yardage record was broken by JERRY RICE. Payton is considered among the greatest running backs in football history.

Paz \'päs**, Octavio** (b. March 31, 1914, Mexico City, Mex.—d. April 19, 1998, Mexico City) Mexican poet, writer, and diplomat. Educated at the University of Mexico, Paz published his first book of poetry, *Savage Moon*, in 1933. He later founded and edited several important literary reviews. Influenced in turn by Marxism, Surrealism, existentialism, Buddhism, and Hinduism, his poetry uses rich imagery in dealing with metaphysical questions, and his most prominent theme is the human ability to overcome existential solitude through erotic love and artistic creativity. His prose works include *The Labyrinth of Solitude* (1950), an influential essay on Mexican history and culture. He was Mexico's ambassador to India (1962–68). He was awarded the Nobel Prize for Literature in 1990.

Paz Estenssoro \'päs-ˌes-ten-'sȯr-ō**, Víctor** (b. Oct. 2, 1907, Tarija, Bol.—d. June 7, 2001, Tarija) President of Bolivia (1952–56, 1960–64, 1985–89). Originally an economics professor, he was elected to the Chamber of Deputies and then became president in 1952, when the National

© 2006 Encyclopædia Britannica, Inc.

Revolutionary Movement (MNR), a left-wing organization that he helped found, seized power. He extended the vote to Indians, implemented agrarian reform, and expropriated three major tin companies. He was elected again in 1964 but was overthrown by a military coup the same year. He regained the presidency in 1985 and instituted a program of economic austerity that reduced the hyperinflation that had imperiled the Bolivian economy.

Pazzi conspiracy \'pät-sē\ (April 16, 1478) Unsuccessful plot to overthrow the MEDICI rulers of Florence. It was led by the rival Pazzi family, with the backing of Pope SIXTUS IV, who wanted to consolidate papal rule over northern central Italy. The conspirators tried to assassinate two Medici brothers during mass at the Cathedral of Florence; they killed Giuliano de' Medici, but Lorenzo de' MEDICI escaped. The people of Florence rallied to the Medici and killed many of the conspirators, leaving Lorenzo more powerful than before and setting off a two-year war with the papacy.

PBS *in full* **Public Broadcasting Service** Private, nonprofit U.S. corporation of public television stations. PBS provides its member stations, which are supported by public funds and private contributions rather than by commercials, with educational, cultural, news, and children's programs that are produced by its members and by independent producers worldwide. Its popular programs have included *Sesame Street*, *Masterpiece Theatre*, *Great Performances*, *NewsHour with Jim Lehrer*, and *Nova*. PBS was founded in 1969 to coordinate and provide services to its member stations, which now number about 350. Funding is provided mainly by viewers' contributions, state governments, and grants from businesses and private foundations; the U.S. government, through the Corporation for Public Broadcasting, supplies about 15%.

PC See PERSONAL COMPUTER

PCB *in full* **polychlorinated biphenyl** \bī-ˈfe-nᵊl, bī-ˈfē-nᵊl\ Any of a class of highly stable organic compounds prepared by the reaction of CHLORINE with biphenyl, a two-ring compound. The commercial product, a mix of several PCB ISOMERS, is a colourless, viscous liquid that is almost insoluble in water, does not degrade under high temperatures, and is a good electrical insulator (see DIELECTRIC). PCBs became widely used as lubricants, heat-transfer fluids, and fire-resistant dielectric fluids in transformers and capacitors in the 1930s and '40s. In the mid 1970s they were found to cause liver dysfunction in humans and came under suspicion as CARCINOGENS; their manufacture and use were consequently restricted in the U.S. and many other countries, though illegal dumping by manufacturers continued. They persist in the environment and have entered the FOOD CHAIN, causing great harm especially to invertebrates and fish.

pea Any of several species, comprising hundreds of varieties, of herbaceous annual plants belonging to the family Leguminosae (or Fabaceae, also known as the pea family; see LEGUME), grown virtually worldwide for their edible seeds. *Pisum sativum* is the common garden pea of the Western world, which GREGOR MENDEL used for his pioneering studies of HEREDITY. While their origins have not been definitely determined, it is known that peas are one of the oldest cultivated crops. Some varieties, called sugar peas, snow peas, or mange-touts, have edible pods and are popular in East Asian cuisines. See also SWEET PEA.

Pea (*Pisum sativum*)
WALTER CHANDOHA

Peabody \'pē-bə-dē**, Elizabeth (Palmer)** (b. May 16, 1804, Billerica, Mass., U.S.—d. Jan. 3, 1894, Jamaica Plain, Mass.) U.S. educator and leader in the kindergarten movement in America. She served as secretary to WILLIAM ELLERY CHANNING (1825–34) and worked with BRONSON ALCOTT in his Temple School. She opened a Boston bookshop in 1839, which became a centre for TRANSCENDENTALIST activities. She published works by MARGARET FULLER and NATHANIEL HAWTHORNE and also published and wrote articles for *The Dial*. Inspired by the work of FRIEDRICH FROEBEL, she opened the first English-language KINDERGARTEN in the U.S. in 1860 and thereafter devoted herself to organizing public and private kindergartens. Her sisters married HORACE MANN and NATHANIEL HAWTHORNE.

Peabody \'pē-ˌbä-dē**, George** (b. Feb. 18, 1795, South Danvers [now Peabody], Mass., U.S.—d. Nov. 4, 1869, London, Eng.) U.S. merchant and financier. Born in South Danvers, Mass. (renamed Peabody in his honour), he earned an early fortune as a partner in a wholesale dry-goods business and as president of the Eastern Railroad (from 1836). On a trip to England, he negotiated an $8 million loan for the near-bankrupt state of Maryland. In 1837 he moved to London permanently and founded a merchant banking house specializing in FOREIGN EXCHANGE; his banking operations helped establish U.S. CREDIT abroad. He spent most of his fortune on philanthropy to promote education and the arts; his gifts include a natural history museum at Yale University, an archaeology museum at Harvard University, and an Asian export art museum in Salem, Mass.

Peace Corps U.S. government agency of volunteers, formed in 1961 by Pres. JOHN F. KENNEDY. Its purpose is to assist other countries in their development efforts by providing skilled workers in the fields of education, agriculture, health, trade, technology, and community development. Volunteers are expected to serve for two years as good neighbours in the host country, to speak its language, and to live on a level comparable to that of the local residents. By the early 21st century, more than 165,000 volunteers had served in the corps.

Peace of God Movement within the medieval Roman Catholic church in response to the breakdown of public order. The movement began at a council at Le Puy in 975, but other, more important councils occured in southern and central France in the late 10th and early 11th centuries. Regional lay and religious authorities attended the councils to ensure God's peace, and they were often joined by large crowds who came to venerate the relics displayed at the meetings. The peace decrees forbade, under pain of excommunication, private warfare or violence against churches, clerics, pilgrims, merchants, women, peasants, and cattle. Participants at the councils took oaths on sacred relics to uphold the decisions made at those councils. The peace was also decreed at the councils of Charoux (c. 989), Limoges (994 and 1031), Poitiers (c. 1000), and Bourges (1038).

peace pipe See CALUMET

Peace River River, western Canada. Formed by the confluence of the Finlay and Parsnip rivers in the Canadian Rockies of British Columbia, it flows east across the border of Alberta to join the Slave River just north of its outlet from Lake ATHABASCA. It is 1,195 mi (1,923 km) long. It was explored by ALEXANDER MACKENZIE in 1792–93 and became a major fur-trading route. It is an important source of hydroelectric power.

Peace River River, west-central Florida, U.S. It rises in Polk county and flows south and southwest into Charlotte Harbor on the southwestern coast. It is about 85 mi (135 km) long.

peach Small to medium-sized fruit tree (*Prunus persica*) of the ROSE family, grown throughout the warmer temperate regions of both hemispheres, and the fruit it produces. It probably originated in China and spread westward. Peach trees are intolerant of severe cold but require winter chilling to induce spring growth. The long, pointed leaves are glossy green and lance-shaped. Pink or white flowers grow singly or clustered. The fleshy, juicy exterior of the fruit is edible; the hard interior is called the stone or pit. In freestone types, stones separate easily from ripe flesh; in clingstone types, the flesh adheres firmly to the stone. Thousands of varieties have been developed. Peach skin is downy or fuzzy; smooth-skinned peaches are NECTARINES. Peaches are widely eaten fresh and are baked in desserts. Canned peaches are a staple commodity in many regions. Related plants include ALMOND, PLUM, and CHERRY.

Peach (*Prunus persica*).
GRANT HEILMAN PHOTOGRAPHY

peacock Any of three species (family Phasianidae) of resplendent birds of open lowland forests. Blue, or Indian (*Pavo cristatus*), and green, or Javanese (*P. muticus*), peacock males are 35–50 in. (90–130 cm) long and have a 60-in. (150-cm) train of metallic green tail feathers tipped with an iridescent eyespot ringed with blue and bronze. The train is erected,

© 2006 Encyclopædia Britannica, Inc.

fanned out, and vibrated during courtship. Females (peahens) are duller and have no train. The male forms a harem of two to five hens, which lay their eggs in a depression in the ground. The blue and green male Congo peacock (*Afropavo congensis*) has a short rounded tail; the reddish and brown hen has a topknot.

Peacock, Thomas Love (b. Oct. 18, 1785, Weymouth, Dorset, Eng.—d. Jan. 23, 1866, Lower Halliford, Middlesex) English novelist and poet. For most of his life Peacock worked for the East India Co. He was a close friend of Percy B. Shelley, who greatly inspired his writing. His best verse is interspersed in his novels, which are dominated by the conversations of their characters and satirize the intellectual currents of the day. His best-known work, *Nightmare Abbey* (1818), satirizes romantic melancholy and includes characters based on Shelley, Samuel Taylor Coleridge, and Lord Byron.

Peale, Charles Willson (b. April 15, 1741, Queen Anne's county, Md.—d. Feb. 22, 1827, Philadelphia, Pa., U.S.) U.S. painter, inventor, and naturalist. He began his career by exchanging a saddle for painting lessons. He later went to London to study with Benjamin West. On his return he became the preeminent portrait painter of the middle colonies. He damaged his professional career by entering enthusiastically into the revolutionary movement. In 1786 he founded an institution in Philadelphia for the study of natural law and display of natural history and technological objects; the Peale Museum, the first major U.S. museum, was widely imitated by other museums of the period and later by P.T. Barnum. Peale is best remembered for his portraits of the leading figures of the American Revolution.

Peale, Norman Vincent (b. May 31, 1898, Bowersville, Ohio, U.S.—d. Dec. 24, 1993, Pawling, N.Y.) U.S. Protestant clergyman. The son of a Methodist preacher, he attended Ohio Wesleyan University and was ordained a pastor in the Methodist Episcopal church. After leading congregations in Brooklyn and Syracuse, N.Y., in 1933 he became pastor of Marble Collegiate Church in New York City, where he remained for the rest of his career. In 1937 he cofounded the Religio-Psychiatric Clinic, which combined religion and psychiatry in the interests of mental health. He gained fame through radio and television sermons and through his books, including the best-selling *Power of Positive Thinking* (1952). In 1969 he was elected president of the Reformed Church in America.

Peale, Rembrandt (b. Feb. 22, 1778, Bucks county, Pennsylvania, U.S.—d. Oct. 3, 1860, Philadelphia, Penn.) U.S. painter and writer. A son of Charles Willson Peale, he studied with his father at the Royal Academy in London. In Paris 1808–10 he was offered the post of court painter to Napoleon I. His early portrait of Thomas Jefferson (1805) was his masterpiece. Following his father's example, he opened a museum and portrait gallery in Baltimore, where he established the first illuminating gasworks. When he resumed painting, he turned to formal subject pieces (e.g., *The Court of Death*, 1820) before returning to portraiture, continuing a series of portraits of George Washington.

peanut *or* **groundnut** Annual legume (*Arachis hypogaea*) and its edible seeds, which have the peculiar habit of ripening underground in pods. Native to tropical South America, peanuts were introduced early into the Old World tropics. Each pod contains one to three oblong seeds with whitish to dark-purple seed coats. Pound for pound, peanuts have more protein, minerals, and vitamins than beef liver, more fat than heavy cream, and more calories than sugar. They are pressed for edible oil, ground into peanut butter, eaten as snacks, and used in cooking. The plant is fed to livestock.

pear Any of several species of trees of the genus *Pyrus*, especially *P. communis*, of the rose family, which is one of the most important fruit trees in the world and is cultivated in all temperate-zone countries of both hemispheres. The thousands of varieties include Bartlett (by far the most widely grown), Beurre Bosc, and Beurre d'Anjou. In the U.S., much of the crop is canned; in Europe, pears are more commonly eaten fresh or used for perry (fermented pear juice). The tree is taller and more upright than the apple tree; pear fruits are sweeter and softer than apples. Hard cells (grit, or stone cells) dot the flesh.

Pear (*Pyrus communis*)
GRANT HEILMAN

pearl Concretion formed by a mollusk and consisting of the same material (called nacre, or mother-of-pearl) as the mollusk's shell. Long treasured as gemstones, pearls are valued for their translucence and lustre and for the delicate play of surface colour. The more perfect a pearl's shape and the deeper its lustre, the greater its value. The colour varies with the mollusk and its environment. Jewelers of the 16th–17th centuries often used irregularly shaped (baroque) pearls, formed from muscular tissue, to form the bodies of animals and other figures. In Europe and China, mother-of-pearl has been used as an inlay material for decorating furniture. The discovery that a pearl could be cultivated by insertion of a foreign object inside the mollusk's shell is said to have been made in 13th-century China.

Blister pearl attached to the shell of an Oriental pearl oyster (*Pinctada martensii Dunker*)
COURTESY OF THE AMERICAN MUSEUM OF NATURAL HISTORY, NEW YORK

Pearl Harbor Inlet, southern coast of Oahu island, Hawaii, U.S. It lies 6 mi (10 km) west of Honolulu, forming a landlocked harbour connected with the Pacific Ocean. In 1887 Hawaii granted the U.S. the exclusive use of the harbour as a coaling and repair station, and in 1908 a naval station was established. In 1941 the harbour was attacked without warning by the Japanese air force, causing great loss of life and precipitating U.S. entry into World War II. It is now the headquarters of the U.S. Pacific Fleet.

Pearl Harbor attack (Dec. 7, 1941) Surprise aerial attack by the Japanese on the U.S. naval base at Pearl Harbor on Oahu island, Hawaii, that precipitated U.S. entry into World War II. In the decade preceding the attack, U.S.-Japanese relations steadily worsened, especially after Japan entered into an alliance with the Axis powers (Germany and Italy) in 1940, and by late 1941 the U.S. had severed practically all commercial and financial relations with Japan. On November 26 a Japanese fleet sailed to a point some 275 mi (440 km) north of Hawaii, and from there about 360 planes were launched. The first dive-bomber appeared over Pearl Harbor at 7:55 AM (local time) and was followed by waves of torpedo planes, bombers, and fighters. Due to lax reconnaissance and the fact that many vessels were undermanned since it was a Sunday morning, the base was unable to mount an effective defense. The *Arizona* was completely destroyed; the *Oklahoma* capsized; the *California*, *Nevada*, and *West Virginia* sank; more than 180 aircraft were destroyed; and numerous vessels were damaged. In addition, more than 2,300 military personnel were killed. The "date which will live in infamy," as U.S. Pres. Franklin Roosevelt termed it, unified the American public and swept away any earlier support of neutrality. On Dec. 8, 1941, Congress declared war on Japan.

Pearl River River, central Mississippi, U.S. It flows southwest through Jackson, then into Louisiana and the Gulf of Mexico. About 410 mi (660 km) long, it forms the boundary between Mississippi and Louisiana. Honey Island Swamp, lying in the mid-delta area southwest of Picayune, Miss., is noted for its wildlife and fishing.

pearlstone See perlite

Pearson, Drew *orig.* **Andrew Russell** (b. Dec. 3, 1897, Evanston, Ill., U.S.—d. Sept. 1, 1969, Rockville, Md.) U.S. newspaper columnist. Pearson taught industrial geography at the University of Pennsylvania before turning to journalism. He was fired from the *Baltimore Sun* for writing *Washington Merry-Go-Round* (1931, with Robert S. Allen), a gossipy book about the scene in the U.S. capital. From 1932 he wrote an influential syndicated column of the same name (with Allen until 1942; from 1965 with Jack Anderson, who inherited it on Pearson's death), which specialized in muckraking. Among the many world leaders he interviewed was Nikita Khrushchev. See muckraker.

Pearson, Lester B(owles) (b. April 23, 1897, Toronto, Ont., Can.—d. Dec. 27, 1972, Ottawa, Ont.) Prime minister of Canada (1963–

© 2006 Encyclopædia Britannica, Inc.

68). He taught at the University of Toronto from 1924 until 1928, when he joined the Canadian foreign service. He was posted to Britain from 1935 to 1941 and to the U.S. from 1942 to 1945; he was ambassador to the U.S. from 1945 to 1946. He served in the Canadian House of Commons from 1948 to 1968 and as minister of external affairs from 1948 to 1956. During the latter period he also led the Canadian delegation to the UN; he was president of the UN General Assembly from 1952 to 1953. In 1957 he received the Nobel Prize for Peace for his role in resolving the Suez Crisis. He became head of the Liberal Party in 1958 and led it to victory in elections in 1963. His government introduced a national pension plan and a family assistance program, broadened old-age security benefits, and laid the groundwork for the National Free Medical Service. In 1967 he rebuked visiting French Pres. Charles de Gaulle for his support of separatism in Quebec. He retired in 1968.

Peary, Harold *orig.* **Harrold Jese Pereira de Faria** (b. July 25, 1908, San Leandro, Calif., U.S.—d. March 30, 1985, Torrance, Calif.) U.S. actor. He created the colourful, arrogant character Throckmorton F. Gildersleeve on the hit comedy series *Fibber McGee and Molly* in 1937. He starred in his own popular radio serial, *The Great Gildersleeve* (1941–50), considered the first spin-off created from another series. He later acted in television series such as *Blondie* (1957) and *Fibber McGee and Molly* (1959), and he appeared in the film *Clambake* (1967). Peary continued to perform on radio into the 1970s.

Peary, Robert E(dwin) (b. May 6, 1856, Cresson, Pa., U.S.—d. Feb. 20, 1920, Washington, D.C.) U.S. explorer. He joined the U.S. Navy in 1881 but was granted leaves of absence to pursue his Arctic expeditions. He explored Greenland by dog sled in 1886 and 1891, finding evidence that it was an island, and returned there in 1893–94, 1895, and 1896 to transport large meteorites to the U.S. After announcing his intention to reach the North Pole, he made several attempts between 1898 and 1905, sailing on a specially built ship and sledding to within 175 mi (280 km) of the pole. On April 6, 1909, accompanied by Matthew Henson (1866–1955) and four Eskimo, he reached what he thought was the pole, and he became widely acknowledged as the first explorer to attain that goal. (The claim of his former colleague Frederick A. Cook to have reached the pole in 1908 was later discredited.) In 1911 Peary retired from the navy with the rank of rear admiral. Examination of Peary's expedition diary and new documents in the 1980s suggested that the point he reached may have been 30–60 mi (50–100 km) short of the pole.

peasant Any member of a class that tills the soil as small landowners or agricultural labourers. The peasant economy generally has a simple technology and a division of labour by age and sex. The basic unit of production is the family or household. Peasant families traditionally consume what they produce, though a portion of their output may be sold in the market or paid to a landlord. Productivity per worker and yields per unit of land are usually low. Peasants as a class tend to disappear as a society industrializes, though peasantlike social structures may persist under new economic regimens. See also ejido; feudalism; hacienda; serfdom.

Peasants' Revolt *or* **Wat Tyler's Rebellion** (1381) First great popular rebellion in English history. It was triggered by the poll tax of 1381, which angered labourers and artisans already resentful of the limits on wages fixed by the Statute of Labourers (1351). Centred in southeastern England and East Anglia, the revolt was led by Wat Tyler (d. 1381), who marched into London with a band of Kentish rebels. They captured the Tower of London and beheaded officials responsible for the poll tax. Richard II promised reforms, but Tyler was killed in his presence by the mayor of London. The last of the rebels were subdued in East Anglia two weeks later.

Peasants' War (1524–25) Peasant uprising in Germany. Inspired by reforms brought by the Reformation, peasants in western and southern Germany invoked divine law to demand agrarian rights and freedom from oppression by nobles and landlords. As the uprising spread, some peasant groups organized armies. Although the revolt was supported by Huldrych Zwingli and Thomas Müntzer, its condemnation by Martin Luther contributed to its defeat, principally by the army of the Swabian League. Some 100,000 peasants were killed. Reprisals and increased restrictions discouraged further attempts to improve the peasants' plight.

peat Organic fuel consisting of a light, spongy material formed in temperate, humid environments by the accumulation and partial decomposition of vegetable remains under conditions of poor drainage. Peat deposition is the first step in the formation of coal. Dried peat burns readily, with a smoky flame and a characteristic odour. It is used for domestic heating and can be used to fire boilers. It is only a minor contributor to the world energy supply, but large deposits occur in Canada, China, Indonesia, Russia, Scandinavia, and the U.S. Major users include Finland, Ireland, Russia, and Sweden.

peat moss *or* **sphagnum moss** \'sfag-nəm\ Any of more than 160 species of plants that make up the bryophyte genus *Sphagnum*, which grow in dense clumps around ponds, in swamps and bogs, on moist, acid cliffs, and on lakeshores from tropical to subpolar regions. These pale-green to deep-red plants can hold 20 times their weight in water. As they die and are compressed, they form organic peat, which is harvested and dried as fuel, as seedbed cover, and as shipping packaging for plants and live aquatic animals. Gardeners stir peat into soil to increase soil moisture, porosity, and acidity and to reduce erosion.

pecan Nut and tree (*Carya illinoinensis*) of the walnut family, native to temperate North America. Occasionally reaching a height of about 160 ft (50 m), the tree has deeply furrowed bark and feather-shaped leaves. Pecan nut meat, rich and distinctive in flavour and texture, has one of the highest fat contents of any vegetable product and a caloric value close to that of butter. Pecan production is a considerable industry of the southeastern U.S., where pecan pie and pecan praline candy are traditional sweets.

Pecan (*Carya illinoinensis*)
GRANT HEILMAN

peccary \'pe-kə-rē\ *or* **javelin** \'ja-və-lən\ Any of three species (family Tayassuidae) of New World even-toed ungulates resembling pigs. Found in deserts and wet tropical forests from Texas to Patagonia, peccaries are gray with white markings and have small, erect ears and almost no tail. They grow to 30–35 in. (75–90 cm) long and weigh 37–66 lb (17–30 kg). A scent gland that opens on the back and emits a strong, musky odour inspired the belief that peccaries have two navels. Peccaries have spearlike upper canines and eat plants, small animals, and carrion. They live in groups of 5–25 or 50–100, depending on the species.

Collared peccary (*Tayassu tajacu*).
JEN AND DES BARTLETT—BRUCE COLEMAN INC.

Pechora River \pi-'chȯ-rə\ River, northeastern Russia. It rises in the northern Ural Mountains and flows south, then west and north to enter the Barents Sea after a course of 1,124 mi (1,809 km). It is frozen from early November to early May. Its basin contains large deposits of coal, petroleum, and natural gas.

Pechora Sea *Russian* **Pechorskoye More** \pi-'chȯr-skə-yə-'mȯr-yə\ Sea, southeastern extension of the Barents Sea, north of European Russia. It is located between Kolguyev Island and the Yugorsky Peninsula. Although it is blocked by floating ice from November to June, its cod, seals, and other marine life are exploited. The main port is Naryan-Mar on the Pechora River.

Peck, (Eldred) Gregory (b. April 5, 1916, La Jolla, Calif., U.S.—d. June 12, 2003, Los Angeles, Calif.) U.S. film actor. While a premed student at the University of California at Berkeley, he developed a taste for acting. He appeared on Broadway in *The Morning Star* (1942) and played several other stage roles before making his film debut in *Days of Glory* (1944). Known for playing likeable, honest men of high moral quality, he starred in movies such as *The Keys of the Kingdom* (1944), *Spellbound* (1945), *Gentleman's Agreement* (1947), *Twelve O'Clock High* (1949), *Roman Holiday* (1953), and *To Kill a Mockingbird* (1962, Academy Award). His later films include *MacArthur* (1977), *The Old Gringo* (1989), and *Cape Fear* (1991). He also served for three years as president of the Academy of Motion Picture Arts and Sciences.

© 2006 Encyclopædia Britannica, Inc.

pecking order Basic pattern of social organization within a flock of poultry in which each bird pecks another lower in the scale without fear of retaliation and submits to pecking by one of higher rank. For groups of mammals (e.g., BABOON, WOLF) or other birds, the term "dominance hierarchy" is usually used, and the ranking often involves feeding or mating.

Peckinpah \'pe-kin-ˌpä**, (David) Sam(uel)** (b. Feb. 21, 1925, Fresno, Calif., U.S.—d. Dec. 28, 1984, Inglewood, Calif.) U.S. film director. He served in the U.S. Marines, studied drama at the University of Southern California, and began working in television in the mid-1950s, writing for and directing programs such as *Gunsmoke* and *The Rifleman*. He made his debut as a film director with *The Deadly Companions* (1961), which was followed by *Ride the High Country* (1962) and *Major Dundee* (1965). Among his later films are *The Wild Bunch* (1969), considered his finest, *Straw Dogs* (1971), *Pat Garrett and Billy the Kid* (1973), and *Cross of Iron* (1977). His films are noted for their magnificent landscapes, embittered characters, and brutal violence.

Pecos \'pā-kəs\ **River** River, eastern New Mexico and western Texas, U.S. It rises in the SANGRE DE CRISTO MOUNTAINS of New Mexico and flows southeast about 500 mi (800 km) across the Texas border. It empties into the RIO GRANDE at the Amistad National Recreation Area. There are many dams along the river, including the Alamogordo, Avalon, and Red Bluff dams.

pectin Any of a class of CARBOHYDRATES found in certain plant cell walls and tissues. They are principally composed of a GALACTOSE derivative, galacturonic acid. In fruits, pectin keeps the walls of adjacent cells joined together, helping them remain firm and hold their shape. As fruits become overripe, the pectin breaks down to simple sugars that dissolve more readily, so the fruits become soft and lose their shape. Because it forms a thick, gel-like solution when added in small amounts to fruit acids, sugar, and water, pectin is used to make jellies, jams, and marmalades. Its thickening properties also make it useful in the confectionery, pharmaceutical, and textile industries.

Pedersen \'pith-ər-sən**, Holger** (b. April 7, 1867, Gelballe, Den.—d. Oct. 25, 1953, Copenhagen) Danish linguist. He specialized in comparative Celtic grammar but made influential contributions to many other areas of linguistics. In addition to his *Comparative Grammar of the Celtic Languages*, 2 vol. (1909–13), he published works on Albanian, Armenian, Russian, and Indo-European dialects; on Lithuanian, Hittite, Tocharian, Czech, and Turkish PHONOLOGY; on the relationship of Indo-European languages to the Semitic and Finno-Ugric languages; and on the origin of runes.

pedestal In CLASSICAL ARCHITECTURE, a support or base for a column, statue, vase, or OBELISK. It may be square, octagonal, or circular. A single pedestal may also support a group of columns, or COLONNADE (see PODIUM). The pedestal, which was first employed by Roman architects, consists (from bottom to top) of three parts: the plinth, the DADO (or die), and the cornice (or cap).

pediatrics \ˌpē-dē-'a-triks\ Medical specialty dealing with the development, health, and diseases of children. It became a specialized area of study in the 18th century, when the first children's hospitals were founded. Early pediatricians studied childhood diseases (see THOMAS SYDENHAM) but could do little to cure them. By the mid-20th century, when ANTIBIOTICS and VACCINES had controlled most of these diseases in the developed world and infant and child mortality had fallen, pediatrics changed its focus to normal growth and child development. Recently, behavioral and social aspects of children's health have been incorporated.

pedigree Record of ancestry or purity of breed. Pedigrees of domesticated animals are maintained by governmental or private record associations or breed organizations in many countries. In human genetics, pedigree diagrams are used to trace the inheritance of a specific trait, abnormality, or disease. Standard symbols are used to represent males, females, mating (marriage), and offspring. The offspring symbols appear from left to right in the order of birth and are connected to the marriage line by a vertical line. Possession of the character under study is shown by a solid or blackened symbol, and absence is shown by an open or clear symbol.

pediment In CLASSICAL ARCHITECTURE, a triangular gable crowning a PORTICO or facade. The pediment was the crowning feature of the Greek temple front. The pediment's triangular wall surface, or tympanum, was often decorated with sculpture. The Romans adapted the pediment as a purely decorative form to finish doors, windows, and niches, sometimes using a series of alternating triangular and segmentally curved pediments, a motif revived in the Italian High Renaissance. Baroque-era designers developed many varieties of broken, scrolled, and reverse-curved pediments.

pediment In geology, any relatively flat surface of bedrock (exposed or lightly covered with soil or gravel) that occurs at the base of a mountain or as a plain having no associated mountain. Pediments are most conspicuous in basin-and-range-type desert areas throughout the world, but they also occur in humid areas. In the tropics, the surfaces tend to be covered with soil and obscured by vegetation. Many tropical river towns are situated on pediments, which offer easier building sites than the steep hillsides above or the river marshes below.

pedology \pi-'dä-lə-jē\ A branch of soil science focusing on the formation, morphology, and classification of soils as bodies within the natural landscape. Pedology seeks to understand how the properties and distribution patterns of soils worldwide (collectively called the pedosphere) have developed along with broader landforms, biogeochemical environments, and habitats of living organisms. Through their understanding of the causes and magnitudes of soil variations, pedologists help to broaden knowledge of the surface of the Earth.

Pedrell \pā-'threl**, Felipe** (b. Feb. 19, 1841, Tortosa, Spain—d. Aug. 19, 1922, Barcelona) Spanish musicologist and composer. He was largely self-taught as a musician. A scholarship for study in Rome exposed him to the great past of Spanish music preserved in archives there, and he set about reviving the tradition by bringing to light both folk and older art music and by promoting a national style of composition. His own works include operas and orchestral and choral works. He is regarded as the father of Spanish musical nationalism.

Pedro \'pā-drō, 'pā-drü\ **I** *known as* **Dom Pedro** (b. Oct. 12, 1798, Lisbon, Port.—d. Sept. 24, 1834, Lisbon) First emperor of Brazil (1822–31) and, briefly, king of Portugal. The son of John VI of Portugal, he became regent of Brazil in 1821, but in 1822 he broke with Lisbon and declared Brazil's independence. The former colony became a constitutional monarchy with Pedro its emperor. Strong opposition to his autocratic manner and impatience with parliamentary procedure induced him to abdicate in favour of his five-year-old son, PEDRO II. When John VI died, Pedro I became Portugal's King Pedro IV, but he quickly abdicated in favour of his daughter, the future Queen Maria II. See also JOSÉ BONIFÁCIO DE ANDRADA E SILVA.

Pedro II *orig.* **Dom Pedro de Alcântara** (b. Dec. 2, 1825, Rio de Janeiro, Braz.—d. Dec. 5, 1891, Paris, Fr.) Second and last emperor of Brazil (1831–89). He became emperor at age five when his father, PEDRO I, abdicated. After a period of regency, he was crowned in 1841. His concern for his subjects, skill at arbitrating political disputes, and leadership in economic matters brought stability to the country. He led Brazil into the PARAGUAYAN WAR, which brought Brazil prestige and territory. His support eroded primarily over the issue of the imperial prerogatives. Emancipation was proclaimed in 1888; in 1889 Pedro II was removed in a military coup, and a republic was established. See also JOSÉ BONIFÁCIO DE ANDRADA E SILVA.

Pee Dee River River, North and South Carolina, U.S. Rising as the Yadkin River in the BLUE RIDGE in northwestern North Carolina, it flows southeast into Winyah Bay near Georgetown, S.C. It is 233 mi (375 km) long. The lower Pee Dee is navigable for 90 mi (145 km).

Peel, Sir Robert, 2nd Baronet (b. Feb. 5, 1788, Bury, Lancashire, Eng.—d. July 2, 1850, London) British prime minister (1834–35, 1841–46) and principal founder of the CONSERVATIVE PARTY. A member of Parliament from 1809, Peel served as chief secretary for Ireland (1812–18) and resisted efforts to admit Catholics to Parliament. As home secretary (1822–27, 1828–30), he reorganized England's criminal code. He established London's first disciplined

Sir Robert Peel, detail of an oil painting by John Linnell, 1838; in the National Portrait Gallery, London.

police force, whose members were nicknamed after him "bobbies" or "peelers." After a brief first term as prime minister, Peel led the newly formed Conservative Party to a strong victory in the 1841 elections and became prime minister again. He imposed an income tax, reorganized the Bank of England, and initiated reforms in Ireland. Favouring reduced tariffs on imports, he repealed the Corn Laws, which caused his government to fall, but he continued to support free-trade principles in Parliament. He was the chief architect of the mid-Victorian age of stability and prosperity that he did not live to see.

Peel River River, northwestern Canada. It rises in western Yukon Territory and flows east and then north into the Mackenzie River in the Northwest Territories, near Fort McPherson, a fur-trading post. It is 425 mi (684 km) long. Its upper course through Peel Plateau is characterized by canyons as deep as 1,000 ft (300 m). Its lower valley consists primarily of nature preserves and game sanctuaries.

peerage Body of peers or titled nobility in Britain. The five ranks, in descending order, are duke, marquess, earl (see count), viscount, and baron. Until 1999, peers were entitled to sit in the House of Lords and exempted from jury duty. Titles may be hereditary or granted for life.

Pegasus \'pe-gə-səs\ In Greek mythology, a winged horse. It sprang from the blood of Medusa as she was beheaded by Perseus. Bellerophon captured Pegasus and rode him in several of his exploits, including his fight with the Chimera, but when he tried to ride the winged horse to heaven he was unseated and killed, and Pegasus was placed in the sky as a constellation. The flight of Pegasus is often regarded as a symbol of poetic inspiration.

pegmatite \'peg-mə-ˌtīt\ Almost any wholly crystalline igneous rock that is at least in part very coarse-grained, the major constituents of which include minerals typically found in ordinary igneous rocks (such as granites) and in which extreme textural variations, especially in grain size, are characteristic. Usually found as irregular dikes, lenses, or veins, pegmatite deposits occur in all parts of the world and are the chief source of commercial feldspar, sheet mica, and beryllium, tantalum-niobium, and lithium minerals.

Pei \'pā**, I(eoh) M(ing)** (b. April 26, 1917, Canton, China) Chinese-born U.S. architect. He immigrated to the U.S. in 1935 and studied at the Massachusetts Institute of Technology and Harvard University. After working for the architectural firm of Webb & Knapp, he formed his own partnership in 1955. Early in his career he created the building for the National Center for Atmospheric Research, Boulder, Colo. (1968), which mimics the broken silhouettes of the surrounding peaks. His innovative East Building of the National Gallery of Art, Washington, D.C. (1978), was hailed as one of his finest achievements. Other works include Boston's John Hancock Tower (1973), Beijing's Fragrant Hill Hotel (1982), and a controversial glass pyramid for a courtyard at the Louvre Museum, Paris (1989). Pei's designs represent an elaboration on the rectangular forms and irregular silhouettes of the International Style but with a uniquely skillful arrangement of geometric shapes and a dramatic use of varied materials, spaces, and surfaces; in his Miho Museum of Art, Shiga, Japan (1997), for example, he achieved a harmony between the building, much of it underground, and its mountain environment. In 1983 Pei received the Pritzker Architecture Prize.

peine forte et dure \'pen-ˈfȯrt-ā-ˈdu̇r\ *French* **"strong and hard punishment"** Formerly in English law, punishment inflicted on those accused of a felony who refused to enter a plea. By a statute of 1275, the *peine* was usually to imprison and starve the prisoner until he submitted; in 1406 pressing by heavy weights was added to this. In one of the few instances of its use in the American colonies, during the Salem witch trials, 80-year-old Giles Corey, who had decided not to stand trial rather than forfeit his family's goods, was pressed to death by interrogators. The practice was abolished in 1772.

Peipsi \'pāp-sē**, Lake** *Estonian* **Peipsi Järv** Lake, north-central Europe, forming the boundary between Estonia and Russia. Lake Peipsi is 60 mi (97 km) long and 31 mi (50 km) wide, and it is frozen for half of the year. In 1242 the Russians, under Alexander Nevsky, defeated the Teutonic Knights (see Teutonic Order) on the frozen lake in the "Battle on the Ice," forcing the order to relinquish claims to Russian lands.

Peipus, Lake See Lake Peipsi

Peirce \'pərs, 'pirs**, Charles Sanders** (b. Sept. 10, 1839, Cambridge, Mass., U.S.—d. April 19, 1914, near Milford, Pa.) U.S. scientist, logician, and philosopher. He was the son of the mathematician and astronomer Benjamin Peirce (1809–80). After attending Harvard University he spent 30 years with the U.S. Coast Guard Survey (1861–91). As a scientist, he is noted for his contributions to the theory of probability, the study of gravity, and the logic of scientific methodology. He eventually abandoned the physical sciences to study logic, which in its widest sense he identified with semiotics. He lectured on logic at Johns Hopkins University from 1879 to 1894, then spent the rest of his life writing in seclusion. He is regarded as the founder of pragmatism. Though he made eminent contributions to deductive logic, he was a student primarily of "the logic of science"—i.e., of induction and of "retroduction," or "abduction," the forming and accepting on probation of a hypothesis in order to explain surprising facts. His lifelong ambition was to establish induction and abduction as permanent branches of logic.

Peisistratus \pi-'sis-trə-təs\ *or* **Pisistratus** (d. 527 BC) Tyrant of Athens (c. 560–559, 556–555, 546–527). Born an aristocrat, he gained military honours early. He first became tyrant in 560 after claiming an attempt had been made on his life and appealing to the people to grant him a bodyguard, which he used to help seize the Acropolis. His reign was short-lived, but he gained power again briefly in 556, before being ousted by Lycurgus and Megacles. After several years in exile, he returned with an army in 546, took control, and remained in power until his death. A patron of the arts, he executed many public works and tried to help small farmers. His unification of Attica and improvement of Athens's prosperity helped make the city preeminent in Greece.

Peking University *or* **Beijing University** One of the oldest and most important institutions of higher education in China. It was founded as Capital College in 1898 and became a university in 1911. By 1920 it had become a centre for progressive thought. During the Sino-Japanese War (1937–45) it was temporarily relocated to Yunnan province. The first disturbances of the Cultural Revolution began at Beijing University in 1966; education there ceased between 1966 and 1970. The university has since reasserted its position as China's foremost nontechnical university. It has more than three dozen colleges and academic departments and scores of research institutes.

Pekingese \ˌpē-kə-'nēz\ Breed of long-haired toy dog developed in ancient China, where it was held sacred and was kept in Peking's Imperial Palace. Looting English forces introduced the breed to the West in 1860. Known as the "lion dog" for its full mane but perhaps also for its courage, it stands 6–9 in. (15–23 cm) and weighs up to 14 lbs (6.5 kg). It has hanging ears, a short, wrinkled muzzle, and a black mask across the face. The coat may be solid or variegated. Chinese royalty carried very small Pekingese, called "sleeve dogs," in their sleeves.

Pekingese
SALLY ANNE THOMPSON-EB INC.

Peko \'pā-kȯ\ In Estonian religion, an agricultural deity who aided the growth of grain, especially barley. Peko was represented by a wax image that was kept buried in the grain in the granary and brought out in early spring for a ritual of agricultural fertility. At the end of a ceremonial feast, leftovers were distributed among the poor, and the men competed in wrestling or fence jumping to determine who had the right to keep Peko in his granary until the following year.

Pelagianism \pə-'lā-jē-ə-ˌni-zəm\ Christian heresy of the 5th century that emphasized free will and the goodness of human nature. Pelagius (354?–after 418), a British monk who settled in Africa in 410, was eager to raise moral standards among Christians. Rejecting the arguments of those who attributed their sins to human weakness, he argued that God made humans free to choose between good and evil and that sin is an entirely voluntary act. His disciple Celestius denied the church's doctrine of original sin and the necessity of infant baptism. Pelagius and Celestius were excommunicated in 418, but their views continued to find defenders until the Council of Ephesus condemned Pelagianism in 431.

Pelé \'pā-ˌlā\ *orig.* **Edson Arantes do Nascimento** (b. Oct. 23, 1940, Três Corações, Braz.) Brazilian football (soccer) player, in his time perhaps the most celebrated athlete in the world. He joined the Santos Football Club in 1956 and helped lead that team to a world club championship in 1962. He was part of three Brazilian national teams that won World Cup championships (1958, 1962, 1970). In 1969, during his 909th match, he scored his 1,000th goal. He combined kicking power and accuracy with a remarkable ability to anticipate other players' moves. In 1975 he joined the New York Cosmos of the North American Soccer League (NASL); he retired after leading the team to the league championship in 1977. He was the 1978 recipient of the International Peace Award, and in 1980 he was named Athlete of the Century.

AFP/PICTORIAL PARADE

Pelée \pə-'lā**, Mount** Active volcanic mountain, northern Martinique, West Indies. It is northwest of Fort-de-France and is 4,583 ft (1,397 m) high. A gently sloping cone, it supports luxuriant forests. A violent eruption in 1902 destroyed the port of Saint-Pierre, killing about 30,000 people. A minor eruption occurred in 1929.

Pelham, Henry (b. 1696—d. March 6, 1754, London, Eng.) British prime minister (1743–54). He was elected to Parliament in 1717 and, as a supporter of Robert Walpole, became secretary for war (1724) and paymaster of the forces (1730). He succeeded Walpole as prime minister and chancellor of the Exchequer in 1743 and led a stable Whig ministry with parliamentary assistance from his brother, Thomas Pelham-Holles, duke of Newcastle. Pelham resisted attempts to prolong the War of the Austrian Succession and signed the Treaty of Aix-la-Chapelle (1748). After the war, he introduced financial reforms, including lower military expenditures, a reduced land tax, and a consolidation of the national debt.

Pelham-Holles, Thomas See Duke of Newcastle

pelican Any of about eight species constituting the genus *Pelecanus* (family Pelecanidae), white or brown birds distinguished by a large, elastic throat pouch. Some species are 70 in. (180 cm) long, have a wingspan of 10 ft (3 m), and weigh up to 30 lbs (13 kg). Most species drive fish into shallow water and, using the pouch as a dip net, scoop them up and immediately swallow them. Pelicans inhabit freshwaters and seacoasts in many parts of the world; they breed in colonies on islands, laying one to four eggs in a stick nest. Chicks thrust their bills down the parent's gullet to obtain regurgitated food.

Brown pelican (*Pelecanus occidentalis*).
NORMAN TOMALIN—BRUCE COLEMAN INC.

Pella Ancient capital, Macedonia. Located in northern Greece, northwest of Thessaloníki, the city flourished at the end of the 5th century BC. Originally known as Bounomos, it developed rapidly under Philip II, but, after the Romans defeated the last Macedonian king, it became a small provincial town. Archaeological excavations began in 1957 and revealed large, well-built houses with rooms with mosaic floors dating from the late 4th century BC. Pella was the birthplace of Alexander the Great.

pellagra \pə-'la-grə\ Nutritional disorder caused largely by a deficiency of niacin, marked by skin lesions and digestive and neurological disturbances. Dermatitis usually appears first, with abnormal sensitivity to sunlight. It may look like a severe sunburn, later becoming reddish brown, rough, and scaly. Diarrhea usually alternates with constipation, along with mouth and tongue inflammation and cracking and dry scaling of the lips. Later, mental abnormalities may include nervousness, depression, and delirium. Mild cases of niacin deficiency respond to a well-balanced diet alone. Pellagra still occurs where diets consist mostly of corn, which is low in both niacin and tryptophan (converted to niacin in the body), with little or no protein-rich food. It can also be a side effect of chronic alcoholism.

Peloponnese \'pe-lə-pə-ˌnēz\ Peninsula, forming the southern part of mainland Greece. A large, mountainous body of land jutting south into the Mediterranean Sea, the peninsula has an area of 8,278 sq mi (21,439 sq km) and is joined to the rest of mainland Greece by the Isthmus of Corinth. The Mycenaean civilization flourished there in the 2nd millennium BC at Mycenae and Pylos. Its chief cities during the classical period were Corinth and Sparta. Under the Romans it was part of the province of Achaea from 146 BC to c. 4th century AD. It was part of the Byzantine Empire until it was taken by the Franks; they held it in the 13th–15th centuries, when it was often known as Morea. The modern city of Patras (pop., 2001: 163,446), in the north, is a commercial centre.

Peloponnesian League *or* **Spartan Alliance** Military coalition of Greek city-states led by Sparta, formed in the 6th century BC. League decisions about war, peace, or alliance were determined by congresses summoned by the Spartans. The league was a major force in Greek affairs, forming the core of resistance to the Persian invasions in 490 and 480 and fighting Athens in the Peloponnesian War. Its power declined after its defeat at Leuctra in 371, and the league disbanded in 366/365.

Peloponnesian War (431–404 BC) War fought between Athens and Sparta, the leading city-states of ancient Greece, along with their allies, which included nearly every other Greek city-state. Its principal cause was a fear of Athenian imperialism. The Athenian alliance relied on its strong navy, the Spartan alliance on its strong army. The war fell into two periods, separated by a six-year truce. Fighting broke out in 431, with Pericles commanding the Athenians. In the first 10 years, Archidamus led the Spartans to defeats. Plague struck Athens in 429, killing Pericles and much of the army. In 428 Cleon almost convinced Athens to massacre the rebellious citizens of Mytilene on Lesbos, but Athens rescinded the order. In 421 both states agreed to accept the Peace of Nicias. This lasted six years, until Athens launched its disastrous Sicilian expedition. By 413 Athens's forces were demolished. In 411 an oligarchy briefly took power. When democratic leaders were restored by the navy later that year, they refused Spartan peace offers, and the war continued until 405, when the Athenian navy was destroyed at the Battle of Aegospotami with Persian help. Under blockade, Athens surrendered in 404. Its empire was dismantled, and the Spartans installed the Thirty Tyrants.

Pelops \'pē-ˌläps, 'pe-ˌläps\ In Greek mythology, founder of the Pelopid dynasty at Mycenae. Pelops was a grandson of Zeus. His father, Tantalus, cooked and served Pelops to the gods at a banquet, and only Demeter, mourning the loss of her daughter, Persephone, was distracted enough to eat from the dish. The gods ordered the body restored, but the shoulder, Demeter's portion, was missing, and the boy was given a replacement of ivory. In another story, Poseidon, helped Pelops gain the hand of Hippodamia, daughter of King Oenomaus of Pisa.

pelota \pə-'lō-tə\ (Spanish: "little ball") Any of several games in which players take turns, using a glove or implement, hitting a rubber ball either directly at one another or off a wall. The latter version is related to handball and jai alai, which are played by two or four players on one-, two-, or three-walled courts using gloves, rackets, or bats. In Spain and elsewhere, pelota is a professional sport on which spectators wager.

Pelusium \pə-'lü-shē-əm\ Ancient Egyptian city. Located on what was once the easternmost mouth of the Nile River, its ruins lay southeast of modern Port Said. Beginning in the 26th dynasty (c. 7th century BC), it was the main frontier fortress facing Palestine and was a customs post for Asian goods. In 522 BC the Achaemenian Persians, under Cambyses II, defeated the pharaoh Psamtik III there. In Roman times it was a station on the trade route to the Red Sea; its ruins date from the Roman period.

pelvic inflammatory disease (PID) Acute inflammation of the pelvic cavity in women, caused by bacterial infection (usually gonorrhea or chlamydia) of the reproductive system. Usually a sexually transmitted disease, it occurs mainly in sexually active women under age 25, more often in those using intrauterine devices (IUDs). PID can resemble gonorrhea, with abdominal and lower pelvic pain, chills, nausea, fever, and thick, foul-smelling vaginal discharge. Fallopian tube scarring can cause infertility and ectopic pregnancy. Treatment requires antibiotics, bed rest, pain

© 2006 Encyclopædia Britannica, Inc.

medication, and sexual abstinence until the infection disappears. Sexual partners must also be treated to prevent reinfection.

Pemex *officially* **Petróleos Mexicanos** Mexico's state-owned oil company. In 1938 Pres. Lázaro Cárdenas nationalized 17 foreign oil companies to create Pemex, the largest Latin American petroleum company and a major world exporter of fossil fuel. Pemex engages in exploration, production, refining, transportation, storage, distribution, and sales of oil and natural gas. In the 1970s promising oil discoveries gave rise to a national spending spree, led by the flamboyant Pres. José López Portillo and financed by massive borrowing. Crude-oil production tripled, but when the international price of oil collapsed in 1981, López Portillo raised Mexican oil prices. The country was virtually bankrupt within one year. Economic reforms have since contributed to greater stability. At the turn of the 21st century, Pemex accounted for nearly 40% of the Mexican government's income.

pen drawing Artwork executed wholly or in part with pen and ink, usually on paper. It is fundamentally a linear method of making images. Artists who wish to suggest three-dimensional forms use hatching and cross-hatching or washes of colour laid onto the drawing with a brush. The three most common types of ink are black carbon ink, the finest type being Chinese ink or the modern India ink; brown ink, which was popular with the Old Masters; and iron gall, a chemical ink. The three pen types are quill, reed, and metal. Quill pens were most popular for their flexibility and ability to be sharpened to extreme fineness. Steel became the predominant pen type by the 20th century.

penal colony Distant or overseas settlement established to punish criminals with forced labour and isolation from society. Such colonies were developed mostly by the English, French, and Russians. Britain sent criminals to its American colonies until the Revolutionary War; Australia was principally a penal colony from its colonization until the mid-19th century. French Guiana, site of a French penal colony, was infamous for its inhumanity; Devil's Island was still operating during World War II. Russian penal colonies were established in Siberia under the tsars but were most widely used during the Stalin era. Notorious for their harsh punishments and underfeeding, most penal colonies have now been abolished.

Penang \pə-'naŋ\ *Malay* **Pinang** Island (pop., 2000 prelim.: 1,225,501), Malaysia, off the northwestern coast of the Malay Peninsula, part of the state of Pulau Pinang. The capital and chief port is George Town (pop., 2000 prelim.: 180,573), in the northeast. British colonization began in 1786. In 1826 Penang (known until 1867 as Prince of Wales Island) combined with Malacca and Singapore to form the Straits Settlements. From the mid-19th century it was a market for tin and rubber. In 1948 it became part of the Federation of Malaya, later Malaysia. In the late 20th century it became Malaysia's prime tourist centre, with resort hotels mainly on the northern coast at Batu Feringgi.

Penates \pə-'nā-tēz, pə-'nä-tēz\ Roman household gods. They were worshiped privately as protectors of the household and also publicly as protectors of the Roman state. They were sometimes associated with other deities of the house, such as Vesta, and their name was often used interchangeably with that of the Lares. Each house had a shrine with their images, which were worshiped at the family meal and on special occasions. Offerings were portions of the regular meal or of special cakes, wine, honey, and incense. The number and precise identities of the Penates were a puzzle even to the ancients.

pencil drawing Drawing executed with a pencil, an instrument made of graphite enclosed in a wood casing. Though graphite was mined in the 16th century, its use by artists is not known before the 17th century. In the 17th–18th century, graphite was used primarily to make preliminary sketches for more elaborate work in another medium, seldom for finished works. By the late 18th century, an ancestor of the modern pencil was constructed by inserting a rod of natural graphite into a hollow cylinder of wood. Pencil rods produced from mixtures of graphite and clays, true prototypes of the modern graphite pencil, were introduced in 1795. This improvement allowed for better control and encouraged wider use. The great masters of pencil drawing kept the elements of a simple linearism with limited shading, but many artists in the 18th–19th century created elaborate effects of light and shade by rubbing the soft graphite particles with a tightly rolled paper or chamois.

pendant *or* **pendent** In architecture, a sculpted ornament suspended from a vault or ceiling, especially an elongated boss (carved keystone) at the junction of the intersecting ribs of the fan vaulting associated with the English Perpendicular style. In stone ceilings, the use of pendant vaulting was a solution to the difficulty of adapting fan vaulting to very wide church naves. Strong transverse arches were made to span the area, and these in turn supported the elongated keystones. Intermediate rib and panel vaults sprang from these pendants.

pendant Ornament suspended from a bracelet, earring, or necklace and derived from the primitive practice of wearing amulets or talismans around the neck. The practice dates from the Stone Age, when pendants consisted of objects such as teeth, stones, and shells. Commemorative and decorative pendants were common in ancient Egypt, Greece, and Rome. In the Middle Ages reliquaries, or devotional pendants, and crosses were created with jewels. By the beginning of the 16th century, Renaissance artists were creating pendants for decorative rather than religious use. The late 19th-century Art Nouveau movement often featured women's figures, butterflies, or flowers on pendants.

Art Nouveau pendant by L. Gautrait, c. 1900; in the Schmuckmuseum, Pforzheim, Ger.
COURTESY OF THE SCHMUCKMUSEUM, PFORZHEIM, GER.

pendentive In architecture, a triangular segment of a spherical surface that forms the transition between the circular plan of a dome and the polygonal plan of its supporting structure. The problem of placing a round dome on a square base assumed growing importance to Roman builders, but it remained for Byzantine architects to recognize the possibilities of the pendentive and fully develop it (see Hagia Sophia). One of the great architectural inventions of all time, the pendentive became very important in the Renaissance and Baroque periods. As a result of Byzantine influence, pendentives are also frequent in Islamic architecture. The vaulting form in which the curve of the pendentive and dome is continuous is known as a pendentive dome.

Penderecki \ˌpen-də-'ret-skē**, Krzysztof** (b. Nov. 23, 1933, Debica, Pol.) Polish composer and conductor. He studied composition at the Kraków Conservatory and would later serve as its director (1972–87). His early music (1960–74) involved dense note clusters and unorthodox sounds, and he developed his own musical notation to convey the desired effects, resulting in vivid works that attracted international attention, including *Threnody for the Victims of Hiroshima* (1960), *Stabat Mater* (1962), the *St. Luke Passion* (1963–65), and the opera *The Devils of Loudun* (1969). After 1975 he embraced a more traditional approach with works such as the opera *Paradise Lost* (1978), concertos for violin (1977), cello (1982), and viola (1983), and *Lux aeterna* (1983).

Pendergast, Thomas J(oseph) (b. July 22, 1872, St. Joseph, Mo., U.S.—d. Jan. 26, 1945, Kansas City, Mo.) U.S. politician. He was active in municipal politics in Kansas City, Mo., and became the political boss of the city's Democrats by 1916. His political machine dominated city and state politics for almost 25 years and influenced national Democratic conventions. He helped Harry S. Truman in his early political career. Attacked by opponents for allowing corrupt practices in Kansas City, he was convicted of income-tax evasion in 1939 and served one year in prison.

Pendleton, George (Hunt) (b. July 29, 1825, Cincinnati, Ohio, U.S.—d. Nov. 24, 1889, Brussels, Belg.) U.S. politician. He served in the U.S. House of Representatives from 1857 to 1865 and was the unsuccessful Democratic candidate for vice president (with George B. McClellan) in 1864. A member of the Greenback movement, he advocated the Ohio Idea for redeeming American Civil War bonds. From 1879 to 1885 he served in the U.S. Senate, where he sponsored the Pendleton Civil Service Act. He served as minister to Germany from 1885 to 1889.

Pendleton Civil Service Act (1883) U.S. legislation establishing the modern civil-service system of permanent federal employment based on merit. Public demand for civil-service reform to replace the system based on political party affiliation (the spoils system) resulted in a bill sponsored by Sen. George Pendleton, which provided for selection of government employees by competitive examination administered by a civil-service

© 2006 Encyclopædia Britannica, Inc.

commission. Only 10% of government jobs were originally covered by the law, but successive Congresses expanded its scope to include more than 90% of federal employees.

pendulum Body suspended from a fixed point so that it can swing back and forth under the influence of gravity. A simple pendulum consists of a bob (weight) suspended at the end of a string. The PERIODIC MOTION of a pendulum is constant, but can be made longer or shorter by increasing or decreasing the length of the string. A change in the mass of the bob alone does not affect the period. Because of their constancy, pendulums were long used to regulate the movement of clocks. Other, special kinds of pendulums are used to measure the value of *g*, the acceleration due to gravity, and to show that the earth rotates on its axis (see FOUCAULT PENDULUM).

peneplain \'pē-nə-ˌplān\ Gently undulating, almost featureless plain near sea level. This would form, theoretically, by various erosional processes that reduce areas of initially high relief produced by active uplift to areas of virtually no relief. The lack of present-day peneplains tends to discredit the theory, but some geomorphologists propose that large areas of low relief at high altitude in some mountains are evidence of uplifted peneplains. Others question whether the dynamic relationship between erosion and rock type would ever allow the development of a peneplain, even over very long timespans.

Peneus River See PINIÓS RIVER

penguin Any of 17 species (order Sphenisciformes) of flightless seabirds that breed mainly on islands in subantarctic waters and on cool coasts of Africa, Australia, New Zealand, and South America. A few species inhabit temperate regions, and the Galápagos penguin (*Spheniscus mendiculus*) lives in the equatorial tropics off South America. Species differ mainly in size and head pattern; all have a dark back and a white belly. The smallest species, the little blue penguin (*Eudyptula minor*), is about 14 in. (35 cm) tall; the largest, the emperor penguin (*Aptenodytes forsteri*), is almost 4 ft (120 cm) tall. At sea for weeks at a time, flocks feed on fish, squid, and crustaceans.

penicillin ANTIBIOTIC derived from the *PENICILLIUM* mold. It was discovered in 1928 by ALEXANDER FLEMING; by 1940, HOWARD WALTER FLOREY, ERNST BORIS CHAIN, and others had produced commercial quantities that proved vital to the treatment of war casualties, making penicillin the first successful antibiotic for human bacterial infections. Many natural and semisynthetic (ampicillin, amoxicillin) variants have since been produced. All work by inhibiting the enzymes responsible for bacterial cell wall synthesis (and therefore do not work against microorganisms without cell walls or with certain variant cell walls; e.g., the tuberculosis bacillus). Among the bacteria susceptible to penicillin are those causing strep throat, spinal MENINGITIS, gas GANGRENE, and SYPHILIS. Overuse has led to DRUG RESISTANCE in some strains. Penicillin's chief side effect is ALLERGY, which can be life-threatening.

Penicillium \ˌpe-nə-'si-lē-əm\ Any blue or green MOLD in the genus *Penicillium* (kingdom Fungi; see FUNGUS). Common on foodstuffs, leather, and fabrics, they are economically important in producing ANTIBIOTICS (see PENICILLIN), organic acids, and cheeses such as English Stilton, Italian Gorgonzola, and French Roquefort.

Peninsular War (1808–14) Part of the NAPOLEONIC WARS, fought on the Iberian Peninsula. After French forces occupied Portugal (1807) and NAPOLEON installed his brother JOSEPH BONAPARTE as king of Spain (1808), a rebellion in Madrid began what was called in Spain "the War of Independence," and insurrections soon erupted in other cities. By 1810 the French overcame the Spanish rebels in Madrid and elsewhere in Spain. Meanwhile, the British under the future duke of WELLINGTON landed in Portugal (1808), where they fought the French in inconclusive campaigns until 1812. After Napoleon withdrew French forces to bolster his invasion of Russia, Wellington began his gradual advance into Spain. The British victory at the Battle of Vitoria (1813) and their march into southwestern France forced the French to withdraw from Spain and to reinstall FERDINAND VII as king (1814).

penis Male sex organ, which also provides the channel for urine to leave the body. Three long columns of tissue extend through its length, covered by elastic tissue and a thin layer of skin. One expands at the tip into a mushroom-shaped structure (glans penis) and contains the urethra (see URINARY SYSTEM), which ends in a slitlike opening. In sexual arousal, blood fills spaces in the tissue, and blood vessels constrict to hold it there, enlarging and hardening the penis in an erection. The foreskin, a circular fold of skin covering the glans, is often removed (see CIRCUMCISION). See also REPRODUCTIVE SYSTEM.

Penn, Irving (b. June 16, 1917, Plainfield, N.J., U.S.) U.S. photographer. He aspired to be a painter but at 26 took a job designing photographic covers for *Vogue* and soon was established as a fashion photographer. His austere fashion images communicated elegance and luxury through compositional refinement and clarity of line rather than through the use of elaborate props and backdrops. He branched out into portraiture after World War II and became much admired as a portraitist of celebrities. In his portraits the subject is usually posed before a bare backdrop and photographed in natural northern light. The resulting images combine simplicity and directness with great formal sophistication.

Penn, William (b. Oct. 14, 1644, London, Eng.—d. July 30, 1718, Buckinghamshire) English Quaker leader and founder of Pennsylvania. Expelled from Oxford for his Puritan beliefs, he was sent to manage the family estates in Ireland, where he joined the Society of FRIENDS in 1667. He was imprisoned four times for stating his Quaker beliefs in print and in speech; one of his trials resulted in the precedent-setting Bushell's Case, which established the independence of juries. In *The Great Case of Liberty of Conscience* (1670), Penn advocated religious toleration and envisioned a colony based on religious and political freedom. On his father's death, he inherited his estates and his influence with CHARLES II, who granted him a vast province on the Delaware River in payment for debts owed his father. In 1682 he drafted a Frame of Government that established freedom of worship in the settlement. Upon his arrival later that year, he negotiated a series of treaties with the local Indians. In 1684 he traveled to England to defend his interests against claims by neighbouring Maryland. With the accession of his friend the duke of York as JAMES II, he secured the release of imprisoned Quakers. He returned to Pennsylvania in 1699, where he wrote the Charter of Privileges, which allowed the assembly greater autonomy. The years after his return to England in 1701 were clouded by debt and illness.

Penney, J(ames) C(ash) (b. Sept. 16, 1875, Hamilton, Mo., U.S.—d. Feb. 12, 1971, New York, N.Y.) U.S. merchant. He became a partner in a dry-goods store in Wyoming in 1902 and five years later bought out his partners' shares to launch what became the J.C. Penney Co. His stores offered a wide variety of inexpensive merchandise, and he offered profit-sharing plans, first to managers and later to all employees. By 1929 the company had 1,392 stores across the U.S., and at the time of Penney's death it was the second largest merchandiser in the country, behind SEARS, ROEBUCK AND CO.

Pennines \'pe-ˌnīnz\ Upland mass, northern England. The Pennines extend south from NORTHUMBERLAND to DERBYSHIRE; the highest point is Cross Fell, at 2,930 ft (893 m). Water action has developed underground caverns in the uplands' limestone, which is extensively quarried. Sheep farming is also important. Archaeological remains in the area include the ancient Roman HADRIAN'S WALL.

Pennsylvania *officially* **Commonwealth of Pennsylvania** State (pop., 2000: 12,281,054), middle Atlantic region, U.S. It covers 45,333 sq mi (117,412 sq km); its capital is HARRISBURG. The state is bounded on the north by Lake Erie and New York; on the east by New York and New Jersey; on the south by Delaware, Maryland, and West Virginia; and on the west by the panhandle of West Virginia and by Ohio; the DELAWARE RIVER forms part of the eastern boundary. The MONONGAHELA RIVER unites with the ALLEGHENY RIVER at PITTSBURGH to form the OHIO RIVER. The area was inhabited by Indian peoples, including the SHAWNEE and DELAWARE, when Europeans arrived in the 17th century. In 1664 the English seized control of the region, and in 1681 the English king granted a charter to WILLIAM PENN, who established a Quaker colony based on religious tolerance in 1682. Much of the fighting of the FRENCH AND INDIAN WAR took place there. The first and second CONTINENTAL CONGRESSES met in PHILADELPHIA, and the DECLARATION OF INDEPENDENCE was signed there in 1776. One of the original states of the Union, it was the second state to ratify the U.S. Constitution in 1787. During the AMERICAN CIVIL WAR it was a centre of military activity (see Battle of GETTYSBURG). The postwar period brought great economic, industrial, and population growth, consolidating the state's position as a major commercial power. It is one of the most prosperous states, with an economy based on farming, mining, manufacturing, and high technology. The state continues to produce much of the

© 2006 Encyclopædia Britannica, Inc.

nation's specialty steel and an abundance of coal. Philadelphia and Pittsburgh are major ports with fine educational, cultural, and musical institutions.

Pennsylvania, University of U.S. private university in Philadelphia, a traditional member of the IVY LEAGUE. Founded in 1740 as a charity school, it became an academy in 1753, with BENJAMIN FRANKLIN as president of the first board of trustees. With the founding of the first medical school in North America (1765), it became a university. Today, in addition to its college of arts and sciences and its medical school, it includes a college of general studies and schools of business (the Wharton School), communication (the Annenberg School), education, engineering, fine arts, law, nursing, dentistry, veterinary medicine, and social work. Its institutes include the Wistar Institute of Anatomy and Biology and the Phipps Institute of Genetics and Community Diseases. The University Museum (of archaeology and ethnology) is a teaching and research organization.

Pennsylvania Railroad Co. Former U.S. railroad. It was chartered in 1846 by the Pennsylvania legislature to build a line between Harrisburg and Pittsburgh, and its passenger service began two years later. By purchasing the Pittsburgh, Fort Wayne and Chicago Railway in 1856, the company extended its service to Chicago. After the Civil War it expanded to St. Louis, Mo., and Cincinnati, Ohio, in the west and Norfolk, Va., in the south, with 10,000 mi (16,000 km) of track at its greatest extent. It began to lose money in the mid 20th century, and in 1968 it merged with its competitor, the NEW YORK CENTRAL, to form the Penn Central Transportation Co. Penn Central declared bankruptcy in 1970; its passenger service was taken over by AMTRAK in 1971 and its assets by CONRAIL in 1976. See also J. EDGAR THOMSON.

Pennsylvania State University U.S. public state system of higher education with a main campus in University Park and numerous other campuses and locations, including the Milton S. Hershey Medical Center in Hershey and the Dickinson School of Law in Carlisle. The university originated with the charter of the Farmers' High School in 1855 and was designated the commonwealth's land-grant college in 1862. It took its current name only in 1953. Research facilities include the Biotechnology Institute, the Center for Applied Behavioral Science, and the Center for Particle Science and Engineering.

Pennsylvanian Period In North America, the interval of geologic time roughly equivalent to what is internationally designated the Late CARBONIFEROUS PERIOD (323–290 million years ago). Because the rocks that originated during this span of time are widespread in the state of Pennsylvania, some U.S. geologists favour the term over Late Carboniferous Period, which was first adopted in Europe.

Penobscot \pə-'näb-skət\ **River** River, central Maine, U.S. The Penobscot, which flows south into Penobscot Bay, is the state's longest river—about 350 mi (560 km). It is navigable for 60 mi (97 km) to Bangor. Once an important source of salmon, it has become economically important to the lumber, pulp, and paper industries because of its hydropower facilities. Navigated by French and English voyagers in the early 17th century, it was named for the Penobscot Indians.

penology \pē-'nä-lə-jē\ Branch of CRIMINOLOGY dealing with prison management and the treatment of offenders. Penological studies have sought to clarify the ethical bases of punishment, along with the motives and purposes of society in inflicting it; differences throughout history and between nations in penal laws and procedures; and the social consequences of the policies in force at a given time. Influential historical works have included Cesare Beccaria's *On Crimes and Punishments* (1764), JEREMY BENTHAM's "Panopticon" scheme (c. 1800), Cesare Lombroso's *Crime* (1876), and MICHEL FOUCAULT's *Discipline and Punish* (1975).

pension Series of periodic money payments made to a person who retires from employment because of age, disability, or the completion of an agreed span of service. The payments generally continue for the rest of the recipient's natural life, and they are sometimes extended to a widow or other survivor. Military pensions have existed for many centuries; private pension plans originated in Europe in the 19th century. There are two basic types of pension plans: defined contribution and defined benefit. A defined contribution plan invests a defined amount each pay period. The individual may have some discretion as to how the money is invested. The benefit, the amount of the pension, depends on the success of those investments. A defined benefit plan pays a known amount according to some formula, but the amount invested in the fund may vary. Pensions may be funded by making payments into a pension TRUST FUND or by the purchase of ANNUITIES from insurance companies. In plans known as multiemployer plans, various employers contribute to one central trust fund administered by a joint board of trustees.

Pentagon Huge five-sided building (1941–43) in Arlington, Va., that is the headquarters of the U.S. Department of Defense. Designed by George Edwin Bergstrom, it was, on its completion, the world's largest office building, covering 34 acres (14 hectares) and offering 3.7 million sq ft (about 344,000 sq m) of usable floor space for as many as 25,000 workers. Built of structural steel and reinforced concrete with some limestone facing at a cost of $83 million, the five-story structure actually consists of five concentric pentagons, with 10 spokelike corridors connecting the whole. In 2001 more than 180 people were killed and many more were injured when part of the Pentagon's southwest side was destroyed in the SEPTEMBER 11 ATTACKS.

Pentagon Papers Secret documents detailing the U.S. role in Indochina from World War II to 1968. The U.S. Defense Department commissioned the study; a project associate, Daniel Ellsberg, who was opposed to U.S. participation in the VIETNAM WAR, leaked details of the documents to the press. In June 1971 *The New York Times* began publishing articles based on the study. The U.S. Justice Department, citing national security, obtained a temporary court order halting publication. The U.S. Supreme Court ruled that the government had failed to justify restraint of publication, and the documents were published widely, fueling debate over the country's Vietnam policy.

Pentateuch See TORAH

pentathlon Athletic contest entailing five distinct types of competitions. In the ancient Olympic Games, the pentathlon included a sprint, the LONG JUMP, DISCUS THROW, JAVELIN THROW, and a WRESTLING match. A modified version (with a medium-distance race substituted for the wrestling match) was included in the revived Olympic Games (1912–24). The modern, or military, pentathlon, included in the Olympics from 1912 and made a team event in 1952, includes an equestrian STEEPLECHASE, FENCING, pistol SHOOTING, a freestyle swim, and a CROSS-COUNTRY RUN. Women's pentathlon competition (SHOT PUT, HIGH JUMP, HURDLING race, sprint, and long jump) was replaced in 1981 by the HEPTATHLON.

Pentecost (from Greek *pentecoste*, "fiftieth day") Christian festival commemorating the descent of the HOLY SPIRIT on the disciples of Jesus, occurring on the Jewish Pentecost, after Jesus' death, resurrection, and ascension. The disciples began to speak in the many languages of the people assembled there, a sign that the disciples should spread the Christian message throughout the world. Jewish Pentecost was a thanksgiving feast for the first fruits of the wheat harvest and was associated with remembrance of God's gift of the Law to Moses on Mount Sinai. Christian Pentecost is celebrated on the Sunday concluding the 50-day period following Easter. It is also the name of the Jewish celebration of Shavuot ("Festival of Weeks").

Pentecostalism Protestant religious movement that originated in the U.S. in the 19th–20th century. It is characterized by a belief that all Christians should seek a postconversion religious experience called BAPTISM with the HOLY SPIRIT. The experience corresponds to the descent of the Holy Spirit on the twelve APOSTLES (PENTECOST) and is evidenced by speaking in tongues, prophesying, and healing. Pentecostalism grew out of the 19th-century HOLINESS MOVEMENT and shares its emphasis on biblical literalism, conversion, and moral rigor. The charismatic movement in Roman Catholic and mainstream Protestant denominations represents the same spirit. Today there are many Pentecostalist denominations in the U.S. and around the world, including the ASSEMBLIES OF GOD. Penetcostalism has been especially successful in the Caribbean, Latin America, and Africa.

penthouse Enclosed area on top of a building. A penthouse can be an apartment on the roof or top floor of a building or a structure on the roof housing the top of an elevator shaft, air-conditioning equipment, or stairs leading to the roof. A penthouse is usually set back from the vertical face of a building, but as a real-estate term, penthouse may refer to any top floor, regardless of setbacks. Though the word now often suggests a luxurious apartment with a panoramic view, historically a penthouse was a lean-to, shed, or other small structure attached to a comparatively large building.

Pentium Family of MICROPROCESSORS developed by INTEL CORP. Introduced in 1993 as the successor to Intel's 80486 microprocessor, the Pentium

© 2006 Encyclopædia Britannica, Inc.

contained two processors on a single chip and about 3.3 million TRANSISTORS. Using a CISC (complex instruction set computer) architecture, its main features were a 32-BIT address BUS, a 64-bit data bus, built-in floating-point and memory-management units, and two 8KB caches. It was available with processor speeds ranging from 60 megahertz (MHz) to 200 MHz. The Pentium quickly became the processor of choice for personal computers. It was superseded by ever faster and more powerful processors, the Pentium Pro (1995), the Pentium II (1997), the Pentium III (1999), and the Pentium 4 (2000).

Penutian languages \pə-'nü-tē-ən\ Hypothetical superfamily of North American Indian languages that unites a number of languages and language families mainly of the far western U.S. and Canada. The Penutian hypothesis was proposed by Roland B. Dixon and ALFRED L. KROEBER in 1913 and refined by EDWARD SAPIR in 1921. Like the Hokan hypothesis (see HOKAN LANGUAGES), it attempted to reduce the number of unrelated language families in one of the world's most linguistically diverse areas. At its core was a group of languages spoken along California's central coast and in the CENTRAL VALLEY, including Ohlone (Costanoan), Miwok, Wintuan, Maidu, and Yokuts. Sapir added Oregon Penutian (languages once spoken in eastern Oregon), Chinookan (spoken along the lower Columbia River), Plateau Penutian (languages of PLATEAU INDIAN peoples), Tsimshian (spoken in western British Columbia), and Mexican Penutian (spoken in southern Mexico). Aside from the Mexican group, all the languages are today either extinct or spoken almost exclusively by older adults. Though the hypothesis remains unproven, at least some languages of the group are probably related to each other.

Penzias \'pent-sē-əs**, Arno (Allan)** (b. April 26, 1933, Munich, Ger.) German-born U.S. astrophysicist. His family fled Nazi Germany, and he received his Ph.D. from Columbia University, after which he joined Bell Telephone Laboratories, where he worked with ROBERT W. WILSON monitoring radio emissions from a ring of gas around the Milky Way Galaxy. The two detected an unexpected uniform background static that suggested a thermal energy throughout the universe at a temperature of about –454 °F (–269 °C), which most scientists now agree is residual COSMIC BACKGROUND RADIATION stemming from the BIG BANG explosion billions of years ago, from which the universe was created. They shared a 1978 Nobel Prize with Pyotr Kapitsa (1894–1984) for their work. In 1981 Penzias became a vice president at Bell Laboratories, retiring in 1998.

peonage \'pē-ə-nij\ Form of involuntary servitude, the origins of which date to the Spanish conquest of Mexico, when the conquerors forced the poor, especially Indians, to work for Spanish planters and mine operators. In the U.S., the word *peon* referred to workers compelled by contract to pay their creditors in labour. Though prohibited under U.S. federal law, peonage persisted in some southern states through state laws that made labour compulsory. Another form of peonage exists when prisoners sentenced to hard labour are farmed out to labour camps.

peony \'pē-ə-nē\ Any of about 33 species of flowering plants in the genus *Paeonia*, sole genus of the family Paenoiaceae, found in Europe, Asia, and western North America and known for their large, showy blossoms. Herbaceous peonies are perennials that grow to about 3 ft (1 m). Their annual stems bear large, glossy, much-divided leaves and produce large single and double flowers of white, pink, rose, and deep crimson. Tree peonies are shrubs about 4–6 ft (1.2–1.8 m) high with permanent rootstocks and woody stems that bear flowers varying in colour from white to lilac, violet, and red.

People's Liberation Army Unified organization of China's land, sea, and air forces. With more than 2,000,000 troops, it is the largest military force of any country in the world. The People's Liberation Army traces its roots to the 1927 Nanchang Uprising of the communists against the Nationalists. Initially called the Red Army, it grew under ZHU DE from 5,000 troops in 1929 to 200,000 in 1933. Only a fraction of this force survived the LONG MARCH in retreat from the Nationalists. After rebuilding its strength, a large portion of it, the Eighth Route Army, fought with the Nationalists against the Japanese in northern China. After World War II the communist forces, renamed the People's Liberation Army, defeated the Nationalists, making possible the formation of the People's Republic of China in 1949. See also LIN BIAO; MAO ZEDONG.

Peoria City (pop., 2000: 112,936), central Illinois, U.S. The city is situated where the Illinois River widens to form Peoria Lake. The first settlement on the site was a French fort established in 1680 by the French explorer LA SALLE. Later settlements were by the French, Indians, and other colonists. It was incorporated as a city in 1845. It is a major port, trade, and shipping centre for a large agricultural area. It is highly industrialized, and its products include earth-moving equipment and chemicals.

Pepin III See PIPPIN III

Pepin, Donation of See DONATION OF PIPPIN

pepper *or* **garden pepper** Any of many plants in the genus *Capsicum* of the NIGHTSHADE FAMILY, notably *C. annuum*, *C. frutescens*, and *C. boccatum*, native to Central and South America and cultivated extensively throughout tropical Asia and the equatorial New World for their edible, pungent fruits. Red, green, and yellow mild bell or sweet peppers, rich in vitamins A and C, are used in seasoning and as a vegetable food. The pungency of hot peppers, including tabasco, chili, and cayenne peppers, comes from the compound capsaicin in the internal partitions of the fruit. The spice BLACK PEPPER comes from an unrelated plant.

Red peppers (*Capsicum annuum*) from which paprika is made

pepper, black See BLACK PEPPER

Pepper, Claude (Denson) (b. Sept. 8, 1900, Dudleyville, Ala., U.S.—d. May 30, 1989, Washington, D.C.) U.S. politician. He practiced law in Florida before being elected to the U.S. Senate (1937–51), where he supported legislation that created SOCIAL SECURITY, a MINIMUM WAGE, and medical assistance for the elderly. Elected to the U.S. House of Representatives (1963–89), he chaired the committee on aging and sponsored legislation abolishing mandatory retirement in federal agencies and raising the retirement age to 70 in the private sector (1968). In 1989 he was awarded the Medal of Freedom.

peppermint Strongly aromatic perennial herb (*Mentha piperita*, MINT family), source of a widely used flavouring. Native to Europe and Asia, it has been naturalized in North America. The stalked, smooth, dark green leaves and blunt, oblong clusters of pinkish lavender flowers are dried for use as a flavouring agent. Oil of peppermint is widely used to flavour confectionery, chewing gum, toothpastes, and medicines. The oil also contains MENTHOL, long used medicinally as a soothing balm.

PepsiCo, Inc. U.S. conglomerate. The SOFT DRINK Pepsi-Cola was created by a pharmacist, Caleb D. Bradham, who gave his tonic its name (from Greek *pepsis*, "digestion") in 1898 and incorporated the Pepsi-Cola Co. in 1902. After two bankruptcies and several reincorporations, the Pepsi-Cola trademark and assets were bought in 1931 by Charles G. Guth, who improved the formula and marketed a 12-ounce bottle for five cents with huge success. Pepsi-Cola merged with the soda-fountain chain Loft, Inc., in 1941, and in 1965 it merged with Frito-Lay, Inc., adopting its current name, PepsiCo, Inc. In the 1970s and '80s PepsiCo bought restaurant chains such as Pizza Hut, Taco Bell, and Kentucky Fried Chicken, but in 1997 it spun off its restaurant business into a separate company, Tricon Global Restaurants. In 2001 the QUAKER OATS CO. merged with PepsiCo.

pepsin Powerful ENZYME in gastric juice (see STOMACH) that partially digests PROTEINS in food. Glands in the stomach lining make pepsinogen, a ZYMOGEN (enzyme precursor) converted to pepsin by the HYDROCHLORIC ACID in gastric juice. Pepsin is active only in the acid environment of the stomach (pH 1.5–2.5 or less); it is ineffective in the intestine (pH 7, neutral). It is used commercially in some cheese making, in the leather industry to remove hair and residual tissue from hides, and in the recovery of silver from discarded photographic films by digesting the gelatin layer that holds the silver.

peptic ulcer Sore that develops in the mucous membrane of the STOMACH (more frequent in women) or DUODENUM (accounting for 80% of ulcers and more frequent in men) when its ability to resist acid in gastric juice is reduced. It causes burning ache and hungerlike pain. Ulcers can bleed, perforate the abdominal wall, or block the gastrointestinal tract. Stress and

© 2006 Encyclopædia Britannica, Inc.

diet were blamed until *Helicobacter pylori* bacteria and long-term use of ASPIRIN and similar drugs were shown to be the two major causes. The former is treated with combination drug therapy and the latter by stopping the causative drugs if possible or with drugs that reduce acid production. A rare cause is Zollinger-Ellison syndrome, in which a tumour causes increased acid secretion. Cigarette smoking slows healing and promotes recurrence.

peptide Organic compound composed of a series of AMINO ACIDS linked by peptide bonds (see COVALENT BOND) between a carbon atom of one and a nitrogen atom of the next. Peptide chains longer than a few dozen amino acids are called PROTEINS. Biosynthesis of peptides from a succession of amino acids carried by transfer RNA molecules takes place on RIBOSOMES and is catalyzed and controlled by ENZYMES. Many HORMONES, ANTIBIOTICS, and other compounds that participate in life processes are peptides.

Pepys \'pēps**, Samuel** (b. Feb. 23, 1633, London, Eng.—d. May 26, 1703, London) English diarist and public official. Born into a humble family, Pepys was appointed about 1659 as a clerk in the office of the Exchequer, where on Jan. 1, 1660, he began the diary for which he is chiefly known. He steadily improved his position, in time becoming secretary of the Admiralty, a member of Parliament, president of the Royal Society, trusted confidant of CHARLES II and JAMES II, and friend of the great scholars of his age. His diary (published 1825), which he kept through 1669, presents a fascinating picture of the official and upper-class life in Restoration London, with vivid, honest accounts of ordinary as well as great events, including the Plague and the GREAT FIRE OF LONDON.

Samuel Pepys, oil painting by John Hayls, 1666; in the National Portrait Gallery, London.
COURTESY OF THE NATIONAL PORTRAIT GALLERY, LONDON

Pequot \'pē-ˌkwät\ North American Indian people now living in eastern Connecticut, U.S. Pequot is an Algonquian language, and the name is derived from an Algonquian word meaning "destroyers." Pequot subsistence was based on corn cultivation, hunting, and fishing. The people were at one time united with the MOHEGAN. For a brief period the Pequot lived amicably with the American colonists, but relations became strained as land pressures grew. Puritan clergymen encouraged violence against the Pequot as infidels, and in 1636 war broke out, resulting in large losses. Further destruction resulted when the remaining Pequot were placed under the control of other tribes. In 1655 the few remaining Pequot were resettled on the Mystic River. The two groups of Pequot number about 1,000.

Perahia \pə-'rī-ə**, Murray** (b. April 19, 1947, New York, N.Y., U.S.) U.S. pianist. He was trained at the Mannes College of Music in New York City. He won the Leeds International Piano Competition by unanimous vote in 1972, and in 1975 he shared the first Avery Fisher Prize. From 1982 he was music director of the Aldeburgh Festival and made his home in England. He is best known for his sensitive recordings of WOLFGANG AMADEUS MOZART's concertos, conducted from the keyboard.

Peranakan \ˌper-ə-'nä-kən\ Any native-born Indonesian of mixed Indonesian and foreign ancestry. The term often refers to the Peranakan Chinese, the largest and most important Peranakan group, who formed a stable community by the mid-19th century, partly adopting the indigenous way of life and generally speaking the native tongue. By contrast, in the early 20th century a large wave of Chinese immigration created a Totok (foreign-born) Chinese community. Unlike the Peranakans, the Totoks retained their own Chinese dialects and remained China-oriented.

perception Process of registering sensory stimuli as meaningful experience. The differences between SENSATION and perception have varied according to how the terms are defined. A common distinction is that sensations are simple sensory experiences, while percepts are complex constructions of simple elements joined through association. Another is that perception is more subject to the influence of learning. Though hearing, smell, touch, and taste perceptions have all been explored, vision has received the most attention. Structuralist researchers such as EDWARD BRADFORD TITCHENER focused on the constituent elements of visual perceptions, whereas GESTALT PSYCHOLOGY has stressed the need to examine organized wholes, believing humans are disposed to identifying patterns. Visual objects tend to appear stable despite continually changing stimulus features (such as ambient light, perspective, ground vs. figure arrangement), which enables an observer to match a perceived object with the object as it is understood to exist. Perceptions may be influenced by expectations, needs, unconscious ideas, values, and conflicts.

Perceval Hero of ARTHURIAN LEGEND. His childlike innocence protected him from worldly temptation. In CHRÉTIEN de Troyes's 12th-century *Le Conte du Graal*, Perceval visits the castle of the wounded Fisher King and sees the GRAIL, but he fails to ask about it and therefore fails to heal the Fisher King. He subsequently sets out in search of the Grail and grows spiritually. In later Grail legend he was displaced by GALAHAD as the hero of the Grail quest but continued to play an important role. His story was told in WOLFRAM von Eschenbach's 13th-century *Parzifal*, which provided the basis for RICHARD WAGNER's opera *Parsifal* (1882).

Perceval \'pər-sə-vəl**, Spencer** (b. Nov. 1, 1762, London, Eng.—d. May 11, 1812, London) British prime minister (1809–12). He entered Parliament in 1796 and supported WILLIAM PITT's policy of war with France. He served as attorney general (1802–06) and as chancellor of the Exchequer (1807–09). As premier from 1809, he was noted as an efficient administrator but also for his opposition to religious tolerance. He was assassinated by a deranged man who had applied to him for redress of a complaint against the government.

perch Either of two species (family Percidae, order Perciformes) of popular food and sport fishes: the Eurasian common perch (*Perca fluviatilis*) or the North American yellow perch (*P. flavescens*). Some consider the two a single species. Both have one spiny and one soft-rayed dorsal fin. Perches are carnivores of quiet ponds, lakes, streams, and rivers. The common perch is greenish, with dark vertical bars on the sides and reddish in the lower fins. It grows to 6 lbs (3 kg), rarely more. The yellow perch, similar but yellower, grows to about 15 in. (40 cm) and weighs up to 2 lbs (1 kg); it is a popular game fish. See also SAUGER, SEA BASS, WALLEYE.

Percheron \'pər-chə-ˌrän\ Heavy breed of draft HORSE that originated in France's Perche region. The breed probably stems from the medieval Flemish "great horse," which was modified by Oriental and draft-type blood to produce animals for heavy farm work. Percherons became popular in the U.S. in the 1850s and influenced U.S. agriculture more than any other draft breed. They average 16–17 hands (64–68 in. [163–173 cm]) high and weigh 1,900–2,100 lb (860–950 kg). Common colours are black and gray. Agile and energetic for their size, they have a mild disposition.

percussion instrument A musical instrument that is struck (or sometimes shaken or scraped) to produce sound. This category includes instruments whose own hard substance is made to vibrate (idiophones) and instruments that include a tight membrane that vibrates (membranophones). Percussion instruments may produce tones of definite or indefinite pitch. Their primary function is often rhythmic, but many are used as melody instruments. They include the BELL, CARILLON, CYMBAL, DRUM, DULCIMER, GAMELAN, GLOCKENSPIEL, MARIMBA, PIANO, STEEL DRUM, TABLA, TAMBOURINE, TIMPANI, VIBRAPHONE, and XYLOPHONE.

Percy, John (b. March 23, 1817, Nottingham, Nottinghamshire, Eng.—d. June 19, 1889, London) British metallurgist. He turned to metallurgy after obtaining a medical degree, and in 1848 he devised a process for extracting silver from its ores, which soon came into widespread use. He improved the BESSEMER PROCESS for making steel, and he was the first to survey British iron ores. At London's Metropolitan School of Sciences, he trained a generation of metallurgists. His multivolume *Treatise on Metallurgy* (1861–80), though unfinished, quickly attained classic status.

Percy, Walker (b. May 28, 1916, Birmingham, Ala., U.S.—d. May 10, 1990, Covington, La.) U.S. novelist. He was orphaned in late childhood and was raised by a cousin in Mississippi. While working as a pathologist he contracted tuberculosis; during his recuperation he decided on a writing career and converted to Roman Catholicism. His first and best-known novel, *The Moviegoer* (1961), introduced his concept of malaise, a sense of spiritual emptiness characteristic of the rootless modern world. His other works, often about the search for faith and love in a New South transformed by industry and technology, include *Love in the Ruins* (1971), *The Second Coming* (1980), and *The Thanatos Syndrome* (1987).

© 2006 Encyclopædia Britannica, Inc.

peregrine falcon \'per-ə-grən\ *or* **duck hawk** FALCON species (*Falco peregrinus*) found worldwide but rare today because of bioaccumulation of pesticides. Peregrines are 13–19 in. (33–48 cm) long and gray above, with black-barred whitish underparts. They fly high and dive at tremendous speed (up to 175 mph, or 280 kph—the greatest speeds attained by any bird), striking with clenched talons and killing by impact. They usually nest in a scrape on a high cliff ledge near water, where bird prey is plentiful. Breeding programs have reintroduced the species into the wild and introduced it into urban areas, where it finds a cliff-like habitat among skyscrapers and preys chiefly on the rock dove (see PIGEON). Despite the programs' success, the species remains vulnerable.

Peregrine falcon (*Falco peregrinus*).
KENNETH W. FINK—ROOT RESOURCES

Pereira \pə-'rā-rä\ City (pop., 1999 est.: 381,725), west-central Colombia. It is in the western foothills of the Cordillera Central of the Andes Mountains above the CAUCA RIVER valley. Founded in 1863 on the former site of Cartago, it is a centre for coffee production and cattle raising and has some light manufacturing.

Perelman \'per-əl-mən**, S(idney) J(oseph)** (b. Feb. 1, 1904, Brooklyn, N.Y., U.S.—d. Oct. 17, 1979, New York, N.Y.) U.S. humorist. Perelman attended Brown University and soon began writing screenplays for early Marx Brothers films such as *Monkey Business* (1931) and *Horse Feathers* (1932). A master of wordplay, he regularly contributed essays to *The New Yorker*; many were collected in books such as *Westward Ha!* (1948) and *The Road to Miltown* (1957). He collaborated with KURT WEILL on the musical *One Touch of Venus* (1943). His later screenplays include *Around the World in 80 Days* (1956, Academy Award).

perennial Any plant that persists for several years, usually with new herbaceous growth from a part that survives from season to season. Trees and shrubs are perennial, as are some herbaceous flowers and vegetative ground covers. Perennials have only a limited flowering period, but with maintenance throughout the growing season, they provide a leafy presence and shape to the garden landscape. Popular flowering perennials include BELLFLOWERS, CHRYSANTHEMUMS, COLUMBINES, LOCKSPURS, HOLLYHOCKS, PHLOX, PINKS, POPPIES, and PRIMROSES. See also ANNUAL, BIENNIAL.

Peres \'per-es**, Shimon** *orig.* **Shimon Perski** (b. Aug. 16, 1923, Wołożyn, Pol.) Polish-born Israeli statesman. He immigrated to Palestine with his family in 1934 and joined the HAGANAH organization in 1947. After Israel achieved independence, he held a number of positions in the defense establishment (1948–65). In 1968 he helped establish the ISRAEL LABOUR PARTY. The indecisive 1984 election led to a power-sharing arrangement with LIKUD candidate YITZHAK SHAMIR, the two men alternating as prime minister. During Peres's tenure (1984–86), Israel withdrew from most of Lebanon. He was foreign minister under YITZHAK RABIN (1992–95); Peres, Rabin, and Palestinian leader YĀSIR ʿARAFĀT shared the 1994 Nobel Prize for Peace. Peres became prime minister again upon Rabin's assassination in 1995 but was narrowly defeated in his bid for reelection by Likud leader Benjamin Netanyahu in 1996. Although Peres declined to seek reelection as leader of the Labour Party in 1997, he later served as foreign minister (2001–02), deputy prime minister (2001–02), and vice prime minister (2005) in the national unity government led by Likud's ARIEL SHARON. In 2003 Peres resumed the chair of the Labour Party but was unexpectedly defeated in the party's leadership election in 2005. He subsequently left the Labour Party.

perestroika \ˌper-ə-'strȯi-kə\ *Russian* **"restructuring"** Program instituted in the Soviet Union by MIKHAIL GORBACHEV in the mid-1980s to restructure Soviet political and economic policy. Gorbachev proposed reducing the direct involvement of the Communist Party leadership in the country's governance and increasing the local governments' authority. Seeking to bring the Soviet Union up to economic par with capitalist countries such as Germany, Japan, and the U.S., he decentralized economic controls and encouraged enterprises to become self-financing. The economic bureaucracy, fearing loss of its power and privileges, obstructed much of his program.

Peretz \'per-ets**, I(saac) L(eib)** *or* **Yitskhok Leybush Perets** (b. May 18, 1852, or May 20, 1851, Zamość, Pol., Russian Empire—d. April 3, 1915, Warsaw) Polish writer. Peretz wrote prolifically, mostly in Yiddish, bringing to the language both a new expressive force and modernizing influences from western European art and literature. His tales of Hasidic lore (e.g., the Silent Souls series) are elegiac meditations on traditional values that draw material from the lives of impoverished eastern European Jews. Among his works are story collections, including *Folktales* (1908), the drama *The Golden Chain* (1909), and articles on many subjects to encourage Jews toward wider secular knowledge.

Pérez (Rodríguez), Carlos (Andrés) (b. Oct. 27, 1922, Rubio, Venez.) President of Venezuela (1974–79, 1989–93). He began his political career at age 18. A founder of Democratic Action, he was elected president in 1973 with the support of the liberal RÓMULO BETANCOURT. He nationalized the oil industry while retaining experienced foreign personnel to ensure efficiency, slowed production to conserve resources, stimulated small business and agriculture, and channeled petroleum income into hydroelectric projects, education programs, and steel mills. Reelected in 1989, Pérez promoted free-market economic reforms. After surviving two attempted coups, he was imprisoned in 1993 on charges of embezzlement and misuse of public funds.

Pérez de Cuéllar \'per-es-thā-'kwā-yär**, Javier** (b. Jan. 19, 1920, Lima, Peru) Fifth secretary-general of the UNITED NATIONS (1982–91). He joined the Peruvian foreign ministry in 1940 and its foreign service in 1944, serving in France, Britain, Bolivia, and Brazil. After serving as ambassador to Switzerland and as Peru's first ambassador to the Soviet Union, he was appointed the country's ambassador to the UN, a post he held until he was appointed secretary-general. As secretary-general he advocated the use of the UNITED NATIONS SECURITY COUNCIL for keeping the peace and as a forum for negotiation. In his second term, he negotiated the cease-fire that ended the IRAN-IRAQ WAR (1988). Pérez de Cuéllar later served as prime minister of Peru (2000–01).

Pérez Galdós \'pā-rāth-gäl-'dōs**, Benito** (b. May 10, 1843, Las Palmas, Canary Islands, Spain—d. Jan. 4, 1920, Madrid) Spanish novelist. In the 1870s he began a cycle of 46 short historical novels, *Episodios nacionales* (1873–1912), that earned him comparison with Honoré de BALZAC and CHARLES DICKENS. Some of his finest works chronicle contemporary Spain, including *The Disinherited Lady* (1881) and his masterpiece, *Fortunata y Jacinta* (1886–87), a study of two unhappily married women. His earlier works show a reforming zeal and anticlericalism, but after the 1880s he displayed greater sympathy for Spain and its idiosyncrasies, as in *Nazarín* (1895), *Compassion* (1897), and a series featuring the character Torquemada. He also wrote plays, some very popular but of less artistic value. He was regarded as Spain's greatest novelist since Miguel de CERVANTES.

Pérez Jiménez \'per-ez-hē-'men-ez**, Marcos** (b. April 25, 1914, Michelena, Venez.—d. Sept. 20, 2001, Madrid, Spain) Soldier and president of Venezuela (1953–58). He graduated from the Venezuelan Military Academy and in 1945 and 1948 participated in coups d'état. Appointed to the presidency by the military and elected in 1953 by the constituent assembly, which he controlled, he embarked on a program of vast public works. He and his associates received commissions on every project. His regime was marked by extravagance, corruption, police oppression, unemployment, and high inflation. He was forced out of office in 1958 and later jailed for embezzling government funds. His repeated attempts to reenter political life were thwarted.

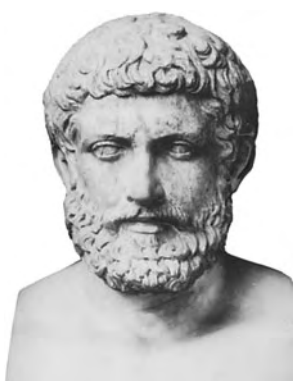
perfect gas *or* **ideal gas** Gas whose physical behaviour conforms to the general GAS LAW, which states that for a given quantity of gas, the product of the volume V and pressure P is proportional to the absolute temperature T, or $PV = kT$, where k is a constant. A perfect gas is assumed to consist of a large number of MOLECULES in random motion, which obey NEWTON'S LAWS OF MOTION. Their volume is assumed to be negligibly small, and no forces are presumed to act on the molecules except during momentary collisions. Though no gas has these properties, real gases at sufficiently high temperatures and low pressures can be described this way.

performance art Art form that arose in Europe and the U.S. in the 1960s. The term describes an art that is live but operates outside the traditional conventions of theatre or music. Early examples represented a challenge to orthodox art forms and cultural norms by creating an ephemeral art experience that could not be captured or purchased. By the 1970s performance art was used as a general term to describe a multitude of

© 2006 Encyclopædia Britannica, Inc.

activities, including happenings, body art, actions, events, and non-matrix theatre. Prominent performance artists have included Joseph Beuys, John Cage, Dennis Oppenheim, Yoko Ono, Nam June Paik, Meredith Monk, and Laurie Anderson.

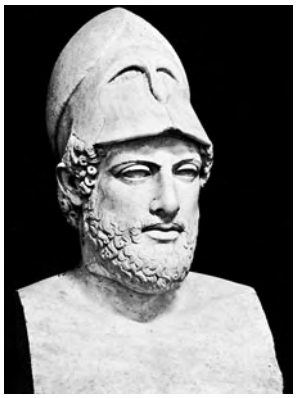
perfume Fluid preparation used for scenting, composed of natural essences or synthetics and a fixative. Perfumes are concocted by the artful blending of certain fragrant substances in appropriate proportions. The art of perfumery was apparently known to the ancient Chinese, Hindus, Egyptians, Israelites, Carthaginians, Arabs, Greeks, and Romans; references to perfumes are found in the Bible. Raw materials used in perfumery include natural products, of plant or animal origin, and synthetic materials. Fine perfumes may be blends of more than 100 ingredients.



perfume bottle Vessel made to hold scent. The earliest example is Egyptian and dates to c. 1000 BC. The fashion for perfume later spread to Greece, where terra-cotta and glass containers were made in a variety of shapes such as animals and human heads. Romans made perfume bottles out of molded and blown glass. The spread of Christianity marked a decline in perfume production, as well as of glassmaking. The revival of perfume making in France in the 12th century and the popularity of Venetian glass in the 13th century revived the production of perfume bottles.

Pergamum \'pər-gə-məm\ *Greek* **Pergamon** \'pər-gə-məs\ Ancient Greek city, western Anatolia, near the modern town of Bergama, Turkey. It existed from at least the 5th century BC but became important in the Hellenistic period when it was the residence of the Attalid dynasty and reached its height (263–133 BC). Then it was bequeathed to Rome. After the fall of Rome, it was ruled by the Byzantine Empire until it passed into Ottoman hands in the early 14th century AD. It is one of the most outstanding examples of city planning in antiquity, and its library was excelled only by that at Alexandria, Egypt. Excavations begun in 1878 by the German archaeologists unearthed many artistic treasures, including the great altar of Zeus, which are now housed in Berlin's Pergamon Museum.

pergola \'pər-gə-lə\ Garden walk or terrace typically formed by two rows of columns or posts roofed with an open framework of beams and cross rafters over which plants are trained. Its purpose is to provide a foundation on which climbing plants can be viewed and to give shade. Known in ancient Egypt, pergolas were a common feature of early Renaissance gardens in Italy and subsequently throughout Europe. They had a marked revival during the Arts and Crafts Movement in Britain. See also arbor.



Pergolesi \ˌpər-gə-'lā-zē**, Giovanni Battista** (b. Jan. 4, 1710, Jesi, Italy—d. March 16, 1736, Pozzuoli) Italian composer. In 1732 he was appointed chapel master to a Neapolitan prince. His comic opera *Lo frate 'nnamorato* (1732) was followed in 1733 by an opera seria, which had a comic intermezzo that became his best-known work, *La serva padrona*. His health failing, he moved into a Franciscan monastery (1736), where he wrote his famous *Stabat Mater* and *Salve Regina* before dying at age 26. Traveling opera troupes took up *La serva padrona*, and in 1752 the success of a Paris production set off the controversy known as the *guerre des bouffons* ("war of the buffoons"), with musical forgers vying to produce spurious works of Pergolesi, leaving some uncertainty about the authenticity of works attributed to him.

Periander \ˌper-ē-'an-dər\ (d. c. 587 BC) Second tyrant of Corinth (c. 627–587). He was the son of Cypselus, founder of the Cypselid dynasty. One of the most violent of the early Greek tyrants, he killed his wife and avenged the death of his son in Corcyra by sending 300 Corcyran boys to be castrated (they managed to escape). He treated the nobility harshly but built a strong, prosperous Corinthian economy. His extensive building program included construction of the Diolkos, a portage used to transport ships across the Isthmus of Corinth.

Periander, marble bust in the Vatican Museum, Rome
THE MANSELL COLLECTION

Pericles \'per-ə-ˌklēz\ (b. c. 495, Athens—d. 429 BC, Athens) Athenian general and statesman largely responsible for the full development of Athenian democracy and the Athenian empire. Related to the influential Alcmaeonid family, he was elected to power sometime after 461, and he quickly helped adopt essential democratic reforms. He asserted Athenian control over the Delian League and used the league's treasury to rebuild the Acropolis, which had been sacked by the Persians. His influential consort Aspasia bore him a son, who was legitimated when his legitimate sons died. In 447–446 Athens lost Megara, giving Sparta direct access to Attica. Though Athens and Sparta agreed on a Thirty Years' Peace (446–445), Pericles had the Long Walls from Athens to the port at Piraeus strengthened for protection. When war broke out in 431, he relied on the navy to keep the city supplied. Attica's population was brought inside the Long Walls, leaving the countryside open to Spartan pillaging. When plague broke out, killing one-fourth of the population, he was deposed and fined. He was reelected, but he too died of the plague. His great funeral oration (c. 430) remains one of the greatest defenses of democracy, and his era is remembered as the Golden Age of Athens.

ANDERSON-ALINARI FROM ART RESOURCE/EB INC.

peridot \'per-ə-ˌdät, 'per-ə-ˌdō\ *or* **precious olivine** \'ä-lə-ˌvēn\ Gem-quality, transparent green olivine. Very large crystals are found in Myanmar; peridots from the U.S. are seldom larger than two carats. Yellow-green peridot has been called chrysolite (Greek for "golden stone"); this term, used for various unrelated minerals, is now less common for the gemstone.

peridotite \pə-'ri-də-ˌtīt\ Coarse-grained, heavy, igneous rock that contains at least 10% olivine, other iron- and magnesium-rich minerals (generally pyroxenes), and not more than 10% feldspar. Peridotite is the ultimate source of all chromium ore and naturally occurring diamonds, and of nearly all chrysotile asbestos. Nearly all peridotite is more or less altered to serpentine; in warm, humid climates peridotite and serpentine have weathered to soils and related deposits that, though now worked on a relatively small scale, are potential sources of iron, nickel, cobalt, and chromium.

Périer \pār-'yā**, Casimir (-Pierre)** (b. Oct. 21, 1777, Grenoble, France—d. May 16, 1832, Paris) French statesman. Son of a financier, he cofounded a bank in 1801 and by 1814 was a leading banker in Paris. He was elected to the French Chamber of Deputies (1817), where he opposed Charles X. After the July Revolution of 1830 made Louis-Philippe king, Périer became premier (1831) and quickly restored civic order in France. Active in foreign affairs, he sent an army to defend Belgium against the Dutch (1831) and ordered the occupation of Ancona to check Austrian predominance in the Papal States (1832). His authoritarian approach brought attacks from both left and right and sometimes alienated the king.

Périgord \ˌpā-rē-'gȯr\ Historic and cultural region, southern France. The counts of Périgord played a part in the troubled affairs of Aquitaine, and control of Périgord was disputed by the French and the English from 1259. The area was transferred to the house of Albret in 1470. After it was inherited by the crown of Navarra, Henry IV united it with the French crown in 1607.

period In geology, the basic unit of the geologic time scale. During these spans of time, specific systems of rocks were formed. Originally, the method for defining the sequence of periods was relative; it was based on stratigraphy and paleontology. Carbon-14 dating and similar methods are now used to determine absolute ages for various periods.

periodic motion Motion that is repeated in equal intervals of time. The time of each interval is the period. Examples of periodic motion include a rocking chair, a bouncing ball, a vibrating guitar string, a swinging pendulum, and a water wave. See also simple harmonic motion.

periodic table Organized array of all the chemical elements in approximately increasing order of their atomic weight. The elements show a periodic recurrence of certain properties, first discovered in 1869 by Dmitry I. Mendeleyev. Those in the same column (group) of the table as usually

© 2006 Encyclopædia Britannica, Inc.

arranged have similar properties. In the 20th century, when the structure of ATOMS was understood, the table was seen to precisely reflect increasing order of ATOMIC NUMBER. Members of the same group in the table have the same number of ELECTRONS in the outermost shells of their atoms and form bonds of the same type, usually with the same VALENCE; the NOBLE GASES, with full outer shells, generally do not form bonds. The periodic table has thus greatly deepened understanding of BONDING and chemical behaviour. It also allowed the prediction of new elements, many of which were later discovered or synthesized. For an illustration of the periodic table, see chemical ELEMENT.

periodical Publication whose issues appear at fixed or regular intervals. Periodicals generally are considered to include NEWSPAPERS, which usually have large, unfastened pages and contents with considerable immediacy; and MAGAZINES, or journals, which have smaller pages, are usually fastened or bound, and often have more specialized, less time-dependent contents.

periodontitis \ˌper-ē-ə-ˌdän-ˈtī-təs\ INFLAMMATION of soft tissues around the teeth (see TOOTH). Poor dental hygiene leads to deposition of bacterial plaque on the teeth below the gum line, irritating and eroding nearby tissues. If it is not treated, the gum margin recedes, exposing the roots of the teeth. The process eventually involves the bone anchoring the teeth, which loosen and may fall out. Removal of all plaque deposits and affected soft tissues can arrest but not reverse bone deterioration.

periosteum \ˌper-ē-ˈäs-tē-əm\ Dense membrane over BONES. The outer layer contains nerve fibres and many blood vessels, which supply cells in the bone. The bone-producing cells of the inner layer are most prominent in fetal life and early childhood, when bone formation is at its peak. In adulthood they are less active but vital to continuous bone remodeling. When bone is injured, they multiply profusely to produce new bone.

periscope Optical instrument (see OPTICS) used in land and sea warfare, submarine NAVIGATION, and elsewhere to enable an observer to see the surroundings while remaining under cover, behind armour, or submerged. A periscope includes two mirrors or reflecting PRISMS to change the direction of the light coming from the scene observed: the first deflects it down through a vertical tube, the second diverts it horizontally so that the scene can be viewed conveniently.

peristalsis \ˌper-ə-ˈstȯl-səs\ Progressive wavelike MUSCLE contractions in the ESOPHAGUS, STOMACH, and intestines, and sometimes in the ureters and other hollow tubes. The waves can be short, local REFLEXES or long, continuous contractions along the length of the organ. In the esophagus, peristaltic waves push food into the stomach. In the stomach, they help mix stomach contents and propel food to the SMALL INTESTINE, where they expose food to the intestinal wall for absorption and move it forward. Peristalsis in the LARGE INTESTINE pushes waste toward the ANAL CANAL and is important in removing gas and dislodging potential bacterial colonies.

peritonitis \ˌper-ə-tᵊn-ˈī-təs\ INFLAMMATION of the peritoneum (see ABDOMINAL CAVITY), with pus accumulating between the parietal and the visceral peritoneum, abdominal pain and distension, vomiting, and fever. It may be acute or chronic, local or generalized. Acute peritonitis usually results from inflammation elsewhere (e.g., by spread of bacterial infection). Primary peritonitis often comes from a perforated gastrointestinal tract, as with rupture in appendicitis. Control of the source problem may be followed by remission, adhesions, or ABSCESSES (much rarer since the development of antibiotics).

periwinkle In botany, any of various plants of the genus *Vinca* of the DOGBANE FAMILY. The lesser periwinkle (*V. minor*), which has small lilac-blue flowers, is a dependable, trailing, evergreen perennial that is native to Europe and has become widespread over much of eastern North America. The greater periwinkle (*V. major*), with larger leaves and larger purplish-blue flowers, is native to continental Europe and has become naturalized in England. ALKALOIDS derived from the periwinkle plant have had some success in inhibiting cancer growth.

periwinkle In zoology, any of some 80 species (family Littorinidae) of widely distributed, chiefly herbivorous shore SNAILS. Periwinkles are usually found on rocks, stones, or pilings between high- and low-tide marks. The common periwinkle (*Littorina littorea*), the largest northern species, may grow to 1.5 in. (4 cm) long. It is usually dark gray and has a solid spiral shell. Introduced into North America c. 1857, it is now common on Atlantic coasts. All periwinkle species are a favourite food of many shorebirds. See photograph above.

Periwinkles (*Littorina*)
JANE BURTON—BRUCE COLEMAN LTD.

Periyar \ˌper-i-ˈyär\ **River** River, central KERALA state, southwestern India. It is 140 mi (225 km) long and rises in the Western GHATS range near the border with TAMIL NADU state. It flows north to Periyar Lake, an artificial reservoir created by damming the river. A tunnel carries water from the lake eastward through the mountains to the Vaigai River, where it is used for irrigation. From the lake it flows northwest and empties into the Arabian Sea.

perjury In law, act or crime of knowingly making a false statement while under oath. The statement must be material to the issue of inquiry. Perjuries that have the effect of obstructing the adjudication of a case may be given increased punishment for that reason. A person who makes a false statement and later corrects it is usually not considered to have committed perjury.

Perkins, Anthony (b. April 4, 1932, New York, N.Y., U.S.—d. Sept. 12, 1992, Hollywood, Calif.) U.S. film actor. He was the son of the actor Osgood Perkins, and he studied at Columbia University. After making his screen debut in *The Actress* (1953), he appeared in films such as *Friendly Persuasion* (1956) and *Fear Strikes Out* (1957), but he was best known as the murderous motel owner Norman Bates in ALFRED HITCHCOCK's *Psycho* (1960). He later appeared in several films in Europe, including *The Trial* (1963), *The Champagne Murders* (1967), and *Ten Days' Wonder* (1972), and in U.S. films such as *Pretty Poison* (1968), *Catch-22* (1970), and *WUSA* (1970). He reprised his role as Norman Bates in three sequels (1983, 1986, and 1990).

Perkins, Frances *orig.* **Fannie Coralie Perkins** (b. April 10, 1882, Boston, Mass., U.S.—d. May 14, 1965, New York, N.Y.) U.S. public official. She became a social worker in New York City and a leader in organizations aiming to improve working conditions for women. From 1929 to 1933 she served as state industrial commissioner under New York Gov. FRANKLIN D. ROOSEVELT. As president, Roosevelt appointed her U.S. secretary of labor; she thereby became the first woman to hold a U.S. cabinet post. In her long term of office (1933–45) she advocated reforms such as a MINIMUM WAGE, a maximum workweek, and unemployment compensation; she also helped draft the SOCIAL SECURITY ACT and supervised the Fair Labor Standards Act (1938). She was later a U.S. Civil Service commissioner (1945–53).

Perkins, Jacob (b. July 9, 1766, Newburyport, Mass., U.S.—d. July 30, 1849, London, Eng.) U.S. inventor. He built a machine to cut and head NAILS in one operation c. 1790. He developed a method of engraving paper money that made counterfeiting difficult; lack of interest in the U.S. led him to set up a bank-note factory in England (1819). He experimented with high-pressure steam BOILERS, built a horizontal STEAM ENGINE (1827), designed an improved paddle wheel (1829), and invented a means for the free circulation of water in boilers (1831) that led to the design of modern water-tube boilers.

Perkins, Maxwell (Evarts) (b. Sept. 20, 1884, New York, N.Y., U.S.—d. June 17, 1947, Stamford, Conn.) U.S. editor. He worked as a reporter for *The New York Times* before joining the publishing firm of Charles Scribner's Sons, of which he later became editorial director and vice president. He is best known for the intensive editorial work that shaped THOMAS WOLFE's sprawling manuscripts into publishable form, but he also assisted the early careers of F. SCOTT FITZGERALD, ERNEST HEMINGWAY, RING LARDNER, ERSKINE CALDWELL, EDMUND WILSON, and ALAN PATON.

Perl *in full* **Practical Extraction and Reporting Language.** High-level computer PROGRAMMING LANGUAGE, the most popular language for writing CGI scripts and the premier scripting (or interpreted) language of the WORLD WIDE WEB. Since it has roots in UNIX, its syntax is similar to C and it includes several UNIX utilities. Because of its excellent text-processing capability, it is widely used by system administrators (for writing administrative tasks) and is especially suited for developing prototype versions of programs. Because it is an interpreted language, its programs are highly portable across different operating systems. Originally developed by Larry Wall at NASA's Jet Propulsion Laboratory in 1986, it has since been improved by hundreds of volunteer developers. Like LINUX, it can be obtained free of charge.

© 2006 Encyclopædia Britannica, Inc.

perlite *or* **pearlstone** Natural glass with concentric cracks such that the rock breaks into small, pearl-like bodies. It is formed by the rapid cooling of viscous LAVA or MAGMA. Perlite is porous and has a waxy to pearly lustre and is commonly gray or greenish but may be brown, blue, or red. Since c. 1950, large deposits have been worked in New Mexico, Nevada, California, and other western states. Heat-treated perlite is a substitute for sand in lightweight wall plaster and concrete aggregate. Perlite is used for heat and sound insulation, lightweight ceramic products, and filters.

Perlman, Itzhak (b. Aug. 31, 1945, Tel Aviv, Palestine) Israeli-born U.S. violinist. Despite a bout with polio at age four that left his legs paralyzed, he was a prodigy, and he made his U.S. television debut at age 13. He studied with Ivan Galamian and Dorothy DeLay at Juilliard. Recognition of his gifts led to a highly successful career as orchestral soloist and chamber-music player, with scores of recordings. Blessed with a popular touch, he appeared on television, played JAZZ and KLEZMER MUSIC, and involved himself in educating young musicians.

permafrost Perennially frozen earth, with a temperature below 32 °F (0 °C) continuously for two years or more. Permafrost is estimated to underlie 20% of the Earth's land surface and reaches depths of 5,000 ft (1,500 m) in northern Siberia. It occurs in 85% of Alaska, more than half of Russia and Canada, and probably all of Antarctica. Permafrost has a significant effect on plant and animal life, and it presents special problems in engineering projects. All land use in permafrost environments must take into account the terrain's special sensitivity; if the delicate natural balance is not maintained, extensive degradation and ecological damage may result.

permeability, magnetic See MAGNETIC PERMEABILITY

Permian Period Interval of geologic time, 290–248 million years ago. The last of the six periods of the PALEOZOIC ERA, it follows the CARBONIFEROUS PERIOD. During the Permian, the continents joined to form a single supercontinent, PANGEA. Hot, dry conditions prevailed almost everywhere, and deserts were widespread. Life evolved as a continuation of established lines. Marine invertebrates evolved into several lineages. Marine and freshwater fish and amphibians thrived. Reptiles evolved into three distinct groups: the cotylosaurs, the pelycosaurs, and the therapsids. Land plants evolved from ferns and seed ferns to conifers and adapted to drier and well-drained land conditions. Toward the close of the Permian, many forms of life suffered mass extinction, whose causes are unknown.

permutations and combinations Number of ways a subset of objects can be selected from a given set of objects. In a permutation, order is important; in a combination, it is not. Thus, there are six permutations of the letters A, B, C selected two at a time (AB, AC, BC, BA, CA, CB) yet only three combinations (AB, AC, BC). The number of permutations of r objects chosen from a set of n objects, expressed in FACTORIAL notation, is $n! \div (n - r)!$ The number of combinations is $n! \div [r!(n - r)!]$. The $(r + 1)$st coefficient in the binomial expansion of $(x + y)^n$ coincides with the combination of n objects chosen r at a time (see BINOMIAL THEOREM). PROBABILITY THEORY evolved from the study of gambling, including figuring out combinations of playing cards or permutations of win-place-show possibilities in a horse race, and such counting methods played an important role in its development in the 17th century.

Pernambuco See RECIFE

pernicious anemia Slow-developing disease in which vitamin B_{12} (see VITAMIN B COMPLEX) deficiency impairs red-blood-cell production. It can result from a diet lacking in vitamin B_{12} or when intrinsic factor, a substance needed for intestinal absorption of B_{12}, either is not produced by stomach cells or cannot bind to the vitamin. It causes weakness, waxy pallor, shiny tongue, and stomach, intestinal, and neurological problems. Its slow development can allow ANEMIA to become very severe by the time of diagnosis. Monthly B_{12} injections into muscle soon reverses the anemia, but the injections must be continued for life.

Perón \pā-'rōn**, Eva (Duarte de)** *known as* **Evita** *orig.* **María Eva Duarte** (b. May 7, 1919, Los Toldos, Arg.—d. July 26, 1952, Buenos Aires) Second wife of Argentine president JUAN PERÓN and a powerful though unofficial political leader. Born into poverty, she was an actress when she married Perón. She was instrumental in the success of his first presidential campaign and won the adulation of the masses. Evita acted as de facto minister of health and labour, awarding generous wage increases to workers. With "voluntary" contributions from businesses, labour unions, and the elite, she established thousands of hospitals, schools, and orphanages. After her death from cancer at age 33, her grief-stricken working-class followers sought to have her canonized.

Perón, Isabel (Martínez de) *orig.* **María Estela Martínez Cartas** (b. Feb. 4, 1931, La Rioja, Arg.) Third wife of JUAN PERÓN and president of Argentina (1974–76). Born into a lower-middle-class family, she was a dancer when she met Perón in 1955 or 1956. They married during his exile in 1961, and she became his running mate in the 1973 presidential election. She succeeded him when he died in 1974, inheriting problems of inflation and political violence, which she tried—ineffectively—to solve by printing money and imposing a state of siege. She was deposed in 1976; after five years of house arrest, she was convicted of corruption but permitted to go into exile in Spain.

Perón, Juan (Domingo) (b. Oct. 8, 1895, Buenos Aires province, Arg.—d. July 1, 1974, Buenos Aires) President of Argentina (1946–55, 1973–74). After attending military school, he served in the 1930s in Italy, where he observed the successes of the Fascists. In 1943 he helped overthrow Argentina's ineffective civilian government. As secretary of labour and social welfare, he built a loyal following among industrial workers, who helped elect him president in 1946. Perón's political views drew on both the far left and the far right: while he showered workers with much-needed benefits, he restricted civil liberties severely. The charisma of his second wife, EVA PERÓN, greatly increased the regime's standing with the populace. He was reelected in 1951, but a disastrous economic decline and increasing disaffection among many elements of Argentine society led to his overthrow in 1955 by democratically inspired military officers. He lived in exile in Spain for two decades but continued to influence Argentine affairs. When the PERONIST party was made legal, he was reelected president in absentia; he died less than a year after returning to Argentina and assuming the presidency. See also ISABEL PERÓN.

Peronist \pə-'rō-nist\ Member of Argentina's Justicialist Nationalist Movement, a supporter of JUAN PERÓN, or an adherent of his populist and nationalist policies. Perón's poorly defined political philosophy embraced elements of both left- and right-wing ideology, combining a commitment to the redistribution of wealth with authoritarian nationalism and disregard for civil rights. After his death in 1974, the Justicialist movement was weakened by factionalism, but it continued to play an important role in Argentine politics and had adherents elsewhere. See also CARLOS MENEM.

Perot \pə-'rō**, H(enry) Ross** (b. June 27, 1930, Texarkana, Texas, U.S.) U.S. businessman. After graduating from the U.S. Naval Academy, he served in the navy (1953–57). He worked for IBM from 1957 to 1962, when he formed his own company, Electronic Data Systems; he sold it in 1984 to General Motors for $2.5 billion. In 1992 he became an independent candidate for U.S. president. Appealing to voters dissatisfied with traditional party politics, he won 19% of the popular vote, the best third-party presidential showing since 1912. He ran again in 1996 but received only 8% of the vote. His Reform Party, which he founded in 1995, gradually established its autonomy from him.

peroxide Any of a class of chemical compounds in which two OXYGEN atoms are linked by a single COVALENT BOND. Several organic (see ORGANIC COMPOUND) and inorganic (see INORGANIC COMPOUND) peroxides are useful as bleaching and oxidizing agents (see OXIDATION-REDUCTION), as initiators of POLYMERIZATION reactions, and in the preparation of hydrogen peroxide (a mild bleach and antiseptic) and other oxygen compounds. The peroxide ANION (chemical formula O_2^{2-}) is present in peroxides of inorganic compounds.

Perpendicular style Phase of late GOTHIC ARCHITECTURE in England roughly parallel in time to the French FLAMBOYANT STYLE. The style, concerned with creating rich visual effects through decoration, was characterized by a predominance of vertical lines in stone window TRACERY, enlargement of windows to great proportions, and conversion of the interior stories into a single unified vertical expanse. Fan VAULTS, springing from slender columns or PENDANTS, became popular. The oldest surviving example of the style is probably the choir of Gloucester Cathedral (begun c. 1335). Other major monuments include King's College Chapel, Cambridge (1446–1515), and the chapel of Henry VII in WESTMINSTER ABBEY. In the 16th century, the grafting of Renaissance elements onto the Perpendicular style resulted in the TUDOR STYLE.

Perpignan \ˌper-pē-'nyäⁿ\ City (pop., 1999: 105,115), southern France. Located just north of the Spanish border, Perpignan was founded c. 10th

© 2006 Encyclopædia Britannica, Inc.

century. It was the capital of Roussillon in the 12th century and of the kingdom of Majorca from 1276 to 1344. The city was heavily fortified during the struggle between France and Spain for the area; it became French in 1659. It is now a market centre for the surrounding agricultural area; its many medieval buildings have made tourism economically important.

Perrault \pe-'rō**, Charles** (b. Jan. 12, 1628, Paris, France—d. May 15/16, 1703, Paris) French poet, prose writer, and storyteller. Perrault began to win a literary reputation c. 1660 with light verse and love poetry. He is best remembered for his collection of charming fairy stories written to amuse his children, *Contes de ma mère l'oye,* or *Tales of Mother Goose* (1697; see Mother Goose). He spent the rest of his life promoting the study of literature and the arts. A leading member of the Académie Française, he was involved in a famous controversy with Nicholas Boileau on the relative merits of ancient and modern literature; his support for the modern was of landmark significance in the revolt against the constraints of prevailing tradition.

Perrot \pe-'rō**, Jules (-Joseph)** (b. Aug. 18, 1810, Lyon, Fr.—d. Aug. 24, 1892, Paramé) French dancer and choreographer. After studying with Auguste Vestris, he debuted at the Paris Opéra in 1830. He often partnered Marie Taglioni until 1835, when he left the company to tour in Europe. He choreographed several ballets for Carlotta Grisi, probably including the famous solos in *Giselle*. As dancer and ballet master in London (1842–48) and St. Petersburg (1848–58), he choreographed many important Romantic ballets with an expressive, dramatic style. In his later years he gave classes at the Paris Opéra.

Perry, Matthew C(albraith) (b. April 10, 1794, South Kingston, R.I., U.S.—d. March 4, 1858, New York, N.Y.) U.S. naval officer. He followed his brother Oliver Perry into the navy and commanded the first U.S. navy steamship, the *Fulton* (1837–40). He led naval forces in the Mexican War and assisted Winfield Scott at Veracruz. In 1852 Pres. Millard Fillmore sent Perry to head a naval expedition to induce Japan to establish diplomatic relations with the U.S. Concluding that the country's centuries-old policy of isolation would be ended only by a show of force, Perry led four ships into the fortified harbour of Uraga (1853) and convinced the Japanese to accept his message. In 1854 he entered Edo (now Tokyo) Bay with nine ships and concluded the first treaty between Japan and the U.S., which granted the U.S. trading privileges and opened the Far East to U.S. influence.

Perry, Oliver Hazard (b. Aug. 20, 1785, South Kingston, R.I., U.S.—d. Aug. 23, 1819, at sea) U.S. naval officer. The older brother of Matthew Perry, he entered the navy in 1799 and served in the West Indies and the Mediterranean. In 1813 he was ordered to Erie, Pa., to assemble a naval squadron to challenge British control of the Great Lakes in the War of 1812. With 10 small ships, he engaged six British warships in Lake Erie (Sept. 10, 1813). After his flagship was disabled, he was rowed to the *Niagara*, from which he won the battle by sailing directly into the British line, firing broadside. In reporting the British surrender he wrote, "We have met the enemy and they are ours."

Perse, Saint-John See Saint-John Perse

Persephone \pər-'se-fə-nē\ *Latin* **Proserpina** In Greek mythology, daughter of Zeus and Demeter. She was gathering flowers when she was seized by Hades, who carried her off to the underworld to make her his wife. On learning of the abduction, Demeter was so distraught that she allowed barrenness and famine to spread over the earth. Zeus commanded Hades to allow Persephone to return to her mother, but because she had eaten some (or, in some versions, just one) pomegranate seeds in the underworld, she had to remain one-third of the year with Hades, spending the other two-thirds with Demeter. This myth accounts for the change of the seasons and the annual cycle of growth and decay.

Persephone abducted by Hades, marble sculpture by Gian Lorenzo Bernini, 1621–22; in the Borghese Gallery, Rome
ANDERSON—ALINARI FROM ART RESOURCE/EB INC.

Persepolis \pər-'se-pə-ləs\ Ancient Persian city, northeast of modern Shīrāz, Iran. It was built in a remote and mountainous area during the reign of Darius I, who made it the capital of Persia, replacing Pasargadae. In 330 BC Alexander the Great plundered the city and burned the palace of Xerxes I. The city's ruins cover an extensive area and comprise a number of colossal buildings, including palaces of early Persian kings, a great staircase, an audience hall, and a treasury.

Perseus (b. c. 212—d. c. 165 BC, Alba Fucens, near Rome) Last king of Macedonia (r. 179–168). Son of Philip V, he fought against Rome (199) and Aetolia (189). He persuaded the king to execute his brother Demetrius. As king he extended his influence in neighbouring states and tried to gain the trust of the Greek world, but he alarmed Greece by visiting Delphi with an army. Eumenes II of Pergamum informed Rome of Perseus's allegedly aggressive designs, provoking the Third Macedonian War (171–168). The struggle ended in a final defeat of the Macedonians by the Romans, ending the monarchy, and Perseus spent the rest of his life in captivity.

Perseus In Greek mythology, the slayer of the Gorgon Medusa. He was the son of Zeus and Danaë. His grandfather had him thrown into the sea in a chest with his mother as an infant because of a prophecy that Perseus would kill him. Perseus and his mother survived, and as a young man Perseus set out to gain the head of Medusa. On his way home he rescued the Ethiopian princess Andromeda from a sea monster, and she became his wife. When he took his mother back to her native Argos, he threw a discus that accidentally killed his grandfather, thus fulfilling the prophecy.

Pershing \'pər-zhiŋ, 'pər-shiŋ**, John J(oseph)** (b. Sept. 13, 1860, Laclede, Mo., U.S.—d. July 15, 1948, Washington, D.C.) U.S. army officer. He graduated from West Point and served on the western frontier (1886–98), in the Spanish-American War, in the Philippines (1899–1903, 1906–13), and as commander of a punitive raid against Pancho Villa (1916). During World War I he was appointed commander in chief of the American Expeditionary Force (AEF). He maintained the AEF as an independent army of two million men and resisted Allied efforts to use U.S. forces as replacement units for French and British troops. He led the successful assault of the St. Mihiel salient in September 1918 and helped defeat German forces in the Meuse-Argonne offensive. He was promoted to general of the armies in 1919 and was army chief of staff from 1921 to 1924. His nickname, "Black Jack," derived from his service with an African American regiment early in his career (see buffalo soldier). His memoirs, *My Experiences in the World War* (1931), won a Pulitzer Prize.

John J. Pershing, 1917.

Persia Historical name for a region roughly coterminous with modern Iran. The term was used for centuries, chiefly in the West, and originally described a region of southern Iran formerly known as Persis or Parsa. Parsa was the name of an Indo-European nomadic people who migrated into the area c. 1000 BC; the use of the name was gradually extended by the ancient Greeks and other Western peoples to apply to the whole Iranian plateau. The people of Iran have always called their country Iran, and in 1935 the government requested that the name Iran be used instead of Persia.

Persian cat Breed of stocky, round-headed DOMESTIC CAT that has a long, silky coat (many colours possible), large round eyes, snub nose, and thick ruff. The breed is often referred to as the LONGHAIR.

Persian Gulf Arm of the ARABIAN SEA. It is about 615 mi (990 km) long and rarely exceeds a depth of 300 ft (90 m). It is connected with the Gulf of OMAN and the Arabian Sea through the Strait of HORMUZ. It contains the island kingdom of Bahrain and is bordered by Iran, the United Arab Emirates, Oman, Saudi Arabia, Qatar, Kuwait, and Iraq. It has long been a maritime trade route between the Middle East and South Asia; its modern economy is dominated by petroleum production.

Persian Gulf War, First *or* **Gulf War** (1990–91) International conflict triggered by Iraq's invasion of Kuwait in August 1990. Though justified by Iraqi leader ṢADDĀM ḤUSSEIN on grounds that Kuwait was historically part of Iraq, the invasion was presumed to be motivated by Iraq's desire to acquire Kuwait's rich oil fields and expand its power in the region. The United States, fearing Iraq's broader strategic intentions and acting under UN auspices, eventually formed a broad coalition, which included a number of Arab countries, and began massing troops in northern Saudi Arabia. When Iraq ignored a UN Security Council deadline for it to withdraw from Kuwait, the coalition began a large-scale air offensive (Jan. 16–17, 1991). Ṣaddām responded by launching ballistic missiles against neighbouring coalition states as well as Israel. A ground offensive by the coalition (February 24–28) quickly achieved victory. Estimates of Iraqi military deaths range up to 100,000; coalition forces lost about 300 troops. The war also caused extensive damage to the region's environment. The Iraqi regime subsequently faced widespread popular uprisings, which it brutally suppressed. A UN trade embargo remained in effect after the end of the conflict, pending Iraq's compliance with the terms of the armistice. The foremost term was that Iraq destroy its nuclear-, biological-, and chemical-weapons programs. The embargo continued into the 21st century and ceased only after the Second PERSIAN GULF WAR.

Persian Gulf War, Second (2003) International conflict that took place between Iraq and a combined force of troops from the United States and Great Britain, with smaller contingents from several other countries. The trade embargo and weapons-inspection process that the UN imposed on Iraq following the First PERSIAN GULF WAR (1990–91) had partly fallen into abeyance by 2001. U.S. Pres. George W. Bush argued that the SEPTEMBER 11 ATTACKS on the U.S. in that same year highlighted the threat to U.S. security posed by hostile countries such as Iraq. Encouraged by Bush and British Prime Minister Tony Blair, the UN issued Security Council Resolution 1441 in November 2002, demanding that Iraq readmit weapons inspectors and comply with all previous resolutions. Although Iraqi did readmit inspectors, Bush and Blair declared in early 2003 (despite objections by many world leaders) that Iraq was continuing to hinder UN inspections and that it still retained proscribed weapons. On March 20, seeking no further UN resolutions, the U.S. and Britain (with token representation from other countries) launched a series of air attacks on Iraq, and a ground invasion followed. Iraqi military and paramilitary forces were rapidly defeated; on April 9 U.S. forces took control of the capital, BAGHDAD, and British forces completed their occupation of the southern city of Al-BAṢRAH the same day. Within a few more days, all major cities had fallen, and by May 1 major combat operations had been completed. Guerrilla assaults on occupying forces continued thereafter, hindering Iraq's recovery.

Persian language *or* **Farsi language** IRANIAN LANGUAGE spoken by more than 25 million people in Iran as a first language, and by millions more as a second. Modern Persian is a KOINE developed from southwestern dialects in the 7th–9th centuries, after the introduction of Islam brought a massive infusion of loanwords from ARABIC. Its standardization and literary cultivation took place in northeastern Persia and Central Asia in the 11th–12th centuries. Polities outside Persia itself (e.g., Mughal India, Ottoman Turkey) have at times been major literary centres. Its status in those countries led to a very strong Persian influence on URDU and Ottoman TURKISH. Other TURKIC and INDO-ARYAN languages, CAUCASIAN LANGUAGES, and Iranian languages have also borrowed heavily from Persian. It is written in a slightly modified form of the ARABIC ALPHABET.

Persian Wars *or* **Greco-Persian Wars** (492–449 BC) Series of wars between Greek states and Persia, particularly two invasions of Greece by Persia (490, 480–479). When DARIUS I came to power in Persia in 522, the Ionian Greek city-states in Anatolia were under Persian control. They rose up unsuccessfully in the IONIAN REVOLT (499–494). The support lent by Athens provoked Darius to invade Greece (492). His fleet was destroyed in a storm. In 490 he assembled a huge army on a plain near Athens; his devastating defeat at the Battle of MARATHON sent him back to Persia. In 480 the Persians under XERXES I again invaded Greece, seeking to avenge the defeat. This time all Greece fought together, with Sparta in charge of the army and Athens of the navy. A band of Spartans under LEONIDAS was overcome at the Battle of THERMOPYLAE, allowing the Persian army to reach Athens, which they sacked (480). When the Persian navy was soundly defeated at the Battle of SALAMIS, Xerxes withdrew it to Persia. His army was defeated at the Battle of PLATAEA in 479 and driven from Greece, and the navy met a similar fate at Mycale on the Anatolian coast. Sporadic fighting went on for 30 more years, during which Athens formed the DELIAN LEAGUE to free the Ionians. The Peace of Callias (449) ended the hostilities.

persimmon Either of two trees of the genus *Diospyros* in the EBONY family, and their globular, edible fruits. The native American persimmon (*D. virginiana*), a small tree with dark-red to maroon fruits that contain several large, flattened seeds, grows from the Gulf states north to central Pennsylvania and central Illinois. The Oriental persimmon (*D. kaki*), grown extensively in China and Japan, has larger, more astringent, yellow to red fruit. Good sources of vitamins A and C, persimmons are eaten fresh or stewed or cooked as jam.

American persimmon (*Diospyros virginiana*).

personal computer (PC) MICROCOMPUTER designed for use by one person at a time. A typical PC assemblage comprises a CPU; internal MEMORY consisting of RAM and ROM; data storage devices (including a HARD DISC, a FLOPPY DISC, or CD-ROM); and input/output devices (including a display screen, keyboard, MOUSE, and PRINTER). The PC industry began in 1977 when APPLE COMPUTER introduced the Apple II. Radio Shack and Commodore Business Machines also introduced PCs that year. IBM entered the PC market in 1981. The IBM PC, with increased memory capacity and backed by IBM's large sales organization, quickly became the industry standard. Apple's Macintosh (1984) was particularly useful for DESKTOP PUBLISHING. MICROSOFT CORP. introduced MS WINDOWS (1985), a GRAPHICAL USER INTERFACE that gave PCs many of the capabilities of the Macintosh, initially as an overlay of MS-DOS. Windows went on to replace MS-DOS as the dominant OPERATING SYSTEM for personal computers. Uses of PCs multiplied as the machines became more powerful and application SOFTWARE proliferated. Today, PCs are used for WORD PROCESSING, INTERNET access, and many other daily tasks.

personal-liberty laws Laws passed by U.S. states in the North to counter the FUGITIVE SLAVE ACTS. Such states as Indiana (1824) and Connecticut (1828) enacted laws giving escaped slaves the right to jury trials on appeal. Vermont and New York (1840) assured fugitives the right of jury trial and provided them with attorneys. Other states forbade state authorities to capture and return fugitives. After the COMPROMISE OF 1850, most Northern states enacted further guarantees of jury trials and punishment for illegal seizure. These laws were cited by proslavery interests as assaults on states' rights and as justification for SECESSION.

personal property See REAL AND PERSONAL PROPERTY

personalismo *Spanish* **"personalism"** In Latin America, the practice of glorifying a leader. It often involves sacrificing the interests of political parties, ideologies, and constitutional government out of loyalty

© 2006 Encyclopædia Britannica, Inc.

to a leader. Political parties throughout Latin America have often consisted of the personal following of a single individual, a fact reflected in the popular terms for the partisans. Members of Argentina's Justicialist National Movement, for example, are called *peronistas* (Peronists), for its charismatic founder, Argentine president Juan Perón, and the followers of Cuban leader Fidel Castro are *fidelistas*. See also caudillo.

personality Totality of an individual's behavioral and emotional characteristics. Personality embraces a person's moods, attitudes, opinions, motivations, and style of thinking, perceiving, speaking, and acting. It is part of what makes each individual distinct. Theories of personality have existed in most cultures and throughout most of recorded history. The ancient Greeks used their ideas about physiology to account for differences and similarities in temperament. In the 18th century Immanuel Kant, Charles-Louis Montesquieu, and Giambattista Vico proposed ways of understanding individual and group differences; in the early 20th century Ernst Kretschmer and the psychoanalysts Sigmund Freud, Alfred Adler, and Carl Jung offered competing personality theories. Freud's model rested on the power of psychosexual drives as mediated by the structural components of the id, ego, and superego and the interplay of conscious and unconscious motives. Particularly important was the array of defense mechanisms an individual employed. Jung, like Freud, emphasized unconscious motives but de-emphasized sexuality and advanced a typal theory that classified people as introverts and extraverts; he further claimed that an individual personality was a persona (i.e., social facade) drawn from the "collective unconscious," a pool of inherited memories. Later theories by Erik H. Erikson, Gordon W. Allport, and Carl R. Rogers were also influential. Contemporary personality studies tend to be empirical (based on the administration of projective tests or personality inventories) and less theoretically sweeping and tend to emphasize personal identity and development. Personality traits are usually seen as the product of both genetic predisposition and experience. See also personality disorder; psychological testing.

personality disorder Mental disorder that is marked by deeply ingrained and lasting patterns of inflexible, maladaptive, or antisocial behaviour to the degree that an individual's social or occupational functioning is impaired. Rather than being illnesses, personality disorders are enduring and pervasive features of the personality that deviate markedly from the cultural norm. They include the dependent, histrionic, narcissistic, obsessive-compulsive, antisocial, avoidant, borderline (unstable), paranoid, and schizoid types. The causes appear to be both hereditary and environmental. The most effective treatment combines behavioral and psychotherapeutic therapies (see behaviour therapy; psychotherapy).

personnel administration See industrial relations

perspective Depiction of three-dimensional objects and spatial relationships on a two-dimensional plane. In Western art, illusions of volume and space are generally created by use of the linear perspective system, based on the observation that objects appear to shrink and parallel lines to converge at an infinitely distant vanishing point as they recede in space from the viewer. The vanishing point may have been known to the Greeks and Romans but had been lost until Filippo Brunelleschi rediscovered the principles of linear or "mathematical" perspective early in the 15th century. Linear perspective dominated Western painting until the late 19th century, when Paul Cézanne flattened the conventional picture plane. The Cubists and other 20th-century painters abandoned depiction of three-dimensional space altogether. See also aerial perspective.

Perspex See Lucite

perspiration Fluid given off by the skin as vapour by simple evaporation or as sweat actively secreted from sweat glands to evaporate and cool the body. When the body temperature rises, the sympathetic nervous system stimulates eccrine sweat glands to secrete water to the skin surface, where it cools the body by evaporation. Human eccrine sweat is essentially a dilute solution of sodium chloride with trace amounts of other plasma electrolytes. In extreme conditions, human beings may excrete several litres of such sweat in an hour.

Perth City (pop., 2004 est.: 1,457,639), capital of Western Australia state, Australia. Located on the Swan River 10 mi (16 km) from its mouth, Perth was settled in 1829. It developed rapidly after the discovery of goldfields around Kalgoonie in the early 1890s and the opening of Fremantle Harbour in 1897. It is now a major industrial centre with a rapidly expanding economy. The site of the 1987 America's Cup, it is the seat of the University of Western Australia and Murdoch University.

Perth City (pop., 1995 est.: 42,000), central Scotland. Located on the River Tay, northwest of Edinburgh, Perth was a Roman settlement; it became a royal burgh in 1210. It was the capital of Scotland until 1437, when King James I of Scotland was murdered there. At the Church of St. John the Baptist in 1559, John Knox denounced idolatry; the result was the plunder of Perth's monasteries and altars. It was a Jacobite city during the Scottish uprisings of 1715 and 1745. The economy is based on whisky blending and distilling and on manufacturing. It is also an agricultural market centre.

pertussis See whooping cough

Peru *officially* **Republic of Peru** Country, western South America. Area: 496,225 sq mi (1,285,216 sq km). Population (2005 est.): 27,968,000. Capital: Lima. Almost half of the people are Quechua Indians,

nearly one-third are mestizos, and most of the remainder are Aymara Indians and people of European ancestry. Languages: Spanish, Quechua, Aymara (all official). Religion: Christianity (predominantly Roman Catholic [official]; also Protestant). Currency: new sol. Peru is the third largest country in South America and may be divided into three geographic regions from west to east: the coast, which consists of a long, narrow belt of desert lowlands; the Sierra (highlands), which is the Peruvian portion of the Andes Mountains; and the Montaña, the vast, forested eastern foothills and plains, consisting mainly of the tropical rainforests of the Amazon River basin. Peru has a developing mixed economy based largely on services, manufacturing, agriculture, and mining. Most industries, including the petroleum industry, were nationalized in the late 1960s and early '70s, but many were privatized again in the 1990s. Peru is a republic with one legislative house; its head of state and government is the president. Peru was the centre of the Inca empire, whose capital, Cuzco, was established in the 12th century. In 1533 the region was conquered by Spanish adventurer Francisco Pizarro and thereafter was dominated by Spain for almost 300 years as the Viceroyalty of Peru. It declared its independence in 1821, and freedom was achieved in 1824. Peru was defeated by Chile in the War of the Pacific (1879–83). In 1941 a boundary dispute with Ecuador erupted into war, which gave Peru control over a larger part of the Amazon basin; further disputes ensued until the border was demarcated again in 1998. The government was overthrown by a military junta in 1968; civilian rule was restored in 1980. The government of Alberto Fujimori dissolved the legislature in 1992 and promulgated a new constitution the following year. The government later successfully combated the Shining Path and Tupac Amarú rebel movements. Fujimori won a second term in 1995, but charges of fraud accompanied his elec-

© 2006 Encyclopædia Britannica, Inc.

tion to a third term in 2000; his government crumbled later that year. In 2001 Alejandro Toledo became Peru's first democratically elected president of Quechuan ethnicity.

Peru, Viceroyalty of Second of the four viceroyalties established by Spain to govern its domains in the Americas. Founded in 1543, it initially included most of South America, but it lost jurisdiction over much of its territory to other viceroyalties over time. Peru, with its wealth of silver, was considered Spain's most valuable possession in the Americas. By the late 18th century, Indian rebellions had destabilized the region, and the viceroyalty was unable to defend itself when the revolutionary forces of José de San Martín entered Lima in 1821. It became part of Peru and Chile in 1824. See also New Granada; New Spain; Viceroyalty of Río de la Plata.

Perugia \pā-'rü-jä\ City (pop., 2001 prelim.: 148,575), capital of Umbria region, central Italy. Perugia lies north of Rome between the Tiber River and Lake Trasimeno. Founded by the Umbrians, it became one of the 12 major cities of the Etruscans; it later was ruled by Rome (from 310 BC). It became a Lombard duchy in AD 592. It was the centre of the great Umbrian school of painting, which flourished in the 15th century (see Perugino; Pinturicchio). Perugia played an active role in the Italian Risorgimento and became part of Italy in 1860. It is an agricultural trade centre noted for its chocolate. There are notable remains of buildings and fortifications from Etruscan and medieval times.

Perugino \ˌper-ə-'jē-nō\ *orig.* **Pietro di Cristoforo Vannucci** (b. c. 1450, Città della Pieve, near Perugia, Romagna—d. February/March 1523, Fontignano, near Perugia) Italian painter. Born near Perugia (the source of his nickname), he was probably a pupil of Piero della Francesca and Andrea del Verrocchio. One of his most famous frescoes, *Giving of the Keys to St. Peter* (1481–82), in the Sistine Chapel, anticipated High Renaissance ideals in its compositional clarity and sense of spaciousness. He was at the height of his powers c. 1490–1500, when he painted the *Crucifixion* fresco for the convent of Santa Maria Maddalena dei Pazzi in Florence. Perugino's art declined in his later years, and c. 1505 he left the highly critical Florentine art scene to work in Umbria. In 1508 he made a brief comeback by painting roundels on the ceiling of the Stanza dell'Incendio in the Vatican. The commission for the wall frescoes went to his pupil Raphael, who had already proved himself the greater artist.

Vision of St. Bernard, wood panel by Perugino, c. 1491–94; in the Alte Pinakothek, Munich.

Perun \pʸi-'rün\ In ancient Slavic religion, the thunder god. He purified the earth and made it fertile, and he was the overseer of right and order. His powers were believed to be evident in the thunderbolt, the rattle of stones, the bellow of a bull, the bleat of a goat, and the touch of an ax blade. In the Christian period the worship of Perun was gradually transferred to St. Elijah, but folk belief in his powers continued. Sacrifices and communal feasts on July 20 in his honor were celebrated in Russia until modern times.

Perutz \pə-'rüts**, Max Ferdinand** (b. May 19, 1914, Vienna, Austria—d. Feb. 6, 2002, Cambridge, Cambridgeshire, Eng.) Austrian-British biochemist. With John Cowdery Kendrew he founded the Medical Research Council Unit for Molecular Biology at the University of Cambridge. His discovery that hemoglobin's structure changes when it picks up or releases oxygen led to the full understanding of the molecular mechanism of respiratory oxygen transport by hemoglobin. For his X-ray diffraction analysis of hemoglobin's structure, Perutz and Kendrew shared the 1962 Nobel Prize for Chemistry. Perutz also used crystallography to study the flow of glaciers.

Pesaro \'pā-zä-ˌrō\ *ancient* **Pisorum** City (pop., 2001 prelim.: 90,311), Marche region, north-central Italy. A seaport on the Adriatic Sea, Pesaro was destroyed by the Ostrogoths in AD 536. Rebuilt and fortified by the Byzantine general Belisarius as one of the cities of the Pentapolis, it was sold to the Sforza family in 1445. It became part of the Papal States in 1631. It was the birthplace of composer Gioacchino Rossini in 1792. In World War II Pesaro suffered heavily in the Allied advance of 1944, but many of its old buildings escaped with minor damage. It is a seaside resort surrounded by an agricultural area. Its museum of majolica houses the richest collection in Italy.

Peshawar \pə-'shä-wər\ City (pop., 1998 est.: 988,055), capital of North-West Frontier province, Pakistan. It is located west of the Bara River near the Khyber Pass. Once the capital of the ancient Buddhist kingdom of Gandhara, it was a centre of the caravan trade with Afghanistan and Central Asia. It became the capital of the Indo-Scythian Kushān empire c. 1st century AD. It was captured by the Muslims in 988. By the 16th century Peshawar was ruled by the Afghans. It was under British control (1849–1947) and served as an important military base. The city is still militarily important; its ancient bazaar remains a meeting place for foreign merchants and traders.

Pessoa \pes-'sō-ə**, Fernando António Nogueira** (b. June 13, 1888, Lisbon, Port.—d. Nov. 30, 1935, Lisbon) Portuguese poet. While living in South Africa, where his stepfather was Portugal's consul, Pessoa became fluent in English. On returning to Lisbon he worked as a translator while contributing to avant-garde reviews, especially *Orpheu* (1915), the organ of Brazilian-Portuguese Modernismo, of which he became a leading aesthetician. Only after his death did the rich dream world of his poetry, peopled with fictional alter egos called "heteronyms," become well known. His important volumes include *Poesias de Fernando Pessoa* (1942), *Poesias de Álvaro de Campos* (1944), *Poemas de Alberto Caeiro* (1946), and *Odes de Ricardo Reis* (1946).

pest Any organism, usually an animal, judged as a threat to humans. Most pests either compete with humans for natural resources or transmit disease to humans, their crops, or their livestock. Invertebrate pests include some protozoans, flatworms, nematodes, mollusks, arachnids, and especially insects. Mammals and birds can also be pests. Human activities, such as monocultural farming practices, use of broad-spectrum pesticides, and introduction of exotic species, often result in the proliferation of pest species. Certain fungi, bacteria, and viruses are also considered pests. Plant pests are usually called weeds.

Pestalozzi \ˌpes-tə-'lōt-sē**, Johann Heinrich** (b. Jan. 12, 1746, Zürich, Switz.—d. Feb. 17, 1827, Brugg) Swiss educational reformer. Between 1805 and 1825 he directed the Yverdon Institute (near Neuchâtel), which drew pupils and educators (including Friedrich Froebel) from all over Europe. His teaching method emphasized group rather than individual recitation and focused on such participatory activities as drawing, writing, singing, physical exercise, model making, collecting, mapmaking, and field trips. Among his ideas, considered radically innovative at the time, were making allowances for individual differences, grouping students by ability rather than age, and encouraging formal teacher training.

pesticide Any toxic substance used to kill animals or plants that damage crops or ornamental plants or that are hazardous to the health of domestic animals or humans. All pesticides act by interfering with the target species' normal metabolism. They are often classified by the type of organism they are intended to control (e.g., insecticide, herbicide, fungicide).

© 2006 Encyclopædia Britannica, Inc.

Some inadvertently affect other organisms in the environment, either directly by their toxic effects or via elimination of the target organism.

pet Any animal kept by humans for companionship or pleasure rather than for utility. The main distinction between pets and domesticated livestock is the degree of contact between owner and animal. Another distinction is the owner's affection for the animal, which is often returned. Dogs are known to have been kept as pets since prehistoric times; cats, since the 16th century BC; and horses, since at least 2000 BC. Other common pets include birds, rabbits, rodents, raccoons, reptiles, amphibians, and even insects. The trend toward making pets of exotic animals (e.g., monkeys and ocelots) is worrisome because owners can rarely provide for their needs, and the animals' already precarious populations are further depleted when members are sold for pets.

PET See POSITRON EMISSION TOMOGRAPHY

Pétain \pā-'ta^{n}**, (Henri-) Philippe** (b. April 24, 1856, Cauchy-à-la-Tour, France—d. July 23, 1951, Île d'Yeu) French general. He served in the French army from 1876 and later taught at the war college. His successful defense in the Battle of VERDUN (1916) made him a national hero, and in 1918 he became commander in chief and a marshal of France. After the war he was appointed vice president of the Supreme War Council (1920–30) and minister of war (1934). After the German invasion of France (1940), Pétain was appointed premier at age 84. He concluded an armistice with Germany, and as head of VICHY FRANCE he attempted to obtain concessions by cooperating with the Germans. In 1942 the Germans forced him to accept PIERRE LAVAL as premier and he withdrew to a nominal role as head of state. After the Allied invasion of France, he fled to Germany. In 1945 he was tried and condemned to death; the sentence was commuted to life in prison, where he died at age 95.

Petén Itzá \pe-ˌten-ēt-'sä**, Lake** Lake, northern Guatemala. It is about 22 mi (35 km) long and covers an area of about 40 sq mi (100 sq km). The region was a stronghold of the Maya Itzá Indians, who were not conquered by the Spanish until 1697. The lakeshore is now dotted with towns such as Flores and San Benito. Much of the surrounding land is covered with dense rainforest, but there is some cultivation of cacao, sugarcane, and tropical fruits around Flores.

Peter I (b. c. 903—d. Jan. 30, 969) Tsar of Bulgaria (927–969). The second son of SIMEON I, he inherited the throne on his father's death in 927. Early in his reign, Peter faced revolts by his brothers, which were suppressed, and he also endured raids by the MAGYARS, who crossed Bulgaria on their way to the Byzantine Empire. His reign, however, was generally peaceful, and he made important gains against the Byzantines, receiving the title *emperor* from them. He also forced the Byzantines to recognize the independence of the Bulgarian church, and he married the granddaughter of the Byzantine emperor ROMANUS I LECAPENUS. In 965 war broke out with the Byzantines; Peter subsequently suffered a stroke and retired to a monastery, where he died two years later. Canonized by the Bulgarian Orthodox church, Peter was deeply religious and an active church builder. During his reign, the BOGOMIL heresy first appeared.

Peter I *Russian* **Pyotr Alekseyevich** *known as* **Peter the Great** (b. June 9, 1672, Moscow, Russia—d. Feb. 8, 1725, St. Petersburg) Tsar of Russia (1682–1725). Son of Tsar ALEXIS, he reigned jointly with his half brother IVAN V (1682–96) and alone from 1696. Interested in progressive influences from western Europe, he visited several countries there (1697–98). After returning to Russia, he introduced Western technology, modernized the government and military system, and transferred the capital to the new city of St. Petersburg (1703). He further increased the power of the monarchy at the expense of the nobles and the Orthodox church. Some of his reforms were implemented brutally, with considerable loss of life. Suspecting that his son Alexis was conspiring against him, he had Alexis tortured to death in 1718. He pursued foreign policies to give Russia access to the Baltic and Black seas, engaging in war with the Ottoman Empire (1695–96) and with Sweden in the Second NORTHERN WAR (1700–21). His campaign against Persia (1722–23) secured for Russia the southern and western shores of the Caspian Sea. In 1721 he was proclaimed emperor; his wife succeeded him as the empress CATHERINE I. For raising Russia to a recognized place among the great European powers, Peter is widely considered one of the outstanding rulers and reformers in Russian history, but he has also been decried by nationalists for discarding much of what was unique in Russian culture, and his legacy has been seen as a model for JOSEPH STALIN's brutal transformation of Russian life.

Peter I (b. July 11, 1844, Belgrade, Serbia—d. Aug. 16, 1921, Topčider, near Belgrade, Kingdom of Serbs, Croats, and Slovenes) King of Serbia (1903–18) and of the Kingdom of Serbs, Croats, and Slovenes (later Yugoslavia) from 1918. The son of Prince Alexander Karadjordjević, who was forced to abdicate in 1858, he lived with his family in exile. He fought with the French army in the FRANCO-PRUSSIAN WAR and with the Serbian revolt against the Turks (1875). After the assassination of Alexander Obrenović (1903), Peter was elected king of Serbia. He advocated a constitutional government and won recognition for his liberal policies. In World War I, he allied Serbia with France and Russia but was defeated by the Central Powers. In 1918 he returned to Belgrade and was proclaimed king of the Serbs, Croats, and Slovenes.

Peter II *Russian* **Pyotr Alekseyevich** (b. Oct. 23, 1715, St. Petersburg, Russia—d. Jan. 29, 1730, Moscow) Tsar of Russia (1727–30). The grandson of PETER I, he was named heir to the throne by CATHERINE I and on her death was crowned at age 11. Peter's regency was directed by ALEKSANDR MENSHIKOV. He fell under the influence of the aristocratic Dolgoruky family, which ousted Menshikov as regent, moved the capital to Moscow (1728), and arranged Peter's betrothal to one of its princesses. On the day set for the wedding, Peter died of smallpox at age 14.

Peter II (b. Sept. 6, 1923, Belgrade, Kingdom of Serbs, Croats, and Slovenes—d. Nov. 3, 1970, Los Angeles, Calif., U.S.) Last king of Yugoslavia. The son of ALEXANDER I, he became titular king on his father's assassination (1934), but he ruled under the regency of his uncle Prince Paul (1893–1976). After a coup deposed Paul (1941), Peter ruled for several weeks until the German invasion forced him to flee to London. He led a government-in-exile until the Yugoslav monarchy was abolished in 1945. He moved to the U.S., where he worked in public relations.

Peter III *Spanish* **Pedro** *known as* **Peter the Great** (b. 1239—d. Nov. 11, 1285, Villafrance del Panades, Catalonia) King of Aragon (1276–85) and of Sicily (as Pedro I, 1282–85). He married the Hohenstaufen heiress of Sicily (1262) and ended the Sicilian revolt (1282), becoming king despite Guelph and papal opposition (see SICILIAN VESPERS). Unhappy with his Sicilian venture, nobles and municipalities in Aragon forced Peter to confirm their legal rights and to diminish crown rights. In 1285 he defeated Philip III of France, who had invaded Aragon in an effort to dethrone him.

Peter III *Russian* **Pyotr Fyodorovich** *orig.* **Karl Peter Ulrich, duke von Holstein-Gottorp** (b. Feb. 21, 1728, Kiel, Holstein-Gottorp—d. July 18, 1762, Ropsha, near St. Petersburg, Russia) Tsar of Russia (1762). Grandson of PETER I, the young duke was brought to Russia by his aunt ELIZABETH when she became empress (1741). Proclaimed the heir to the Russian throne, he was unpopular at court for his pro-Prussian attitude. After he succeeded Elizabeth (1762), he reversed her foreign policy, making peace with Prussia and withdrawing from the SEVEN YEARS' WAR. He offended the Orthodox church by trying to force it to adopt Lutheran practices. After six months he was forced to abdicate by a group of nobles, in collusion with his own wife, Catherine (later CATHERINE II), and Count GRIGORY ORLOV, and was murdered while in the conspirators' custody.

Peter IV *Spanish* **Pedro** *known as* **Peter the Cruel** (b. Sept. 5, 1319, or Sept. 15, 1317, Balaguer, Catalonia—d. Jan. 5, 1387, Barcelona) King of Aragon (1336–87). He took the Balearic Islands and Roussillon from Majorca (1343–44), defeated the Aragonese nobles (1348), and became duke of Athens and Neopatras (1380). He waged war against Castile (1356–66) but failed to gain any territory; after 1369 France favoured Castile over Aragon. Peter tried to maintain neutrality in the HUNDRED YEARS' WAR, and he quarreled with his heir, the future John I, who became the tool of French intrigues.

Peter, Saint See Saint PETER THE APOSTLE

Peter Damian \'dā-mē-ən**, Saint** (b. 1007, Ravenna—d. Feb. 22, 1072, Faenze; feast day February 21) Italian cardinal and Doctor of the Church. He was prior of Fonte Avellana in the Apennines before being named a cardinal in 1057. A leading monastic reformer and ascetic, he played an important role in the promotion of apostolic poverty and in support of papal reformers who sought to enforce clerical celibacy and abolish SIMONY. He defended Pope Alexander II against the ANTIPOPE Honorius II and reconciled Alexander with the city of Ravenna. He was also sent as a papal legate to resolve disputes in Milan and Cluny, Burgundy, and he played a key role in the formulation of the papal election decree of 1059.

Peter Lombard (b. c. 1100, Novara, Lombardy—d. Aug. 21/22, 1160, Paris) French bishop and theologian. He studied in Bologna and taught theology in the school of Notre-Dame, Paris. He was consecrated bishop of Paris in 1159. His *Four Books of Sentences* (1148–51), a systematic collection of teachings of the Church Fathers and opinions of medieval theologians, served as the standard theological text of the Middle Ages. In it Peter touched on every doctrinal issue, from God and the Trinity to the four "last things" (death, judgment, hell, and heaven). He asserted that sacraments are the cause and not merely the signal of grace and that human actions may be judged good or bad according to their cause and intention.

Peter the Apostle, Saint *orig.* **Simon** (d. c. AD 64, Rome) Disciple of JESUS, recognized as the leader of the Twelve APOSTLES. Jesus called him Cephas (Aramaic for "Rock"; rendered in Greek as "Petros") and said "Upon this rock I will build my church" (Matthew 16:18). When Jesus was arrested, according to the biblical account, Peter denied him three times, as Jesus had foretold. Accounts of Peter's life and ministry rely on the four GOSPELS, the Acts of the Apostles, the epistles of Peter, and the epistles of St. PAUL. Peter worked with Paul in Antioch and later carried on missionary work in Asia Minor. According to tradition, he eventually went to Rome, where he suffered martyrdom by being crucified upside down. SAINT PETER'S BASILICA is said to have been built on the site of his grave in Rome. In ROMAN CATHOLICISM he is regarded as the first in the unbroken succession of POPES. Jesus' promise to give him the "keys of the kingdom" led to the popular perception of Peter as the gatekeeper of heaven. The Roman Catholic church celebrates five feast days in honour of Peter, and in each the name of Paul is associated.

Peter the Great See PETER I (Russia), PETER III (Aragon)

Peter the Great Bay Inlet, Sea of JAPAN (East Sea), northwestern Pacific Ocean, in extreme southeastern RUSSIA. It extends for 115 mi (185 km) from the mouth of the TUMEN RIVER northeast across to Cape Povorotny. The bay reaches inland for 55 mi (88 km) and contains the port of VLADIVOSTOK. The bay freezes from early December to mid-April.

Peter the Hermit (b. c. 1050, probably Amiens—d. July 8, 1115, Huy, Flanders) French ascetic and one of the most important preachers of the First CRUSADE. A charismatic ascetic, he preached widely in Europe in support of the First Crusade and led his enthusiastic followers to Constantinople in 1096. They advanced to Nicomedia, but Peter was unable to maintain discipline; he returned to Constantinople to ask for help from ALEXIUS I, and in his absence his army was annihilated by the Turks. Peter reached Jerusalem in 1099 and afterwards returned to France, where he became prior of an Augustinian monastery.

Peter the Venerable (b. c. 1092, Montboissier, Auvergne, Arles—d. Dec. 25, 1156, Cluny, Burgundy) French abbot of Cluny (from 1122). He joined BERNARD DE CLAIRVAUX in supporting Pope Innocent II and weakened the position of the antipope ANACLETUS II. He befriended PETER ABELARD and reconciled him to Bernard and the pope. Peter's reforms restored Cluny to its prominence among the religious establishments of Europe. He also wrote numerous letters and treatises against heresy, the Jews, and the Muslims and commissioned the first Latin translation of the QUR'ĀN.

Peterhof See PETRODVORETS

Peterloo Massacre (Aug. 16, 1819) Brutal dispersal of a meeting held on St. Peter's Fields in Manchester, Eng. Called to protest unemployment and high food prices and demand parliamentary reform, the meeting drew about 60,000 people, including many women and children. Alarmed by its size, city officials ordered the city's volunteer cavalry to arrest the speakers. The untrained cavalry also attacked the peaceable crowd with sabres, and professional soldiers were sent to join the attack. After a 10-minute rout, about 500 people lay injured and 11 were dead. The incident (likened to Waterloo) came to symbolize Tory tyranny.

Peters, Carl (b. Sept. 27, 1856, Neuhaus an der Elbe, Hanover—d. Sept. 10, 1918, Bad Harzburg, Ger.) German explorer and colonizer in East Africa. After studying British principles of colonization, he founded the Society for German Colonization (1884) and made treaties with chiefs in East Africa to cede their territories to him. He helped establish the German East African protectorate of Tanganyika and formed the German East Africa Company in 1885. He served as imperial high commissioner for Kilimanjaro (1891–97) and explored the Zambezi River (1899–1901), where he discovered relics of ancient cities and gold mines.

Peter's Pence In medieval England, an annual tax of a penny paid by landowners to the papal treasury in Rome. Peter's Pence was instituted during the 7th or 8th century and continued until the 16th century. It also existed in several northern European kingdoms.

Petersburg Campaign (1864–65) Series of military operations in southern Virginia at the end of the AMERICAN CIVIL WAR. The rail centre of Petersburg, Va., was a strategic defense point near the Confederate capital of Richmond. In June 1864 the Union army began a siege of both cities, and each side built fortifications 35 mi (56 km) long. Confederate troops under ROBERT E. LEE held the cities, but supplies were scarce and Lee's 50,000 troops were immobilized by lack of horses. In April 1865 the 120,000 Union troops under ULYSSES S. GRANT drove the Confederates behind Petersburg's inner defenses, forcing the evacuation of both cities. Soon thereafter the Confederates surrendered at APPOMATTOX COURT HOUSE.

Peterson, Oscar (Emmanuel) (b. Aug. 15, 1925, Montreal, Que., Can.) Canadian jazz pianist and composer. Peterson grew up in Montreal and studied classical piano. His jazz playing, influenced by ART TATUM and NAT KING COLE, is characterized by cascades of notes and an effervescent swing. After his Carnegie Hall debut in 1949 he became one of the busiest pianists in JAZZ, in demand as an accompanist, solo pianist, and leader of his own trio. An outstanding, extroverted improviser and sensitive accompanist, Peterson demonstrates in his performance his roots in SWING as well as BEBOP.

Peterson, Roger Tory (b. Aug. 28, 1908, Jamestown, N.Y., U.S.—d. July 28, 1996, Old Lyme, Conn.) U.S. ornithologist. He started drawing birds in high school. His *Field Guide to the Birds* (1934), illustrated with paintings that stressed the features that best identified a species in the field, greatly stimulated public interest in bird study in the U.S. and Europe. Many other guides followed. More responsible than any other person for fostering a widespread awareness of birds by the American public, he received such awards as the American Ornithologists' Union's Brewster Medal (1944) and the World Wildlife Fund's Gold Medal (1972).

Petipa \pā-tē-'pȧ**, Marius** (b. March 11, 1818, Marseille, Fr.—d. July 14, 1910, Gurzuf, Ukraine, Russian Empire) French-born Russian dancer and choreographer. He received his early training from his ballet-master father and was a principal dancer in France, Belgium, and Spain before joining the Imperial Theatre in St. Petersburg in 1847. There he also created several ballets, including *The Pharaoh's Daughter*, which led to his appointment as chief choreographer in 1869. By his retirement in 1903, he had produced more than 60 ballets for the imperial theatres in St. Petersburg and Moscow—including *Don Quixote* (1869), *La Camargo* (1872), *Sleeping Beauty* (1890), *Swan Lake* (1895), and *The Seasons* (1900)—which formed the core of the classical Russian repertoire.

Petit \pə-'tē**, Roland** (b. Jan. 13, 1924, Villemomble, Fr.) French dancer and choreographer. He danced with the Paris Opéra Ballet (1940–44) and then formed several companies, with which he toured Europe and the U.S. His dramatic ballets combined fantasy with elements of contemporary realism and included *The Strolling Players* (1945), *The Young Man and Death* (1946), and *Carmen* (1949). He choreographed dances for films in the 1950s, and he later staged revues featuring his wife, Zizi Jeanmaire. From 1973 to 1997 he was director of the Ballet de Marseille.

petit \'pe-tē\ **jury** *or* **trial jury** Group chosen from the citizens of a district to try a question of fact at issue in a trial. Though petit juries in England and the U.S. historically have contained 12 members, there is no uniform number. Numerical requirements for a valid verdict vary (e.g., unanimity in most courts in the U.S., a majority in Scotland and Italy, two-thirds in Portugal). The petit jury is the standard jury for civil and criminal trials. It has less discretion than is often imagined. The trial judge supervises it, rules on what EVIDENCE it may view and which laws are applicable, and sometimes directs or, at the end of the trial, sets aside its verdict. See also GRAND JURY.

petition Written instrument directed to an individual, government official, legislative body, or court in order to seek redress of grievances or to request a favour. In some jurisdictions, petitions brought by a sufficient number of people (represented by their signatures) are used to place a candidate on a ballot, to submit an issue to the electorate (see REFERENDUM AND INITIATIVE), or to exert pressure on legislators to vote in a certain way. In the U.S., the right to petition is guaranteed by the 1st Amendment to the Constitution.

© 2006 Encyclopædia Britannica, Inc.

Petition of Right (1628) Petition sent by Parliament to King Charles I complaining of a series of breaches of law. The petition sought recognition of four principles: no taxation without the consent of Parliament, no imprisonment without cause, no quartering of soldiers on subjects, and no martial law in peacetime. To continue receiving subsidies for his policies, Charles was compelled to accept the petition, but he later ignored its principles.

Petőfi \'pet-ə̄-fē**, Sándor** (b. Jan. 1, 1823, Kiskőrös, Hung.—d. probably 1856, Siberia) Hungarian poet and revolutionary. He became famous with his first poetry volume, *Versek* (1844). Before the revolution of 1848 he wrote poems that glowed with political passion; one of them, "Talpra magyar" ("Rise, Hungarian"), became an anthem. He disappeared in battle and was assumed dead in 1849, but archives opened in the 1980s revealed that he was marched to Siberia and died there. His works are characterized by realism, humour, descriptive power, and a peculiar vigour and have a direct style adapted from national folk songs. *János vitéz* (1845), an entrancing fairy tale, is his most popular epic.

Petra \'pē-trə\ *Arabic* **Baṭrā** Ancient city, Middle East. Located in what is now southwestern Jordan, it was the capital of the Nabataean kingdom until its defeat by the Romans in AD 106. It then became part of the Roman province of Arabia. After several centuries as a flourishing trade centre, it declined with the shifting of trade routes away from the city. It was captured by the Muslims in the 7th century. Its ruins were rediscovered in 1812 by the Swiss traveler Johann L. Burckhardt. Excavations since the mid-20th century have revealed many rock-cut monuments, including tombs with elaborate facades carved in the rose, crimson, and purple sandstone of the surrounding hills. Petra was designated a UNESCO World Heritage site in 1985.

Petrarch \'pē-ˌträrk, 'pe-ˌträrk\ *Italian* **Francesco Petrarca** (b. July 20, 1304, Arezzo, Tuscany—d. July 18/19, 1374, Arquà, near Padua, Carrara) Italian scholar, poet, and humanist. After 1326 he abandoned the study of law for his true interests, literature and the religious life. He took minor ecclesiastical orders and moved to Avignon, where in 1327 he first saw Laura, the idealized subject of his chaste love and of his celebrated Italian love lyrics; mainly sonnets and odes written over some 20 years, most were included in his *Canzoniere* or *Rime* (1360). The greatest scholar of his age, especially of Classical Latin, he traveled widely, visiting learned men, searching out manuscripts, and undertaking diplomatic missions. He strongly advocated the continuity between Classical culture and the Christian message; in combining the two ideals he is considered the founder and a great representative of humanism. His Latin works, reflecting his religious and philosophical interests, include *On Illustrious Men* (begun c. 1337), the epic poem *Africa* (begun c. 1338), the autobiographical treatise *Petrarch's Secret* (written 1342–58), *De vita solitaria* (1345–47; "The Life of Solitude"), and *Epistolae metricae* (begun c. 1345; "Metrical Letters"). After 1367 he lived in and near Padua. His influence on European literature was enormous and lasting, and his deep consciousness of the Classical past as a source of literary and philosophical meaning for the present was of great importance in paving the way for the Renaissance.

petrel Any of numerous seabirds (order Procellariiformes, particularly family Procellariidae), including 24 species (genera *Pterodroma* and *Bulweria*) called gadfly petrels because of their fluttering flight. Most are dark above and light below, with long wings and a short, wedge-shaped tail. They nest in colonies on tropical and subtropical islands. Both parents tend the single chick until it is almost fully fledged. During the nonbreeding season, petrels roam the open ocean, eating squid and small fishes. Species in the family Pelecanoididae are called diving petrels. See also fulmar, shearwater, storm petrel.

Petrie \'pē-trē**, Sir (William Matthew) Flinders** (b. June 3, 1853, Charlton, near Greenwich, London, Eng.—d. July 28, 1942, Jerusalem) British archaeologist who made valuable contributions to the techniques of excavation and dating. During excavations in Egypt in the mid 1880s Petrie developed a sequence dating method, based on a comparison of potsherds at various levels, that made possible the reconstruction of ancient history from material remains. His excavations, together with those of Heinrich Schliemann at Troy, marked the beginning of the examination of successive levels of a site, rather than the previously haphazard digging. Petrie made many important discoveries in Egypt and Palestine. His *Methods and Aims in Archaeology* (1904) was the definitive work of its time. He taught at the University of London (1892–1933).

Petrified Forest National Park National park, eastern Arizona, U.S. Established as a national monument in 1906 and as a national park in 1962, it has an area of 146 sq mi (378 sq km). It features extensive exhibits of petrified wood in several "forest" areas, fossilized leaves, plants, and broken logs, and the Painted Desert. Other features include petroglyphs and ancient Pueblo Indian ruins.

petrified wood Fossil formed by the infiltration of minerals into cavities between and within cells of natural wood, usually by silica (silicon dioxide, SiO_2) or calcite (calcium carbonate, $CaCO_3$). Often this replacement of organic tissue by mineral deposits is so precise that the internal structure as well as the external shape is faithfully represented; sometimes even the cell structure may be determined.

Petrobrás \'pe-trō-ˌbräs\ *officially* **Petróleo Brasileiro SA** Brazilian oil and natural-gas company, the largest corporation in South America. It was founded in 1953 as a government-owned monopoly to prospect, extract, and refine domestic petroleum and to transport that oil and its derivatives. A government agency sets its policies and oversees its development. Although mainly devoted to developing petroleum sources in Brazil, Petrobrás also has interests in the Middle East, North Africa, and Colombia. In 1995, as part of a campaign to privatize state-owned industries, the Brazilian government ended the company's monopoly and allowed foreign competition. Petrobrás subsequently developed joint ventures with foreign businesses.

petrochemical Strictly, any of a large class of chemicals (as distinct from fuels) derived from petroleum and natural gas. The category has been broadened to include a much larger range of organic compounds and a few inorganic compounds (including carbon black, sulfur, and ammonia). Some materials cannot be classifed unequivocally because they have alternative sources (benzene from coal, ethanol from fermentation). Like crude oil and natural gas, most petrochemicals consist mainly of carbon and hydrogen and are called hydrocarbons. Petrochemicals used as raw materials (feedstocks) include ethylene, propylene, butadiene, benzene, toluene, xylene, and naphthalene. Among the myriad petrochemical products are plastics (e.g., polyethylene, polypropylene, polystyrene), soaps and detergents, solvents, drugs, fertilizers, pesticides, explosives, synthetic fibres and rubberss, paints, epoxies, flooring and insulating materials, luggage, and recording disks and tapes.

Petrodvorets \ˌpyi-trə-dvȧ-'ryets\ *formerly (until 1944)* **Peterhof** City (pop., 1995 est.: 82,000), northwestern Russia. Located near St. Petersburg, it was founded by Peter I the Great as a country estate in 1709. After visiting France in 1717, he decided to create a residence that would rival the Palace of Versailles. The Baroque Grand Palace (1714–28) was designed by Domenico Trezzini, and its gardens by Alexandre Le Blond (1679–1719). It became the most lavish and popular of the Russian royal summer residences. Today the Grand Palace (now a museum) and the vast park, with 39 mi (63 km) of canals that connect the intricate system of fountains, are part of the 2,500-acre (1,000-hectare) preserved area in the city of Petrodvorets.

Petrograd See Saint Petersburg

petrol See GASOLINE

Petróleos de Venezuela \,pe-trō-'lā-ōs-thā-,ve-nəz-'wā-lə\, SA (PDVSA) State-owned Venezuelan energy company with interests in oil, natural gas, coal, and petrochemicals. It was created in 1976 through the nationalization of Venezuela's petroleum industry, which had been controlled by foreign companies since the end of World War I. Petróleos de Venezuela engages in the exploration, refining, and marketing of oil, petrochemicals, and natural gas in many parts of the world. Through its acquisition of CITGO Petroleum in 1990, PDVSA became a leading supplier of gasoline and other petroleum products in the U.S. Given the scale of its operations, PDVSA usually earns the largest share of Venezuela's foreign currency.

petroleum *or* **crude oil** Complex mixture of HYDROCARBONS derived from the geologic transformation and decomposition of plants and animals that lived hundreds of millions of years ago. As a technical term, *petroleum* encompasses the liquid (crude oil), gaseous (NATURAL GAS), and viscous or solid (BITUMEN, ASPHALT) forms of hydrocarbons that occur in the Earth, but the meaning is often restricted to the liquid oil form. Crude oil and natural gas are the most important primary FOSSIL FUELS. Asphalt has been used since ancient times to caulk ships and pave roads. In the mid 1800s petroleum began to replace whale oil in lamps, and the first well specifically to extract it was drilled in 1859. The development of the automobile gave petroleum a new role as the source of GASOLINE. Petroleum and its products have since been used as fuels for heating, for land, air, and sea transport, and for electric power generation and as PETROCHEMICAL sources and lubricants. Crude oil and natural gas, produced mostly in Saudi Arabia, the U.S., and Russia, now account for about 60% of world energy consumption; the U.S. is by far the largest consumer. At present rates of consumption, the known supply will be exhausted by the mid 21st century. Petroleum is recovered from drilled wells, transported by pipeline or tanker ship to refineries, and there converted to fuels and petrochemicals.

petroleum trap Subsurface reservoir of petroleum. The oil is always accompanied by water and often by NATURAL GAS; all are confined in porous rock. The natural gas, being lightest, occupies the top of the trap and is underlain by the oil and then the water. A layer of impervious rock, called the roof rock, prevents the escape of the petroleum. The part of the trap that is actually occupied by the oil and gas is called the petroleum reservoir.

petrology Scientific study of rocks, including their composition, texture, and structure; occurrence and distribution; and conditions of origin. Petrology is concerned with all three major types of rocks: igneous, metamorphic, and sedimentary. The subdiscipline of experimental petrology involves synthesizing rocks in the laboratory to ascertain the physical and chemical conditions under which they form. The subdiscipline of petrography is concerned primarily with the systematic study and description of rocks using a petrographic microscope.

Petronas \pe-'trō-nəs\ Towers Twin stainless-steel-clad skyscrapers, linked by a skybridge, in Kuala Lumpur, Malaysia. Designed by Cesar Pelli (b. 1926) and completed in 1998, the circular, step-tapered towers house the headquarters of Malaysia's national petroleum company. Each tower is 88 stories high, has a structural frame of high-strength, steel-reinforced concrete, and reaches a height of 1,483 ft (451.9 m)—a figure that includes a pinnacle and steel spire atop each. In 1996, after achieving their full height, the towers were considered the world's tallest buildings, surpassing the then-tallest SEARS TOWER; they, in turn, were superseded in 2003 by the Taipei 101 (Taipei Financial Center) building in Taipei, Taiwan, that rose to 1,667 ft (508 m).

Petronius Arbiter, Gaius *orig.* **Titus Petronius Niger** (d. AD 66) Roman writer. Of a noble family, Petronius belonged to a class of idle pleasure-seekers, but he served ably as governor of the Asian province of Bithynia and as consul in Rome. After being appointed NERO's authority on taste (hence "Arbiter"), he was accused of plotting to kill the emperor and, though innocent, committed suicide. He is the reputed author of the *Satyricon*, a comic PICARESQUE NOVEL vividly portraying contemporary Roman society through the escapades of a disreputable trio of adventurers, with unrelated stories and the author's commentaries on Roman life interspersed.

Petty, Richard (b. July 2, 1937, Level Cross, N.C., U.S.) U.S. stock-car racer. He entered professional stock-car racing in 1958. In his long professional career he won 200 races. In 1975 he set the NASCAR record of 13 victories in one season. "King Richard" also won seven Daytona 500 races and seven NASCAR Grand National championships. His father, son, and grandson were all NASCAR racers.

Petty, Sir William (b. May 26, 1623, Romsey, Hampshire, Eng.—d. Dec. 16, 1687, London) British political economist and statistician. He gave up a life at sea to study medicine, and taught anatomy at the University of Oxford. He founded mines, ironworks, and fisheries in Ireland. He was also responsible for several inventions and was a founder of the ROYAL SOCIETY. Petty was an originator of political arithmetic, which he defined as the art of reasoning by figures upon things relating to government. In his best-known work, *Treatise of Taxes and Contributions* (1662), he favoured giving free rein to the forces of individual self-interest but declared the maintenance of a high level of employment to be a duty of the state. He also argued that the labour necessary for production was the main determinant of exchange value.

petunia Any of many species of flowering plants in the genus *Petunia*, in the NIGHTSHADE FAMILY, which originated in South America. The innumerable varieties of showy, trumpet-shaped flowers are immensely popular. There are two types: the compact, erect sort seen in summer garden beds, and the sprawling, long-stemmed sort seen in hanging baskets and window boxes. From early summer until frost, petunias bloom profusely with single or double blossoms; crisped, fringed, or ruffled flowers; and spectacular hues from pure white to deep crimson or purple, speckled or veined in contrasting colours. Leaves are soft, flabby, and covered with fine, sticky hairs. Technically perennials, petunias are most often grown as annuals.

Pevsner \'pevz-nər\, Antoine *orig.* **Natan Borisovich Pevzner** (b. Jan. 18, 1886, Oryol, Russia—d. April 12, 1962, Paris, France) Russian-born French sculptor and painter. After travels to Paris and Oslo, he returned to become a professor at Moscow's school of fine arts. He helped form the SUPREMATIST group, and in 1920 he and his brother, NAUM GABO, issued the *Realist Manifesto* of CONSTRUCTIVISM. He settled in Paris in 1923. He used zinc, brass, copper, and celluloid for his early sculptures; later he relied mainly on parallel arrays of bronze wire soldered together to form plates, which he joined to form intricate shapes.

Pevsner \'pefs-nər\, Sir Nikolaus (b. Jan. 30, 1902, Leipzig, Ger.—d. Aug. 18, 1983, London, Eng.) German-born British art historian. He studied at various German universities and taught at Göttingen University (1929–33) before moving to England to escape Nazism. There he taught at the Universities of London, Oxford, and Cambridge. He is best known for his writings on architecture, especially his 46-volume series of county-by-county guides, *The Buildings of England* (1951–74), one of the great achievements of 20th-century art scholarship. He conceived and edited the *Pelican History of Art* series (1953–); many of these individual volumes have become classics.

pewter Tin-based ALLOY used to make domestic utensils. Pewter dates back at least 2,000 years, to Roman times. Ancient pewter contained about 70% TIN and 30% LEAD. Such pewter, also called black metal, darkened greatly with age, and the lead readily leached out in contact with acidic foods. Pewter with little or no lead is of finer quality, and alloys that include ANTIMONY and BISMUTH are more durable and shinier. Modern pewter is about 91% tin, 7.5% antimony, and 1.5% copper; the absence of lead makes it safe to use for foods and beverages. The surface of modern pewter is bluish white with either a bright finish or a soft, satin sheen. It resists tarnish, retaining its colour and finish indefinitely.

peyote \pā-'ō-tē\ Either of two species of the genus *Lophophora* in the CACTUS family, native to North America, almost exclusively to Mexico. The body of the peyote cactus is spineless, soft, usually blue-green, and only 3 in. (8 cm) wide and 2 in. (5 cm) tall. The more common species, mescal (*L. williamsii*), has pink to white flowers. *L. diffusa*, more primitive, has white to yellow flowers and a yellow-green body. Well known for its hallucinogenic effects (primarily due to the alkaloid MESCALINE), peyote figures prominently in old and recent religious

Peyote (*Lophophora williamsii*)

rituals of certain American Indian peoples. The sale, use, or possession of dried mescal buttons (flowering heads) or live plants is prohibited by law in many places.

peyotism See Native American Church

pH Quantitative measure of the strength of the acidity or alkalinity (see acid, base) of a solution. It is defined as the negative common logarithm of the concentration of hydrogen ions [H^+] in moles/litre: pH = $-\log_{10}$ [H^+]. The letters of its name are derived from the absolute value of the power (p) of the hydrogen ion concentration (H). The product of the concentrations in water of H^+ and OH^- (the hydroxide ion) is always about 10^{-14}. The strongest acid solution has about 1 mole/litre of H^+ (and about 10^{-14} of OH^-), for a pH of 1. The strongest basic solution has about 10^{-14} moles/litre of H^+ (and about 1 of OH^-), for a pH of 14. A neutral solution has about 10^{-7} moles/litre of both H^+ and OH^-, for a pH of 7. The pH value, measured by a pH meter, titration, or indicator (e.g., litmus) strips, helps inform chemists of the nature, composition, or extent of reaction of substances, biologists of the composition and environment of organisms or their parts or fluids, physicians of the functioning of bodily systems, and agronomists of the suitability of soils for crops and any treatments needed. The pH is now defined in electrochemical terms (see electrochemistry).

Phaedra \'fē-drə\ In Greek legend, the daughter of King Minos. She became the second wife of Theseus after he abandoned her sister Ariadne. She later fell in love with her stepson Hippolytus; rejected, she accused him of rape. He was killed, and she hanged herself.

Phaedrus \'fē-drəs\ (b. c. 15 BC, Thrace—d. c. AD 50, Italy) Roman fabulist. A slave by birth, Phaedrus became a freedman in Augustus's household. He was the first writer to Latinize whole books of fables, producing free versions in iambic metre of Greek prose fables that were then circulating under the name of Aesop. Phaedrus's renderings, noted for their charm, brevity, and didacticism, became very popular in medieval Europe; they include such favourites as "The Fox and the Sour Grapes" and "The Wolf and the Lamb."

Phaethon \'fā-ə-thən\ In Greek mythology, the son of Helios, the sun god, and a nymph. Taunted as illegitimate, Phaethon asked for permission to drive the chariot of the sun through the heavens for a single day in order to prove that Helios was his father. He proved unable to control the horses, and, after making a gash in the heavens that became the Milky Way, he rode too close to earth and began to scorch it. To prevent further damage, Zeus hurled a thunderbolt, killing him.

Phag-mo-gru family \'fäg-mō-grü\ Tibetan family that in the 14th century liberated Tibet from Mongol control. At that time Tibet was governed by lamas from the Sa-skya monastery who resided at the Mongol (Yuan) court in China. Under Byang-chub rgyal-mtshan (1302–1364), the Phag-mo-gru liberated central Tibet. For the next 100 years, a semblance of central authority was reestablished in the country.

phage See bacteriophage

phalanger See possum

phalanx \'fā-ˌlaŋks\ Tactical formation consisting of a block of heavily armed infantry standing shoulder to shoulder in files several ranks deep. First used by the Sumerians and fully developed by the ancient Greeks, it is viewed today as the beginning of European military development. The Greek city-states adopted a phalanx eight men deep during the 7th century BC. The spectacle of Greek hoplites marching forward in solid ranks was frightening to the enemy, but the phalanx was difficult to maneuver and easily thrown into confusion if its ranks were broken.

phalarope \'fa-lə-ˌrōp\ Any of three species (genus *Phalaropus*, family Scolopacidae) of slim-necked shorebirds, 6–10 in. (25–25 cm) long, with lobed toes and a straight, slender bill. In summer, their gray-and-white plumage has red markings. Females fight for nesting territory and court the males; males, smaller and duller, do all the nesting duties and lead the young south in autumn. Two species breed around the Arctic Circle and winter on tropical oceans, where they are known as sea snipe. Wilson's phalarope (*P. tricolor*) breeds in western North America and migrates to the Argentine pampas.

Phan Boi Chau \'pän-'bȯi-'chaù\ *or* **Phan Giai San** \'pän-'gyī-'sän\ *orig.* **Phan Van San** (b. 1867, Nghe An province, Viet.—d. Sept. 29, 1940, Hue) Vietnamese resistance figure. Son of a poor scholar, he received a doctorate in 1900, by which time he was already a firm nationalist. Opposed to French rule in Vietnam, he organized efforts to place the nationalist Prince Cuong De (1882–1951) on the throne. In 1905 he moved his resistance movement to Japan, where he met Sun Yat-sen and Phan Chau Trinh. His monarchist scheme failed, as did a plan to assassinate the governor-general of French Indochina, and Chau was imprisoned in 1914–17. Hundreds of Vietnamese protested when he was arrested again in 1925; subsequently released, he spent his remaining years in quiet retirement.

Phan Chau Trinh \'pän-'chü-'trin\ (b. 1872, Tay Loc, Quang Nam province, Viet.—d. March 24, 1926, Saigon) Vietnamese nationalist leader and reformer. Trinh, who fought in the resistance movement against the French even as a boy, came to believe that modernization was a prerequisite for developing an autonomous state, and he thus made modernization his primary goal. He urged replacing the civil service system with vocational schools and commercial firms, but his attempts to persuade the French to undertake major reforms failed, and he was twice imprisoned. He was mourned as a national hero after his death. See also Phan Boi Chau.

Phanerozoic \ˌfa-nə-rə-'zō-ik\ **Eon** Span of geologic time from c. 543 million years ago, the end of the Proterozoic Eon, to the present. The Phanerozoic, the eon of visible life, is divided into three major eras: the Paleozoic, Mesozoic, and Cenozoic. Although life originated in Precambrian time, it was in the Phanerozoic that many forms arose and evolved. The Earth gradually assumed its present configuration and physical features through such processes as plate tectonics, mountain building, and glaciation.

pharaoh \'fer-ō\ Epithet applied to Egyptian kings from c. 1500 to 343 BC. The term later evolved into a generic term for all ancient Egyptian kings. Pharaohs were regarded as gods, retaining their divine status even after death. A pharaoh's will was supreme, and he governed by royal decree, with the assistance of viziers. The common people nevertheless judged a pharaoh by his deeds; many were criticized, plotted against, and even deposed and killed. See also Akhenaton; Amenemhet I; Amenhotep II; Amenhotep III; Ramses II; Thutmose III; Tutankhamen.

Pharisee \'far-ə-ˌsē\ Member of a Jewish religious party in Palestine that emerged c. 160 BC in opposition to the Sadducees. The Pharisees held that the Jewish oral tradition was as valid as the Torah. They struggled to democratize the Jewish religion, arguing that the worship of God was not confined to the Temple of Jerusalem and fostering the synagogue as an institution of worship. Their belief that reason must be applied in the interpretation of the Torah and its application to contemporary problems is now basic to Jewish theology.

pharmaceutical industry Producers of pharmaceuticals, substances used in the diagnosis, treatment, and prevention of disease and the modification of organic functions. The earliest records of medicinal plants and minerals are those of the ancient Chinese, Hindu, and Mediterranean civilizations. Medicines were prepared first by physicians and later by apothecary shops. The modern pharmaceutical industry began in the 19th century with the discovery of highly active medicinal compounds that could be manufactured most efficiently on a large scale. As these drugs replaced the herbal medicines of earlier times, the occurrence and severity of such diseases as rheumatic fever, typhoid fever, pneumonia, poliomyelitis, syphilis, and tuberculosis were greatly reduced. Many drugs are extracted from plant substances; alkaloids such as quinine, cocaine, and morphine are among the best-known examples. Others are made from animal substances, such as the glandular extracts that are used to produce insulin. Pharmaceutical industry research has greatly aided medical progress, and many new drugs have been discovered and produced in industrial laboratories. Increasing health-care costs, government regulation, and research ethics are all issues of concern to the industry.

pharmacology \ˌfär-mə-'käl-ə-jē\ Branch of medicine dealing with the actions of drugs in the body—both therapeutic and toxic effects—and development and testing of new drugs and new uses of existing ones. Though the first Western pharmacological treatise (a listing of herbal plants) was compiled in the 1st century AD, scientific pharmacology was possible only from the 18th century on, when drugs could be purified and standardized. Pharmacologists develop drugs from plant and animal sources and create synthetic versions of these, along with new drugs based on them or their chemical structure. They also test drugs, first in vitro (in the laboratory) for biochemical activity and then in vivo (on animals, human volunteers, and patients) for safety, effectiveness, side effects, and

© 2006 Encyclopædia Britannica, Inc.

interactions with other drugs and to find the best dose, timing, and route (mouth, injection, etc.). Drug products are constantly tested for potency and purity. See also DRUG POISONING; PHARMACY; PHARMACEUTICAL INDUSTRY.

pharmacy Science dealing with collection, preparation, and standardization of DRUGS. Pharmacists, who must earn a qualifying degree, prepare and dispense prescribed medications. They formerly mixed and measured drug products from raw materials according to doctors' prescriptions, and they are still responsible for formulating, storing, and providing correct dosages of medicines, now usually produced by pharmaceutical companies as premeasured tablets or capsules. They also advise patients on the use of both prescription and over-the-counter drugs. Laws regulating the pharmaceutical industry are based on the national pharmacopoeia, which outlines the purity and dosages of numerous medicinal products.

Pharsalus \fär-'sā-ləs**, Battle of** (48 BC) Decisive engagement in the Roman civil war between Julius CAESAR and POMPEY. Caesar had recently been defeated by Pompey when the two met again in Greece. Though Pompey had twice as many men, Caesar used unorthodox tactics to overwhelm him. Pompey fled and about half his men surrendered; the rest were killed or took flight.

pharyngitis \ˌfar-ən-'jī-təs\ INFLAMMATION and INFECTION (usually bacterial or viral) of the PHARYNX. Symptoms include pain (sore throat, worse on swallowing), redness, swollen lymph nodes, and fever. Throat culture may be the only way to distinguish infection with STREPTOCOCCUS bacteria (strep throat), which can cause RHEUMATIC FEVER if not treated in time with ANTIBIOTICS, from viral infections, which do not respond to antibiotics and require only symptom relief.

pharynx \'far-iŋks\ Inside of the throat, from the oral and nasal cavities (see MOUTH, NOSE) to the TRACHEA and ESOPHAGUS. It has three connected sections: the nasopharynx, at the back of the nasal cavity; the oropharynx, in the back of the oral cavity down to the epiglottis (a flap of tissue that closes off the LARYNX during swallowing); and the laryngopharynx, from the epiglottis to the esophagus. The oropharynx contains the palatine TONSILS. The eustachian tubes connect the middle EARS to the pharynx, allowing air pressure on the eardrum to be equalized. Disorders include PHARYNGITIS, TONSILLITIS, and cancer.

phase In THERMODYNAMICS, a chemically and physically uniform quantity of matter that can be separated mechanically from a nonhomogeneous mixture. It may consist of a single substance or of a mixture of substances. The three basic phases of matter are SOLID, LIQUID, and GAS; other phases that are considered to exist include crystalline (see CRYSTAL), colloidal (see COLLOID), GLASS, amorphous, and PLASMA. The different phases of a pure substance are related to each other in terms of TEMPERATURE and PRESSURE. For example, if the temperature of a solid is raised enough, or the pressure is reduced enough, it will become a liquid.

phase In wave motion, the fraction of the time required to complete a full cycle that a point completes after last passing through the reference position. Two PERIODIC MOTIONS are said to be in phase when corresponding points of each reach maximum or minimum displacements at the same time. If the crests of two waves pass the same point at the same time, they are in phase for that position. If the crest of one and the trough of the other pass the same point at the same time, the phase angles differ by 180° and the waves are said to be of opposite phase. Phase differences are important in alternating electric current technology (see ALTERNATING CURRENT).

Phazania See FEZZAN

pheasant Any of about 50 species of mostly long-tailed birds in the family Phasianidae (order Galliformes), chiefly Asian but naturalized elsewhere. Most species inhabit open woodlands and brushy fields. All have a hoarse call. The feet and lower legs are unfeathered. Females are inconspicuous. Most males are strikingly coloured and have one or more leg spurs, and some have a fleshy facial ornament. Males sometimes fight to the death for a harem of hens. Male ring-necked or common pheasants (*Phasianus colchicus*), 35 in. (90 cm) long, have a streaming tail, coppery breast, purplish green neck, and ear tufts; they are widespread in the northern U.S. Japanese green pheasants (*P. versicolor*) call in concert when an earthquake is imminent.

Common pheasant (*Phasianus colchicus*)
H. REINHARD—BRUCE COLEMAN INC./EB INC.

Pheidias See PHIDIAS

phenol \'fē-ˌnōl, 'fē-ˌnȯl\ Any of a class of organic compounds with a hydroxyl group (–OH; see FUNCTIONAL GROUP) attached to a carbon atom in a ring of an AROMATIC COMPOUND. The simplest one, CARBOLIC ACID (C_6H_5OH), is also called phenol; its most important reaction is with FORMALDEHYDE, with which it forms widely used polymers called phenol-formaldehyde (phenolic) resins. Phenols are similar to ALCOHOLS but form stronger hydrogen bonds (see BONDING), so they dissolve more readily in water and boil at higher temperatures. They may be colourless liquids or white solids; many have a sharp, spicy odour. Some are found in ESSENTIAL OILS. Phenols with higher MOLECULAR WEIGHTS and phenol derivatives have supplanted phenol itself as industrial ANTISEPTICS (germicidal cleaners). See also LEO BAEKELAND.

phenol See CARBOLIC ACID

phenomenalism View that statements about material objects are reducible to statements about actual and possible sensations, or SENSE-DATA. According to phenomenalists, a material object is not a mysterious something "behind" the appearances presented in sensation. If it were, the material world would be unknowable; indeed, the term *matter* is unintelligible unless it somehow can be defined by reference to sensations. In speaking about a material object, then, reference must be made to a very large system of possible sense-data, only some of which (if any) are ever actualized. Thus the statement "There is a fire in the next room" would be analyzed as a series of hypothetical statements such as "If one were to enter the next room with one's eyes open, one would see a bright light of a yellowish orange colour." Some philosophers have objected that it is difficult to remove all references to material objects from the hypothetical statements to which material-object talk is supposedly reducible. See also GEORGE BERKELEY.

phenomenology Philosophical discipline originated by EDMUND HUSSERL. Husserl developed the phenomenological method to make possible "a descriptive account of the essential structures of the directly given." Phenomenology emphasizes the immediacy of experience, the attempt to isolate it and set it off from all assumptions of existence or causal influence and lay bare its essential structure. Phenomenology restricts the philosopher's attention to the pure data of consciousness, uncontaminated by metaphysical theories or scientific assumptions. Husserl's concept of the life-world—as the individual's personal world as directly experienced—expressed this same idea of immediacy. With the appearance of the *Annual for Philosophical and Phenomenological Research* (1913–30), under Husserl's editorship, his personal philosophizing flowered into an international movement. Its most notable adherents were MAX SCHELER and MARTIN HEIDEGGER.

phenotype \'fē-nə-ˌtīp\ All the observable characteristics of an organism, such as shape, size, colour, and behaviour, that result from the interaction of its GENOTYPE (total genetic makeup) with the environment. The phenotype may change throughout the life of an individual because of environmental changes and the changes associated with aging. Different environments can influence the development of inherited traits (e.g., size is affected by available food supply) and can alter expression by similar genotypes (e.g., twins brought up in dissimilar families may mature differently). Furthermore, not all inherited possibilities in the genotype are expressed in the phenotype, because some are the result of inactive, recessive, or inhibited genes. See also VARIATION.

phenylalanine \ˌfe-nᵊl-'a-lə-ˌnēn, ˌfē-nᵊl-'a-lə-ˌnēn\ One of the essential AMINO ACIDS, present in many common PROTEINS, especially HEMOGLOBIN. It is used in medicine and nutrition and as one of the two amino acids making up ASPARTAME. Persons with PHENYLKETONURIA do not metabolize phenylalanine properly and must adhere to a diet free of it.

phenylketonuria \ˌfe-nᵊl-ˌkē-tᵊn-'ůr-ē-ə\ **(PKU)** *or* **phenylpyruvic oligophrenia** \ˌfe-nᵊl-pī-ˌrü-vik-ˌäl-i-gō-'frē-nē-ə\ Inability to normally metabolize PHENYLALANINE, the accumulation of which interferes with normal childhood development. Central NERVOUS SYSTEM effects include mental retardation and seizures (see EPILEPSY), with behavioral signs seen at four to six months of age. Abnormal metabolism also leads to low MELANIN levels, with light hair, eye, and skin colour. Tests detect this recessive genetic disorder (see CONGENITAL DISORDER; RECESSIVENESS) in two-thirds of the 1 in 10,000 newborns born with high levels of phenylalanine. Keeping

© 2006 Encyclopædia Britannica, Inc.

phenylalanine out of the diet (by total avoidance of meat, dairy, and high-protein foods and ASPARTAME) until adolescence permits normal development. Protein is supplied in a phenylalanine-free formula. Pregnant women with PKU must resume the diet to prevent severe damage to the unborn child.

pheromone \'fer-ə-ˌmōn\ Any chemical compound secreted by an organism in minute amounts to elicit a particular reaction from other organisms of the same species. Pheromones are widespread among insects and vertebrates (except birds) and are present in some fungi, slime molds, and algae. The chemicals may be secreted by special GLANDS or incorporated into other substances (e.g., urine), shed freely, or deposited in selected locations. Pheromones are used to bring creatures together (e.g., in termite, bee, and ant colonies), lead them to food (e.g., in scent trails laid by ants), signal danger (e.g., when released by wounded fish to alert others), attract a mate and elicit sexual behaviour (numerous examples, possibly including humans), and influence sexual development (in many mammals and certain insects). Alarm pheromones often last a shorter time and travel a shorter distance than other types. In vertebrates, chemical stimuli often influence parent-young responses. Sex-attractant pheromones are used in certain products to lure and trap unwanted or harmful insects.

Phi Beta Kappa Leading academic honour society in the U.S., which draws its membership from college and university students. The oldest Greek-letter society in the U.S., it was founded in 1776 as a secret literary and philosophical society at the College of WILLIAM AND MARY. It became an honour society in the 19th century. Membership is now based on general scholarship, and new members are usually elected by Phi Beta Kappa faculty.

Phibunsongkhram \'pē-bùn-sòŋ-ˌkräm**, Luang** *orig.* **Plaek Khittasangkha** (b. July 14, 1897, near Bangkok, Siam—d. June 12, 1964, Tokyo, Japan) Field marshal and premier of Thailand (1938–44, 1948–57). After military training in France, he helped organize the PROMOTERS REVOLUTION of 1932, which ended absolute monarchy in what was then Siam; in 1939 he changed the country's name to Thailand. As premier during World War II, he allied himself with Japan, but, as the war turned against Japan, his government collapsed. The army seized power in 1947, and he was reinstalled as premier in 1948. Opposed to communism, he further allied Thailand to the West during the Cold War by helping establish the SOUTHEAST ASIA TREATY ORGANIZATION. He was ousted by his military colleagues in 1957 and fled to Japan.

Phidias \'fid-ē-əs\ *or* **Pheidias** \'fī-dē-əs\ (fl. c. 490–430 BC, Athens, Greece) Greek sculptor. Placed in charge of the great building program initiated by PERICLES in Athens, he supervised and probably designed the overall sculptural decoration of the PARTHENON. He also created its most important religious images, including the colossal statue of the Athena Parthenos (438–436 BC). Many of the Parthenon's sculptures (the ELGIN MARBLES) are now in the British Museum. Ancient writers considered his masterpiece to be the statue of Zeus (c. 430 BC) for the Temple of Zeus at Olympia. He initiated the idealistic Classical style that distinguishes Greek art in the later 5th and 4th centuries BC.

"Heracles," marble statue produced in the workshop of Phidias, from the eastern pediment of the Parthenon, the Acropolis, Athens, *c.* 5th century BC; in the British Museum

Philadelphia City (pop., 2000: 1,517,550) and port, southeastern Pennsylvania, U.S., at the confluence of the DELAWARE and Schuylkill rivers. The site was occupied by the DELAWARE Indians before WILLIAM PENN founded the city in 1682. It was the capital of Pennsylvania 1683–1799 and the capital of the U.S. between 1790 and 1800. It played a prominent role in opposing British policies and was the site of the first and second CONTINENTAL CONGRESSES, the signing of the DECLARATION OF INDEPENDENCE, and the CONSTITUTIONAL CONVENTION. The population grew in the 18th century, with many immigrants from Scotland, Ireland, and Germany. It was the largest and most important city of the U.S. in the 19th century and a centre of the anti-slavery movement. In 1876 it was the site of the U.S. Centennial Exposition. It is also the site of the U.S.'s oldest art museum (the Pennsylvania Academy of the Fine Arts, founded in 1805) and the first U.S. hospital (the Pennsylvania Hospital, founded in 1751). It is the largest city in the state and a centre of commerce, finance, industry, and culture. Its numerous educational institutions include the University of PENNSYLVANIA.

Philadelphia Inquirer Morning newspaper, long one of the most influential dailies in the eastern U.S. Founded in 1847 as the *Pennsylvania Inquirer*, it took its present name c. 1860. It was a strong supporter of the Union in the American Civil War. In the 19th and early 20th centuries it survived circulation wars by providing broad news coverage and by constantly modernizing its plant and equipment. Bought by Moses Annenberg in 1936, it stayed in his family's hands until 1969, when it was acquired by John S. Knight. In 1974 it became part of the merged Knight-Ridder Newspapers group.

Philae \'fī-lē\ Former island of the NILE RIVER in Upper Egypt. It was sacred to ISIS and contained many temples, the earliest dating from the 7th century BC. After the completion of the ASWAN HIGH DAM in 1970, the temples were moved to the nearby island of Agilkia before Philae was submerged by the waters of Lake NASSER.

philanthropy Voluntary, organized efforts intended for socially useful purposes. Philanthropic groups existed in the ancient civilizations of the Middle East, Greece, and Rome: an endowment supported Plato's Academy (c. 387 BC) for some 900 years; the Islamic *waqf* (religious endowment) dates to the 7th century AD; and the medieval Christian church administered trusts for benevolent purposes. Merchants in 17th- and 18th-century western Europe founded organizations for worthy causes. Starting in the late 19th century, large personal fortunes led to the creation of private foundations that bequeathed gifts totaling millions and then billions in support of the arts, education, medical research, public policy, social services, environmental causes, and other special interests. See ANDREW CARNEGIE; B'NAI B'RITH; BILL GATES; GEORGE PEABODY; ROCKEFELLER FOUNDATION; STRAUS FAMILY.

Philaretus See Arnold GEULINCX

philately \fə-'la-tᵊl-ē\ Collection and study of postage stamps. The first postage stamps were issued in England in 1840, and in the U.S. in 1842. Stamp collectors usually specialize, collecting stamps of one country, one period of time, or one subject (e.g., birds, flowers, art). Value depends on rarity and condition. An issue of stamps that includes a printer's error may have increased value.

Inverted airplane airmail stamp, U.S., 1918

LEE BOLTIN

Philby, Kim *orig.* **Harold Adrian Russell** (b. Jan. 1, 1912, Ambāla, India—d. May 11, 1988, Moscow, Russia, U.S.S.R.) British intelligence officer and Soviet spy. He became a communist at the University of Cambridge in the 1930s, and in 1933 he became a Soviet agent. Recruited into the MI-6 section of British intelligence by GUY BURGESS (1940), he became head of counterespionage operations. In 1949 he was sent to Washington, D.C., as top liaison officer between British and U.S. intelligence services. He revealed top-secret information to the Soviets and in 1951 warned Burgess and Donald Maclean (1913–83) that they were under suspicion, enabling them to escape. Philby himself came under suspicion and was dismissed from MI-6 in 1955. He worked as a journalist in Beirut, then in 1963 he fled to the Soviet Union, where he worked for the KGB and rose to the rank of colonel. The most successful Soviet double agent of the Cold War period, he was responsible for the deaths of many Western agents.

Philemon and Baucis \fi-'lē-mən...'bò-sis\ In GREEK MYTHOLOGY, a pious old couple in Phrygia. When ZEUS and HERMES, disguised as wayfarers, had been turned away by the couple's richer neighbors, Philemon and Baucis extended them hospitality. As a reward they were spared when a flood swept the countryside. Their cottage was turned into a temple, and they became priest and priestess of it. Years later they were granted their wish to die at the same moment, and they were turned into trees.

Philip (of Swabia) *German* **Philipp** (b. 1178—d. June 21, 1208, Bamberg, Ger.) German HOHENSTAUFEN king (1198–1208). The youngest son of FREDERICK I Barbarossa, he was elected German king on the death

© 2006 Encyclopædia Britannica, Inc.

of Emperor Henry VI. The rival Welf dynasty elected Otto IV king, and a civil war broke out. A truce was finally called in 1207; Innocent III recognized Philip and promised to crown him emperor (1208), but Philip was murdered first.

Philip II *or* **Philip of Macedon** (b. 382—d. 336 BC, Asia Minor) Eighteenth king of Macedonia (359–336), father of Alexander the Great. Appointed regent for his nephew, he seized the throne. He initially promoted peace with his neighbours, using the time gained thereby to build his forces and introducing innovations in arms, tactics, and training and stabilizing his western frontier. His movements on the eastern frontier provoked the Greeks into forming a coalition against him. He intervened in the Sacred War to free Delphi from the Phocians, becoming the ally of Thebes and the Thessalian League, whose president he became. Demosthenes turned Athens against him with his *Philippics* (346–342), and Thebes also came to view Philip as a threat. He defeated both at the Battle of Chaeronea, becoming leader of all Greece. He formed the Greek states into the League of Corinth to attack Persia but was undone by family politics. After he took a second wife, his first wife, Olympias, left him, taking Alexander. Philip was assassinated by a Macedonian nobleman, possibly in collusion with Olympias and Alexander.

Philip II *French* **Philippe** *known as* **Philip the Bold** (b. Jan. 17, 1342, Pontoise, France—d. April 27, 1404, Halle, Brabant) Duke of Burgundy (1363–1404). He was granted the duchy of Burgundy by his father, John II, and by marriage and purchase he acquired additional lands in northern and central France, Flanders, and the Netherlands. He shared the government with his brothers during the minority of his nephew Charles VI, ensuring friendly relations with England and Germany. When Charles went insane (1392), Philip became virtual ruler of France. He formed an alliance with England (1396) and withdrew his support of the Avignon papacy (1398).

Philip II *French* **Philippe** *known as* **Philip Augustus** (b. Aug. 21, 1165, Paris—d. July 14, 1223, Mantes) French king (1179–1223). The first of the great Capetian kings, he gradually reconquered the French territories held by the kings of England. He joined with Richard I on the Third Crusade, but the two kings soon quarreled. Philip returned to France (1191) and attacked English possessions; imprisoned in Austria on his journey home, Richard was freed in 1194 and promptly went to war with the French. When Richard was killed (1199), his brother John signed a treaty with Philip (1200), but within two years France and England were again at war. Philip conquered Normandy (1204) and subdued Maine, Touraine, Anjou, and most of Poitou (1204–05). John later organized a coalition against France, but he was defeated by Philip at the Battle of Bouvines (1214). Philip also expanded his territory into Flanders and Languedoc.

Philip II *Spanish* **Felipe** \fā-'lē-pā\ (b. May 21, 1527, Valladolid, Spain—d. Sept. 13, 1598, El Escorial) King of Spain (1556–98) and of Portugal (as Philip I, 1580–98). The son of Emperor Charles V, Philip received from his father the duchy of Milan (1540), the kingdoms of Naples and Sicily (1554), the Netherlands (1555), and Spain and its overseas empire (1556). He ruled from the Netherlands from 1555 and waged a successful war against France in 1557. From 1559 he ruled from Spain, where he built the palace of El Escorial and encouraged Spain's literary golden age. He was a champion of the Counter-Reformation but failed to put down rebellions in the Netherlands (from 1568) and to conquer England, suffering the defeat of the Spanish Armada (1588). He gained a victory in the Mediterranean with the defeat of the Ottoman offensive at the Battle of Lepanto (1571) and unified the Iberian Peninsula as king of Portugal from 1580. During his reign the Spanish empire attained its greatest power, extent, and influence.

ALINARI/ART RESOURCE, NEW YORK

Philip III *French* **Philippe** *known as* **Philip the Good** (b. July 31, 1396, Dijon, Burgundy—d. June 15, 1467, Bruges) Duke of Burgundy (1419–67). The most important of the Valois dukes of Burgundy, he founded the Burgundian state that rivaled France in the 15th century. He confirmed his right to Burgundy by signing the Treaty of Troyes with Henry V of England (1420), and he maintained an alliance with England, breaking it only during his unsuccessful attempt to capture Calais (1435–39). Philip avoided conflict with France and instead attacked his smaller neighbors, conquering Hainaut, Brabant, Holland and Zeeland, and Luxembourg by 1443. A renowned patron of the arts, he presided over one of Europe's most extravagant courts.

Philip III *Spanish* **Felipe** (b. April 14, 1578, Madrid, Spain—d. March 31, 1621, Madrid) King of Spain and of Portugal (1598–1621). The son of Philip II, he was an indifferent ruler and allowed royal favourites to govern in his place. From 1609 his government continued the policy of expelling the Moriscos (Christians of Moorish ancestry), which caused serious economic problems. The huge sums he spent on court entertainments exacerbated Spain's growing economic problems.

Philip IV *French* **Philippe** *known as* **Philip the Fair** (b. 1268, Fontainebleau, France—d. Nov. 29, 1314, Fontainebleau) King of France (1285–1314). On inheriting the French throne, he modeled himself on his grandfather, Louis IX. He was also king of Navarre (as Philip I, 1284–1305), ruling jointly with his wife, Joan I of Navarre. War with England (1294–1303) ended with a peace treaty and the betrothal of his daughter to the future Edward II. Philip forced a harsh treaty on Flanders in 1305. He conducted a long struggle with Boniface VIII (1297–1303) that led to the breakdown of the medieval papacy. He was pacified by succeeding popes, including Clement V, who began the Avignon papacy. Philip expelled the Jews from France (1306), and his persecution of the Knights Templar in 1307 led to their suppression by the pope four years later.

Philip IV *Spanish* **Felipe** (b. April 8, 1605, Valladolid, Spain—d. Sept. 17, 1665, Madrid) King of Spain (1621–65) and of Portugal (as Philip II, 1621–40). He succeeded his father, Philip III, and left the administration of his rule to his chief ministers, the duke de Olivares (1621–43) and the duke's nephew Luis Méndez de Haro (1643–61). Spain's industry and commerce declined, and wars against Holland, France, and Germany further drained Spain's economy. Portugal regained its independence (1640), and Holland was lost by the Peace of Westphalia (1648). A poet and patron of the arts, Philip was the friend and frequent subject of Diego Velázquez.

Philip V (b. 238—d. 179 BC, Amphipolis, Macedonia) King of Macedonia (221–179). Son of Demetrius II, he succeeded Antigonus Doson. He supported the Hellenic League against Sparta, Aetolia, and Elis (220–217), allying himself with Hannibal in 215 and attacking Roman client states in Illyria. Rome responded in the First Macedonian War. Intrigue against Egypt and Philip's unsuccessful sea battle with Rhodes and Pergamum led Rome to initiate the Second Macedonian War, in which it prevailed at Cynoscephalae (197). Rome's harsh terms eased after Philip made common cause against its Greek foes. Fearing that Rome would turn on him again, he attempted to expand by attacking the Balkans (184, 183, 181); he died on a fourth attempt in 179.

Philip V *Spanish* **Felipe** *orig.* **Philippe, duke d'Anjou** (b. Dec. 19, 1683, Versailles, France—d. July 9, 1746, Madrid, Spain) King of Spain (1700–46). Grandson of Louis XIV of France and great-grandson of Philip IV of Spain, Philip was named to succeed the childless Charles II as king in 1700. Louis's refusal to exclude Philip from the line of succession to the French throne led to the War of the Spanish Succession. The resultant Peace of Utrecht (1713) deprived Philip of the Spanish Netherlands and parts of Italy, but it left him Spain and Spanish America. Initially influenced by his French advisers through his wife, Maria Luise of Savoy, after her death (1714) he was influenced by his second wife, Elizabeth Farnese, and her Italian advisers. Attempts to secure territories in Italy caused the formation of the Quadruple Alliance (1718) against Spain. Philip later brought Spain into the War of the Austrian Succession. His reign marked the beginning of the Bourbon dynasty in Spain (see house of Bourbon).

Philip VI *or* **Philip of Valois** \väl-'wä\ *French* **Philippe de Valois** (b. 1293—d. Aug. 22, 1350, near Paris) First French king of the Valois dynasty (1328–50). He continued Capetian efforts to centralize the state but made concessions to the nobility, clergy, and bourgeoisie. His knights killed thousands of rebellious Flemings at the Battle of Cassel (1328). His disputes with Edward III of England led to the outbreak of the Hundred Years' War (1337). French defeats at the Battles of Sluys (1340) and Crécy

(1346) caused crises in France until the spread of the Black Death (from 1348) overshadowed other considerations.

Philip, duke of Edinburgh *known as* **Prince Philip** (b. June 10, 1921, Corfu, Greece) Husband of Queen Elizabeth II of Britain. Son of Prince Andrew of Greece and Denmark (1882–1944) and Princess Alice (1885–1969), a great-granddaughter of Queen Victoria, he was reared in Britain. In World War II he served in combat with the Royal Navy. In 1947 he became a British subject, taking his mother's surname, Mountbatten, and renouncing his right to the Greek and Danish thrones. He married Princess Elizabeth in 1947 and continued on active service in the navy until her accession to the throne in 1952. Charles, prince of Wales, is their son.

Philip Morris tobacco companies Two of the world's largest tobacco companies, comprising Philip Morris International Inc. and Philip Morris USA Inc., both of which are owned by U.S. holding company Altria Group, Inc. Drawing on the name of Philip Morris, a London tobacconist who opened shop in the mid 1800s, the company was incorporated in New York in 1902 as a British-American venture; ownership shifted to American stockholders in 1919, when the company was renamed Philip Morris & Co. It became a principal maker of cigarettes in the 1930s and '40s, and the popularity of its Marlboro cigarettes grew with its use of cowboy imagery to advertise them in the mid 1950s. The company developed other American cigarette brands such as Parliament, Virginia Slims, and Merit. Overseas ventures in the manufacture and marketing of cigarettes led to the formation of Philip Morris International, which by 1972 had established sales in many parts of the world, including the former Soviet Union. Its global brands include Chesterfield and Lark.

Philip of Hesse (b. Nov. 13, 1504, Marburg, Hesse—d. March 31, 1567, Kassel, Ger.) German nobleman, landgrave of Hesse, and champion of the Reformation. His skillful management made Hesse a sovereign state. Won to the cause of Martin Luther, Philip became a Reformation leader in Germany. In 1529 he founded the first Protestant university at Marburg (1529), and in 1531 he united several princes and towns to form the Schmalkaldic League. However, his folly in contracting a bigamous second marriage damaged his reputation. After the emperor crushed the league, Philip was imprisoned (1547–52). Long imprisonment undermined his influence and his health, though he finally saw Lutheranism gain a position of legal equality with Catholicism in the Peace of Augsburg (1555). In the year of his death, he divided Hesse among his four sons.

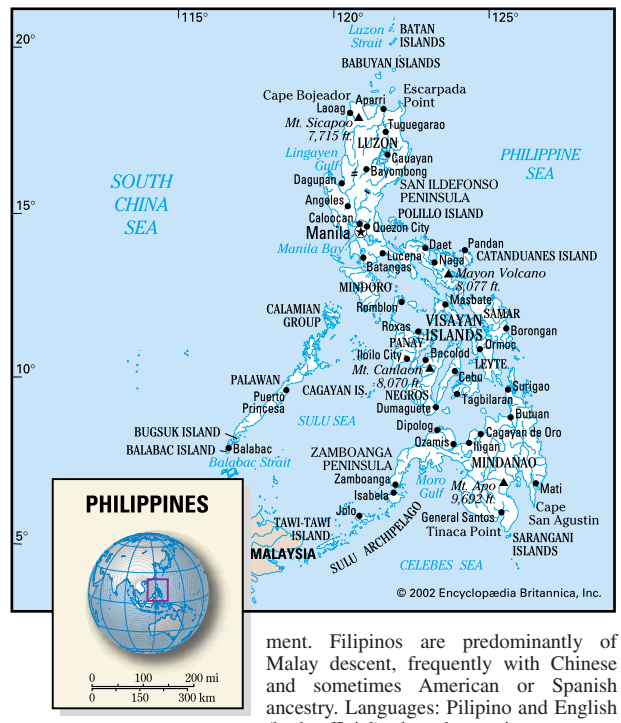
Philipon \fē-lē-ˈpōⁿ\ **, Charles** (b. April 19, 1802, Lyon, France—d. Jan. 25, 1862, Paris) French caricaturist, lithographer, and journalist. An excellent draftsman with a fertile sense of satire and vigorous political opinions, he published a series of journals of political satire. *La Caricature*, which he introduced in 1830, was suppressed in 1835; *Le Charivari*, introduced in 1832, became the inspiration for *Punch*, subtitled *The London Charivari*. His drawing showing the transformation of Louis-Philippe into the shape of a pear established the pear as the common symbol for the king. He attracted and inspired the best caricaturists in France, including Honoré Daumier and Gustave Doré.

Philippe Égalité See duc d'Orléans



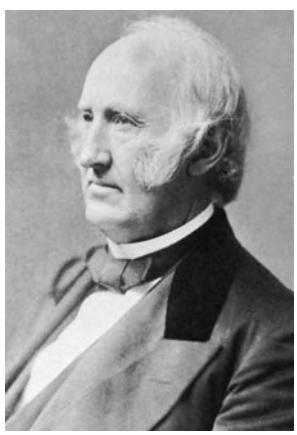
Philippi \ˈfi-lə-ˌpī\ Ruined hill town, northern central Macedonia, Greece. In c. 357 BC it was fortified by King Philip II to control nearby gold mines. In 42 BC it was the scene of the decisive Roman battle in which Mark Antony and Octavian (later Augustus) defeated Brutus and Cassius, the leading assassins of Julius Caesar. Many Christian ruins, especially of the 5th–6th century AD, are spread over the site. St. Paul preached the gospel to Christian converts there.

Philippine-American War *or* **Philippine Insurrection** (1899–1902) War between the U.S. and Filipino revolutionaries, which may be seen as a continuation of the Philippine Revolution against Spanish rule. The Treaty of Paris (1898), which concluded the Spanish-American War, transferred Philippine sovereignty from Spain to the U.S.; but it was not recognized by Filipino leaders, whose troops controlled the entire archipelago except the capital city of Manila. By 1902 U.S. troops had defeated the insurgency, though sporadic fighting continued until 1906. The U.S. retained possession of the islands (except for the Japanese occupation during World War II) until 1946.

Philippine Revolution (1896–98) Filipino independence struggle that failed to end Spanish colonial rule in the Philippines. There had been numerous quasi-religious uprisings during the more than 300 years of colonial rule, but the late 19th-century writings of Jose Rizal and others helped stimulate a more broad-based movement for Philippine independence. Spain was unwilling to reform its colonial government, and armed rebellion broke out in 1896. Rizal, who had advocated reform but not revolution, was shot for sedition; his martyrdom fueled the revolution. The rebel forces of Emilio Aguinaldo were unable to defeat the Spanish, but the Filipinos proclaimed their independence in the wake of Spain's defeat in the Spanish-American War (1898). The Treaty of Paris ceded the Philippines to the U.S., however, and Aguinaldo continued the revolutionary struggle, now against the U.S.; he gave up the struggle after being arrested in 1901. See also Philippine-American War.

Philippine Sea \ˈfil-ə-ˌpēn**, Battle of the** (June 19–20, 1944) Naval battle of World War II between the U.S. and Japan. On June 19, after the U.S. invaded Saipan, Japan sent 430 planes to destroy U.S. ships but suffered heavy losses from U.S. carrier aircraft before retiring the next day. Called the greatest carrier battle of the war, it ended with the loss of over 300 Japanese planes and two carriers, while U.S. aircraft losses totaled 130, with minor damage to ships.

Philippines *officially* **Republic of the Philippines** Island country, western Pacific Ocean, on an archipelago off the southeast coast of Asia. Area: 122,121 sq mi (316,294 sq km). Population (2005 est.): 84,191,000. Capital: Manila; Quezon City is the designated centre of national government. Filipinos are predominantly of Malay descent, frequently with Chinese and sometimes American or Spanish ancestry. Languages: Pilipino and English (both official); the other main groups are Cebuano, Ilocano, Hiligaynon, and Bicol. Religions: Christianity (predominantly Roman Catholic; also Protestant, other Christians); also Islam. Currency: Philippine peso. The Philippines consist of about 7,100 islands and islets. The two principal islands are Luzon in the north and Mindanao in the south. The Visayan group is in the central Philippines, Mindoro is directly south of Luzon, and Palawan is isolated in the west. The topog-



© 2006 Encyclopædia Britannica, Inc.

raphy is varied; inactive volcanoes and mountain ranges are the main features of most of the larger islands. The country has a predominantly market economy based largely on agriculture, light industries, and services. The Philippines is a republic with two legislative houses; its chief of state and head of government is the president. First visited by Ferdinand Magellan in 1521, the islands were colonized by the Spanish, who retained control until the Philippines were ceded to the U.S. in 1898 following the Spanish-American War. The Commonwealth of the Philippines was established in 1935 to prepare the country for political and economic independence, which was delayed by World War II and the invasion of Japanese troops. The islands were liberated by U.S. forces in 1944–45, and the Republic of the Philippines was proclaimed in 1946, with a government patterned on that of the U.S. In 1965 Ferdinand Marcos was elected president. He declared martial law in 1972, which lasted until 1981. After 20 years of dictatorial rule, Marcos was driven from power in 1986. Corazon Aquino became president and instituted a period of democratic rule that continued with the elections of subsequent presidents. The government has tried to come to terms with Muslim independence fighters in the southern islands by establishing the Muslim Mindanao autonomous region in southwestern Mindanao and nearby islands.

Philips Electronics NV *in full* **Royal Philips Electronics NV** *Dutch* **Koninklijke Philips Electronics NV** Major Dutch manufacturer of consumer electronics, household appliances, lightbulbs, and imaging equipment. It was founded by Dutch engineer Gerard Philips in 1891 to make incandescent lamps and incorporated in 1912 under the name NV Philips Gloeilampenfabrieken (Dutch: Philips Incandescent Light Works). Its strong research efforts were consolidated in 1914 in a separate organization that became the Philips Research Laboratories. It began manufacturing radios in the 1920s, and after World War II it marketed stereo equipment, televisions, and other products under such brand names as Philips, Magnavox, and Norelco. Philips helped create the compact disc, the cassette tape, and the videocassette recorder, and it is a leading supplier of diagnostic medical equipment. Renamed Philips Electronics NV in 1991, the firm has manufacturing and marketing subsidiaries throughout the world.

Philistine Member of a group of Aegean origin that settled on the southern coast of Palestine. The Philistines first settled the region during the 12th century BC, about the time the Israelites arrived. They lived in five cities (the Pentapolis) that together made up Philistia, from which the Greeks derived the name Palestine. They first fought the Israelites in the 11th century BC. In the 10th century BC they were defeated by the Israelite king David. They were later ruled by Assyria, Egypt, Babylonia, Persia, Greece, and Rome. The group appears prominently in the Old Testament—from which much of the information about them is derived—though they left no written records of their own. It is from these many and coloured biblical references that the term assumes its modern significance in the English language.

Phillips, Irna (b. July 1, 1901, Chicago, Ill., U.S.—d. Dec. 22, 1973, Chicago) U.S. radio producer and director. She worked as a teacher before turning to writing for radio and creating the first soap opera, *Painted Dreams* (1930). Later known as "Queen of the Soaps," she introduced techniques such as the organ bridge to give a smooth flow between scenes and the cliff-hanger ending to each episode. Her daytime radio serials included *Today's Children* (1933–38, 1943–50); *The Guiding Light* (1937–56; television, 1952–); *Road of Life* (1937–59); and *Women in White* (1938–42, 1944–48), the first hospital soap opera. She also created the television serials *As the World Turns* (1956) and *Another World* (1964).

Wendell Phillips
LIBRARY OF CONGRESS, WASHINGTON, D.C.

Phillips, Wendell (b. Nov. 29, 1811, Boston, Mass., U.S.—d. Feb. 2, 1884, Boston) U.S. reformer and abolitionist. A wealthy graduate of Harvard Law School, he sacrificed social status and a prospective political career in order to join the antislavery movement. His reputation as an inspirational orator was established with his address at an abolitionist meeting in 1837 to protest the murder of Elijah Lovejoy. He became an associate of William Lloyd Garrison and lectured widely at meetings of the American Anti-Slavery Society, serving as its president from 1865 to 1870. He also advocated prohibition, woman suffrage, prison reform, regulation of corporations, and labour reform.

Phillips curve Graphic representation of the inverse relationship between the rate of unemployment and the rate of change in money wages. In 1958 A. W. Phillips plotted British unemployment rates and rates of change in money wages and found that when unemployment rates were low, employers were more likely to bid wages up to lure good employees away from their competitors. He claimed that this was a stable relationship. In the 1960s macroeconomists substituted the rate of price inflation for the rate of change in money wages and promulgated the curve as a tool of economic policy, arguing that the simultaneous achievement of low unemployment and low inflation was problematic. Monetarists, including Milton Friedman, claimed the relationship was not stable.

Philo Judaeus \'fī-lō-jü-'dē-əs\ *or* **Philo of Alexandria** (b. 10–15 BC, Alexandria—d. AD 45–50, Alexandria) Greek-speaking Jewish philosopher. A leader of the Jewish community of Alexandria, he led a delegation to the emperor Caligula c. AD 40 to ask that Jews not be forced to worship him. His writings provide the clearest view of this development of Judaism in the Diaspora. His philosophy was influenced by Plato, Aristotle, the Neo-Pythagoreans, the Cynics, and Stoicism. In his view of God, Philo was original in insisting on an individual Providence able to suspend the laws of nature, in contrast to the prevailing Greek view of a universal Providence which is itself subject to the laws of nature. As the first to attempt to synthesize revealed faith and philosophic reason, he occupies a unique position in the history of philosophy. He is regarded as the most important representative of Hellenistic Judaism and a forerunner of Christian theology.

philodendron \ˌfi-lə-'den-drən\ Any of about 200 species of climbing herbaceous plants that make up the genus *Philodendron* in the arum family, native to the New World tropics. Some are popular indoor foliage plants in colder areas and landscape plants in warmer climates. The leaves are often large and smooth-edged to variously lobed and cut. The inflorescence is seldom produced indoors. Many forms are available in cultivation, foremost among them the common heart-leaf (*Philodendron scandens oxycardium*). Large varieties include the spade-leaf philodendron (*P. domesticum* or *P. hastatum*), with triangular leaves up to 2 ft (60 cm) long, and the selloum philodendron (*P. selloum*), with deeply cut leaves up to 3 ft (1 m) long.

Philopoemen \ˌfi-lə-'pē-mən\ (b. c. 253, Megalopolis, Arcadia—d. 182 BC, Messene, Messenia) General of the Achaean League. Elected federal cavalry commander (c. 210) and general of the league (208–207, 206–205, 201–200), he won victories against the Aetolians and the Spartans, using Macedonian armour and tactics. In his fourth generalship (193–192) he failed against the Spartans by sea but crushed their army on land. The Roman Flamininus stopped his capture of Sparta, but when the Spartan leader was assassinated Philopoemen added that state to the confederation. He was captured when Messene rebelled and given poison.

philosophe \ˌfē-lə-'zȯf\ Any of the literary men, scientists, and thinkers of 18th-century France who were united, in spite of divergent personal views, in their conviction of the supremacy and efficacy of human reason. Inspired by the philosophy of René Descartes, the skepticism of the libertines (or freethinkers), and the popularization of science by Bernard de Fontenelle (1657–1757), they were dedicated to the advancement of science and secular thought and to the open-mindedness of the Enlightenment. They included Voltaire, Montesquieu, Denis Diderot, Jean Le Rond d'Alembert, and Jean-Jacques Rousseau. The philosophes compiled the *Encyclopédie*, one of the great intellectual achievements of the century.

philosophical anthropology Study of human nature conducted by the methods of philosophy. It is concerned with questions such as the status of human beings in the universe, the purpose or meaning of human life, and whether humanity can be made an object of systematic study. Among the most important works in philosophical anthropology are *Man's Place in the Universe* (1928), by Max Scheler; *The Levels of the Organic and Man* (1928), by Helmuth Plessner; *Being and Time* (1929), by Martin Heidegger; *Der Mensch* (1940), by Arnold Gehlen; and *An Essay on Man* (1944), by Ernst Cassirer.

© 2006 Encyclopædia Britannica, Inc.

philosophy Critical examination of the rational grounds of our most fundamental beliefs and logical analysis of the basic concepts employed in the expression of such beliefs. Philosophy may also be defined as reflection on the varieties of human experience, or as the rational, methodical, and systematic consideration of the topics that are of greatest concern to humanity. Philosophical inquiry is a central element in the intellectual history of many civilizations. Difficulty in achieving a consensus about the definition of the discipline partly reflects the fact that philosophers have frequently come to it from different fields and have preferred to reflect on different areas of experience. All the world's great religions have produced significant allied philosophical schools. Western philosophers such as THOMAS AQUINAS, GEORGE BERKELEY, and SØREN KIERKEGAARD regarded philosophy as a means of defending religion and dispelling the antireligious errors of MATERIALISM and RATIONALISM. PYTHAGORAS, RENÉ DESCARTES, and BERTRAND RUSSELL, among others, were primarily mathematicians whose views of reality and knowledge were influenced by mathematics. Figures such as THOMAS HOBBES, JEAN-JACQUES ROUSSEAU, and JOHN STUART MILL were mainly concerned with POLITICAL PHILOSOPHY, whereas SOCRATES and PLATO were occupied chiefly by questions in ETHICS. The PRE-SOCRATICS, FRANCIS BACON, and ALFRED NORTH WHITEHEAD, among many others, started from an interest in the physical composition of the natural world. Other philosophical fields include AESTHETICS, EPISTEMOLOGY, LOGIC, METAPHYSICS, philosophy of MIND, and PHILOSOPHICAL ANTHROPOLOGY. See also ANALYTIC PHILOSOPHY; CONTINENTAL PHILOSOPHY; FEMINIST PHILOSOPHY; philosophy of SCIENCE.

phlebitis \fli-'bī-təs\ INFLAMMATION of the wall of a VEIN. Causes include nearby infection, trauma, surgery, and childbirth. The area over the vein is painful, swollen, red, and hot. A tender, cordlike mass may be felt under the skin. It usually occurs in surface veins in the lower leg and can be treated with pain relievers and bed rest, with mild exercise after inflammation subsides. Phlebitis can last for years; in such cases, irritation of the vein's inner lining leads to blood-clot formation, a condition known as thrombophlebitis (see THROMBOSIS). In deeper veins, this requires anticoagulants to prevent EMBOLISMS.

phloem \'flō-ˌem\ *or* **bast** Plant tissues that conduct foods made in the leaves to all other parts of the plant. Phloem is composed of several types of specialized cells, including sieve-tube cells and phloem fibers. Sieve tubes (columns of sieve-tube cells), which have perforated areas in their walls, provide the main channels in which food substances travel. Phloem fibers are long, flexible cells that make up the soft fibers used commercially (e.g., FLAX and HEMP).

phlox Any of about 65 species of plants (genus *Phlox*), belonging to the family Polemoniaceae, admired both in gardens and in the wilds for their clustered heads of flowers. All species but one are native to North America. Phlox is herbaceous, usually with oval or linear leaves; it has heads of massed tubular flowers with five flaring lobes. A few species are woody, but most are herbaceous annuals or perennials. Sizes range from the 5-ft-high (1.5-m) summer phlox (*P. paniculata*) to the 18-in.-high (45-cm) woodland PERENNIAL blue phlox (*P. divaricata*) to the low-creeping, freely branching, evergreen moss pink, or creeping phlox (*P. subulata*).

Moss pink (*Phlox subulata*)

Phnom Penh \pə-'nȯm-'pen\ City (pop., 1999 est.: 938,000), capital of Cambodia, at the junction of the Sab River (a tributary of the TONLE SAP) with the MEKONG RIVER. Founded in 1434 as the capital of the Khmer kingdom, it was abandoned several times before being reestablished in 1865. It was a cultural centre, with many institutions of higher learning. When the KHMER ROUGE came to power in Cambodia in 1975, they forced the city's population into the countryside to work in the fields. The city was repopulated beginning in 1979, and its educational institutions began a difficult period of recovery from the virtual extermination of Cambodia's educated class. Although the city is 180 mi (290 km) from the sea, it is a major port of the Mekong River valley; it is linked to the South CHINA SEA via a channel of the Mekong delta in Vietnam.

phobia Extreme and irrational fear of a particular object, class of objects, or situation. A phobia is classified as a type of ANXIETY disorder (a NEUROSIS), since anxiety is its chief symptom. Phobias are generally believed to result when fear produced by an original threatening situation (such as a near-drowning in childhood) is transferred to other similar situations (such as encounters with bodies of water), the original fear often being repressed or forgotten. BEHAVIOUR THERAPY can be helpful in overcoming phobias, the phobic person being gradually exposed to the anxiety-provoking object or situation in a way that demonstrates that no threat really exists.

Phocaea \fō-'sē-ə\ Ancient city on the Aegean Sea, northernmost of the IONIAN cities on the western coast of ASIA MINOR (now the Gulf of Izmir, Turkey). An important maritime state c. 1000–550 BC, it founded a number of colonies, including Massilia (MARSEILLE) in the western Mediterranean. It declined after the Persian conquest c. 545 BC. The modern town of Foça is located in an olive- and tobacco-growing region and attracts tourists to the ancient city's ruins.

Phocis \'fō-sis\ Ancient territory, central Greece. It extended north from the Gulf of Corinth over the range of Mount PARNASSUS to the Locrian Mountains, which formed the northern frontier. Its chief towns were Elateia, DELPHI, and Daulis. Mainly a pastoral region, its early history is obscure. Traditionally, the Phocians controlled the sanctuary and oracle at Delphi, but they lost control after a war with neighbouring Greek states c. 590 BC. Phocis was allied with SPARTA in the PELOPONNESIAN WAR (431–404 BC) and was conquered by PHILIP II of Macedon in 346 BC.

phoebe \'fē-bē\ Any of three species (family Tyrannidae, suborder Tyranni) of suboscine PASSERINES with a habit of twitching their tail when perching. The eastern phoebe (*Sayornis phoebe*) of North America is 7.5 in. (18 cm) long, plain brownish gray above, and paler below. Its call is a brisk "fee-bee" uttered over and over. It makes a mossy nest, strengthened with mud, on a ledge, often under a bridge. Say's phoebe (*S. saya*), a slightly larger bird with buff-hued underparts, occurs in open country in western North America. The black phoebe (*S. nigricans*), occurring from the southwestern U.S. to Argentina, is dark above with a white belly.

Phoenicia \fi-'nē-shə\ Ancient region, Middle East. Corresponding to modern Lebanon, with adjoining parts of Syria and Israel, its chief cities were Sidon, TYRE, and Berot (modern BEIRUT). The PHOENICIANS were notable merchants, traders, and colonizers (see CARTHAGE) of the Mediterranean region in the 1st millennium BC. The area was conquered successively by the Assyrians, Babylonians, Persians, and Macedonians under ALEXANDER THE GREAT. In 64 BC it was incorporated into the Roman province of Syria.

Phoenician \fi-'nē-shən\ One of a people of ancient PHOENICIA. They were merchants, traders, and colonizers who probably arrived from the Persian Gulf c. 3000 BC. By the 2nd millennium BC they had colonies in the Levant, North Africa, Anatolia, and Cyprus. They traded wood, cloth, dyes, embroideries, wine, and decorative objects; ivory and wood carving became their specialties, and the work of Phoenician goldsmiths and metalsmiths was well known. Their alphabet became the basis of the Greek alphabet.

Phoenix \'fē-niks\ City (pop., 2000: 1,321,045), capital of Arizona, U.S. It is located on the SALT RIVER. The river valley was occupied as early as AD 1300 by prehistoric Indians, now known as the HOHOKAM CULTURE, who disappeared in the early 15th century. A village was founded on the site in 1867 and incorporated as a city in 1881. It became the territorial capital in 1889 and state capital in 1912. There was widespread expansion after World War II, with the population quadrupling between 1950 and 1960. Phoenix occupies a semiarid valley surrounded by mountains and irrigated fields; its economy is based on farming, manufacturing, mining, and tourism.

phoenix In ancient Egypt and in classical antiquity, a fabulous bird associated with the worship of the sun. The Egyptian phoenix was said to be as large as an eagle, with brilliant scarlet and gold plumage and a melodious cry. Only one phoenix existed at a time, and it lived no less than 500 years. As its end approached, it built a nest of aromatic boughs and spices, set it on fire, and was consumed in the flames. From the pyre was born a new phoenix, which sealed its predecessor's ashes in an egg of myrrh and flew to HELIOPOLIS to deposit them on the altar of the sun god. The phoenix thus symbolized immortality. See also FENGHUANG.

Phoenix Islands Group of eight small coral atolls, KIRIBATI. Lying in the west-central Pacific Ocean 1,650 mi (2,650 km) southwest of Hawaii, the low, sandy atolls have a total land area of about 11 sq mi (28 sq km)

© 2006 Encyclopædia Britannica, Inc.

and were discovered in the 19th century by U.S. whaling ships. Annexed by Britain in 1889, they were joined to the Gilbert and Ellice Islands in 1937. They became part of independent Kiribati in 1979. Kanton is the only inhabited atoll.

Phoenix Park murders (May 6, 1882) Assassination in Dublin of British officials. The newly arrived chief secretary of Ireland, Lord Frederick Cavendish, and his undersecretary, Thomas Burke, were walking in Dublin's Phoenix Park when they were stabbed to death by members of the Invincibles, a radical Irish nationalist secret society. The murders caused a revulsion against terrorism and enabled Charles Stewart Parnell to subordinate the Irish National League to the more moderate Home Rule Party in Parliament.

phoneme Smallest unit of speech distinguishing one word (or word element) from another (e.g., the sound *p* in *tap*, which differentiates that word from *tab* and *tag*). The term is usually restricted to vowels and consonants, but some linguists include differences of pitch, stress, and rhythm. A phoneme may have variants, called allophones, that differ phonetically without affecting meaning. Phonemes may be recorded with special symbols, such as those of the International Phonetic Alphabet. In transcription, linguists conventionally place symbols for phonemes between slash marks: /p/.

phonetics Study of speech sounds. It deals with their articulation (articulatory phonetics), their acoustic properties (acoustic phonetics), and how they combine to make syllables, words, and sentences (linguistic phonetics). The first phoneticians were Indian scholars (c. 300 BC) who tried to preserve the pronunciation of Sanskrit holy texts. The Classical Greeks are credited as the first to base a writing system on a phonetic alphabet. Modern phonetics began with Alexander Melville Bell (1819–1905), whose *Visible Speech* (1867) introduced a system of precise notation for writing down speech sounds. In the 20th century linguists focused on developing a classification system that can permit comparison of all human speech sounds. Another concern of modern phonetics is the mental processes of speech perception.

phonics \'fä-niks\ Method of reading instruction that breaks language down into its simplest components. Children learn the sounds of individual letters first, then the sounds of letters in combination and in simple words. Simple reading exercises with a controlled vocabulary reinforce the process. Phonics-based instruction was challenged by proponents of "whole-language" instruction, a process in which children are introduced to whole words at a time, are taught using real literature rather than reading exercises, and are encouraged to keep journals in which "creative" spelling is permitted. A strong backlash against whole-language teaching polarized these two approaches to reading instruction. Many schools have since come to use a combination of the two techniques.

phonograph *or* **record player** Instrument for reproducing sounds. A phonograph record stores a copy of sound waves as a series of undulations in a wavy groove inscribed on its rotating surface by the recording stylus. When the record is played back, another stylus (needle) responds to the undulations, and its motions are then reconverted into sound. Its invention is generally credited to Thomas Alva Edison (1877). Stereophonic systems, with two separate channels of information in a single groove, became a commercial reality in 1958. All modern phonograph systems had certain components in common: a turntable that rotated the record; a stylus that tracked a groove in the record; a pickup that converted the mechanical movements of the stylus into electrical impulses; an amplifier that intensified these electrical impulses; and a loudspeaker that converted the amplified signals back into sound. Phonographs and records were the chief means of reproducing recorded sound at home until the 1980s, when they were largely replaced by recorded cassettes (see tape recorder) and compact discs.

phonology \fə-'nä-lə-jē\ Study of sound patterns within languages. Diachronic (historical) phonology traces and analyzes changes in speech sounds and sound systems over time (e.g., the process by which *sea* and *see*, once pronounced with different vowel sounds, have come to be pronounced alike). Synchronic (descriptive) phonology investigates sound patterns at a single stage in a language's development, to identify which ones can occur and in what position (in English, for example, *nt* and *rk* appear within or at the end of words but not at the beginning).

phonon \'fō-ˌnän\ In solid-state physics, a quantum of lattice vibrational energy. In analogy to a photon (a quantum of light), a phonon is viewed as a wave packet with particlelike properties (see wave-particle duality). The way phonons behave determines or affects various properties of solids. Thermal conductivity, for instance, is explained by phonon interactions. Phonons also provide the basis for understanding superconductivity in certain metals.

Phony War (1939–40) Early months of World War II, marked by no major hostilities. The term was coined by journalists to derisively describe the six-month period (October 1939–March 1940) during which no land operations were undertaken by the Allies or the Germans after the German conquest of Poland in September 1939.

phosgene \'fäz-ˌjēn\ *or* **carbonyl chloride** \'kär-bə-ˌnil\ Colourless, highly toxic gas used in chemical warfare as well as in industrial processes including the making of dyestuffs and polyurethane resins. Either alone or in combination with chlorine, it was used against troops in World War I. It smells like musty hay. Inhalation causes severe lung injury several hours after exposure. First prepared in 1811, it is manufactured by the reaction of carbon monoxide and chlorine in the presence of a catalyst. Gaseous phosgene is usually stored and transported as a liquid under pressure in steel cylinders or as a solution in toluene. Mixed with water, it forms carbon dioxide and hydrochloric acid.

phosphate Any of numerous chemical compounds related to phosphoric acid (H_3PO_4). Phosphate salts are inorganic compounds containing the phosphate ion (PO_4^{3-}), the hydrogen phosphate ion (HPO_4^{2-}), or the dihydrogen phosphate ion ($H_2PO_4^-$), along with any cation. Phosphate esters are organic compounds in which the hydrogens of phosphoric acid are replaced by organic groups (e.g., methyl, ethyl, phenyl), with one of their carbon atoms bonding to an oxygen atom in the phosphate group. Nucleic acids and ATP both contain phosphate; bones and teeth contain calcium phosphate. Phosphate rock (mainly calcium phosphate) is one of the four most important basic chemical commodities. Phosphates were formerly used in detergents, which washed into rivers and lakes, causing water blooms of algae and bacteria (see eutrophication); such use is now generally outlawed or regulated. Phosphates are still used in fertilizers, baking powder, and toothpaste.

phospholipid \ˌfäs-fō-'li-pəd\ *or* **phosphatide** Any member of a large class of fatlike organic compounds that in their molecular structure resemble the triglycerides, except for the replacement of a fatty acid with a phosphate-containing polar group. The polar end of the molecule is soluble in water (hydrophilic) and water solutions (including cytoplasm); the other, fatty-acid end is soluble in fats (hydrophobic). In a watery environment phospholipids naturally combine to form a two-layer structure (lipid bilayer) with the fat-soluble ends sandwiched in the middle and the water-soluble ends sticking out. Such lipid bilayers are the structural basis of cell membranes. Phospholipids are the principal components of the myelin sheaths of neurons. Examples of phospholipids include lecithin, cephalins, phosphoinositides (in the brain), and cardiolipin (in the heart). See also detergent.

phosphorescence Emission of light from a substance exposed to radiation and persisting as an afterglow after the exciting radiation has been removed. Unlike fluorescence, in which the absorbed light is emitted about 10^{-8} second after excitation, in phosphorescence the extra energy absorbed is stored in metastable states and reemitted later. Phosphorescence may last from about 10^{-3} second to days or even years. The term phosphorescence is often applied to luminescence of living organisms, as well.

phosphorite \'fäs-fər-ˌit\ *or* **phosphate rock** Rock with a high concentration of phosphates in nodular or compact masses. The phosphates may be derived from a variety of sources, including marine invertebrates that secrete shells of calcium phosphate and the bones and excrement of vertebrates. Typical phosphorite beds contain about 30% phosphorus pentoxide (P_2O_5) and constitute the primary source of raw materials for phosphate fertilizers. Significant deposits in the U.S. include the Phosphoria Formation in Idaho and the Monterey Formation in California. Major deposits also occur in the Sechura Desert in Peru.

phosphorus Nonmetallic chemical element, chemical symbol P, atomic number 15. The ordinary allotrope, called white phosphorus, is a poisonous, colourless, semitransparent, soft, waxy solid that glows in the dark (see phosphorescence) and combusts spontaneously in air, producing dense white fumes of the oxide P_4O_{10}; it is used as a rodenticide and a military smokescreen. Heat or sunlight converts it to the red phosphorus allotrope,

© 2006 Encyclopædia Britannica, Inc.

a violet-red powder that does not phosphoresce or ignite spontaneously. Much less reactive and soluble than white phosphorus, it is used in manufacturing other phosphorus compounds and in semiconductors, fertilizers, safety matches, and fireworks. Black phosphorus, made by heating the white form under pressure, is flaky like GRAPHITE. Phosphorus seldom occurs uncombined in nature. As the PHOSPHATE ion, it is abundant and widely distributed, in APATITE, PHOSPHORITE, and many other minerals. Phosphorus has VALENCE 3 or 5 in compounds, which have many uses in industry. Phosphine (PH_3) is a chemical raw material and a doping agent (deliberately added impurity) for solid-state electronics components. Organic phosphorus compounds are used as plasticizers, gasoline additives, insecticides (e.g., parathion), and nerve gases. In living organisms the role of phosphorus is essential; it is a component of DNA and RNA, ATP, and BONE.

Photian Schism See Photian SCHISM

Photius \'fō-shē-əs**, Saint** (b. c. 820, Constantinople—d. 10th century; feast day February 6) Patriarch of Constantinople (858–867, 877–886). A high-ranking civil servant, he was promoted swiftly through the ecclesiastical orders to become patriarch after the deposition of Ignatius, an action that offended Pope Nicholas I. Photius added to the conflict by refusing to restore dioceses earlier transferred from the Roman to the Byzantine church. Angry that Nicholas would not recognize him, Photius excommunicated the pope (867), thus beginning the PHOTIAN SCHISM. Photius was deposed the same year but restored in 877 after his successor died. He and Pope John VIII agreed to return Bulgaria to the Roman church but to allow Greek bishops to remain.

Photo-Realism Late 20th-century painting style based on photography, in which realistic scenes are rendered in meticulous detail. An offshoot of POP ART, it became a trend in U.S. painting in the 1970s among artists fascinated by camera images. Though photographs had been used by 19th-century painters such as EUGÈNE DELACROIX as substitutes for reality, the Photo-Realists relied on the photograph itself, replicating it in large-scale detail as the reality on which to base an ACRYLIC PAINTING. Its subjects often included reflecting surfaces (chrome-plated diners, motorcycles, glass-fronted buildings, etc.). Its awesome technical precision, brilliant colour schemes, and visual complexity earned the style wide popularity. Its most notable practitioners were CHUCK CLOSE, Don Eddy, Richard Estes, and Audrey Flack.

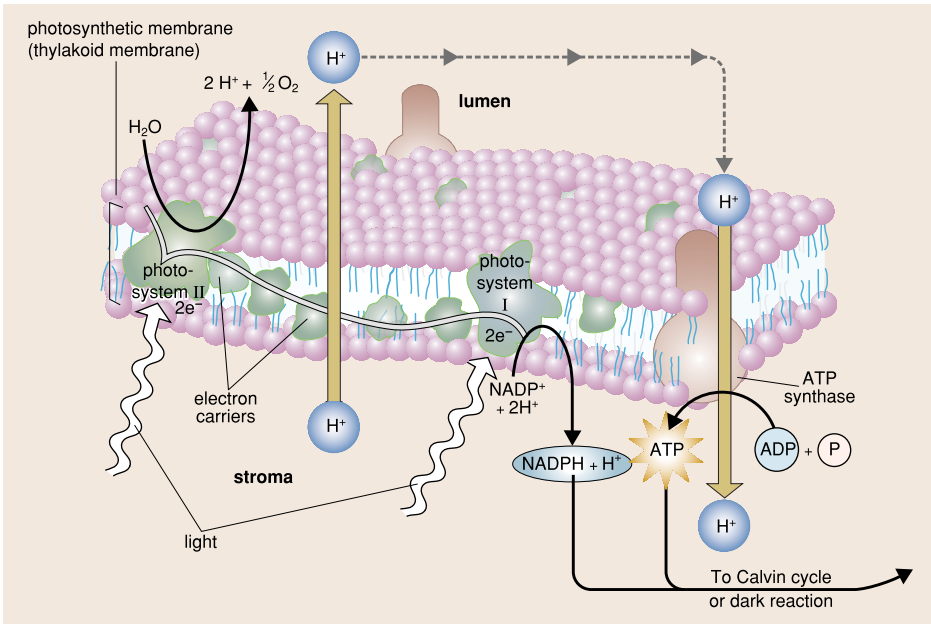
Photo-Secession Group of U.S. photographers influenced by the Pictorialist movement. Founded in 1902 by ALFRED STIEGLITZ, the Photo-Secession sought recognition of photography as an art to be judged on its own terms. It was akin to such groups as the Linked Ring in London, and its name reflected that of the SEZESSION movement in Austria and Germany. The group regularly showed its work at the Little Galleries of the Photo-Secession, also known as "291" (its address on Fifth Avenue in New York City), a gallery run by Stieglitz. While Stieglitz did not believe in retouching or manipulating negatives or prints, others of the group, such as EDWARD STEICHEN, were adherents of the impressionistic soft-focus school and the new techniques. By 1910 many members of the group left due to different aesthetic visions. The record of the Photo-Secession is contained in the quarterly *Camera Work* (1903–17).

photocell *or* **photoelectric cell** *or* **electric eye** SOLID-STATE DEVICE with a photosensitive CATHODE that emits ELECTRONS when illuminated and an ANODE for collecting the emitted electrons. Illumination excites electrons, which are attracted to the anode, producing current proportional to the intensity of the illumination. In a photovoltaic cell, light is used to produce voltage. In a photoconductive cell, light is used to regulate the flow of current. Photocells are used in control systems, where interrupting a beam of light opens a circuit, actuating a relay that supplies power to a mechanism to bring about a desired operation, such as opening a door or setting off a burglar alarm. Photocells are also used in PHOTOMETRY and SPECTROSCOPY.

photochemical reaction CHEMICAL REACTION initiated by absorption of ENERGY in the form of visible (LIGHT), ULTRAVIOLET, or INFRARED radiation. Primary photochemical processes occur as an immediate result, and secondary processes may follow. The most important example is PHOTOSYNTHESIS. Vision depends on photochemical reactions that occur in the eye (see RETINA; RHODOPSIN). In photographic film and paper, light activates their SILVER salts to a state that is easy to reduce to metallic silver grains during development. Bleaching of laundry, tanning of human skin, formation of Earth's OZONE LAYER, and many industrial reactions are also photochemical. Certain air pollutants (see SMOG) become more reactive and form noxious compounds in photochemical reactions.

photocopier Device for producing copies of text or graphic material by the use of light, heat, chemicals, or electrostatic charge. Most modern copiers use a method called XEROGRAPHY.

photoelectric effect Phenomenon in which charged particles are released from a material when it absorbs radiant energy (see RADIATION). It is often thought of as the ejection of ELECTRONS from the surface of a metal plate when visible light falls on it. It can also occur if the radiation is in the wavelength range of ULTRAVIOLET RADIATION, X RAYS, or GAMMA RAYS. The emitting surface may be a solid, liquid, or gas, and the emitted particles may be electrons or ions. The effect was discovered in 1887 by HEINRICH HERTZ and explained by ALBERT EINSTEIN in work for which he received the Nobel Prize.



photoengraving Any of several processes for producing PRINTING plates by photographic means (see PHOTOGRAPHY). In general, a plate coated with a photosensitive substance is exposed to an image, usually on film; the plate is then treated in various ways, depending on the printing process to be used. Photoengraving is particularly useful for reproducing photographs via the HALFTONE PROCESS. See also OFFSET PRINTING.

photography Method of recording permanent images by the action of light projected by a lens in a camera onto a film or other light-sensitive material. It was developed in the 19th century through the artistic aspirations of two Frenchmen, NICÉPHORE NIEPCE and LOUIS-JACQUES-MANDÉ DAGUERRE, whose combined discoveries led to the invention of the first commercially successful process, the DAGUERREOTYPE (1837). In addition, two Englishmen, Thomas Wedgwood and WILLIAM HENRY FOX TALBOT, patented the negative-positive calotype process (1839) that became the forerunner of modern photographic technique. Photography was initially used for portraiture and landscapes. In the 1850s and '60s, MATHEW B. BRADY and ROGER FENTON pioneered war photography and photojournalism. From its inception, two views of photography predominated: one approach held that the camera and its resulting images truthfully document the real world, while the other considered the camera simply to be a tool, much like a paintbrush, with which to create artistic statements. The latter notion, known as Pictorialism, held sway from the late 1860s through the first decade of the 20th century, as photographers manipulated their negatives and prints to create hazy, elaborately staged images that resembled paintings. By the 1920s and '30s, a new, more realistic style of photography gained prominence, as photographers such as PAUL STRAND, EDWARD WESTON, and ANSEL ADAMS began to pursue sharply focused, detailed images. The Great Depression and two world wars inspired many photographers, including WALKER EVANS and DOROTHEA LANGE, to pursue documentary, often socially conscious photography. Inspired by such work, many photojournalists, including ALFRED EISENSTAEDT and MARGARET BOURKE-WHITE, also emerged during this period. In the second half of the 20th century, the urban social scene became a subject of much interest to photographers, as did celebrity portraiture and fashion photography. At the turn of the 21st century, photographers took advantage of digital capabilities by experimenting with enormous formats and new manipulative techniques. As technological advances improve photographic equipment, materials, and techniques, the scope of photography continues to expand enormously. See also DIGITAL CAMERA.

photolysis \fō-'tä-lə-səs\ Breakdown of MOLECULES into smaller units via absorption of LIGHT. Flash photolysis, an experimental technique developed by MANFRED EIGEN, Ronald George Weyford Norrish, and George Porter, studies short-lived chemical intermediates formed in many PHOTOCHEMICAL REACTIONS. An intense, brief flash of light splits molecules into short-lived fragments, which are analyzed by SPECTROPHOTOMETRY in a second, less intense flash.

photometry \fō-'tä-mə-trē\ Precision measurement of the brightness, colour, and spectrum of STARS and other celestial objects to obtain data on their structure, temperature, and composition. About 130 BC HIPPARCHUS used a system that divided the stars into six MAGNITUDES, from brightest to faintest. Beginning in the 17th century, use of the TELESCOPE led to the discovery of many fainter stars, and the scale was extended. The use of photographic and, since the 1940s, photoelectric equipment has vastly extended the sensitivity and wavelength range of astronomical photometry. The main (UBVRI) classification system uses wave bands in the ultraviolet, blue, visual, red, and infrared ranges. More elaborate systems can distinguish giant and dwarf stars, detect metals in stars, and determine surface gravity.

© 2006 Encyclopædia Britannica, Inc.

The light reaction of photosynthesis. The light reaction occurs in two photosystems (units of chlorophyll molecules). Light energy (indicated by wavy arrows) absorbed by photosystem II causes the formation of high-energy electrons, which are transferred along a series of acceptor molecules in an electron transport chain to photosystem I. Photosystem II obtains replacement electrons from water molecules, resulting in their split into hydrogen ions (H+) and oxygen atoms. The oxygen atoms combine to form molecular oxygen (O_2), which is released into the atmosphere. The hydrogen ions are released into the lumen. Additional hydrogen ions are pumped into the lumen by electron acceptor molecules. This creates a high concentration of ions inside the lumen. The flow of hydrogen ions back across the photosynthetic membrane provides the energy needed to drive the synthesis of the energy-rich molecule ATP. High-energy electrons released as photosystem I absorbs light energy are used to drive the synthesis of NADPH. Photosystem I obtains replacement electrons from the electron transport chain. ATP provides the energy and NADPH provides the hydrogen atoms needed to drive the subsequent photosynthetic dark reaction, or Calvin cycle.

© MERRIAM-WEBSTER INC.

photon *or* **light quantum** Minute energy packet of ELECTROMAGNETIC RADIATION. In 1900 MAX PLANCK found that heat radiation is emitted and absorbed in distinct units, which he called quanta. In 1905 ALBERT EINSTEIN explained the PHOTOELECTRIC EFFECT, proposing the existence of discrete energy packets in light. The term photon came into use for these packets in 1926. The energies of photons range from high-energy gamma rays and X rays to low-energy infrared and radio waves, though all travel at the same speed, the speed of light. Photons have no ELECTRIC CHARGE or rest mass and are the carriers of the ELECTROMAGNETIC FIELD.

photoperiodism Response by an animal or plant to changes in daily, seasonal, or yearly cycles of light and darkness. Among animals, sleep, migration, reproduction, and the changing of coats or plumage are regulated to some extent by day length. In the poultry industry, photoperiodism is commonly induced by artificial lighing to maximize egg laying and body weight. Plant growth, seed setting, germination, flowering, and fruiting are also affected by day length. Other environmental factors that modify an organism's responses include temperature and nutrition.

photoreception Biological responses to stimulation by light, most often referring to the mechanism of vision. In one-celled organisms such as the amoeba, the whole cell may be sensitive to light. Earthworms have photoreceptive cells scattered over their bodies to help orient themselves by comparison of light intensities in different directions. Most animals have localized photoreceptors of varying complexity. In humans, photoreception relies on the chemical response of a light-sensitive pigment, RHODOPSIN, in photoreceptor cells in the RETINA of the EYE. Stimulation of those cells results in a stimulus being conducted toward the NERVOUS SYSTEM. Humans, like other vertebrates, have two types of photosensitive cells, rod cells and cone cells. Rod cells are responsible for vision when there is little light; cone cells mediate daylight vision and colour. Photoreception also refers to PHOTOSYNTHESIS in plants. See also SENSE.

photosphere Visible surface of the SUN, about 250 mi (400 km) thick. It emits most of the Sun's light that reaches Earth directly. Temperatures range from about 18,000 °F (10,000 °C) at the bottom to 8,000 °F (4,000 °C) at the top; its density is about 1/1,000 that of air at the surface of Earth. SUNSPOTS are photospheric phenomena. The photosphere has a granular structure. Each grain (cell), a mass of hot gas several hundred miles in diameter, rises from inside the Sun, radiates energy, and sinks back within minutes to be replaced by others in a constantly changing pattern.

photosynthesis Process by which green plants and certain other organisms transform light into chemical energy. In green plants, light energy is captured by CHLOROPHYLL in the CHLOROPLASTS of the leaves and used to convert water, carbon dioxide, and minerals into oxygen and energy-rich organic compounds (simple and complex sugars) that are the basis of both plant and animal life. Photosynthesis consists of a number of photochemical and enzymatic reactions. It occurs in two stages. During the light-dependent stage (light reaction), chlorophyll absorbs light energy, which excites some electrons in the pigment molecules to higher energy levels; these leave the chlorophyll and pass along a series of molecules, generating formation of NADPH (an enzyme) and high-energy ATP molecules. Oxygen, released as a by-product, passes into the atmosphere through pores in the leaves. NADPH and ATP drive the second stage, the dark reaction (or Calvin cycle, discovered by MELVIN CALVIN), which does not require light. During this stage glucose is generated using atmospheric carbon dioxide. Photosynthesis is crucial for maintaining life on Earth; if it ceased, there would soon be little food or other organic matter on the planet, and most types of organisms would disappear.

phototube See PHOTOCELL

photovoltaic effect Process in which two dissimilar materials in close contact act as an electric cell when struck by light or other radiant energy. In CRYSTALS of certain elements, such as SILICON and GERMANIUM, the ELECTRONS are usually not free to move from atom to atom. Light striking the crystal provides the energy needed to free electrons from their bound condition. These electrons can cross the junction between two dissimilar crystals more easily in one direction than another, so one side of the junction acquires a negative voltage with respect to the other. As long as light falls on the two materials, the photovoltaic BATTERY can continue to provide voltage and current. The current can be used to measure the brightness of the light or as a source of power, as in a SOLAR CELL.

Phrachunlachomklao See CHULALONGKORN

Phramongkutklao See VAJIRAVUDH

phratry \'frā-trē\ In ancient Greece, tribal subdivisions of households or families claiming a common kin relation. At the apex of each phratry were aristocratic clans that had certain hereditary rights, such as the right to hold priestly offices. Both phratries and clans were patrilineal. The Athenian phratry is well known. Every native Athenian male belonged to a phratry; they were concerned with such matters as legitimacy of descent and inheritance.

Phraya Taksin See TAKSIN

phrenology \fri-'nä-lə-jē\ Study of the shape of the SKULL as an indication of mental abilities and character traits. FRANZ JOSEPH GALL stated the principle that each of the innate mental faculties is based in a specific brain region ("organ"), whose size reflects the faculty's prominence in a person and is reflected by the skull's surface. He examined the skulls of persons with particular traits (including "criminal" traits) for a feature he could identify with it. His followers Johann Kaspar Spurzheim (1776–1832) and George Combe (1788–1858) divided the scalp into areas they labeled with traits such as combativeness, cautiousness, and form perception. Though popular well into the 20th century, phrenology has been wholly discredited.

Phrygia \'fri-jē-ə\ Ancient district, west-central ANATOLIA. It was named for a people whom the Greeks called Phryges and who dominated Anatolia between the HITTITE collapse (12th century BC) and ascent of LYDIA (7th century BC). The Phrygians were possibly of Thracian origin (see THRACE) and had their capital at Gordium. The kingdom of their legendary ruler, MIDAS, ended c. 700 BC with the invasion of the CIMMERIANS, who burned the capital. The Phrygians excelled in metalwork, wood carving, carpet making, and embroidery. Their religious cult of the GREAT MOTHER OF THE GODS was passed on to the Greeks. Excavations conducted since 1945 have uncovered carved stone tombs and shrines there.

Phumiphon Adunlayadet See BHUMIBOL ADULYADEJ

Phyfe \'fīf**, Duncan** *orig.* **Duncan Fife** (b. 1768, near Loch Fannich, Ross and Cromarty, Scot.—d. Aug. 16, 1854, New York, N.Y., U.S.) Scottish-born U.S. furniture designer. His family settled in Albany, N.Y., c. 1784; there he became an apprentice cabinetmaker and eventually opened his own shop. In 1792 he moved to New York City, where he changed the spelling of his name and became so successful that he employed 100 carvers and cabinetmakers. He was one of the first Americans to use the factory method of manufacturing furniture successfully. Though he did not originate a new furniture style, he interpreted fashionable European styles—SHERATON, REGENCY, DIRECTOIRE, EMPIRE—with such grace that he became a major exponent of NEOCLASSICISM. His furniture, decorated with typical period ornaments such as harps and acanthus leaves, was generally of high-quality mahogany.

COURTESY OF THE HENRY FRANCIS DU PONT WINTERTHUR MUSEUM, DELAWARE

phyle \'fī-lē\ Any of several TRIBES that formed the largest political subgroups in all Dorian and most Ionian Greek city-states. Phylae were simultaneously kinship groups, corporations with their own officials and priests, and local units for administrative and military purposes. Athens's original four phylae were replaced by 10 under a reorganization (508/507 BC) initiated by CLEISTHENES; Sparta's original three were supplanted by five in the 8th century BC.

phyllite \'fi-,līt\ Fine-grained METAMORPHIC ROCK formed by the recrystallization of fine-grained, parent SEDIMENTARY ROCKS, such as mudstones or shales. Phyllite has a marked tendency to split into sheets or slabs; it may have a sheen on its surfaces due to tiny plates of micas. Its grain size is larger than that of SLATE but smaller than that of SCHIST.

phylloxera \,fi-,läk-'sir-ə, fə-'läk-sə-rə\ Any of numerous, chiefly North American, INSECT species (genus *Phylloxera*, order Homoptera), many of which are serious pests of plants. Phylloxera form galls on and can defoliate trees, especially HICKORY and PECAN. See also GRAPE PHYLLOXERA.

phylogenetic tree \,fī-lō-jə-'ne-tik\ Diagram showing the evolutionary interrelations of a group of organisms that usually originated from a shared ancestral form. The ancestor is in the tree trunk; organisms that have arisen from it are placed at the ends of tree branches. The distance of one group from the other groups indicates the degree of relationship; that is, closely related groups are located on branches close to one another. Though phylogenetic trees are speculative, they provide a convenient method for studying phylogenetic relationships and EVOLUTION. See also PHYLOGENY.

phylogeny \fī-'lä-jə-nē\ History of the EVOLUTION of a species or group, especially lines of descent and relationships among broad groups. The fundamental proposition is that plants or animals of different species descended from common ancestors. Because the evidence for such relationships is almost always incomplete, most judgments of phylogenicity are based on indirect evidence and cautious speculation. Modern TAXONOMY, the science of classifying organisms, is based on phylogeny. Early taxonomic systems had no theoretical basis; organisms were grouped according to apparent similarity. Biologists who propose a phylogeny obtain evidence from the fields of paleontology, comparative anatomy, comparative embryology, biochemistry, and molecular biology. The data and conclusions of phylogeny indicate that today's living creatures are the product of a historical process of evolution and that degrees of resemblance within and between groups correspond to degrees of relationship by descent from common ancestors. See also PHYLOGENETIC TREE.

physiatry See PHYSICAL MEDICINE AND REHABILITATION

physical anthropology Branch of ANTHROPOLOGY concerned with the study of HUMAN EVOLUTION and human biological variation. Research on human evolution involves the discovery, analysis, and description of fossilized human remains. Two key goals are the identification of differences between humans and their human and nonhuman ancestors, and the clarification of the biological emergence of humankind. A variety of quantitative methods are used, including the comparative analysis of genetic codes. Research on biological variation among contemporary humans once relied heavily on the concept of RACE, but today principles of GENETICS and the analysis of such factors as BLOOD TYPE have largely eliminated race as a scientific category.

physical chemistry Branch of CHEMISTRY concerned with interactions and transformations of materials. Unlike other branches, it deals with the principles of physics underlying all chemical interactions (e.g., GAS LAWS), seeking to measure, correlate, and explain the quantitative aspects of reactions. QUANTUM MECHANICS has clarified much for physical chemistry by modeling the smallest particles ordinarily dealt with in the field, ATOMS and MOLECULES, enabling theoretical chemists to use computers and sophisticated mathematical techniques to understand the chemical behaviour of matter. Chemical thermodynamics deals with the relationship between heat and other forms of chemical energy, kinetics with CHEMICAL REACTION rates. Subdisciplines of physical chemistry include ELECTROCHEMISTRY, photochemistry (see PHOTOCHEMICAL REACTION), surface chemistry, and CATALYSIS.

physical education Training in physical fitness and in skills requiring or promoting it. In the U.S. it is required in most primary and secondary schools. It generally includes CALISTHENICS, GYMNASTICS, various sports, and some study of health. College majors in physical education have been available since the early 20th century. Most teaching is done in gymnasiums, though outdoor sports are also emphasized.

physical medicine and rehabilitation *or* **physiatry** \,fiz-ē-'a-trē\ *or* **physical therapy** *or* **rehabilitation medicine** Medical specialty treating chronic disabilities through physical means to help patients return to a comfortable, productive life despite a medical problem. Its objectives are pain relief, functional improvement or maintenance, training in essential activities, and functional testing of areas such as strength, mobility, breathing capacity, and coordination. Physical medicine may use DIATHERMY, HYDROTHERAPY, MASSAGE, exercise, and functional training. The last can mean learning to work with a guide dog or a PROSTHESIS or learning new ways to carry out everyday activities with a limb missing, sometimes by using assistive devices. Physician specialists head rehabilitation teams including a physical therapist, rehabilitation engineer, rehabilitation nurse, psychological counselor, and sometimes a respiratory or speech therapist. See also OCCUPATIONAL THERAPY; ORTHOPEDICS.

physics Science that deals with the structure of MATTER and the interactions between the fundamental constituents of the observable universe. Long called natural philosophy (from the Greek *physikos*), physics is concerned with all aspects of nature, covering the behaviour of objects under the action of given forces and the nature and origin of gravitational, electromagnetic, and nuclear force fields. The goal of physics is to formulate comprehensive principles that bring together and explain all discernible phenomena. See also AERODYNAMICS; ASTROPHYSICS; ATOMIC PHYSICS; BIOPHYSICS; MECHANICS; NUCLEAR PHYSICS; PARTICLE PHYSICS; QUANTUM MECHANICS; SOLID-STATE PHYSICS; STATISTICAL MECHANICS.

physics, mathematical See MATHEMATICAL PHYSICS

© 2006 Encyclopædia Britannica, Inc.

physics, philosophy of Philosophical investigation of the concepts, problems, and methods of PHYSICS and related sciences. The philosophy of physics traditionally has been concerned with clarifying the logical structure, ontological commitments, and intertheoretic relations of fundamental physical theories, including RELATIVITY, QUANTUM MECHANICS, and STATISTICAL MECHANICS. The field also addresses various metaphysical and epistemological aspects of problems encountered in the foundations of theoretical physics. Examples include the apparent "directed" nature of time, the meaning of probabilistic descriptions of the initial state of the universe in statistical mechanics, the measurement problem in quantum mechanics (the problem of stating in precise terms the conditions in which probabilistic as opposed to deterministic laws apply to the motion of an elementary particle), and the problem of reconciling quantum mechanics with special, and ultimately general, relativity. See also UNCERTAINTY PRINCIPLE; UNIFIED FIELD THEORY.

physiocrat Member of a school of economics, founded in 18th-century France, that held that government should not interfere with the operation of natural economic laws. Generally regarded as the first scientific school of ECONOMICS, the physiocratic school (the name refers to the "rule of nature") was founded by FRANÇOIS QUESNAY, who demonstrated the economic relation between a workshop and a farm and asserted that the farm alone added to a nation's wealth. LAND and AGRICULTURE were therefore believed to be the source of all wealth. The physiocrats envisaged a society in which written law would be in harmony with NATURAL LAW. They pictured a predominantly agricultural society, attacking MERCANTILISM for its emphasis on manufacturing and foreign trade and its mass of economic regulations. Quesnay's disciples included Victor Riqueti, count de MIRABEAU, and Pierre Samuel du Pont de Nemours (1739–1817). The school was in decline by 1768, and after the dismissal of a sympathetic comptroller general in 1776 the leading physiocrats were exiled. Though many of their theories, notably their theory of wealth, were later demolished, their introduction of SCIENTIFIC METHOD to economics had a permanent effect on the discipline.

physiological psychology Study of the physiological basis of behaviour. Traditional specializations in the field cover PERCEPTION, MOTIVATION, EMOTION, LEARNING, MEMORY, COGNITION, or MENTAL DISORDERS. Also considered are other physical factors that affect the nervous system, including heredity, metabolism, hormones, disease, drug ingestion, and diet. An experimental science, physiological psychology relies heavily on laboratory research and quantitative data.

physiology \ˌfi-zē-ˈä-lə-jē\ Study of the functioning of living organisms or their constituent tissues or cells. Physiology was usually considered separately from ANATOMY until the development of high-powered microscopes made it clear that structure and function were inseparable at the cellular and molecular level. An understanding of BIOCHEMISTRY is fundamental to physiology. Physiological processes are dynamic; cells change their function in response to changes in the composition of their local environment, and the organism responds to alterations in both its internal and external environment. Many physiological reactions are aimed at preserving a constant physical and chemical internal environment (HOMEOSTASIS). See also CYTOLOGY.

phytoflagellate \ˌfī-tō-ˈfla-jə-lət\ Any of several PROTOZOANS that have flagella in addition to sharing many characteristics with typical ALGAE, especially the pigment CHLOROPHYLL and various other pigments. Some species, though similar in form, lack chlorophyll. Phytoflagellates may obtain nutrients by photosynthesis, by absorption through the body surface, or by ingestion of food particles. CRYPTOMONADS are among the more important phytoflagellates.

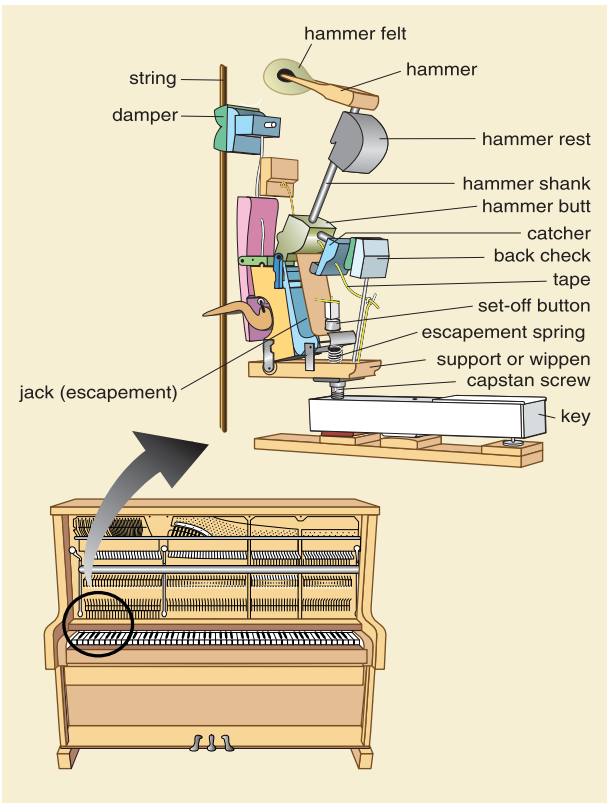
phytoplankton \ˌfī-tō-ˈplaŋk-tən\ FLORA of freely floating, often minute organisms that drift with water currents. Like land vegetation, phytoplankton uses carbon dioxide, releases oxygen, and converts minerals to a form animals can use. In fresh water, large numbers of green ALGAE often colour lakes and ponds, and CYANOBACTERIA may affect the taste of drinking water. Oceanic phytoplankton is the primary food source, directly or indirectly, of all sea organisms. Composed of groups with silica-containing skeletons, such as DIATOMS and DINOFLAGELLATES, phytoplankton varies seasonally in amount, increasing in spring and fall with favourable light, temperature, and minerals.

pi In mathematics, the RATIO of the circumference of a CIRCLE to its diameter. An IRRATIONAL NUMBER (see also TRANSCENDENTAL NUMBER), it has an approximate value of 3.14, but its exact value must be represented by a symbol, the Greek letter π. Pi is used in calculations involving lengths, areas, and volumes of circles, spheres, cylinders, and cones. It also arises frequently in problems dealing with certain periodic phenomena (e.g., motion of pendulums, alternating electric currents). By the end of the 20th century, computers had calculated pi to more than 200 billion decimal places.

Piaf, Edith \ˈpyäf\ *English* \ˈpē-ˌaf\ *orig.* **Edith Giovanna Gassion** (b. Dec. 19, 1915, Paris, France—d. Oct. 11, 1963, Paris) French popular singer and actress. Her mother, a café singer, abandoned her at birth; Piaf became blind at age three as a result of meningitis but recovered her sight four years later. Her father, a circus acrobat, took her along on tours and encouraged her to sing. She sang for years in the streets of Paris until discovered by a cabaret owner who gave her her first nightclub job and suggested she change her name to Piaf, Parisian slang for "sparrow." She was soon singing her *chansons* (ballads) in the large music halls of Paris. During World War II she entertained French prisoners of war and aided several in their escapes. She spent the postwar years touring, gaining worldwide fame with her intense performances of songs such as "Non, je ne regrette rien" ("No, I regret nothing"). Her throaty, expressive voice, combined with her fragile appearance and a dramatic tight spotlight on her face and hands, made her concerts memorable.

Piaget \pyä-ˈzhā**, Jean** (b. Aug. 9, 1896, Neuchâtel, Switz.—d. Sept. 17, 1980, Geneva) Swiss psychologist. Trained in zoology and philosophy, Piaget later studied psychology in Zürich (from 1918) with CARL GUSTAV JUNG and EUGEN BLEULER, and he was subsequently affiliated with the University of Geneva from 1929 until his death. He developed a theory of "genetic epistemology," a natural timetable for the development of the child's ability to think in which he traced four stages—the sensorimotor (ages 0–2), preoperational or symbolic (2–7), concrete operational (7–12), and formal operational (through adulthood)—each marked by increased cognitive sophistication and ability to use symbols. In 1955 Piaget founded and became director (to 1980) of an international centre for genetic epistemology in Geneva. His numerous books include *The Language and Thought of the Child* (1923), *Judgment and Reasoning in the Child* (1924), *The Origin of Intelligence in Children* (1948), and *The Early Growth of Logic in the Child* (1964). He is regarded as the foremost developmental psychologist of the 20th century.

piano *or* **pianoforte** Keyboard instrument with wire strings that sound when struck by hammers operated by a keyboard. It was invented in Florence by BARTOLOMEO CRISTOFORI before 1720, with the particular aim of permitting note-to-note dynamic variation (lacking in the HARPSICHORD). It differs from the older CLAVICHORD in that its hammers (rather than tangents) are thrown at the strings and bounce back, permitting the struck string to vibrate loudly. A cast-iron frame is needed to withstand the strings' tremendous tension. Pianos have taken various shapes. The original harpsichord (or wing) shape has survived in the modern grand piano; the less-expensive square (actually rectangular) piano, standard in the early 19th century, was replaced by the upright piano, in which the strings are vertical. For at least 150 years the piano was the most important instrument in Western music. See illustration on following page.



piano nobile \ˌpyä-nō-ˈnō-bi-lā\ (Italian: "noble floor") In a Renaissance building, the first floor above ground level. In the typical palace erected by an Italian prince, the large, high-ceilinged reception rooms were in this upper, main story. Often a grand exterior staircase or pair of staircases led from ground level up to the piano nobile.

Piave River \ˈpyä-vā\ River, northeastern Italy. Rising in the Carnic Alps south of Lienz near the Austrian frontier, it flows south and southeast into the Adriatic Sea, east of VENICE. It is 137 mi (220 km) long. During World War I, its valley was the scene of several battles against the Austrians (see Battle of CAPORETTO). In 1966 the river burst its dikes in a major flood.

piazza \pē-ˈät-sə, pē-ˈa-zə\ Open square or marketplace, surrounded by buildings, in an Italian town or city. It was equivalent to the plaza of Spanish-speaking countries. The term became more widely used in the 16th–18th century, denoting any large open space with buildings around it. In 17th–18th-century Britain, long covered walks or galleries with roofs supported by columns were called piazzas; in the U.S. in the 19th century, piazza was another name for a veranda formed by projecting eaves.

Piazzetta \pyät-ˈtsät-tä**, Giovanni Battista** *or* **Giambattista Piazzetta** (b. Feb. 13, 1682, Venice—d. April 28, 1754, Venice) Italian painter, illustrator, and designer. Trained as a wood carver by his father, he turned to painting and became one of the outstanding Venetian artists

© 2006 Encyclopædia Britannica, Inc.

Each key of a piano actuates a complex mechanical system to strike a taut string and produce a musical tone. Depending on how the keys and pedals are operated, the mechanism may produce a variety of effects on the same note, from muffled to brilliant and from quick to sustained.

© MERRIAM-WEBSTER INC.

of the 18th century. His art evolved from Italian Baroque traditions of the 17th century to the Rococo style. He had a strong influence on the young Giovanni Battista Tiepolo at the time he painted the finest of his early religious works, *St. James Led to Martyrdom* (1722). His most popular work is the celebrated *Fortune Teller* (1740). On the founding of the Venetian Academy in 1750, he was made its first director.

Piazzolla \pyät-'sō-lə**, Astor** (b. March 11, 1921, Mar del Plata, Arg.—d. July 5, 1992, Buenos Aires) Argentine composer. He lived in the Bronx, N.Y., until he was 15; he then returned to Argentina to play bandoneon (a type of accordion) in a tango band led by Anibal Troilo (1917–75). From 1944 he led his own groups. His interest in classical music led to study with Nadia Boulanger (1954–55) and the development of his own compositional style, infusing elements of jazz and modern music into tango. Not always initially popular with tango fans, his music is now recognized as having revived the genre and greatly expanded its artistic potential.

Picabia \pē-käb-'yä**, Francis** (b. Jan. 22, 1879, Paris, France—d. Nov. 30, 1953, Paris) French painter, illustrator, designer, writer, and editor. After studying at the École des Beaux-Arts and the École des Arts Décoratifs, he painted for a time in an Impressionist and then a Cubist style. Picabia went on to combine the Cubist style with Orphic elements in such paintings as *I See Again in Memory My Dear Udnie* (1913–14), to which he gave proto-Dadaist names. About 1916 he began to paint the satiric, machinelike contrivances that are his chief contribution to Dadaism. In 1915 in New York City, Picabia, Marcel Duchamp, and Man Ray together founded an American Dadaist movement. In 1917 Picabia returned to Europe and joined Dadaist movements in Barcelona, Paris, and Zürich. After Dadaism broke up about 1921, he followed the poet André Breton into the Surrealist movement. He subsequently painted in Surrealist, abstract, and figurative styles.

Picardy \'pi-kər-dē\ *French* **Picardie** \,pē-kär-'dē\ *Région* (pop., 2003 est.: 1,869,386), encompassing the northern French *départements* of Oise, Somme, and Aisne and roughly coextensive with the historical region of Picardy. In the 13th century the historical region included the countships of Amiénois and Vermandois, which were united with the French crown by Philip II from 1185. Picardy was joined to Burgundy in 1435 and attached to France in 1477. The province of Picardy from the 16th century to the end of the ancien régime in 1789 comprised the Somme River basin from Saint-Quentin to the English Channel, the basins of the Serre and upper Oise rivers, and Montreuil on the Canche beyond the Authie River. The region was the scene of heavy fighting in both world wars, especially in the First Battle of the Somme (1916). The capital of the French administrative region of Picardy is Amiens. Picardy has an area of 7,490 sq mi (19,399 sq km).

picaresque novel Early form of the novel, usually a first-person narrative, relating the episodic adventures of a rogue or lowborn adventurer (Spanish, *pícaro*). The hero drifts from place to place and from one social milieu to another in an effort to survive. The genre originated in Spain and had its prototype in Mateo Alemán's *Guzmán de Alfarache* (1599). It appeared in various European literatures until the mid-18th century, when the growth of the realistic novel led to its decline. Because of the opportunities for satire they present, picaresque elements enriched many later novels, such as Nikolay Gogol's *Dead Souls* (1842), Mark Twain's *Huckleberry Finn* (1884), and Thomas Mann's *Confessions of Felix Krull* (1954).

Picasso, Pablo (Ruiz y) (b. Oct. 25, 1881, Málaga, Spain—d. April 8, 1973, Mougins, France) Spanish-born French painter, sculptor, printmaker, ceramicist, and stage designer. Trained by his father, a professor of drawing, he exhibited his first works at 13. After moving permanently to Paris in 1904, he replaced the predominantly blue tones of his so-called Blue Period (1901–04) with those of pottery and flesh in his Rose Period (1904–06). His first masterpiece, *Les Demoiselles d'Avignon* (1907), was controversial for its violent treatment of the female body and the mask-like faces derived from his study of African art. From 1909 to 1912 Picasso worked closely with Georges Braque—the only time Picasso ever worked with another painter in this way—and they developed what came to be known as Cubism. The artists presented a new kind of reality that broke away from Renaissance tradition, especially from the use of perspective and illusion. Neither Braque nor Picasso desired to move into the realm of total abstraction in their Cubist works, although they implicitly accepted inconsistencies such as different points of view, different axes, and different light sources in the same picture. By 1912 they had taken Cubism further by gluing paper and other materials onto their canvases. Between 1917 and 1924 Picasso designed stage sets for five ballets for Sergey Diaghilev's Ballets Russes. In the 1920s and '30s, the Surrealists spurred him to explore new subject matter, particularly the image of the Minotaur. The Spanish Civil War inspired perhaps his greatest work, the enormous *Guernica* (1937), whose violent imagery condemned the useless destruction of life. After World War II he joined the Communist Party and devoted his time to sculpture, ceramics, and lithography as well as painting. In his late years he created variations on the works of earlier artists, the most famous being a series of 58 pictures based on *Las Meninas* of Diego Velázquez. For nearly 80 of his 91 years Picasso devoted himself to an artistic production that contributed significantly to and paralleled the whole development of modern art in the 20th century.

Piccard \pē-'kär**, Auguste** (b. Jan. 28, 1884, Basel, Switz.—d. March 24, 1962, Lausanne) Swiss-born Belgian physicist and balloon and undersea explorer. He studied and taught physics in Zürich and later at the University of Brussels (1922–54). In 1930 he designed a balloon with an airtight, pressurized cabin to ascend into the stratosphere to study cosmic rays. In 1932 he ascended over 55,500 ft (16,650 m). The undersea bathyscaphe he designed with his son, Jacques (b. 1922), descended in 1953 more than 10,000 ft (3,000 m). His grandson Bernard Piccard made the first round-the-world balloon flight in 1999.

Piccolomini \,pēk-kō-'lȯ-mē-nē\ **(-Pieri), Ottavio** (b. Nov. 11, 1599, Florence—d. Aug. 11, 1656, Vienna) Italian general. He entered the service of the Habsburgs in 1616 and became a trusted lieutenant to Albrecht Wenzel Eusebius von Wallenstein. Overlooked for advancement, he turned against his superior and conspired in his assassination (1634). He served Spain against the French in the Netherlands and won the Battle of Thionville (1639), for which he was created duke of Amalfi. In 1648 Emperor Ferdinand III named him commander in chief, and he conducted

© 2006 Encyclopædia Britannica, Inc.

the last campaign of the Thirty Years' War. He represented Austria at the Congress of Nürnberg (1649), which negotiated issues left unsettled by the Peace of Westphalia.

picker Machine for harvesting a crop (e.g., corn, cotton) and preparing it for storage. The mechanical picker removes mainly the desired portion of the plant (e.g., grain and cobs of corn, bolls of cotton) rather than harvesting the entire plant.

pickerel Any of several North American pikes (family Esocidae), distinguished from the northern pike and muskellunge by their smaller size, completely scaled cheeks and gill covers, and banded or chainlike markings. The chain pickerel (*Esox niger*) grows to about 2 ft (0.6 m) and a weight of about 3 lbs (1.4 kg). The barred (*E. americanus*) and grass (*E. vermiculatus*) pickerels reach a maximum weight of about 1 lb (0.5 kg).

Pickering, Timothy (b. July 17, 1745, Salem, Mass.—d. Jan. 29, 1829, Salem, Mass., U.S.) U.S. politician. He joined the militia in 1766 and served in the American Revolution under George Washington, becoming adjutant general (1777–78) and quartermaster general (1780–85). He later served as U.S. postmaster general (1791–95), secretary of war (1795), and secretary of state (1795–1800). He served in the U.S. Senate from 1803 to 1811 and in the House of Representatives from 1813 to 1817. A leader of the Federalist Party, he was a member of the Essex Junto, and he opposed the War of 1812. After retiring from politics, he turned to experimental farming and education.

picketing Act by workers of standing in front of or near a workplace to call attention to their grievances, discourage patronage, and, during strikes, to discourage strikebreakers. Picketing is also used in non-work-related protests. The U.S. Norris-LaGuardia Act (1932) made it easier for workers to picket by restricting the use of court injunctions against strikes, but the Taft-Hartley Act (1947) outlawed mass picketing.

Pickett, George E(dward) (b. Jan. 25, 1825, Richmond, Va., U.S.—d. July 30, 1875, Norfolk, Va.) U.S. and Confederate army officer. He graduated from West Point and served in the Mexican War. In 1861 he resigned his commission to enter the Confederate army. He rose to major general and commanded a division at the Battle of Fredericksburg. At the Battle of Gettysburg, he led the climactic attack known as Pickett's Charge, in which 4,300 men of his division constituted almost half the attacking force under James Longstreet. The attempt to breach the Union lines on Cemetery Ridge was repulsed with the loss of about 60% of his men. Though criticized for his leadership, he retained his command.

Pickford, Mary *orig.* **Gladys Mary Smith** (b. April 9, 1893, Toronto, Ont., Can.—d. May 28, 1979, Santa Monica, Calif., U.S.) Canadian-born U.S. film actress. She acted with a stock company from age 5, went on tour at 8, and was performing on Broadway by 18. She starred in D.W. Griffith's *The Lonely Villa* (1909) and by 1913 was acting in movies exclusively. One of the first movie stars, she became a symbol of innocence and was known as "America's sweetheart." Her silent films include *Tess of the Storm Country* (1914), *Rebecca of Sunnybrook Farm* (1917), *Poor Little Rich Girl* (1917), and *Pollyanna* (1920). A shrewd businesswoman, she formed United Artists Corp. (1919) with her second husband, Douglas Fairbanks, and others. She received an Academy Award for her first sound film, *Coquette* (1929). She retired from acting in 1933 and received a special Academy Award in 1975.

Pico Bolívar See Bolívar Peak

Pico della Mirandola \'pē-kō-ˌdāl-lä-mē-'rän-dō-ˌlä**, Giovanni, conte (count) di Concordia** (b. Feb. 24, 1463, Mirandola, duchy of Ferrara—d. Nov. 17, 1494, Florence) Italian scholar, philosopher, and humanist. He settled in Florence in 1484 as a protégé of Lorenzo de' Medici and Marsilio Ficino. In 1486 he posted in Rome a list of 900 theses on logic, mathematics, physics, and other subjects that he proposed to defend against any opponent. His *Oration on the Dignity of Man* (1486), which accompanied the posting, epitomizes Renaissance humanism. Accused of heresy by the pope, he was later cleared, and he was later reconverted to orthodoxy by Girolamo Savonarola. Pico was the first Christian scholar to use Kabbalistic doctrine (see Kabbala) in support of Christian theology. His other works include *Heptaplus* (a seven-point exposition of the Book of Genesis) and a synoptic treatment of Plato and Aristotle, of which *Of Being and Unity* is a portion. He died at age 31.

picornavirus \pē-ˌkór-nə-'vī-rəs\ Any of a group of the smallest known animal viruses. (*Pico* refers to their small size, *rna* to their core of RNA.) This group of spheroidal viruses includes viruses that attack the vertebrate intestinal tract and often invade the central nervous system as well (such as polioviruses), viruses that infect tissues in the vertebrate nose (rhinoviruses), and the virus agent of foot-and-mouth disease.

Pict \'pikt\ Any member of an ancient people of what is now eastern and northeastern Scotland. The name (from Latin *picti*, "painted") referred to their body painting or tattooing. They were probably descended from pre-Celtic peoples. They attacked Hadrian's Wall in 297 and warred constantly with the Romans. They united their two kingdoms by the 7th century and converted to Christianity, and in 843 Kenneth I, king of the Scots, included them in the kingdom of Alba, later Scotland.

pictography \pik-'tä-grə-fē\ Expression of words and ideas through drawings (pictographs), considered a forerunner of true writing. Pictographs are drawn in a standardized way, omitting unnecessary details. A pictograph that stands for a specific idea or meaning is an ideogram; one that stands for an individual word is a logogram.

picturesque Artistic concept and style of the late 18th and early 19th century characterized by a preoccupation with architecture and landscape in pictorial combination with each other. In Britain, the picturesque was defined as an aesthetic quality marked by pleasing variety, irregularity, asymmetry, and interesting textures; medieval ruins in a natural landscape were thought to be picturesque. John Nash produced some of the most exemplary works embodying the concept. See also folly.

Picus \'pī-kəs\ In Roman mythology, a woodpecker sacred to Mars. A minor agricultural deity associated with the fertilization of the soil, Picus was widely worshiped in ancient Italy. Later versions of the myth made him an early king of Italy, whose bride, Circe, changed him into a woodpecker. In art he was shown as a woodpecker mounted on a pillar, and later as a youth with a woodpecker on his head. The woodpecker was also an important bird in augury.

pidgin \'pi-jən\ Language with a very limited vocabulary and a simplified grammar. Pidgins usually arise to permit communication between groups with no language in common; if a pidgin becomes established as the native language of a group, it is known as a creole. Pidgins such as Chinese Pidgin English and Melanesian Pidgin English arose through contact between English-speaking traders and inhabitants of East Asia and the Pacific islands. Other pidgins appeared with the slave trade in Africa and with the importation of West African slaves to Caribbean plantations. Most of the small vocabulary of a pidgin language (Melanesian Pidgin has only 2,000 words, Chinese Pidgin English only 700) is usually drawn from a single language (Melanesian Pidgin, for example, has an English word stock of more than 90%).

Piedmont \'pēd-ˌmänt\ *Italian* **Piemonte** \pyä-'mòn-tā\ Autonomous region (pop., 2001 prelim.: 4,166,442), northwestern Italy. With its capital at Turin, Piedmont borders France and Switzerland; it has an area of 9,807 sq mi (25,399 sq km). In Roman times its passes connected Italy with the transalpine provinces of Gaul. In the Middle Ages the house of Savoy was the region's most important power. It was a centre during the 19th-century Risorgimento that united Italy. Victor Emmanuel II, originally king of Piedmont and Sardinia, became modern Italy's first king in 1861. Surrounded by mountains, Piedmont is centred on the Po River valley, which contains some of Italy's best farmland, producing wheat, rice, and wines. Its hydroelectric plants supply energy for much of northern Italy.

Piedmont Geographic region, eastern U.S. Lying between the Appalachian Mountains and the Atlantic coastal plain, it is about 600 mi (950 km) long and stretches between the Hudson River and central Alabama. A relatively low, rolling plateau crossed by many rivers, it is a fertile agricultural region.

Pielinen \'pē-ə-ˌlē-nən**, Lake** Lake, southeastern Finland. Located near the border with Russia, Lake Pielinen is 56 mi (90 km) long and has an area of 422 sq mi (1,093 sq km). The lake has many islands and is drained southward into Lake Saimaa by the Pielis River. It is surrounded by dense forests, especially on its western shore. The shore is capped by Koli hill, the centre of a winter sports area.

Pieman River \'pī-mən\ River, northwestern Tasmania, Australia. It is formed near Tullah by the confluence of the Macintosh and Murchison rivers. Rising on the western edge of the central highlands, it is about 70 mi (115 km) long and flows west to the Indian Ocean. There was some gold and tin mining in the area during the 1870s and 1890s. It was named for an

© 2006 Encyclopædia Britannica, Inc.

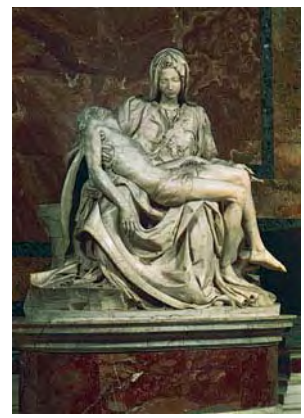
infamous convict, Alexander Pierce (Jimmy the Pieman), who was recaptured at its mouth after escaping from the Macquarie Harbour penal colony.

pier In building construction, a vertical load-bearing member such as an intermediate support for adjacent ends of two bays or spans. Bulkier than a column but smaller than a wall, a pier can support an arch or beam. The lower portion of a pier may be widened to better distribute the downward pressure of a massive overlying structure. In Romanesque and Gothic architecture, a feature of the nave arcade is the compound pier, which is cross-shaped in cross section, with shafts placed in the recesses.

Pierce, Franklin (b. Nov. 23, 1804, Hillsboro, N.H., U.S.—d. Oct. 8, 1869, Concord, N.H.) 14th president of the U.S. (1853–57). He served in the U.S. House of Representatives from 1833 to 1837 and in the Senate from 1837 to 1842. At the deadlocked Democratic Party convention of 1852, he was nominated as a compromise presidential candidate; though largely unknown nationally, he unexpectedly trounced Winfield Scott in the general election. For the sake of harmony and business prosperity, he was inclined to oppose antislavery agitation. His promotion of U.S. territorial expansion resulted in the diplomatic controversy of the Ostend Manifesto. He reorganized the diplomatic and consular service and created the U.S. Court of Claims. Pierce encouraged plans for a transcontinental railroad and approved the Gadsden Purchase. To promote northwestern migration and conciliate sectional demands, he approved the Kansas-Nebraska Act but was unable to settle the resultant problems. Defeated for renomination by James Buchanan in 1856, he retired from politics.

Franklin Pierce.
LIBRARY OF CONGRESS, WASHINGTON, D.C.

Piero della Francesca \fran-'ches-kə\ (b. c. 1420, Sansepolcro?, Republic of Florence—d. Oct. 12, 1492, Sansepolcro) Italian painter. Son of a prosperous tanner and wool merchant, he became known for his serene, disciplined exploration of perspective. His fresco cycle for San Francesco at Arezzo, *The Legend of the True Cross* (1450s), exemplifies his simplicity and clarity of structure, controlled use of perspective, and aura of serenity. His famous diptych portrait of his patrons, Count Federico da Montefeltro and his wife (c. 1470), is known for its unidealized depiction of their features and the use of landscape in the background. Though he had little influence on his contemporaries, Piero's important scientific and poetic contributions to Renaissance painting are now well recognized. Also a writer, he produced theoretical treatises on geometry and perspective.



The Baptism of Christ, panel painting by Piero della Francesca, c. 1440–45; in the National Gallery, London.
COURTESY OF THE TRUSTEES OF THE NATIONAL GALLERY, LONDON; PHOTOGRAPH, A.C. COOPER LTD.

Piero di Cosimo \kō-'sē-mō\ *orig.* **Piero di Lorenzo** (b. 1462, Florence, Republic of Florence—d. 1521, Florence) Italian painter. His name derives from that of his master, Cosimo Rosselli, whom he assisted on frescoes for the Sistine Chapel. His later mythological paintings exhibit a bizarre Romantic style. Many are filled with fantastic hybrid human-animal forms engaging in revels (*The Discovery of Honey*, c. 1500) or fights (*Battle of the Centaurs and the Lapiths*, c. 1500). His art reflects his eccentric personality. He belonged to no school of painting but borrowed from many artists, including Sandro Botticelli and Leonardo da Vinci.

Pierre \'pir\ City (pop., 2000: 13,876), capital of South Dakota, U.S. It is located on the Missouri River, in the geographic centre of the state. The area was originally inhabited by Arikara Indians. The city was founded in 1880 as the western terminus of the Chicago and North Western Railway, which spurred its growth as a mining and trade centre. It became the state capital in 1889. It is the hub of a large, diversified agricultural area with a significant tourist industry based on nearby lakes.

Pietà \pyā-'tä\ *Italian* **"Pity"** Depiction of the Virgin Mary supporting the body of the dead Christ. The theme grew out of that of the Lamentation, the moment between the Descent from the Cross and the Entombment. It first appeared in Germany in the early 14th century. It enjoyed greater popularity in northern Europe than in Italy through the 15th century, yet the supreme representation is Michelangelo's sculpture (1499) in St. Peter's Basilica. The Pietà was widely represented in both painting and sculpture. Michelangelo's conception of Mary bearing Jesus' body on her knees was standard until the 16th century, when artists began to place Jesus at Mary's feet. Though most religious art declined after the 17th century, the Pietà retained its popularity through the 19th century.

Pietà, marble sculpture by Michelangelo, 1499; in St. Peter's Basilica, Rome.
SCALA/ART RESOURCE, NEW YORK

Pietism \'pī-ə-ˌti-zəm\ Reform movement in German Lutheranism that arose in the 17th century. Philipp Jakob Spener (1635–1705), a Lutheran pastor, originated the movement when he organized an "assembly of piety," a regular meeting of Christians for devotional reading and spiritual exchange. Spener advocated greater involvement of the laity in worship, more extensive study of scripture, and ministerial training that emphasized piety and learning rather than disputation. Under Spener's successor, August Hermann Francke (1663–1727), the University of Halle became a centre of the movement. Pietism influenced the Moravian and Methodist churches (see Methodism).

Pietro da Cortona *orig.* **Pietro Berrettini** (b. Nov. 1, 1596, Cortona, Tuscany—d. May 16, 1669, Rome, Papal States) Italian painter, architect, and decorator. The son of a stonemason, he was apprenticed to a painter in Florence. His first major work, a series of frescoes in the small church of Santa Bibiana in Rome (1624–26), was commissioned by Pope Urban VIII, and the patronage of the pope's family, the Barberinis, advanced Pietro's career. The rich exuberance of those Baroque frescoes was a prelude to his best-known work, the large ceiling fresco *Allegory of Divine Providence and Barberini Power* (1632–39) in the Barberini Palace. Here he demonstrated his mastery of illusion, for the centre of the vault appears open to the sky and the figures seem to hover in space. He provided a series of frescoes for the Pitti Palace in Florence. Also a master architect, his greatest architectural accomplishment is the church of Santi Martina e Luca in Rome (1634), the first Baroque church built as a unitary whole.

piezoelectricity \pē-ˌā-zō-ə-ˌlek-'tri-sə-tē\ Appearance of an electric field in certain nonconducting crystals as a result of the application of mechanical pressure. Pressure polarizes some crystals, such as quartz, by slightly separating the centers of positive and negative charge. The resultant electric field is detectable as a voltage. The converse effect also occurs: an applied electric field produces mechanical deformation in the crystal. Using this effect, a high-frequency alternating electric current (see alternating current) can be converted to an ultrasonic wave of the same frequency, while a mechanical vibration, such as sound, can be converted into a corresponding electrical signal. Piezoelectricity is utilized in microphones, phonograph pickups, and telephone communications systems.

pig Any wild or domestic even-toed ungulate (family Suidae) that is a stout-bodied, short-legged omnivore, with thick, sparsely bristled skin, a long mobile snout, small tail, and hooves with two functional and two nonfunctional digits. Pigs are native to European, Asian, and North African forests. Wild pigs use their tusklike teeth to forage and for defense; the teeth of domestic pigs, which were developed from wild pigs in

© 2006 Encyclopædia Britannica, Inc.

Europe c. 1500 BC, are less developed. Pigs are regarded as highly intelligent. Domestic pigs are classified as lard (thick fat, carcass weighing at least 220 lbs, or 100 kg), bacon (carcass about 150 lbs, or 70 kg), and PORK (carcass about 100 lbs, or 45 kg) pigs, depending on the principal product derived from them; they are also a source of leather. Today they are usually bred in almost complete confinement. See also BOAR, HOG.

pig iron Crude IRON obtained directly from the BLAST FURNACE and cast in molds (see CAST IRON). The crude ingots, called pigs, are then remelted along with scrap and alloying elements and recast into molds to produce various iron and STEEL products (see BESSEMER PROCESS, FINERY PROCESS, PUDDLING PROCESS).

Pigalle \pē-'gäl**, Jean-Baptiste** (b. Jan. 26, 1714, Paris, France—d. Aug. 21, 1785, Paris) French sculptor. Born into a family of master carpenters, he began training as a sculptor in Paris at 18 and then studied in Rome (1736–40). Returning to France, he modeled the first version of his famous *Mercury Fastening His Sandals*, which in a later version won him admission to the Royal Academy (1744). The statue became so popular that in 1748 LOUIS XV commissioned a life-size marble version to present to FREDERICK II of Prussia. He was also noted for his portrait sculptures. His *Nude Voltaire* (1776), an anatomically realistic rendering of the aged philosopher, caused a furor when it was first shown.

pigeon Plump, small-billed, monogamous birds of the family Columbidae, found almost worldwide and recognizable by their head-bobbing strut. Unlike other birds, pigeons suck liquids and provide the young with regurgitated "pigeon's milk." The 175 species of true pigeons include the Old and New World *Columba* species and the Old World *Streptopelia* species; all eat seeds and fruit. Common street pigeons, or rock doves, are descendants of the Eurasian rock dove (*Columba livia*). From antiquity pigeons were trained to carry messages over long distances. About 115 species of fruit pigeons occur in Africa, southern Asia, Australia, and the Pacific islands. The three species of crowned pigeons (genus *Goura*), of New Guinea, are nearly the size of a turkey. See also DOVE; MOURNING DOVE; PASSENGER PIGEON; TURTLEDOVE.

pigeon hawk See MERLIN

pigment Any intensely coloured compound used to colour other materials. Unlike DYES, pigments do not dissolve; they are applied as fine solid particles mixed with a liquid. In general, the same ones are used in oil- and water-based PAINTS, printing INKS, and PLASTICS. They may be inorganic compounds (usually brighter and longer-lasting) or organic compounds. Natural organic pigments have been used for centuries, but today most are synthetic or inorganic. The primary white pigment is TITANIUM dioxide. CARBON black is the most usual black pigment. IRON oxides give browns, ranging from yellowish through orange to dark brown. CHROMIUM compounds yield chrome yellows, oranges, and greens; CADMIUM compounds brilliant yellows, oranges, and reds. The most common blues, Prussian blue and ultramarine, are also inorganic. Organic pigments, usually synthesized from aromatic HYDROCARBONS, include the nitrogen-containing azo pigments (red, orange, and yellow; see AZO DYES) and the COPPER phthalocyanines (brilliant, strong blues and greens). CHLOROPHYLL, CAROTENE, RHODOPSIN, and MELANIN are pigments produced by plants and animals for specialized purposes.

pika \'pē-kə, 'pī-kə\ Any of numerous round-eared, tailless members (genus *Ochotona*, family Ochotonidae) of the RABBIT order (Lagomorpha), found in Asia, eastern Europe, and parts of western North America. Though not HARES, they are sometimes called mouse hares. The hind legs are less developed than a rabbit's; pikas scamper rather than bound. Their brownish or reddish fur is soft, long, and thick. Most pikas weigh between 4.5 and 7.1 oz. (125 and 200 g) and are about 6 in. (15 cm) long. Many species live in rocky, mountainous areas, but some Asian species inhabit burrows. Pikas do not hibernate, but in summer and autumn they "harvest" vegetation and store it in protected places (e.g., under rocks) to be eaten in winter.

American pika (*Ochotona princeps*).
KENNETH W. FINK/ROOT RESOURCES

pike Ancient and medieval INFANTRY weapon consisting of a long, metal-pointed spear with a heavy wooden shaft 10–20 ft (3–6 m) in length. Its use by Swiss foot soldiers in the 14th century contributed to the decline of the feudal knights. A variation is used by the picador in BULLFIGHTING.

pike Any of several voracious freshwater fishes (family Esocidae, order Salmoniformes) with a slender body, small scales, long head, shovel-like snout, large mouth, and strong teeth, and with dorsal and anal fins far back on the tail. The northern pike (*Esox lucius*) of North America, Europe, and northern Asia may grow to 4.5 ft (1.4 m) long and weigh 45 lbs (20 kg). A solitary hunter, it lies motionless or lurks among weeds, then suddenly lunges, seizing an approaching fish or invertebrate. Large species also take waterfowl and small mammals. See also MUSKELLUNGE, PICKEREL.

Northern pike (*Esox lucius*).
RUSS KINNE—PHOTO RESEARCHERS

Pike, Kenneth L(ee) (b. June 9, 1912, Woodstock, Conn., U.S.—d. Dec. 31, 2000, Dallas, Tex.) U.S. linguist and anthropologist. Pike was associated throughout his career with the Summer Institute of Linguistics (now SIL International), an organization dedicated to linguistic study of little-known, unwritten languages, as an ancillary to Bible translation. He originated the linguistic theory known as tagmemics. The tagmeme, a unit comprising a function (e.g., a subject) and a class of items fulfilling that function (e.g., nouns), is identified by semantic as well as syntactic function.

Pike, Zebulon Montgomery (b. Jan. 5, 1779, Lamberton, N.J., U.S.—d. April 27, 1813, York, Ont.) U.S. explorer. He joined the army at age 15. In 1805 he led an expedition to find the headwaters of the Mississippi River, traveling 2,000 mi (3,200 km) from St. Louis to northern Minnesota, where he erroneously identified Leech Lake as the river's source. In 1806 he was sent to the Southwest to explore the Arkansas and Red rivers. Passing through Colorado, he tried unsuccessfully to climb the 14,110-ft (4,301-m) mountain later named PIKES PEAK. His party continued into northern New Mexico (1807); his report on the Santa Fe region encouraged later expansion into the Southwest. In the WAR OF 1812 he was killed in the attack on York (Toronto).

Pikes Peak Mountain peak, eastern Colorado, U.S. It is located in the Front Range of the ROCKY MOUNTAINS, near COLORADO SPRINGS. At 14,110 ft (4,301 m) in height, it is known for the panoramic view from its summit. It was discovered in 1806 by U.S. explorer ZEBULON PIKE. The view from it is said to have inspired Katharine Lee Bates to write "America the Beautiful" in 1893.

pilaster \pi-'las-tər\ In CLASSICAL ARCHITECTURE, a shallow rectangular column built into a wall and projecting slightly beyond it. It has a capital and base and conforms to one of the ORDERS. In Roman architecture the pilaster gradually became more decorative than structural, and it served to break up otherwise empty expanses of wall.

Pilate \'pī-lət**, Pontius** (d. AD 36) Roman prefect of JUDAEA (AD 26–36) who presided at the trial of JESUS and gave the order for his CRUCIFIXION. The NEW TESTAMENT represents Pilate as a weak and vacillating man who found no fault with Jesus but ordered his execution to please the mob calling for his death. Known for his severity toward the Jews, he was eventually ordered back to Rome to stand trial for cruelty and oppression. A tradition of uncertain accuracy holds that he killed himself on orders from CALIGULA in AD 39; another legend relates that both Pilate and his wife converted to Christianity.

pilchard \'pil-chərd\ Local name in Britain and elsewhere for the European SARDINE (*Sardina pilchardus*). It is found in the Mediterranean and off the Atlantic coasts of Spain, Portugal, France, and Britain.

Pilcomayo \ˌpēl-kō-'mä-yō\ **River** River, south-central South America. The chief western tributary of the PARAGUAY RIVER, it rises in the eastern ANDES MOUNTAINS in west-central Bolivia. It flows southeast through the

© 2006 Encyclopædia Britannica, Inc.

Gran Chaco of Paraguay to join the Paraguay River opposite Asunción, after about 1,000 mi (1,600 km). It forms part of the border between Argentina and Paraguay.

pile In building construction, a postlike foundation member used from prehistoric times. Piles transfer building loads down to a suitable bearing stratum when the soil mass immediately below a construction is unsuitable for the direct bearing of footings (see foundation). Piles support loads either by bearing directly on rock or suitable soil or by developing friction along their very ample length. In modern civil engineering, piles of timber, steel, or concrete are driven into the ground to support a structure; bridge piers and building foundations may be supported on groups of piles.

pile See hemorrhoid

pileworm See shipworm

pilgrimage Journey to a shrine or other sacred place undertaken to gain divine aid, as an act of thanksgiving or penance, or to demonstrate devotion. Medieval Christian pilgrims stayed at hospices set up specifically for pilgrims, and on their return trip they wore on their hats the badge of the shrine visited. The chief attractions for pilgrims in the Middle Ages were the Holy Land, Santiago de Compostela in Spain, and Rome, but there were hundreds of local pilgrimage sites, including the tomb of St. Francis of Assisi and that of St. Thomas Becket in Canterbury. More recent pilgrimage sites include the shrine of Our Lady of Guadalupe in Mexico (1531), Lourdes in France (1858), and Fátima in Portugal (1917). The tradition of pilgrimage is also important in Buddhism, with sites including Bodh Gaya, where the Buddha received enlightenment, and Varanasi, where he delivered his first sermon. In Islam all members of the faith are enjoined to perform the hajj, the pilgrimage to Mecca, at least once in their lifetime.

Pilgrimage of Grace (1536) Uprising in the northern counties of England against the Reformation legislation of Henry VIII. Royal mandates to dissolve the monasteries in the north triggered riots in Lincolnshire and Yorkshire, where 30,000 armed rebels under Robert Aske occupied York, demanding a return to papal obedience and a parliament free from royal influence. Playing for time to assemble enough royal forces to oust the rebels, the 3rd duke of Norfolk made vague promises, and the rebels dispersed, believing they had won, only to be arrested later; about 220 were executed, including Aske.

Pilgrims First settlers of Plymouth (Massachusetts), the first permanent colony in New England (1620). The members of the English Separatist Church, a radical faction of Puritanism, composed a third of the 102 colonists who sailed aboard the *Mayflower* to North America, and they became the dominant group in the colony. The settlers were later collectively referred to as the Forefathers; the term Pilgrim Fathers was applied to them by Daniel Webster at the bicentennial celebration (1820). See also Mayflower Compact; Plymouth Co.

pill bug Any species of terrestrial crustacean in the genera *Armadillidium* and *Armadillo* (both in the order Isopoda), native to Europe and introduced worldwide. Pill bugs (sometimes called wood lice) resemble tiny armadillos in appearance and behaviour; they have a gray, oval body covered with plate-like armour and, when disturbed, roll into a ball. They are about 0.75 in. (19 mm) long. Pill bugs live in dry, sunny places, in dry leaf litter, and on forest edges. See also sow bug.

Pill bugs (*Armadillidium vulgare*)
E.S. ROSS

pillar Relatively slender isolated vertical structural member such as a pier or (usually squat) column. It may be constructed of a single piece of stone or wood or built up of units, such as bricks. A pillar commonly has a load-bearing or stabilizing function, but it may also stand alone, as do commemorative pillars.

Pillars of Hercules Two promontories at the eastern end of the Strait of Gibraltar. They include the Rock of Gibraltar (at Gibraltar) in Europe and Jebel Musa (at Ceuta) in northern Africa. They are fabled to have been set there by Heracles as a memorial in his labour of seizing the cattle of the three-bodied giant Geryon.

Pillars of Islam See Pillars of Islam

Pillsbury Co. U.S. food-products company. It was established in Minneapolis in 1871 as C.A. Pillsbury & Co. Its founder, Charles Alfred Pillsbury (1842–99), built the company into one of the world's largest milling concerns in the 1880s, expanding the business by obtaining favourable freight rates and building his own grain elevators throughout the Northwest. He sold the firm to an English syndicate but remained its managing director until his death. Pillsbury later became a successful manufacturer of food products, acquiring subsidiaries such as Burger King, Häagen-Dazs, and Green Giant. It was acquired by Grand Metropolitan PLC (now Diageo PLC) in a hostile takeover in 1989, and in 2001 it was sold to former rival General Mills, Inc.

Pilon \pē-'lō^{n}**, Germain** (b. 1535, Paris, France—d. Feb. 3, 1590, Paris) French sculptor. His decoration of the tomb of Francis I (1558), a relatively early work, shows an Italian influence, but he later developed a distinctively French expression by fusing elements of Classical and Gothic art with the Fontainebleau adaptation of Mannerism. His best-known works are funerary sculptures for Henry II and Catherine de Médicis at St.-Denis (1561–70). His work represents a transitional link between the Gothic tradition and Baroque sculpture.

pilot fish Widely distributed species (*Naucrates ductor*, family Carangidae) of carnivorous fish that inhabits warm and tropical open seas. It is slender and has a forked tail, a lengthwise keel on each side of the tail base, and a few small spines in front of the dorsal and anal fins. It may grow to 2 ft (60 cm) but is usually about 14 in. (35 cm) long. Five to seven distinctive vertical dark bands mark the bluish body. Pilot fishes follow sharks and ships, apparently to feed on parasites and leftover scraps. It was formerly thought that they were leading, or "piloting," the larger fishes to food.

pilot whale Any of one to three species (genus *Globicephala*, family Delphinidae) of toothed whale found in all oceans except the Arctic and Antarctic, also called caa'ing whale for a roaring sound it makes when stranded. It is black, usually with a lighter splash on the throat and chest, and has a round, bulging forehead, a short beaklike snout, and slender, pointed flippers, and grows to 13–20 ft (4–6 m) long. Pilot whales live in large schools, sometimes hundreds or thousands, feeding mainly on squid. They have been kept in oceanariums and trained to perform.

Piłsudski \pil-'süt-skē, pil-'züt-skē**, Józef (Klemens)** (b. Dec. 5, 1867, Żułów, Pol., Russian Empire—d. May 12, 1935, Warsaw, Pol.) Polish revolutionary leader. Reared with a hatred for Russian oppression, he was politically active and was banished to Siberia for his socialist agitation (1887–92), and he became a leader of the Polish Socialist Party on his return. In 1908 he organized the secret Union of Military Action, which fought in World War I under Austro-Hungarian command against the Russians. In 1916 he demanded recognition of Poland's independence, which was granted in 1918. He served as Poland's first head of state until the constitution was established in 1922. After staging a coup in 1926, he served as premier (1926–28) and minister of defense (1926–35) under handpicked premiers, enabling him to rule as the dictator of Poland.

Piltdown hoax Forgery of human fossil remains that impeded early 20th-century progress in the study of human evolution. The apparently fossilized skull found at Piltdown Common near Lewes, Eng., was first proposed as a new species of prehistoric man ("Piltdown man") in 1912. Only in 1954 was the skull shown to consist of a human cranium skillfully joined to the jaw of an orangutan. The hoax may have been perpetrated by the skull's discoverer, Charles Dawson, though evidence discovered in the 1970s suggests a British Museum staff member, Martin A.C. Hinton.

Pima \'pē-mə\ North American Indian people living mainly in Arizona, U.S. The Pima language is of Uto-Aztecan language stock, and the name Pima was given by the Spanish, who may have derived it from the phrase *pi-nyi-match*, meaning "I don't know." They call themselves Akimel O'odham, meaning "River People." Their traditional lands are located in the core area of the prehistoric Hohokam culture, from which they probably descend. The Pima originally were sedentary corn farmers who lived in one-room houses and used the Gila and Salt rivers for irrigation. Some hunting and gathering were also done. Their villages were larger than those of the related Papago Indians, and they possessed a stronger tribal

© 2006 Encyclopædia Britannica, Inc.

unity. The Pima were long friendly with whites but enemies of the Apache. At the turn of the 21st century they numbered some 15,000.

pimiento *or* **pimento** Any of various mild peppers of the genus *Capsicum* that have distinctive flavour but lack pungency, including the European paprikas. A common flavouring in Hungarian dishes, paprika is made by grinding dried peppers. The term *pimento* sometimes refers to allspice because early Spanish explorers of the West Indies and Central America mistook the highly aromatic berries of the tropical allspice tree for a type of pepper and called it *pimenta*.

pin (fastener) In mechanical and civil engineering, a peg or bar designed to fasten machine and structural components together or to keep them aligned. Dowel pins are used to keep machine components aligned, sometimes without making a rigid joint (as in a pin-connected truss). Taper pins are used to fix the hub of a gear or a pulley to a shaft. Split cotter pins prevent nuts from turning on bolts and keep loosely fitting pins in place. The clevis pin has a ridge at one end and is kept in place by a cotter pin inserted through a hole in the other end. Many other types of pins are used in various machines.

Pinatubo \ˌpē-nä-ˈtü-bō**, Mount** Volcano, western Luzon, Philippines. Located about 55 mi (90 km) northwest of Manila, it rose to a height of about 4,800 ft (1,460 m) before its eruption in 1991 (for the first time in 600 years). Its explosions produced a column of smoke and ash more than 19 mi (30 km) high and left some 100,000 people homeless. The ashfalls forced the evacuation and eventual closing of a nearby U.S. Air Force base. The eruption was one of the largest of the 20th century.

Pinchback, Pinckney (Benton Stewart) (b. May 10, 1837, Macon, Ga., U.S.—d. Dec. 21, 1921, Washington, D.C.) U.S. politician. Born to a former slave and a white planter, he became a steward on river steamboats. At the outbreak of the American Civil War, he reached Union-held New Orleans, where he raised and led a company of black Union volunteers called the Corps d'Afrique (1862–63). After the war he was elected to the Louisiana senate (1868) and served as lieutenant governor (1871). Elected to the U.S. House of Representatives (1872) and Senate (1873), he was denied his seat in each body on unproved charges of election fraud. He subsequently became a lawyer and moved to Washington, D.C.

Pinchot \ˈpin-shō**, Gifford** (b. Aug. 11, 1865, Simsbury, Conn., U.S.—d. Oct. 4, 1946, New York, N.Y.) U.S. forestry and conservation pioneer. He graduated from Yale University and studied forestry in Europe. In 1892 he became the first professional U.S. forester. In 1896 he joined the national forest commission of the National Academy of Sciences and helped plan the U.S. system of forest reserves (later national forests). As chief of the U.S. Forest Service (1898–1910), he established the nation's forest-service system. He founded the Yale School of Forestry and taught there from 1903 to 1936. He served as governor of Pennsylvania from 1923 to 1927 and from 1931 to 1935.

Pinckney, Charles (b. Oct. 26, 1757, Charleston, S.C.—d. Oct. 29, 1824, Charleston, S.C., U.S.) U.S. statesman. A cousin of Charles C. Pinckney and Thomas Pinckney, he fought in the American Revolution. From 1784 to 1787 he served in the Continental Congress, where he was instrumental in calling for the Constitutional Convention. As a delegate to the convention from South Carolina, he proposed numerous provisions that were incorporated in the final draft of the Constitution of the United States. He helped write the South Carolina constitution and was also governor of the state (1789–92, 1796–98, 1806–08). He served in the U.S. Senate from 1798 to 1801 and as minister to Spain from 1801 to 1805.

Pinckney, Charles Cotesworth (b. Feb. 25, 1746, Charleston, S.C.—d. Aug. 16, 1825, Charleston, S.C., U.S.) U.S. soldier, statesman, and diplomat. A cousin of Charles Pinckney and the brother of Thomas Pinckney, he was an aide to George Washington in the American Revolution, commanded at Savannah, Ga., and was promoted to brigadier general in 1783. He was a delegate to the Constitutional Convention. Appointed minister to France (1796), he was involved in negotiations that ended in the XYZ Affair; when one of the group of French negotiators suggested that the U.S. representatives offer a gift in order to gain a peace treaty, Pinckney is said to have replied, "No! No! Not a sixpence!" He was the unsuccessful Federalist candidate for vice president in 1800 and for president in 1804 and 1808.

Pinckney, Eliza *orig.* **Elizabeth Lucas** (b. c. Dec. 28, 1722, Antigua, West Indies—d. May 26, 1793, Philadelphia, Pa., U.S.) British-American planter. The daughter of a British landowner in South Carolina, she managed his plantations from 1739. Experimenting with various crops, she succeeded in marketing the first American crop of indigo. After her marriage to the lawyer Charles Pinckney (1744), she revived the cultivation of silkworms and manufacture of silk on his plantation. She continued to manage their extensive landholdings after his death (1758). Charles C. Pinckney and Thomas Pinckney were her sons.

Pinckney, Thomas (b. Oct. 23, 1750, Charleston, S.C.—d. Nov. 2, 1828, Charleston, S.C., U.S.) U.S. soldier, politician, and diplomat. The brother of Charles C. Pinckney and a cousin of Charles Pinckney, he served as governor of South Carolina (1787–89) and as minister to Britain (1792–96). As special envoy to Spain (1795), he negotiated the Treaty of San Lorenzo, also called Pinckney's Treaty, which fixed the southern border of the U.S. and granted the U.S. navigation rights on the Mississippi River and the right of deposit (storage of goods) at New Orleans. He was a major general in the War of 1812.

Pindar (b. 518/522, Cynoscephalae—d. c. 438 BC, Argos) Greek poet. A Boeotian of aristocratic birth, Pindar was educated in neighbouring Athens and lived much of his life in Thebes. Almost all his early poems have been lost, but his reputation was probably established by his later hymns in honour of the gods. He developed into the greatest lyric poet of ancient Greece, respected throughout the Greek world. Of his 17 volumes, comprising almost every genre of choral lyric, only four have survived complete, and those lack his musical settings. The extant poems, probably representing his masterpieces, are odes (see Pindaric ode) commissioned to celebrate triumphs in various Hellenic athletic games. Lofty and religious in tone, they are noted for their complexity, rich metaphors, and intensely emotive language.

Pindaric ode Ceremonious poem in the manner of Pindar, who employed a triadic, or three-part, structure consisting of a strophe (two or more lines repeated as a unit) followed by a metrically harmonious antistrophe and an epode (summary line) in a different metre. The three parts correspond to movements onstage by the chorus in Greek drama. After the 16th-century publication of Pindar's choral odes in the epinicion (celebratory) form, poets writing in various vernaculars created irregular rhymed odes that suggest his style. Such odes in English are among the greatest poems in the language, including John Dryden's "Alexander's Feast," William Wordsworth's "Ode: Intimations of Immortality," and John Keats's "Ode on a Grecian Urn."

pine Any of 10 genera of coniferous trees (rarely shrubs) of the family Pinaceae (see conifer), native to northern temperate regions, especially about 90 species of ornamental and timber evergreen conifers of the genus *Pinus*. Needlelike leaves and cones are solitary or in bunches. Shallow root systems make pines susceptible to wind and surface disturbance. The family includes fir, Douglas fir, hemlock, spruce, larch, and cedar. Many species are sources of softwood timber, paper pulp, oils, and resins. Some are cultivated as ornamentals.

Cluster of pollen-bearing male cones of Austrian (black) pine (*Pinus nigra*).
GRANT HEILMAN/EB INC.

pineal \ˈpī-nē-əl, pī-ˈnē-əl\ **gland** *or* **pineal body** Endocrine gland in the brain that produces melatonin. It is large in children and begins to shrink at puberty. The gland may play a significant role in sexual maturation, circadian rhythm and sleep induction, and seasonal affective disorder and depression. In animals it is known to play a major role in sexual development, hibernation, and seasonal breeding.

pineapple Fruit-bearing plant (*Ananas comosus*) of the family Bromeliaceae, native to the New World tropics and subtropics but introduced elsewhere. Pineapple is served fresh where available and in canned form worldwide. It is a key ingredient in

Pineapple (*Ananas comosus*).

Polynesian cuisine. Like AGAVE and some YUCCAS, the plant has a rosette of 30–40 stiff, succulent leaves on a thick, fleshy stem. A determinate inflorescence forms 15–20 months after planting. After fertilization, the many lavender flowers fuse and become fleshy to form the 2–4 lb (1–2 kg) fruit. Ripening takes 5–6 months.

Pinero \pi-'nir-ō**, Sir Arthur Wing** (b. May 24, 1855, London, Eng.—d. Nov. 23, 1934, London) British playwright. He entered the theatrical world as an actor with HENRY IRVING's theatre company. His first play, *£200 a Year*, was produced in 1877. He wrote a series of successful farces such as *The Magistrate* (1885) before turning to dramas of social issues. *The Second Mrs. Tanqueray* (1893), the first of his plays depicting women confronting their situation in society, established his reputation, and he followed it with works such as *The Notorious Mrs. Ebbsmith* (1895) and *Trelawny of the "Wells"* (1898), becoming the most successful playwright of his time.

Piniós River \ˌpē-nē-'ȯs\ *or* **Peneus River** \pi-'nē-əs\ River, THESSALY, north-central Greece. It rises in the Pindus Mountains and flows about 125 mi (200 km) southeast and northeast through the plain of Thessaly and the Vale of TEMPE into the Gulf of Salonika (see Thessaloníki). In prehistoric times it formed a great lake before it broke through the Vale of Tempe. It is navigable in its lower course.

pink family Family Caryophyllaceae, composed of 2,070 species of flowering plants in 89 genera found mainly in northern temperate regions. The approximately 300 species of true pinks belong to the genus *Dianthus*; relatively easy to grow, these are popular in rock gardens for their fragrant, showy flowers. Though members of the pink family are diverse in appearance and habitat, most have swollen leaf and stem joints. The family includes CARNATIONS, BABY'S BREATH, SWEET WILLIAM, CAMPION, and CHICKWEED.

pink salmon Food fish (*Oncorhynchus gorbuscha*, family Salmonidae) of the North Pacific that constitutes half of the commercial fishery of Pacific SALMON. It weighs about 4.5 lbs (2 kg) and is marked with large, irregular spots. Pink salmon often spawn on tidal flats. The young enter the sea immediately after hatching.

Pinkerton National Detective Agency U.S. independent police force. The agency was founded in 1850 by Allan Pinkerton (1819–84), former deputy sheriff of Cook county, Ill. It originally specialized in railway theft cases, protecting trains and apprehending train robbers. It solved the $700,000 Adams Express Co. theft in 1856, and in 1861 it thwarted an assassination plot against president-elect ABRAHAM LINCOLN. It later participated in anti-labour union activities (see HOMESTEAD STRIKE). It was instrumental in breaking up the MOLLY MAGUIRES.

Pinkham \'piŋk-əm**, Lydia E(stes)** (b. Feb. 9, 1819, Lynn, Mass., U.S.—d. May 17, 1883, Lynn) U.S. patent-medicine proprietor. Pinkham began making Vegetable Compound as a home remedy, sharing it with her neighbours. Her compound, a blend of ground herbs, was 18% alcohol by content. In 1875 the Pinkham family decided to go into business selling the medicine, which Pinkham claimed could cure any "female complaint" from nervous prostration to a prolapsed uterus. It quickly gained acceptance, and the business was soon grossing close to $300,000 a year. Not until the 1920s, when federal regulation of drugs and advertising increased, did the Lydia E. Pinkham Medicine Co. reduce both the alcohol content of the medicine and the claims for its efficacy.

pinniped \'pi-nə-ˌped\ Any member of the three existing families of aquatic, fin-footed mammals that constitute the suborder Pinnipedia (order Carnivora; see CARNIVORE). They include the Odobenidae (see WALRUS) and the Phocidae and Otariidae (see SEAL).

Pinochet (Ugarte) \ˌpē-nə-'shā,\ *Spanish* \ˌpē-nō-'che**, Augusto** (b. Nov. 25, 1915, Valparaiso, Chile) Head of Chile's military government (1974–90). A career military officer, he planned and led the coup d'état in which Pres. SALVADOR ALLENDE died. He immediately moved to crush liberal opposition and in the next three years arrested about 130,000 Chileans and foreigners, many of whom were tortured and some of whom were killed. He led a rapid transition to a free-market economy, which slowed inflation but led to acute hardship for the lower classes. A new constitution in 1981 granted him eight more years as president. Rejected in a plebiscite in 1989, he stepped down after free elections installed Patricio Aylwin in 1990. In 1998 he was arrested in England at the request of Spain and held for trial for crimes against Spanish citizens in Chile during his tenure; he was released 16 months later. He was then indicted in Chile for the murder of dissidents but was declared mentally unfit for trial.

pinochle \'pē-ˌnə-kəl\ Card game. In one popular version of pinochle three players use two packs of 24 cards ranking ace, 10, king, queen, jack, and 9 of each suit. Each player is dealt 15 cards, 3 at a time. Bidding is based on certain combinations of cards within the player's hand and an estimation of tricks, or hands, the player can win. The name derives from *Binokel*, a German game resembling bezique.

Pinsky, Robert (b. Oct. 20, 1940, Long Branch, N.J., U.S.) American poet and critic. Pinsky was poetry editor of *The New Republic* from 1979 to 1986. His own poems, many of which are to be found in *The Figured Wheel: New and Collected Poems* (1996), often explore the meaning of ordinary acts. He also did a notable verse translation of Dante's *Inferno* (1994). Pinsky was poet laureate consultant from 1997 to 2000.

pintail Any of four species (genus *Anas*, family Anatidae) of sleek, long-tailed, long-necked DABBLING DUCKS that are swift fliers and popular game birds. The common, or northern, pintail (*A. acuta*), widespread in the Northern Hemisphere, is a long-distance flier; some Alaskan birds winter in Hawaii. It is 26–30 in. (66–75 cm) long. The male has a white breast, gray back, and black tail; the female is mottled brown. The preferred diet is seeds. The brown, or yellow-billed, and the Bahama, or white-cheeked, pintails are primarily found in South America. The red-billed pintail is a grayish African species.

Pinter, Harold (b. Oct. 10, 1930, London, Eng.) British playwright. Born into a working-class family, he acted with touring companies until 1959. His early one-act plays were followed by the full-length *The Birthday Party* (1958). His next major plays, *The Caretaker* (1960) and *The Homecoming* (1965), established his reputation as an innovative and complex dramatist, sometimes considered as belonging to the THEATRE OF THE ABSURD. He often used disjointed small talk and lengthy pauses in dialogue to convey a character's thought, which often contradicts his speech. Pinter's later plays include *Old Times* (1971), *No Man's Land* (1975), *Betrayal* (1978; film, 1983), *Mountain Language* (1988), and *Moonlight* (1993). He also wrote radio and television plays as well as screenplays for *The Go-Between* (1970), *The French Lieutenant's Woman* (1981), and *The Handmaid's Tale* (1990). In 2005 he won the Nobel Prize for Literature.

pinto Spotted HORSE, also called paint, piebald, skewbald, and other terms to describe variations in colour and markings. The American Indian ponies of the western U.S. were often pintos. Most pure-breed associations refuse to register horses with pinto colouring. Pintos have colour patterns called overo (white spreading irregularly up from the belly, mixed with a darker colour) and tobiano (white spreading down from the back in smooth, clean-cut patterns).

Pinturicchio \ˌpēn-tü-'rēk-kyō\ *or* **Pintoricchio** \ˌpēn-tȯ-'rēk-kyō\ *orig.* **Bernardino di Betto di Biago** (b. c. 1454, Perugia, Romagna—d. Dec. 11, 1513, Siena, Republic of Siena) Italian painter. He assisted PERUGINO on the frescoes in the Vatican's SISTINE CHAPEL (1481–82). Painting in the early Renaissance style, he was more interested in decorative effects than in clarity of design; his most important work, the fresco decoration of six rooms in the Borgia Apartments for Pope ALEXANDER VI (1492–94), features brilliant colours, gilding, and ancient Roman ornamental motifs. His last major works were 10 scenes from the life of PIUS II in the Piccolomini Library of Siena Cathedral. He was also a prolific panel painter.

Pinworm (*Enterobius vermicularis*)
WALTER DAWN

pinworm Common species (*Enterobius vermicularis*) of NEMATODE parasitic to humans, especially children. Female pinworms may be 0.5 in. (13 mm) long; males are much smaller. Pinworms have a very long tail that gives them a pinlike appearance. They mate in the upper gastrointestinal tract, usually in the

© 2006 Encyclopædia Britannica, Inc.

large intestine; the females travel to the anus, deposit their fertilized eggs on the skin near the anal opening, and die. The worms' movements cause itching; eggs transferred to the fingernails when the victim scratches may be passed to the mouth. Eggs can also be inhaled with air dust. The eggs or larvae make their way to the intestine, and the cycle begins again.

Pio, Padre *orig.* **Francesco Forgione** (b. May 25, 1887, Pietreclina, Italy—d. Sept. 23, 1968, San Giovanni Rotondo) Italian priest. Born into a devout Catholic family, he consecrated himself to Jesus at 5. At 15 he joined the Capuchins and took the name Pio; in 1910 he became a priest. That same year he received the stigmata for the first time. They were healed, but he received them again in 1918; this time they remained with him until his death. This and other signs of his holiness (perfume and, reportedly, the ability to be in two places at once), drew growing numbers of pilgrims to him. He was canonized in 2002.

Piombo, Sebastiano del See SEBASTIANO DEL PIOMBO

Pioneer First series of unmanned U.S. deep-space probes. Pioneers 0–4 were all intended to be lunar missions, but only Pioneer 4 succeeded in escaping Earth's gravity (1964). Pioneer 1 was the first spacecraft launched by NASA (1958). Pioneers 6–9 were successfully launched into solar orbits (1965–68) to study the SOLAR WIND, solar magnetic field, and COSMIC RAYS. Pioneer 10, launched in 1972, was the first space probe to traverse the ASTEROID belt and the first to fly by JUPITER (1973), where it discovered Jupiter's huge magnetic tail. It then became the first man-made object to exit the solar system. Pioneer 11's data and photographs (1979) enabled scientists to identify two previously undiscovered moons and an additional ring around SATURN and radiation belts in its magnetosphere. Two Pioneer Venus spacecraft, the Orbiter and the Multiprobe (Pioneer 12 and 13, respectively), reached VENUS in 1978. The Orbiter observed the planet's clouds and atmosphere and mapped its surface by radar; the Multiprobe released four instrument packages into the atmosphere at different locations.

pipa \'pē-'pä\ *or* **p'i-p'a** Short-necked Chinese lute. It has a pear-shaped body and a fretted fingerboard, and the silk strings are plucked with the fingernails. It is prominent in the opera orchestra and as an ensemble, solo, and accompanying instrument. The Japanese *biwa* is a similar instrument.

pipe, sacred See CALUMET

Pipestone National Monument National monument, southwestern Minnesota, U.S. Established in 1937, it has an area of 282 acres (114 hectares) and contains quarries of a reddish-coloured stone that was used by the PLAINS INDIANS to make ceremonial peace pipes. The stone is reserved for use by the Indians, who quarry it under special permits from the National Park Service. HENRY WADSWORTH LONGFELLOW popularized the quarries in "The Song of Hiawatha."

pipit *or* **fieldlark** Any of about 50 species (especially in the genus *Anthus*) of small, slender-bodied, ground-dwelling songbirds belonging to the family Motacillidae. Found worldwide except in polar regions and on some islands, they are brownish-streaked and 5–9 in. (12–23 cm) long. They have a thin, pointed bill, pointed wings, and elongated hind toes and claws. Named for their twittering sounds, they walk and run rapidly (but never hop), searching the ground for insects. Their flight is strongly undulating. Their white outer tail feathers show best in flight. See also WAGTAIL.

Pippin \'pe-pən\ **III** *or* **Pepin** *or* **Pippin the Short** (b. c. 714—d. Sept. 24, 768, Saint-Denix, Neustria) King of the Franks (751–768), the first king of the CAROLINGIAN DYNASTY and the father of CHARLEMAGNE. A son of CHARLES Martel, he became mayor of Neustria, Burgundy, and Provence in 741 and de facto ruler of the Franks when his brother entered a monastery in 747. With the backing of the pope, he deposed the last MEROVINGIAN ruler, Childeric III, in 751 and was crowned king by the bishops of his realm and, possibly, by the papal legate St. BONIFACE. Pippin was crowned king in 754 by Pope STEPHEN II. The king bestowed on the pope the Donation of Pippin and invaded Italy twice (754, 756) to protect the pope from the Lombards. He also put down revolts in Saxony and Bavaria and struggled to subdue rebellious Aquitaine. Pippin called several church councils and promoted religious reform in the kingdom.

Pippin, Horace (b. Feb. 22, 1888, West Chester, Pa., U.S.—d. July 6, 1946, West Chester) U.S. folk painter. Pippin served in the infantry in World War I, but he was wounded in 1918 and discharged with a partially paralyzed right arm. His first large canvas was an eloquent protest against war, *End of the War: Starting Home* (1931–34). His primary theme became the African American experience, as seen in his series entitled *Cabin in the Cotton* (mid 1930s) and his paintings of episodes in the lives of the antislavery leader John Brown and Pres. Abraham Lincoln. After the art world discovered Pippin in 1937, he received wide acclaim as the greatest black painter of his time.

piracy Illegal act of violence, detention, or plunder committed for private ends by the crew of a private ship (usually) against another ship on the HIGH SEAS. Air piracy (i.e., the HIJACKING of an aircraft) is a more recent phenomenon. Piracy has occurred in all stages of history: the Phoenicians, Greeks, and Romans engaged in it, as did the Vikings, Moors, and other Europeans. It also occurred among Asian peoples. During the wars between England and Spain in the late 16th century, treasure-laden Spanish galleons proceeding from Mexico into the Caribbean were a natural target for pirates. In the 16th–18th centuries pirates from North Africa's BARBARY COAST threatened commerce in the Mediterranean. The increased size of merchant vessels, improved naval patrolling, and recognition by governments of piracy as an international offense led to its decline in the late 19th century. In the late 20th century incidents of piracy occurred with increasing frequency in the seas of East and Southeast Asia. See also BLACKBEARD; FRANCIS DRAKE; JEAN LAFFITE; HENRY MORGAN.

Piraeus \pī-'rē-əs\ City (pop., 2001: 175,697), port of ATHENS, Greece. The port and its "long walls," fortified barriers connecting it with Athens, were completed in the mid-5th century BC. The walls were destroyed by SPARTA at the end of the PELOPONNESIAN WAR. Rebuilt under the Athenian leader Conon in 393 BC, Piraeus was burned in 86 BC by the Roman commander LUCIUS CORNELIUS SULLA. The city regained importance after AD 1834, when Athens became capital of the newly independent Greece. The largest port in Greece, it is the centre for all sea communication with the Greek islands.

Pirandello, Luigi (b. June 28, 1867, Agrigento, Sicily, Italy—d. Dec. 10, 1936, Rome) Italian playwright and novelist. He earned a doctorate in philology at the University of Bonn but turned to writing poetry, short stories, and several novels, including the successful *The Late Mattia Pascal* (1904). His first major play, *Right You Are (if You Think You Are)* (1917), explored the relativity of truth, a lifelong subject for Pirandello. *Six Characters in Search of an Author* (1921) contrasted art and life; it was followed by the tragedy *Henry IV* (1922). His other plays include *Each in His Own Way* (1924) and *Tonight We Improvise* (1930). He established the Teatro d'Arte in Rome and toured the world with his company (1925–27). Recognized as a major figure in 20th-century theatre, he was awarded the Nobel Prize for Literature in 1934.

Luigi Pirandello.
COURTESY OF THE ITALIAN INSTITUTE, LONDON

Piranesi \ˌpē-rä-'nā-sē**, Giovanni Battista** *or* **Giambattista Piranesi** (b. Oct. 4, 1720, Mestre, near Venice—d. Nov. 9, 1778, Rome, Papal States) Italian draftsman, printmaker, architect, and art theorist. He went to Rome at 20 as a draftsman for the Venetian ambassador. After settling there in 1747, he developed a highly original etching technique that produced rich textures and bold contrasts of light and shadow. His many prints of Classical and post-Classical Roman structures contributed to the growth of Classical archaeology and the NEOCLASSICAL art movement. He is best known today for his extraordinary series of imaginary prisons (*Carceri d'invenzione*, 1745). His prints are among the most impressive architectural representations in Western art.

piranha \pə-'rä-nə, pə-'rän-yə\ *or* **caribe** \kə-'rē-bē\ Any of several species of deep-bodied, carnivorous fishes in the genus *Serrasalmus* (family Characidae), abundant in rivers of eastern and central South America and noted for voracity. The red-bellied piranha (*S. nattereri*) grows to 2 ft (60 cm) long, but most species are smaller. Some species are silvery with an orange belly and throat; others are almost completely black. All have sharp, saw-edged teeth that close in a scissorlike bite. Traveling in groups, they usually prey on other fishes, but red-bellied piranhas occasionally converge on larger animals. Though generally scavengers, they are attracted to the scent of blood and can quickly reduce even a large animal to a skeleton.

© 2006 Encyclopædia Britannica, Inc.

Pirquet \pir-'kā**, Clemens, baron von** (b. May 12, 1874, Vienna, Austria—d. Feb. 28, 1929, Vienna) Austrian physician. In 1906 he noticed that patients who received two injections of horse serum or smallpox vaccine usually had quicker, more severe reactions (which he called "allergies") to the second injection. While studying cowpox vaccination symptoms, he also developed a new theory about infectious diseases' incubation times and about antibody formation. In the Pirquet test, a drop of tuberculin is scratched into the skin; a red, raised area developing at the site (Pirquet reaction) indicates tuberculosis.

Pisa \'pē-zə,\ *Italian* \'pē-sä\ *ancient* **Pisae** City (pop., 2001 prelim.: 85,379), central Italy. Located on the Arno River, Pisa probably began as an Etruscan town. It became a Roman colony c. 180 BC. A Christian bishopric by AD 313, it flourished during the Middle Ages as the principal urban centre of Tuscany. Pisa's participation in the Crusades made it a rival of Genoa and Venice. It became part of the Kingdom of Italy in 1860. The city was the scene of heavy fighting during World War II. It is now an important railway junction. Its cathedral, the Leaning Tower of Pisa, and other attractions, make it a tourist destination. It is the site of the University of Pisa (founded 1343) and the birthplace of Galileo.

Pisano \pi-'sä-nō, pi-'zä-nō**, Andrea** *or* **Andrea da Pontedera** (b. c. 1270–90, Pontedera, near Pisa—d. c. 1348/49, Orvieto, Papal States) Italian sculptor and architect. He created the earliest of three bronze doors for the Baptistery of the cathedral of Florence (1330–36). On Giotto's death in 1337, Andrea succeeded him as chief architect of the cathedral's bell tower, to which he added two stories adorned with panel reliefs. In 1347 he was appointed superintending architect of the cathedral of Orvieto. One of the most important Italian sculptors of the 14th century, he is known for his restrained style and skillful arrangement of figures.

Pisano, Giovanni (b. c. 1250, Pisa—d. after 1314, Siena?) Italian sculptor and architect. His early work is similar to that of Nicola Pisano, his father and teacher. About 1285 he began work on the facade of Siena's cathedral, whose lavish and ordered design and ornamentation became the model for future Gothic facade decoration in central Italy. His other great achievement, the Pistoia pulpit (c. 1298–1301), is characterized by extreme agitation, its figures, animals, drapery, and landscape being wrenched into physically impossible configurations. His pulpit for the Pisa cathedral (1302–10) is much more Classical, perhaps to accord with Giotto's monumental style, then in the ascendancy. Though regarded as Italy's only true Gothic sculptor, he never lost sight of the heritage of Classical Rome.

Pisano, Nicola (b. c. 1220, Apulia?—d. 1278/84, Pisa?) Italian sculptor. His work, along with that of his son, Giovanni Pisano, created a new sculptural style for the late 13th and 14th centuries in Italy. His greatest work, the pulpit in the Baptistery of Pisa Cathedral (1260), is extraordinary in its assertion of a new style, distinct from all its predecessors though indebted to them. The work draws on many motifs, including Roman reliefs, early Christian frescoes and mosaics, and French Gothic architecture and sculpture, but assimilates them, creating a unified whole that gave a new sense of direction to Tuscan art.

Adoration of the Magi (detail) by Nicola Pisano, c. 1259–60; part of the marble pulpit in the Baptistery at Pisa.
ALINARI/ART RESOURCE, NEW YORK

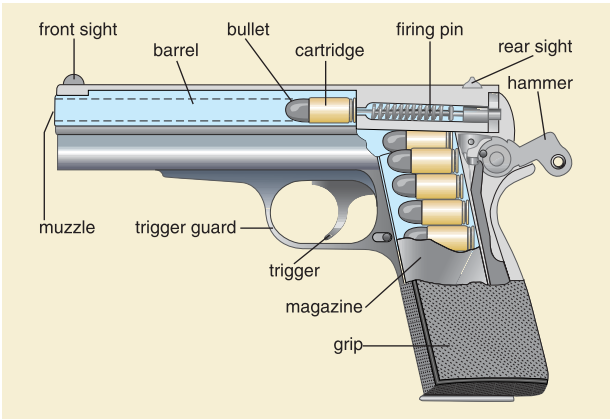
Pisces \'pī-ˌsēz\ (Latin: "Fishes") In astronomy, the constellation lying between Aries and Aquarius; in astrology, the twelfth sign of the zodiac, governing approximately the period February 19–March 20. Its symbol is two fish tied together. These are a reference to the Greek myth of Aphrodite and Eros, who jumped into a river to escape the monster Typhon and were changed into fish. In another version of the myth, two fish carried them to safety.

Pishpek See Bishkek

Pisidia \pi-'si-dē-ə\ Ancient region, southern Anatolia. Most of it was composed of the Taurus Mountains, which provided refuge for a lawless population that resisted successive conquerors. It was incorporated into the Roman province of Galatia in the early 1st century AD and became part of Lycia and Pamphylia under the emperor Vespasian in AD 74. Diocletian included Pisidia in the diocese of Asia c. 297. During Byzantine times it continued to be a region of revolt. By 1204 the Byzantine Empire had lost control of the region to Turkish invaders.

Pissarro \pə-'sär-ō**, (Jacob-Abraham-) Camille** (b. July 10, 1830, St. Thomas, Danish West Indies—d. Nov. 13, 1903, Paris, France) West Indian-born French painter. The son of a prosperous Jewish merchant, he moved to Paris in 1855. His earliest canvases are broadly painted figure paintings and landscapes; these show the careful observation of nature that was to remain a characteristic of his art. In 1871 he took a house in Pontoise, in the countryside outside Paris. These surroundings formed the theme of his art for some 30 years. Pissarro's leading motifs during the 1870s and 1880s were houses, factories, trees, haystacks, fields, labouring peasants, and river scenes. In these works, forms do not dissolve but remain firm, and colours are strong; during the latter part of the 1870s his comma-like brushstrokes frequently recorded the sparkling scintillation of light. These works were admired by the Impressionist artists; Pissarro was the only Impressionist painter who participated in all eight of the group's exhibitions. Despite acute eye trouble, his later years were his most prolific.

Self-portrait by Camille Pissarro, oil on canvas, 1903; in the Tate Gallery, London.
COURTESY OF THE TRUSTEES OF THE TATE GALLERY, LONDON



pistachio \pə-'sta-shē-ˌō\ Any of nine species of aromatic trees and shrubs, some ornamental, that make up the genus *Pistacia* of the sumac (or cashew) family, native to Eurasia, with one species in southwestern North America and another in the Canary Islands. Commercial pistachio nuts are seeds from the fruit of *P. vera*. They have a pleasing, mild, resinous flavour and are used extensively as food and for yellowish green colouring in confections. The tree bears leaves with thick, wide, leathery, featherlike leaflets and small fruit in clusters.

pistil Female reproductive part of a flower. Centrally located, the pistil typically has a swollen base called the ovary, which contains the potential seeds (ovules). The stalk (style) arises from the ovary and has a pollen-receptive tip, the stigma, which is variously shaped and often sticky. There may be a single pistil, as in the lily, or several to many pistils, as in the buttercup. Each pistil is constructed of one to many rolled leaflike structures, or carpels. Differences in the composition and form of the pistil are useful in classifying flowering plants. See also stamen.

pistol Small firearm designed to be operated with one hand. The name may derive from the city of Pistoia, Italy, where handguns were made as early as the 15th century. It was originally a cavalry weapon. However, because the firepower of pistols must be kept low in order to reduce them to manageable weight, and because only skilled soldiers can shoot them accurately beyond 10 yards, they have never been satisfactory military weapons. In legal use, pistols are most frequently carried by police and other security personnel and serve mainly as a defensive weapon of last resort. Their compact size, low cost, and ease of operation make them a common weapon in violent crime, so that pistols are a common object of laws regulating the ownership of firearms. The two classes of pistol are revolvers and automatics. Automatics have a mechanism, actuated by the energy of recoil, that feeds cartridges from a magazine in the grip. See illustration on opposite page.

piston and cylinder In mechanical engineering, a sliding cylinder with a closed head (the piston) that moves up and down (or back and forth) in a slightly larger cylindrical chamber (the cylinder) by or against pressure of a fluid, as in an engine or pump. The cylinder of a steam engine is closed by plates at both ends, with provision for the piston rod, which is rigidly attached to the piston, to pass through one of the end cover plates. The cylinder of an internal-combustion engine is closed at one end by a plate called the head and open at the other end to permit free oscillation of the connecting rod, which joins the piston to the crankshaft.

pit bull terrier *or* **Staffordshire terrier** Dog breed developed in 19th-century Britain for fighting other dogs in pits. It was created by crossing the BULLDOG (which at the time was longer-legged and more agile) with a terrier, possibly the FOX TERRIER. Once known by such names as bull-and-terrier and half-and-half, the pit bull is a stocky, muscular, unusually strong dog with powerful jaws, standing 17–19 in. (43–48 cm) tall and weighing 30–50 lb (14–23 kg). Its stiff, short coat may be any colour, solid or variegated. See also BULL TERRIER.

pit viper Any species of VIPER (subfamily Crotalinae) that has, in addition to two movable fangs, a heat-sensitive pit organ between each eye and nostril which together help it accurately aim its strike at its warm-blooded prey. Pit vipers are found from deserts to rain forests, primarily in the New World. They may be terrestrial, arboreal, or aquatic. Some species lay eggs; others produce live young. See also BUSHMASTER, COPPERHEAD, FER-DE-LANCE, MOCCASIN, RATTLESNAKE.

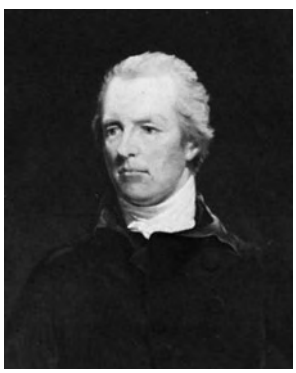
Pitcairn Island Island (pop., 2003 est.: 47) and British overseas territory, south-central PACIFIC OCEAN. It is the only inhabited island of the Pitcairn island group, which also includes Henderson, Ducie, and Oeno islands. It has an area of about 2 sq mi (5 sq km). Discovered in 1767 by the British, it was uninhabited until 1790, when it was settled by mutineers from HMS *BOUNTY*, led by Fletcher Christian. Pitcairn was annexed by Britain in 1838. The inhabitants were removed to NORFOLK ISLAND in 1856 because of overpopulation. Some returned to Pitcairn, and it is their descendants who make up the present population, subsisting on fishing and farming. In 1970 the British High Commissioner in NEW ZEALAND was appointed Pitcairn's governor.

pitch In music, position of a single sound in the complete range of sound; this quality varies with the number of vibrations per second (hertz, Hz) of the sounding body and is perceived as highness or lowness. A higher pitch has a higher number of vibrations. In Western music, standard pitches have long been used to facilitate tuning. A confusing variety of pitches prevailed until the 19th century, when the continual rise in pitch made some international agreement a matter of practical necessity. In 1939 the A above middle C was standardized as 440 Hz. See also INTERVAL; TUNING AND TEMPERAMENT.

pitchblende Amorphous, dense, black, pitchy form of the crystalline uranium oxide mineral URANINITE; it is one of the primary mineral ores of URANIUM. Pitchblende is found in granular masses and has a greasy lustre. Three chemical elements were first discovered in pitchblende: uranium, polonium, and RADIUM. Deposits, frequently in association with uraninite or with secondary uranium minerals, are known in the Czech Republic, Britain, the Northwest Territories and Saskatchewan in Canada, and Arizona, Colorado, Montana, New Mexico, and Utah in the U.S.

Pitcher, Molly (b. c. 1753—d. Jan. 22, 1832, Carlisle, Pa., U.S.) U.S. patriot. Little is known of her early life, though she is thought to have been Irish. In the AMERICAN REVOLUTION she accompanied her husband, William Hays, a gunner, at the Battle of Monmouth (1778), where she carried pitchers of water to wounded American soldiers, earning the nickname "Molly Pitcher." According to legend, after her husband collapsed from the heat, she took his place at the cannon and served heroically through the battle. In 1822 she was recognized for her heroism with a state pension. Some historians attribute the act of replacing her husband at the cannon to Margaret Corbin (1751–1800) in the attack on Fort Washington in 1776.

pitcher plant Any CARNIVOROUS PLANT with pitcher-, trumpet-, or urn-shaped leaves. Several families include pitcher plants: Nepenthaceae (Old World pitcher plants), Cephalotaceae, Asclepiadaceae (MILKWEED FAMILY), and especially Sarraceniaceae (New World pitcher plants, particularly those in the eastern North American genus *Sarracenia*). Pitcher plants inhabit bogs, swamps, wet or sandy meadows, or savannas where the soils are water-saturated, acidic, and deficient in nitrates or phosphates. Their unusual tubular leaves have a series of nectar-secreting glands that extend from the lip down into the interior and attract insects. Once in the plant, the prey tumbles down into a liquid pool and drowns, after which an enzyme secreted within the leaf digests it, releasing nitrates and other nutrients, which supplement the meager nutrient supply of bogs. Most pitcher plants produce pitcher-shaped, insect-catching leaves in the spring and tubeless leaves in the fall. Their flowers are showy and have an agreeable scent.



Yellow pitcher plant (*Sarracenia flava*).
JEFF LEPORE/PHOTO RESEACHERS

pitot tube \'pē-ˌtō\ Instrument for measuring the velocity (speed) of a flowing FLUID. Invented by Henri Pitot (1695–1771), it consists of a tube with a short, right-angled bend, which is placed vertically in a moving fluid with the mouth of the bent part directed upstream; the PRESSURE, measured with an attached device, depends on the fluid flow and can be used to calculate the velocity. Pitot tubes are used to measure airspeed in WIND TUNNELS and aboard aircraft in flight; they are also used to measure the flow of liquids (see FLOW METER).

Pitt, William, the Elder *later* **1st earl of Chatham** (b. Nov. 15, 1708, London, Eng.—d. May 11, 1778, Hayes, Kent) British statesman and orator, twice virtual prime minister (1756–61, 1766–68). He entered Parliament in 1735 and provoked controversy with his maiden speech, which criticized the ministry of ROBERT WALPOLE. With the outbreak of the SEVEN YEARS' WAR, he was named secretary of state and became virtual prime minister. His leadership brought many British victories that greatly extended the British Empire. His wide popular appeal led to the nickname "the Great Commoner," though he was disliked by many in government for his high-handedness. He resigned in 1761 when the cabinet refused to declare war on Spain. He became a champion of liberty and spoke in favour of American colonial resistance to the STAMP ACT. He formed another government in 1766, in which he served as lord privy seal, but he resigned in 1768 because of ill health. Widely mourned on his death in 1778, he was buried in Westminster Abbey.

Pitt, William, the Younger (b. May 28, 1759, Hayes, Kent, Eng.—d. Jan. 23, 1806, London) British statesman and prime minister (1783–1801, 1804–06). The son of WILLIAM PITT, he entered Parliament in 1781 and served as chancellor of the Exchequer (1782–83). He was appointed prime minister in 1783 and undertook reforms that reduced the large national debt incurred by the AMERICAN REVOLUTION, reduced tariffs, placed the EAST INDIA CO. under government control, and restructured the government in India. Forced into conflict with France by the FRENCH REVOLUTIONARY WARS, he formed a series of coalitions with European states against France (1793, 1798, 1805). Pitt responded to demands by radicals for parliamentary reform

with repressive measures. In 1800 he secured the Act of Union with Ireland but resigned in 1801 when his proposal for Catholic emancipation was denied. His second term as premier (1804–06) was marked by the collapse of the Third Coalition after the Battles of Ulm and Austerlitz, the news of which weakened his already fragile health.

pittosporum \pə-'täs-pə-rəm\ Any of various evergreen shrubs or trees, mainly from Australia and New Zealand, that make up the genus *Pittosporum* (family Pittosporaceae), commonly known as Australian laurel. They are planted especially as ornamentals in warm regions. The most popular and hardiest species, called tobira, or house-blooming mock orange (*P. tobira*), is native to China and Japan; it is a popular fragrant hedge plant in warm climates and a handsome indoor plant elsewhere.

Pittsburgh City (pop., 2000: 334,563), southwestern Pennsylvania, U.S. It is situated at the confluence of the Allegheny and Monongahela rivers where they form the Ohio River. In 1758 the French Fort Duquesne was captured there by the British, and the site was renamed Pitt. It was incorporated as a borough in 1794 and as a city in 1816. In the 19th century it developed rapidly as a steel-manufacturing centre. The American Federation of Labor began there in 1881 (see AFL-CIO). The second-largest city in the state, it is the centre of an urban industrial complex that includes several neighbouring cities. There are more than 150 industrial research laboratories in the area. It is home to the University of Pittsburgh, Carnegie Mellon University, and other educational institutions.

Pittsburgh Platform Manifesto of Reform Judaism, drawn up in 1885 by a conference of rabbis chaired by Isaac Mayer Wise in Pittsburgh, Pa. It declared that Judaism taught the highest conception of God, but it recognized the efforts of other religions to grasp the truth. The Bible was understood as the primary instrument of moral and religious instruction even though it reflected the primitive ideas of the time of its composition. It rejected the Mosaic and rabbinic laws regulating diet and dress, accepting only those laws that elevate the spirit. The Pittsburgh Platform looked forward to the messianic kingdom and accepted the immortality of the soul but not resurrection of the body. It advocated social justice and universal moral reform and maintained that Judaism was an evolving religion. It remained the official philosophy of the U.S. Reform movement until 1937, when the Columbus Platform moved Reform Judaism back to a more traditional position.

pituitary \pə-'tü-ə-ˌter-ē\ **gland** *or* **hypophysis** \hī-'päf-ə-səs\ Endocrine gland lying on the underside of the brain. It plays a major part in regulating the endocrine system. Its anterior lobe secretes most of the pituitary hormones, which stimulate growth (see growth hormone); egg and sperm development; milk secretion; release of other hormones by the thyroid gland, adrenal glands, and reproductive system; and pigment production. The posterior lobe stores and releases hormones from the hypothalamus that control pituitary function, uterine contraction and milk release, and blood pressure and fluid balance.

Pius \'pī-əs\ **II** *orig.* **Enea Silvio Piccolomini** (b. Oct. 18, 1405, Corsignano, Republic of Siena—d. Aug. 14/15. 1464, Ancona, Papal States) Pope (1458–64). An Italian diplomat who became bishop of Trieste (1447) and Siena (1449), he mediated between the German princes and the papacy, arranged the coronation of Frederick III as Holy Roman emperor (1452), and made peace with Aragon and Naples. As pope he tried to unite Europe in a Crusade against the Turks, but he was unable to win the support of the Christian princes. Pius was also a noted humanist and a prolific writer on the events of his day.

Pius V, Saint *orig.* **Antonio or Michele Ghislieri** (b. Jan. 17, 1504, Bosco, duchy of Milan—d. May 1, 1572, Rome, Papal States; canonized May 22, 1712; feast day April 30) Pope (1566–72). He joined the Dominican order at age 14 and was ordained in 1528. A relentless pursuer of heretics, he was named commissary general of the Inquisition in 1551. By 1556 he was a cardinal, and in 1566 he was elected pope. He zealously carried out church reforms and succeeded in keeping Protestantism out of Italy. In 1570 he excommunicated Elizabeth I, thus worsening the position of Catholics in England. He organized the campaign that led to the victory of the Spanish, Venetian, and papal fleets over the Turks in the Battle of Lepanto in 1571.

Pius IX *orig.* **Giovanni Maria Mastai-Ferretti** (b. May 13, 1792, Senigallia, Papal States—d. Feb. 7, 1878, Rome; beatified Sept. 3, 2000; feast day February 7) Pope (1846–78). He became an archbishop in 1827, a cardinal in 1840, and pope on the death of Gregory XVI (1831–46). He set out to make liberal reforms, but the revolutionary fervour of 1848 frightened him into extreme conservatism. He proclaimed the dogma of the Immaculate Conception (1854) and convened the First Vatican Council (1869–70), which promulgated the doctrine of papal infallibility. After losing temporal power to Victor Emmanuel II upon Italian unification, he regarded himself as a "prisoner in the Vatican" and refused any contact with the Italian government. Pius's pontificate was the longest in history. He was beatified in 2000 by Pope John Paul II (1978–2005).

Pius IX.
FELICI

Pius X, Saint *orig.* **Giuseppe Melchiorre Sarto** (b. June 2, 1835, Riese, Venetia, Austrian Empire—d. Aug. 20, 1914, Rome, Italy; canonized May 29, 1954; feast day August 21) Pope (1903–14). Born in the Italian region of Venetia, he became bishop of Mantua in 1884 and patriarch of Venice in 1893. He was elected pope in 1903 and soon became known both for his piety and for his staunch religious and political conservatism. Pius suppressed the Catholic intellectual movement known as Modernism and opposed the political movement for social reform known as Christian Democracy. He worked to organize the laity for collaboration in the church's apostolic work, and he reformed the Catholic liturgy. His decision to systematize canon law led to the publication of the new code in 1917, which became effective in 1918.

Pius XII *orig.* **Eugenio Maria Giuseppe Giovanni Pacelli** (b. March 2, 1876, Rome, Italy—d. Oct. 9, 1958, Castel Gandolfo) Pope (1939–58). Before succeeding Pius XI in 1939, he served in the papal diplomatic service and as secretary of state to the Holy See. He was active in humanitarian work with prisoners and refugees during World War II but has been criticized by some for not having done more to prevent or battle the Holocaust. In the postwar era he was a defender of persecuted Catholics in communist countries. Known for his austere conservatism, he in 1950 defined the dogma of the bodily Assumption of the Virgin.

Pius, Sextus Pompeius Magnus See Sextus Pompeius Magnus Pius

pixel *in full* **picture element** Smallest resolved unit of a video image that has specific luminescence and colour. Its proportions are determined by the number of lines making up the scanning raster (the pattern of dots that form the image) and the resolution along each line. In the most common form of computer graphics, the thousands of tiny pixels that make up an individual image are projected onto a display screen as illuminated dots that from a distance appear as a continuous image. An electron beam creates the grid of pixels by tracing each horizontal line from left to right, one pixel at a time, from the top line to the bottom line. A pixel may also be the smallest element of a light-sensitive device, such as cameras that use charge-coupled devices (see CCD).

Pizarro, Francisco (b. c. 1475, Trujillo, Extremadura, Castile—d. June 26, 1541, Lima) Conquistador who seized the Inca empire for Spain. In 1510 he enrolled in an expedition of exploration in the New World, and three years later he joined Vasco Núñez de Balboa on the expedition that discovered the Pacific. He made two voyages of discovery down the Colombian coast (1524–25, 1526–28) and continued his explorations southward, naming the new territory Peru. In 1531 he set sail for Peru with his 4 brothers, 180 men, and 37 horses. He soon encountered emissaries of the Inca emperor, Atahuallpa, and arranged a meeting. There his men slaughtered the emperor's unarmed retainers and took him hostage. After

© 2006 Encyclopædia Britannica, Inc.

accepting a rich ransom for Atahuallpa's release, Pizarro had him garroted. He spent the rest of his life consolidating Spain's hold on Peru. He founded Lima (1535), where he was killed by fellow Spaniards he had betrayed.

Pizarro, Gonzalo (b. 1502?, Trujillo, Spain—d. April 10, 1548, Cuzco, Peru) Spanish explorer and conqueror. With his half brother Francisco Pizarro, he took part in the conquest of Peru (1531–33), for which he received extensive land grants and was made governor of Quito (1539). In 1541–42 he led a disastrous expedition into the unexplored region east of Quito that cost the lives of almost 200 Spaniards and 4,000 Indians. He returned to find that Spain had restricted the conquerors' privileges; the conquistadores revolted against the viceroy, and Pizarro led the anti-royalist forces to victory at the Battle of Anaquito (1546), but they were defeated in 1548, and he was executed.

pizza Food of Neapolitan origin. It consists of a flattened disk of bread dough, typically topped with olive oil, tomatoes, and mozzarella cheese, baked quickly, and served hot. Pizza is eaten throughout Italy, with regional variations in toppings. Pizza came to the U.S. with Italian immigrants; the first U.S. pizzeria opened in 1905, and pizza became one of the nation's favourite foods after World War II. It is now popular worldwide.

PKK See Kurdistan Workers Party

PKU See phenylketonuria

PL Kyodan \'pē-'el-'kyō-dän\ *in full* **Perfect Liberty Kyodan** Religious group founded in Japan by Miki Tokuchika in 1946 as a revival of his father's group, Hito-no-michi. Unaffiliated with any of the major religious traditions of Japan, it teaches that the goal of human life is joyful self-expression. Misfortune and suffering come from forgetting God, but the believer may pray that his troubles be transferred to the patriarch, who is strengthened for vicarious suffering by the group's collective prayers. Today PL Kyodan claims more than 2.5 million adherents worldwide. The sect's headquarters are at Habikino, near Osaka.

placenta \plə-'sen-tə\ Organ in most mammals that develops in the uterus along with a fetus to mediate metabolic exchange. The umbilical cord attaches it to the fetus at the navel. Nutrients and oxygen in the mother's blood pass across the placenta to the fetus, and metabolic wastes and carbon dioxide from the fetus cross in the other direction; the two blood supplies do not mix. Other substances (e.g., alcohol or drugs) in the mother's blood can also cross the placenta, with effects including congenital disorders and drug addiction in the newborn (see fetal alcohol syndrome); some microorganisms can cross it to infect the fetus, but so do the mother's antibodies. The placenta, weighing a pound or more at the end of pregnancy, is expelled at parturition. Some animals eat it as a source of nutrients; in some species this stimulates lactation.

placer deposit Natural concentration of heavy minerals caused by the effect of gravity on moving particles. When heavy, stable minerals are freed from their matrix by weathering processes, they are slowly washed downslope into streams that quickly winnow the lighter matrix. Thus the heavy minerals become concentrated in stream, beach, and lag (residual) gravels and constitute workable ore deposits. Minerals that form placer deposits include gold, platinum, cassiterite, magnetite, chromite, ilmenite, rutile, native copper, zircon, monazite, and various gemstones.

placer mining Oldest method of recovering gold from alluvial deposits. It takes advantage of gold's high density, which causes it to sink more rapidly from moving water than the lighter siliceous materials with which it is found. Panning, used by 19th-century miners, employed a pan in which a few handfuls of the gold-bearing soil or gravel and a large amount of water were placed; by swirling the pan's contents, the miner washed the siliceous material over the side, leaving the gold and heavy materials behind. Dredging is the most important placer-mining method today. Used worldwide is the bucket-ladder dredge, with its continuous chain of buckets rotating around a rigid adjustable frame called the ladder. In sluicing, a slightly sloping wooden trough called a box sluice, or a ditch cut in hard gravel or rock called a ground sluice, is used as a channel along which gold-bearing gravel is carried by a stream of water. Riffles placed transversely along the bottom of the sluice cause the water to eddy into small basins, retarding the current so that gold may settle.

Placid, Lake See Lake Placid

plagioclase \'plā-jē-ə-ˌklās\ Any member of the series of abundant feldspar minerals that usually occur as light- to medium-grey-coloured, transparent to translucent grains or crystals. Plagioclase ranges in composition from albite to anorthite. It is used in the manufacture of glass and ceramics; iridescent varieties are valued as gemstones. The primary importance of plagioclase, however, derives from its role as a rock-forming mineral.

plague \'plāg\ Infectious fever caused by the bacterium *Yersinia pestis*, carried by the rat flea. It usually spreads to humans only when the flea runs out of rodent hosts. It takes three forms. Bubonic, the mildest, has characteristic swollen lymph nodes (buboes) and is spread only by the flea. It accounts for three-fourths of plague cases. Pneumonic plague has extensive lung involvement and is spread in droplets from the lungs; it is often fatal in three or four days without treatment. In septicemic plague, bacteria overwhelm the bloodstream and often cause death within 24 hours, before other symptoms have a chance to develop. In the 14th century, plague ravaged Europe and Asia and was called the Black Death. Plague does not respond to penicillin, but other antibiotics are effective. Sanitary measures against fleas and rodents, quarantine, and extreme caution in handling infectious materials help to suppress epidemics. A vaccine can prevent plague.

plaice Commercially valuable European flatfish (*Pleuronectes platessa*). At most 36 in. (90 cm) long, the plaice normally has both eyes on the right side of the head and four to seven bony bumps near its eyes. It is brown with red or orange spots. The American plaice (*Hippoglossoides platessoides*) is found in both Europe (where it is called the rough dab) and the U.S. It is reddish or brownish and grows to about 24 in. (60 cm) long.

Plaice (*Pleuronectes platessa*)
JACQUES SIX

plain Any relatively level area of the Earth's surface that exhibits gentle slopes and small local relief (differences in elevation). Occupying slightly more than one-third of the terrestrial surface, plains are found on all continents except Antarctica. Some are tree-covered, and others are grassy. Still others support scrub brush and bunch grass, and a few are nearly waterless deserts. With certain exceptions, plains have become the sites of major centres of population, industry, commerce, and transportation.

Plain, the *French* **la Plaine** In the French Revolution, the centrist deputies in the National Convention. They formed the majority of the assembly's members and were essential to the passage of any measures. Their name derived from their place on the floor of the assembly; above them sat the members of the Mountain, or Montagnard. Led by Emmanuel-Joseph Sieyès, the Plain initially voted with the moderate Girondins but later joined the Montagnards in voting for the execution of Louis XVI. In 1794 they helped overthrow Maximilien de Robespierre and other extreme Jacobins (see Jacobin Club).

Plain of Esdraelon See Plain of Esdraelon

Plain of Reeds See Plain of Reeds

Plain of Sharon See Plain of Sharon

Plains Indian Any member of various Native American tribes that formerly inhabited the Great Plains of the U.S. and southern Canada. Plains Indians are popularly regarded as the typical American Indians. They were essentially big-game hunters, the buffalo being a primary source of food and equally important as a source of materials for clothing, shelter, and tools. Until supplanted by the white settlers from the 16th century onward, the Plains Indians occupied the area between the Mississippi River and the Rocky Mountains, which includes portions of both the United States and Canada. It is a vast grassland stretching from northern Alberta and Saskatchewan in Canada to the Rio Grande border of Texas. The Arapaho, Assiniboin, Blackfoot, Cheyenne, Comanche, Plains Cree, Crow, Hidatsa, Kiowa, Mandan, Osage, Pawnee, and Sioux are Plains Indians.

Plains of Abraham See Plains of Abraham

planarian \plə-'nar-ē-ən\ Any of about 3,000 species of widely distributed, mostly free-living flatworms of the family Planariidae and related families (class Turbellaria), usually found in freshwater but also in marine and terrestrial environments. The soft, ciliated body is leaf-shaped when elongated. The spade-shaped head has two eyes and sometimes tentacles. The tail is pointed. The mouth is on the lower side, often more than halfway

© 2006 Encyclopædia Britannica, Inc.

toward the tail. Most species are 0.1–0.6 in. (3–15 mm) long; some grow to about 1 ft (30 cm). Planarians swim with an undulating motion or creep like slugs. Most feed at night on protozoans, snails, and other worms.

Planck \'plänk**, Max (Karl Ernst Ludwig)** (b. April 23, 1858, Kiel, Schleswig—d. Oct. 4, 1947, Göttingen, W.Ger.) German physicist. He studied at the Universities of Munich and Kiel, then became professor of theoretical physics at the University of Berlin (1889–1928). His work on the second law of thermodynamics and blackbody radiation led him to formulate the revolutionary quantum theory of radiation, for which he received a Nobel Prize in 1918. He also discovered the quantum of action, now known as Planck's constant, *h*. He championed ALBERT EINSTEIN's special theory of RELATIVITY, but he opposed the indeterministic, statistical worldview introduced by NIELS BOHR, MAX BORN, and WERNER HEISENBERG after the advent of QUANTUM MECHANICS. As the influential president of the Kaiser Wilhelm Society (later the Max Planck Society) until his resignation in 1937, he appealed to ADOLF HITLER to reverse his devastating racial policies. His son was later implicated in the JULY PLOT against Hitler and was executed.

plane tree Any of ten species of large trees that make up the genus *Platanus*, sole genus of the family Platanaceae, native to North America, eastern Europe, and Asia. Plane trees are planted widely in cities for their resistance to diseases and to air pollution and because they grow rapidly and furnish quick shade. They are characterized by scaling bark; large, deciduous, usually lobed leaves; and globular heads of flower and seed. Ball-shaped smooth or bristly seed clusters, which dangle singly and often persist after leaf fall, are key identifiers. Winter bark is patchy and picturesque; as the outer bark flakes off, inner bark shows shades of white, gray, green, and yellow.

planer Metal-cutting MACHINE TOOL in which the workpiece is firmly attached to a horizontal table that moves back and forth under a single-point cutting tool. The tool-holding device is mounted on a crossrail so that the tool can be moved across the table in small sideward movements. Since the cutting tool can be moved at almost any angle, a wide variety of grooves and surfaces can be generated. Mechanical planers, or surfacers, are also used to smooth wood to an even thickness. Planers perform the same operations as SHAPERS but can machine workpieces up to 50 ft (15 m) long.

planet Any large body orbiting the SUN or another STAR (see PLANETS OF OTHER STARS); COMETS, ASTEROIDS, meteoroids (see METEOR), and natural SATELLITES are excluded. The word comes from the Greek for "wanderer," because their positions change relative to those of the stars. The nine major planets known to revolve around the Sun, in order of increasing distance, are MERCURY, VENUS, EARTH, MARS, JUPITER, SATURN, URANUS, NEPTUNE, and PLUTO. The first four are called terrestrial planets and the next four Jovian planets. Pluto, distinct from either group, resembles a giant comet or one of the icy satellites of the Jovian planets. The terrestrial planets are less than 8,000 mi (13,000 km) in diameter and rocky, with comparatively thin or negligible atmospheres. The Sun's heat is thought to have prevented the abundant gases in the original SOLAR NEBULA from condensing in them. The Jovian planets formed farther out, where the gases were cool enough to condense, so the planets grew very massive and accumulated huge atmospheres of light gases, mainly hydrogen and helium. Called gas giants, the Jovian planets appear to be similar in structure; none has an accessible surface. Pluto is by far the smallest body traditionally called a major planet, although many astronomers now consider it the largest known member of the KUIPER BELT. Additional bodies rivaling Pluto in size may exist in this region of the solar system; one about half its size was discovered in 2002. The term *minor planet* is sometimes used (less now than formerly) to refer to any of the asteroids that lie between the terrestrial and Jovian planets. In ASTROLOGY great importance is placed on the planets' positions in the 12 constellations of the ZODIAC. See also PLANETESIMAL; SOLAR SYSTEM.

Planet X Supposed distant PLANET of the SOLAR SYSTEM, hypothesized on the basis of calculations of effects on the orbits of Uranus and Neptune. The term was first used by PERCIVAL LOWELL c. 1905, and though his prediction eventually resulted in the discovery of PLUTO (1930), Pluto's mass was insufficient to explain the apparent perturbations of Uranus and Neptune. Proposals and searches for other planets beyond Neptune or Pluto continued sporadically during the remainder of the 20th century. However, VOYAGER spacecraft data gathered about the masses of the outer planets indicate that no additional large bodies are needed to explain the planets' observed orbits. See also KUIPER BELT.

planetarium Institution devoted to popular education in ASTRONOMY and related fields, especially space science, whose main teaching tool is a hemispheric screen onto which images of celestial objects as seen from Earth are projected from an instrument also known as a planetarium, or planetarium projector. Major planetariums have extensive exhibit space, museum collections, sizable staffs, projection domes 80 ft (25 m) or more across, and seating capacities of over 600.

planetary nebula Any of a class of bright NEBULAE that may somewhat resemble PLANETS when viewed through a small telescope but are, in fact, expanding shells of luminous gas around dying stars. A planetary nebula is the outer envelope shed by a red GIANT STAR not massive enough to become a SUPERNOVA. Instead, the star's intensely hot core becomes exposed (see WHITE DWARF STAR) and ionizes the surrounding shell of gas, which is expanding at tens of miles per second.

planetesimal \ˌpla-nə-'te-sə-məl\ One of a class of hypothetical bodies that joined to form the PLANETS after condensing from dust and gas early in the history of the SOLAR SYSTEM. According to the nebular hypothesis, a rotating cloud of interstellar dust and gas underwent gravitational contraction, eventually forming a SOLAR NEBULA comprising a disk of matter with a central hub. As the disk contracted further, clumps of dust left behind in its midplane coalesced successively into bodies the size of pebbles and boulders and then into planetesimals up to several hundred miles across. These then combined under the force of gravity to form protoplanets, precursors of the current planets.

planets of other stars *or* **extrasolar planets** Planets that orbit stars other than the Sun. The existence of extrasolar planets, many light-years from Earth, was confirmed in the early 1990s with the detection of three bodies circling a PULSAR. The first planet revolving around a more sunlike star, 51 Pegasi, was reported in 1995. Within a decade over 100 stars with one or more planets were known. Current detection methods, based on the planets' gravitational effects on the stars they orbit, have revealed only planets much more massive than Earth; some are several times the size of JUPITER. A number of them have highly elliptical orbits, and many are closer to their stars than MERCURY is to the Sun. These findings have raised questions regarding astronomers' ideas of how Earth's SOLAR SYSTEM formed and how typical it is.

plankton Marine and freshwater organisms that, because they are unable to move or are too small or too weak to swim against water currents, exist in a drifting, floating state. Plankton is the productive base of both marine and freshwater ecosystems, providing food for larger animals and indirectly for humans, whose fisheries depend on plankton. As a human resource, plankton has only begun to be developed and used. The plantlike community of plankton is called PHYTOPLANKTON, and the animal-like community is called ZOOPLANKTON, but many planktonic organisms are better described as PROTISTS. Most phytoplankton serves as food for zooplankton, but some of it is carried below the light zone. Zooplankton is used directly as food by fish (including herring) or mammals (including whales), but several links on the food chain usually have been passed before plankton is available for human consumption.

plant Any organism in the kingdom Plantae, consisting of multicellular, eukaryotic life forms (see EUKARYOTE) with six fundamental characteristics: PHOTOSYNTHESIS as the almost exclusive mode of nutrition, essentially unlimited growth at MERISTEMS, cells that contain CELLULOSE in their walls and are therefore somewhat rigid, the absence of organs of movement, the absence of sensory and nervous systems, and life histories that show ALTERNATION OF GENERATIONS. No definition of the kingdom completely excludes all nonplant organisms or even includes all plants. Many plants, for example, are not green and thus do not produce their own food by photosynthesis, being instead parasitic on other living plants (see PARASITISM). Others obtain their food from dead organic matter. Many animals possess plantlike characteristics, such as a lack of mobility (e.g., SPONGES) or the presence of a plantlike growth form (e.g., some CORALS and BRYOZOANS), but in general such animals lack other plant characteristics. Some past classification systems (see TAXONOMY) placed difficult groups such as PROTOZOANS, BACTERIA, ALGAE, SLIME MOLDS, and fungi (see FUNGUS) in the plant kingdom, but structural and functional differences between these organisms and plants have convinced most scientists to classify them elsewhere.

plant virus Any of various VIRUSES that can cause plant disease (e.g., the tobacco mosaic virus). Plant viruses are economically important because many of them infect crop and ornamental plants. Numerous plant viruses are rodlike and can be extracted readily from plant tissue and crystallized.

© 2006 Encyclopædia Britannica, Inc.

Most lack the fatty membrane found in many animal viruses, and all contain RNA. Plant viruses are transmitted in various ways, most importantly through insect bites, mainly by aphids and plant hoppers. Symptoms of virus infection include colour changes, dwarfing, and tissue distortion. The appearance of streaks of colour in certain tulips is caused by a virus. See also REOVIRUS.

Plantagenet \plan-'ta-jə-nət**, House of** *or* **House of Anjou** \'an-jü\ Royal house of England (1154–1485) that provided 14 kings, including six from the cadet houses of LANCASTER and YORK. The line descended from Geoffrey, count of Anjou (died 1151), and the empress MATILDA, daughter of the English king HENRY I. Some historians apply the name House of Anjou, or ANGEVIN DYNASTY, to only HENRY II, RICHARD I, and JOHN, and label their successors, including EDWARD I, EDWARD II, and EDWARD III, as Plantagenets. The name may have originated as a nickname (Plantegeneste) for Count Geoffrey, who planted broom shrubs (Latin *Genista*) to improve his hunting covers. The Wars of the ROSES saw the defeat of the last Plantagenet king, RICHARD III, in 1485. The legitimate line ended with Edward of Warwick (died 1499).

plantain Tall plant (*Musa paradisiaca*) of the BANANA family that is closely related to the common banana (*M. sapientum*). Believed to have originated in Southeast Asia, the plantain grows 10–33 ft (3–10 m) tall and has a conical false "trunk" formed by the leaf sheaths of its spirally arranged, long, thin leaves. The green-coloured fruit is larger than that of the banana and contains more starch. Because the starch is maximal before the fruit ripens, the fruit is not eaten raw but is boiled or fried, often with coconut juice or sugar as flavouring. It may also be dried for later use in cooking or ground for use as meal, which can be further refined to a flour. The plantain is a staple food and beer-making crop for East African peoples and is also eaten in the Caribbean and Latin America.

plantain \'plan-tᵊn\ Any of about 265 species of familiar garden, lawn, and roadside WEEDS in the genus *Plantago* of the family Plantaginaceae. Distinctively, the leaves lack a proper blade. What appears to be a blade is an expanded petiole (leafstalk), with several parallel main veins, emerging at the base of the stalk. Small flowers are borne in spikes or heads atop long leafless stalks. The greater plantain (*P. major*) provides seed spikes for bird food. Ribwort, or English, plantain (*P. lanceolata*) and hoary plantain (*P. media*) are troublesome weeds. Some species have been useful in medicine (e.g., as an ingredient in laxatives).

plantation walking horse See TENNESSEE WALKING HORSE

Plante, (Joseph) Jacques (Omer) (b. Jan. 17, 1929, Shawinigan Falls, Que., Can.—d. Feb. 26, 1986, Geneva, Switz.) Canadian ice-hockey player. A goalie, he recorded a shutout in his first NHL game. He was an integral member of the powerful Montreal Canadiens team that won a record five successive STANLEY CUPS (1956–60). He was the first goalie to wear a protective face mask (1959). Honoured throughout his 18-year NHL career, he was one of the most successful of all NHL goaltenders.

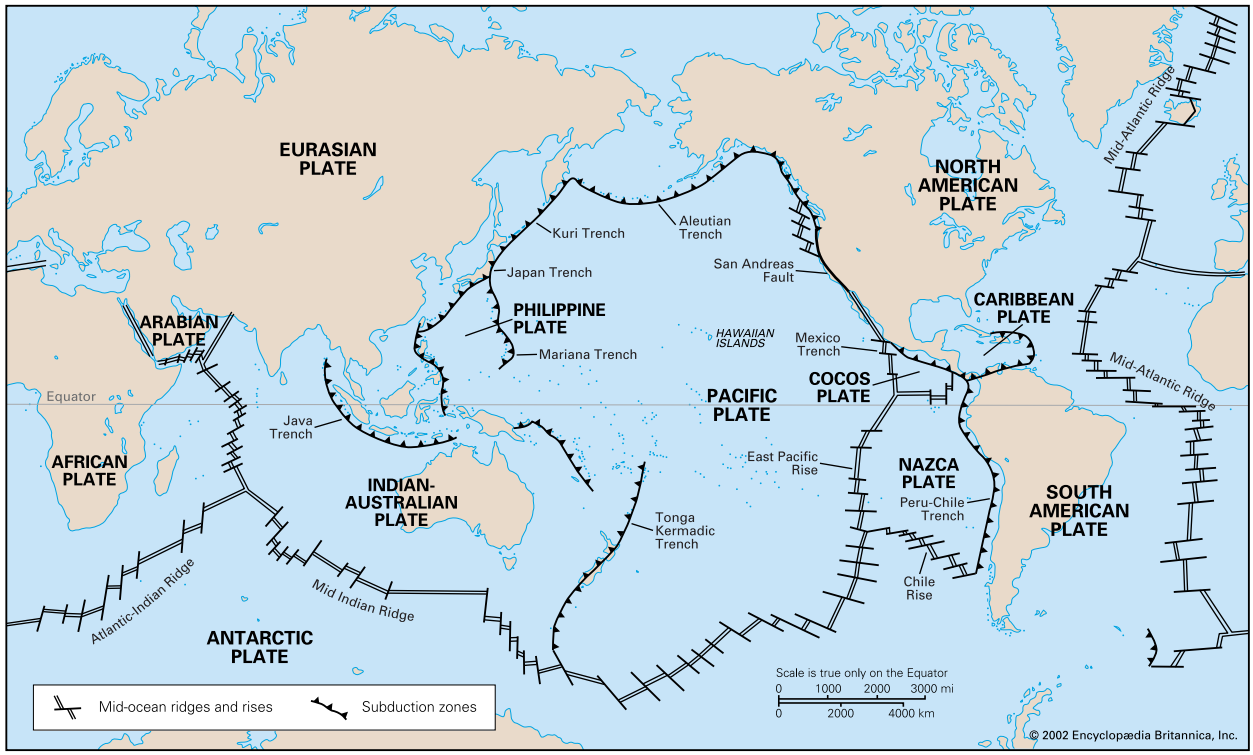
Planudes \plā-'nü-dēz**, Maximus** *orig.* **Manuel Planudes** (b. 1260, Nicomedia, Byzantine Empire—d. c. 1310, Constantinople) Greek Orthodox scholar, anthologist, and polemicist. He established a school in Constantinople that gained a strong reputation for its humanities curriculum. His Greek translations of Latin philosophy and literature and of Arabic mathematics publicized these areas of learning throughout the Greek Byzantine cultural world. Though chiefly known for his theological writings, he made a distinctive contribution to the history of Greek literature with his revision of the *Greek Anthology*, a collection of Greek prose and poetry c. 700 BC–AD 1000.

plasma \'plaz-mə\ Liquid part of blood (including dissolved chemicals but not the cells and PLATELETS). This straw-coloured fluid serves as the blood's transport medium, helps maintain BLOOD PRESSURE, distributes body heat, and maintains the pH balance in the bloodstream and body. More than 90% consists of water, about 7% proteins, and the rest other substances, including waste products of METABOLISM. Important plasma proteins include ALBUMIN, COAGULATION factors, and GLOBULINS, including GAMMA GLOBULIN and a hormone that stimulates ERYTHROCYTE formation. Serum is the liquid part of the blood that remains after clotting.

plasma Electrically conducting medium in which there are roughly equal numbers of positively and negatively charged particles, produced when the atoms in a gas become ionized (see IONIZATION). Plasma is sometimes called the fourth state of MATTER (the first three being solid, liquid, and gas). A plasma is unique in the way it interacts with itself, with ELECTRIC and MAGNETIC fields, and with its environment. It can be thought of as a collection of ions, electrons, neutral atoms and molecules, and photons in which some atoms are being ionized at the same time as electrons are recombining with other ions to form neutral particles, while photons are continuously being produced and absorbed. It is estimated that more than 99% of the matter in the universe exists in the plasma state.

plasmid \'plaz-məd\ Genetic element not contained within a CHROMOSOME. It occurs in many bacterial strains. Plasmids are circular DNA molecules that replicate independently of the bacterial chromosome. They are not essential for the bacterium but may give it a selective advantage. Some plasmids determine the production of proteins that can kill other bacteria; others make bacteria resistant to antibiotics. Plasmids are extremely valuable tools in the fields of molecular biology and genetics, specifically in the area of GENETIC ENGINEERING.

plasmodium \plaz-'mō-dē-əm\ Any of the parasitic PROTOZOANS that make up the genus *Plasmodium*, the cause of MALARIA. Infecting red blood cells in mammals, birds, and reptiles, plasmodia occur worldwide, especially in tropical and temperate zones. They are transmitted to humans by the bite of the *Anopheles* mosquito. From the bloodstream, young plasmodia enter liver cells, where they divide and form an adult stage that is then released back into the bloodstream and infects red blood cells. Rapid division of the parasites results in the destruction of the red blood cells, which release toxins that cause the periodic chill and fever cycles typical of malaria.



plaster of paris Quick-setting GYPSUM plaster consisting of a fine white powder, calcium sulfate hemihydrate, which hardens when moistened and allowed to dry. It is made by heating gypsum to 250–360°F (120–180°C). Used since ancient times, plaster of paris is so called because of its preparation from the abundant gypsum found in Paris. It is used to make molds and casts for ceramics and sculptures, to precast and hold ornamental plasterwork on ceilings and cornices, and for orthopedic bandages (casts). In medieval and Renaissance times, gesso (plaster of paris mixed with glue) was applied to wood panels, plaster, stone, or canvas to provide the ground for tempera and oil painting.

plastic surgery SURGERY to correct disfigurement, restore function, or improve appearance. It may involve reshaping or moving tissues to fill a depression, cover a wound, or improve appearance. Cosmetic surgery solely to improve appearance is not the main focus of plastic surgery. It is utilized after disfigurement by burns or tumour removal or for reconstructive work, and it may involve hiding incisions in skin folds or using buried sutures to hold wounds closed. Reconstructive plastic surgery corrects severe functional impairments, fixes physical abnormalities, and compensates for tissue lost to trauma or surgery. MICROSURGERY and computerized DIAGNOSTIC IMAGING techniques have revolutionized the field.

plasticity Ability of certain SOLIDS to flow or to change shape permanently when subjected to STRESSES between those that produce temporary deformation, or elastic behaviour, and those that cause failure of the material, or rupture (see FRACTURE). Plasticity allows a solid under the action of outside forces to become permanently deformed without rupturing; ELASTICITY enables a solid to return to its original shape after the load is removed. Plastic deformation occurs in many metal-forming processes (ROLLING, pressing, FORGING, WIRE DRAWING) and in geologic processes (rock folding and rock flow within the Earth under extremely high pressures and at elevated temperatures).

plastics POLYMERS that can be molded or shaped, usually by heat and pressure. Most are lightweight, transparent, tough organic compounds that do not conduct electricity well. They fall into two classes: Thermoplastics (e.g., POLYETHYLENE, polystyrene) can be melted and formed again and again; thermosetting plastics, or thermosets (e.g., POLYURETHANE, EPOXY), once formed, are destroyed rather than melted by heating. Few plastics contain only the polymer RESIN; many also contain plasticizers (to change the melting point and make them softer), colorants, reinforcements, and fillers (to improve mechanical properties such as stiffness), and stabilizers and antioxidants (to protect against aging, light, or biological agents). Traditional plastics are not biodegradable (see BIODEGRADABILITY); RECYCLING of plastics, especially thermoplastics, has become an important industry, and the development of low-cost biodegradable plastics and plastic substitutes is a significant pursuit of industrial research. Major commercial uses of plastics include cars, buildings, packaging, textiles, paints, adhesives, pipes, electrical and electronic components, prostheses, toys, brushes, and furniture. Common plastics include polyethylene terephtha-

Major tectonic plates of the earth's lithosphere. New lithosphere is created by upwelling magma at certain plate boundaries, called spreading centers or oceanic ridges, where the plates diverge. At other boundaries, called subduction zones, plates converge until one is forced under the other (subducted) into the earth. The continents are rigidly connected to their respective plates and move as the plates move, a few inches a year.

late, or PET (beverage bottles), PVC (pipes and hoses), foamed polystyrene, or Styrofoam (insulated food containers), and LUCITE (shatterproof windows). See also LEO BAEKELAND.

Plata, Río de la Estuary of the PARANÁ and URUGUAY rivers, between Uruguay and Argentina. It is about 180 mi (290 km) long, with a maximum width of 136 mi (219 km) at its mouth, but it narrows gradually to the northwest as it approaches BUENOS AIRES. Discovered by the Spanish in 1516, it was explored by FERDINAND MAGELLAN in 1520 and by SEBASTIAN CABOT (1526–29). The first permanent settlement in the area was at Asunción in 1537.

Plata, Viceroyalty of the Río de la See Viceroyalty of the RÍO DE LA PLATA

Plataea \plə-'tē-ə\ Ancient city, BOEOTIA, east-central Greece, south of THEBES. Plataea was settled by Boeotians who expelled the earlier Bronze Age inhabitants. The Plataeans fought along with the Athenians against the Persians at the Battle of MARATHON (490 BC). Plataea was the scene of the Greek victory over the invading Persians in the Battle of PLATAEA (479 BC). It was destroyed by the Spartans in 427 BC but was rebuilt under the Macedonian kings PHILIP II and ALEXANDER THE GREAT as a symbol of Greek courage in resisting Persia.

Plataea, Battle of (479 BC) Battle between Greek and Persian forces near Plataea (modern Plataiaí) in Boeotia on the slopes of Mount Cithaeron. A largely Spartan force, including HELOTS, defeated the Persian army of XERXES I, led by Mardonius; the victory marked this battle as the final Persian attempt to invade mainland Greece.

plate tectonics Theory that the Earth's LITHOSPHERE (the crust and upper portion of the mantle) is divided into about 12 large plates and several small ones that float on and travel independently over the ASTHENOSPHERE. The theory revolutionized the geological sciences in the 1960s by combining the earlier idea of CONTINENTAL DRIFT and the new concept of SEAFLOOR SPREADING into a coherent whole. Each plate consists of rigid rock created by upwelling magma at OCEANIC RIDGES, where plates diverge. Where two plates converge, a SUBDUCTION ZONE forms, in which one plate is forced under another and into the Earth's mantle. The majority of the earthquakes and volcanoes on the Earth's surface occur along the margins of tectonic plates. The interior of a plate moves as a rigid body, with only minor flexing, few earthquakes, and relatively little volcanic activity.

plateau Extensive area of flat upland, usually bounded by an escarpment on all sides but sometimes enclosed by mountains. Plateaus are extensive, and together with enclosed basins they cover about 45% of the Earth's land surface. The essential criteria for a plateau are low relative relief and some altitude. Low relief distinguishes plateaus from MOUNTAINS, although their origin may be similar. Plateaus, being high, often create their own local climate; the topography of plateaus and their surroundings often produce arid and semiarid conditions.

Plateau Indian Any member of various North American Indian peoples that inhabited the high plateau between the Rocky Mountains on the east and the Cascade Range on the west. The Plateau culture was not stable. By AD 1200–1300 the "classic" phase had emerged, characterized by permanent winter villages with semi-subterranean earth lodges along the main rivers and by summer camps with mat-covered conical lodges in the meadows. During the centuries that followed, the Plateau area was influenced by cultural elements from the highly specialized Northwest Coast culture. Part of this diffusion was possibly brought about by a Chinook group, the Wishram, who migrated from the coast into the Cascade Mountains. During the 18th century there were influences from the east. The SHOSHONE had acquired horses by that time and furnished their closest neighbours on the Plains and the Plateau with horses. Other elements of Plains culture, such as beaded dresses, warbonnets, and tepees, came with the horse. Among this group were the Coeur d'Alene, FLATHEAD, KLAMATH, Kutenai, MODOC, NEZ PERCÉ, Spokan, Thompson, and Salish.

platelet *or* **thrombocyte** Small, colourless, irregular blood cell crucial in COAGULATION. Produced in BONE MARROW and stored in the SPLEEN, platelets accumulate to block a cut in a blood vessel and provide a surface for fibrin strands to adhere to, contract to pull the strands together,

© 2006 Encyclopædia Britannica, Inc.

and take part in the conversion sequence of coagulation factors. They also store and transport several chemicals.

Plateresque \ˌpla-tə-ˈresk\ Main architectural style in Spain and its New World colonies in the late 15th and 16th centuries. The name (which comes from a comparison to the intricate work of silversmiths) came to be generally applied to late Gothic and early Renaissance Spanish architecture, which was characterized by minutely detailed relief ornament derived from Moorish, Gothic, and Italian Renaissance sources and applied without regard for structure. Favourite motifs for this ornament included twisted columns, heraldic escutcheons, and sinuous scrolls; clusters of ornament often contrasted with broad expanses of flat wall surface. Over time, the style evolved so that ornamentation became purer and more unified with the overall structure. Outstanding examples of the style include Diego de Siloé's Granada Cathedral (1528–43), Diego de Riaño's work on the Seville Cathedral (c. 1530), and Rodrigo Gil de Hontañón's facade of the University of Alcalá de Henares (1541–53).

platform tennis Variation of PADDLE TENNIS, played on a platform enclosed by a wire fence. It was devised in 1928 in Scarsdale, N.Y., U.S. The short-handled oval paddles are made of perforated plywood; the balls are made of sponge rubber. The rules are the same as for TENNIS, except that balls may be played off back or side walls after first striking inside the court.

Plath, Sylvia (b. Oct. 27, 1932, Boston, Mass., U.S.—d. Feb. 11, 1963, London, Eng.) U.S. poet. The daughter of an entomologist, Plath was driven to excel as a writer from an early age and published her first poem at age eight. At Smith College she made an early suicide attempt and submitted to electroshock treatment. While attending Cambridge University on a Fulbright grant, she married the poet TED HUGHES. After their separation, she committed suicide at age 30. Though she was not widely recognized in her lifetime, her reputation grew rapidly afterward; by the 1970s she was considered a major contemporary poet. Her works, often confessional and preoccupied with alienation, death, and self-destruction, include the volumes *The Colossus* (1960), *Ariel* (1965), and *The Collected Poems* (1981, Pulitzer Prize) and a semiautobiographical novel, *The Bell Jar* (1963).

plating Coating a METAL or other material, such as plastic or china, with a hard, nonporous metallic surface to improve durability and beauty. Early plated goods ("old SHEFFIELD PLATE") are made by the process invented by THOMAS BOULSOVER, and consist of a sandwich of copper between two layers of silver. Today surfaces such as gold, silver, stainless steel, palladium, copper, and nickel are applied by dipping an object into a solution containing the desired surface material, which is deposited by chemical or electrochemical action (see ELECTROPLATING). Much plating is done for decorative purposes, but still more is done to increase the durability and CORROSION resistance of softer materials. Most automotive parts, appliances, housewares and flatware, hardware, plumbing and electronic equipment, wire goods, aircraft and aerospace products, and machine tools are plated for durability. See also GALVANIZING, TERNEPLATE, TINPLATING.

platinum Metallic chemical ELEMENT, one of the TRANSITION ELEMENTS, chemical symbol Pt, atomic number 78. A very heavy, silvery white precious METAL, it is soft and ductile, with a high melting point (3,216 °F [1,769 °C]) and good resistance to corrosion and chemical attack. Small amounts of IRIDIUM are commonly added for a harder, stronger ALLOY that retains platinum's advantages. Platinum is found usually as alloys of 80–90% purity in PLACER DEPOSITS or more rarely combined with arsenic or sulfur. It is indispensable in high-temperature laboratory work for electrodes, dishes, and electrical contacts that resist chemical attack even when very hot. Platinum is used in dental alloys and surgical pins; alloys typically containing 90–95% platinum are used in expensive jewelry. The international primary standard for the kilogram is made of 90% platinum, 10% iridium. Platinum has VALENCE 2 or 4 in its compounds, which include many coordination complexes. It and some compounds are useful CATALYSTS, particularly for HYDROGENATION and in catalytic converters for reducing automobile emissions.

Plato \ˈplā-tō\ *orig.* **Aristocles** (b. 428/427, Athens, or Aegina, Greece—d. 348/347 BC, Athens) Greek philosopher, who with his teacher SOCRATES and his student ARISTOTLE laid the philosophical foundations of Western culture. His family was highly distinguished; his father claimed descent from the last king of Athens, and his mother was related to Critias and Charmides, extremist leaders of the oligarchic terror of 404. Plato (whose acquired name refers to his broad forehead, and thus his range of knowledge) must have known Socrates from boyhood. After Socrates was put to death in 401, Plato fled Athens for Megara, then spent the next 12 years in travel. Upon his return, he founded the Academy, an institute of scientific and philosophical research, where Aristotle was one of his students. Building on but also departing from Socrates' thought, he developed a profound and wide-ranging philosophical system, subsequently known as PLATONISM. His thought has logical, epistemological, and metaphysical aspects, but much of its underlying motivation is ethical. It is presented in his many dialogues, in most of which Socrates plays a leading role. See also NEOPLATONISM.

Platonic solid *also known as* **regular polyhedron** Geometric solid all of whose faces are identical regular POLYGONS and all of whose angles are equal. There are only five such POLYHEDRONS. The cube is constructed from the square, the dodecahedron from the regular pentagon, and the tetrahedron, octahedron, and icosahedron (with 20 faces) from the equilateral triangle. They are known as the Platonic solids because of PLATO's attempt to relate each to one of the five elements that he believed formed the world.

Platonism \ˈplā-tə-ˌni-zəm\ Any philosophy that embodies some major idea of Plato's, especially in taking abstract forms as metaphysically more basic than material things. Though there was in antiquity a tradition about Plato's "unwritten doctrines," Platonism then and later was based primarily on a reading of the dialogues. It is characterized by an intense concern for the quality of human life—always ethical, often religious, and sometimes political, based on a belief in unchanging and eternal realities (the Platonic Forms), independent of the changing things of the physical world perceived by the senses. This belief in absolute values rooted in an eternal world distinguishes Platonism from the philosophies of Plato's immediate predecessors and successors and from later philosophies inspired by them. See also NEOPLATONISM.

platoon Principal subdivision of a military company, battery, or troop. Usually commanded by a lieutenant, it consists of 25–50 soldiers organized into two or more squads led by noncommissioned officers. The term was first used in the 17th century to refer to a small body of musketeers who fired together in a volley alternately with another platoon. It has been used in U.S. military manuals since 1779, and throughout the 19th century it meant half a company. It was reintroduced into the British army in 1913. See also MILITARY UNIT.

Platt, Orville Hitchcock (b. July 19, 1827, Washington, Conn., U.S.—d. April 21, 1905, Washington) U.S. politician. He served in the Connecticut legislature (1861–62, 1864, 1869) and later in the U.S. Senate (1879–1905), where he sponsored legislation concerning patents and copyrights. He was chairman of the committee on territories (1887–93), which recommended admission of six new western states. He is remembered for sponsoring the PLATT AMENDMENT (1901), which became the basis for the withdrawal of U.S. troops from Cuba following the SPANISH-AMERICAN WAR of 1898.

Platt Amendment (1901) Rider appended to a U.S. Army appropriations bill stipulating conditions for withdrawing of U.S. troops remaining in Cuba after the SPANISH-AMERICAN WAR. The amendment, which was added to the Cuban constitution of 1901, affected Cuba's rights to negotiate treaties and permitted the U.S. to maintain its naval base at GUANTÁNAMO BAY and to intervene in Cuban affairs "for the preservation of Cuban independence." In 1934 Pres. FRANKLIN ROOSEVELT supported abrogation of the amendment's provisions except for U.S. rights to the naval base. See also GOOD NEIGHBOR POLICY.

Platte River River, central Nebraska, U.S. Formed by the confluence of the NORTH PLATTE and SOUTH PLATTE rivers, it is 310 mi (500 km) long. It flows southeast into a big bend at Kearney, Neb., then empties into the MISSOURI RIVER at Plattsmouth, south of OMAHA. It is too shallow for navigation and is almost dry for much of the year. Its waters are used for irrigation and municipal water systems.

Plattsburgh City (pop., 2000: 18,816), northeastern New York, U.S. Situated on the western shore of Lake CHAMPLAIN, south of the Canadian border, Plattsburgh was founded by Zephaniah Platt in 1784. It was the scene of an important U.S. victory during the WAR OF 1812 on Lake Champlain that saved New York from British invasion via the HUDSON RIVER valley. Incorporated as a city in 1902, it became the centre of the Lake Champlain resort area.

platyhelminth See FLATWORM

© 2006 Encyclopædia Britannica, Inc.

platypus *or* **duckbill** MONOTREME amphibious MAMMAL (*Ornithorhynchus anatinus*) of lakes and streams in eastern Australia and Tasmania. About 23 in. (60 cm) long, the squat-bodied platypus has a ducklike snout, short legs, webbed feet, and a beaverlike tail. Each day it eats nearly its own weight in crustaceans, fishes, frogs, mollusks, tadpoles, and earthworms; lacking teeth, it crushes its food with ridges in the bill. The female lays one to three eggs in a nest in a long twisting passage above the waterline. The young are weaned about four months after hatching. The male's heel bears a spur connected to a poison-secreting gland. Large fishes and perhaps snakes prey on platypuses. Formerly trapped for their dense, soft fur, they are now protected by law.

Plautus \'plȯ-təs\ (b. c. 254, Sarsina, Umbria?—d. 184 BC) Roman comic playwright. Little is known for certain about his life, but tradition holds that he was associated with the theatre from an early age. Like other Roman playwrights, he borrowed plots and dramatic techniques from Greek authors, especially NEW COMEDY playwrights such as MENANDER. His plays, written in verse, were often farces marked by cases of mistaken identity and opportunities for slapstick, and he popularized character types such as the braggart soldier and the sly servant. Twenty-one of his comedies—among the earliest surviving works in Latin—are extant, including *The Pot of Gold*, *The Captives*, *The Two Menaechmuses*, *The Braggart Warrior*, and *Pseudolus*. His work influenced European comedy from the Renaissance onward, notably WILLIAM SHAKESPEARE's *Comedy of Errors* (1592–93) and MOLIÈRE's *The Miser* (1669).

play See THEATRE

play In zoology, actions that have all the elements of purposeful behaviour but are performed for no apparent reason. Play has been documented only among mammals and birds. It is most common among immature animals, but adult animals also play. Horses, cattle, and other ungulates run and kick up their heels even when not fleeing from predators or defending themselves. Dogs adopt an aggressive posture to entice others to join in mock combat. Otters are well known for their mud sliding. Male birds may spontaneously perform their territorial songs when there is no intruding rival.

playa \'plī-ə\ *or* **pan** *or* **flat** *or* **dry lake** Flat-bottomed depression that is periodically covered by water. Playas occur in interior desert basins and adjacent to coasts in arid and semiarid regions. The water that periodically covers the playa slowly filters into the groundwater system or evaporates into the atmosphere, causing the deposition of salt, sand, and mud along the bottom and around the edges of the depression.

Player, Gary (Jim) (b. Nov. 1, 1935, Johannesburg, S.Af.) South African golfer. Player entered the U.S. PGA circuit in 1957. He won the British Open three times (1959, 1968, 1974), the Masters three times (1961, 1974, 1978), the PGA twice (1962, 1972), and the U.S. Open once (1965). Player was the third man (after GENE SARAZEN and BEN HOGAN) to win the four tournaments composing the modern grand slam of golf (the Masters, the U.S. Open, the British Open, and the PGA Championship).

player piano Piano that mechanically plays music encoded as perforations on a paper roll. An early version, patented in 1897 by the American engineer E.S. Votey, was a cabinet placed in front of an ordinary piano, with wooden "fingers" projecting over the keyboard. A paper roll with perforations corresponding to the notes passed over a tracker bar to activate the release of air by pneumatic devices that set the fingers in motion; the user could control tempo and loudness by levers and pedals. Soon this mechanism was built into the piano itself. The later "reproducing piano" could reproduce the nuances of tempo and dynamics in great performances, the roll having been produced by the performance itself. After the 1920s the phonograph led to the instrument's quick decline. Modern versions, such as the Yamaha Disklavier, are operated by digital memory on a computer disk.

Steinway-Welte player piano, 1910; in the British Piano and Musical Museum, Brentford, Middlesex, Eng.
COURTESY OF THE BRITISH PIANO AND MUSICAL MUSEUM, BRENTFORD, MIDDLESEX, ENG.

playing cards Small rectangular cards used for playing games and sometimes for divination and conjuring. Modern cards are divided into four suits: spades, hearts, diamonds, and clubs. A complete pack, or deck, of cards includes 13 cards in each suit (10 numbered cards and 3 court cards—king, queen, and jack, or knave); 2 extra cards, called jokers (many times portraying a medieval jester), are often included as well. The origin of playing cards is obscure—China and India being the two most likely sources—as is the meaning of their symbols. The earliest reference to cards in Europe occurs in Italy in 1299. The 52-card French deck is now standard throughout the world, but decks with fewer cards evolved in Germany and Spain. Other suit emblems were also used (e.g., bells in Germany, cups in Spain and Italy). See also TAROT.

plea bargaining Negotiation of an agreement between the prosecution and the defense whereby the defendant pleads guilty to a lesser offense or (in the case of multiple offenses) to one or more of the offenses charged, in exchange for more lenient sentencing, recommendations, a specific sentence, or a dismissal of other charges. Supporters claim plea bargaining speeds court proceedings and guarantees a conviction; opponents believe it prevents justice from being served.

plebeian \ple-'bē-ən\ (Latin, *plebs*) Member of the general citizenry, as opposed to the PATRICIAN class, in the ancient ROMAN REPUBLIC. Plebeians were originally excluded from the SENATE and from all public offices except military TRIBUNE, and they were forbidden to marry patricians. Seeking to acquire equal rights, they carried on a campaign called Conflict of the Orders, developing a separate political organization and seceding in protest from the state at least five times. The campaign ceased when a plebeian dictator (appointed 287 BC) made measures passed in the plebeian assembly binding on the whole community.

plebiscite \'ple-bə-ˌsīt\ Vote by the people of an entire country or district to decide an issue. Voters are asked to accept or reject a given proposal rather than choose between alternative proposals. By means of plebiscites, intermediaries such as political parties can be bypassed. Because plebiscites offer a way to claim a popular mandate without permitting an opposition party, totalitarian regimes have used them to legitimize their power. See also REFERENDUM AND INITIATIVE.

Plehve \'plā-vyi**, Vyacheslav (Konstantinovich)** (b. April 20, 1846, Kaluga province, Russia—d. July 28, 1904, St. Petersburg) Russian government administrator. In 1881 he was appointed director of the secret police in the ministry of the interior. He became head of the imperial chancellery (1894), state secretary for Finland (1899), and minister of the interior (1902). Concerned with upholding autocratic principles, he suppressed revolutionary and liberal movements, harshly pursued Russification policies against minority nationality groups, and backed police-controlled labour unions. He was assassinated by a member of the Socialist Revolutionary Party.

Pleiades \'plē-ə-ˌdēz\ OPEN CLUSTER of stars in the constellation Taurus, about 400 light-years from Earth. It contains a large amount of bright nebulous material and several hundred stars, of which six or seven can be seen by the unaided eye and have figured prominently in the myths and literature of many cultures. In the Northern Hemisphere, the rising of the Pleiades near dawn in spring has from ancient times marked the opening, and their morning setting in autumn the end, of seafaring and farming seasons.

Pleistocene \'plīs-tə-ˌsēn\ **Epoch** Earlier and longer of the two epochs that constitute the QUATERNARY PERIOD. The Pleistocene began c. 1.8 million years ago and ended c. 10,000 years ago. It was preceded by the PLIOCENE EPOCH of the TERTIARY PERIOD and followed by the HOLOCENE EPOCH. At the height of the Pleistocene glacial ages, more than 30% of the land area of the Earth was covered by glacial ice; during the interglacial stages, probably only about 10% was covered. The animals of the Pleistocene began to resemble those of today, and new groups of land mammals, including humans, appeared. At the end of the epoch, mass extinctions occurred: in North America more than 30 genera of large mammals became extinct within a span of roughly 2,000 years. Of the many causes that have been proposed for these extinctions, the two most likely are changing environment with changing climate and disruption of the ecological pattern by early humans.

Plekhanov \pli-'kä-nȯf**, Georgy (Valentinovich)** (b. Dec. 11, 1856, Gudalovka, Russia—d. May 30, 1918, Terioki, Fin.) Russian Marxist theorist. From 1874 he was active in the Populist movement and

© 2006 Encyclopædia Britannica, Inc.

became a leader of the Land and Freedom group (1877–80). To avoid arrest, he went into a long exile in Geneva (1880–1917). In 1883 he founded the first Russian Marxian revolutionary organization, Liberation of Labour, which became the Russian Social-Democratic Workers' Party (1898). In *Socialism and Political Struggle* (1883) and *Our Differences* (1885), he described a two-phase revolutionary scheme that influenced Russian Marxist thought. Followers in the 1890s included Vladimir Ilich Lenin. After the party split (1903), Plekhanov joined the Mensheviks but spent years trying to reunite the party. He supported the Allies in World War I and opposed the Bolshevik seizure of power. After returning briefly to Russia in 1917, he died in exile in Finland.

Plessy v. Ferguson (1896) U.S. Supreme Court decision that established the legality of racial segregation so long as facilities were "separate but equal." The case involved a challenge to Louisiana laws requiring separate railcars for African Americans and whites. Though the laws were upheld by a majority of 8 to 1, a famous dissent by John Marshall Harlan advanced the idea that the U.S. Constitution is "color-blind." The *Plessy* decision was overturned in 1954 by *Brown v. Board of Education*.

Pleven \plā-'ven**, René** (b. April 13 or 15, 1901, Rennes, France—d. Jan. 13, 1993, Paris) French politician and premier (1950–51, 1951–52). A lawyer and industrial executive, he served in Charles de Gaulle's wartime government (1940–45). Elected to the National Assembly in 1945, he cofounded with François Mitterrand the Democratic and Socialist Union of the Resistance, serving as its president (1946–53). He held several postwar cabinet posts, including minister of defense (1949–50, 1952–54). He sponsored the Pleven Plan for a unified European army, but the European Defense Community, based on his plan, collapsed in 1954. He served as minister of justice (1969–73).

Plexiglas See Lucite

Pleyel \ple-'yel,\ *English* \'plī-əl**, Ignace Joseph** *or* **Ignaz Josef Pleyel** (b. June 18, 1757, Ruppersthal, Austria—d. Nov. 14, 1831, Paris, France) Austrian-French music publisher, piano maker, and composer. He studied with Joseph Haydn (c. 1772–77), then held posts in Vienna and Strasbourg and traveled in Italy before settling in Paris. His publishing house, Maison Pleyel, published Haydn's complete string quartets (1801), and in 1802 it published the first miniature scores for study. It ceased publishing in 1834, but the piano-manufacturing company he founded in 1807 lasted until the 1960s. Pleyel's music, including 45 symphonies and more than 70 string quartets, was once very popular.

Plimsoll \'plim-səl**, Samuel** (b. Feb. 10, 1824, Bristol, Gloucestershire, Eng.—d. June 3, 1898, Folkestone, Kent) British reformer. A London coal merchant, he served in Parliament (1868–80). With his book *Our Seamen* (1873), he helped overcome resistance to the Merchant Shipping Act, which instituted such reforms as the loading limit for cargo ships. A load line (the Plimsoll mark or line) was marked on the hull of every cargo ship, indicating the maximum depth to which the ship could be safely loaded.

Pliny \'plin-ē\ **the Elder** *Latin* **Gaius Plinius Secundus** (b. AD 23, Novum Comum, Transpadane Gaul—d. Aug. 24, 79, Stabiae, near Mt. Vesuvius) Roman scholar. Descended from a prosperous family, Pliny pursued a military career, held official positions (including procurator of Spain), and later spent years in semiretirement, studying and writing. His fame rests on his *Natural History* (AD 77), an encyclopaedic work of uneven accuracy that was the European authority on scientific matters up to the Middle Ages. Six other works ascribed to him were probably lost in antiquity. He died while observing the great eruption of Vesuvius.

Pliny the Younger *Latin* **Gaius Plinius Caecilius Secundus** (b. AD 61/62, Comum—d. c. 113, Bithynia, Asia Minor) Roman author and administrator. The nephew of Pliny the Elder, he practiced law and held official posts, including consul and head of the military and senatorial treasuries. He is known for the nine books of private letters he published in AD 100–109. The carefully composed letter, at that time a fashion among the wealthy, was transformed by Pliny into an art. His are charming and meticulous occasional pieces on diverse literary, social, and domestic themes that intimately illustrate public and private life in the heyday of the Roman Empire.

Pliocene \'plī-ə-ˌsēn\ **Epoch** Last and shortest epoch of the Tertiary Period, from c. 5.3 to c. 1.8 million years ago. It follows the Miocene Epoch and precedes the Pleistocene Epoch of the Quaternary Period. Pliocene environments were generally cooler and drier than those of preceding Tertiary epochs. In general, Pliocene mammals grew larger than those of earlier epochs. The more advanced primates continued to evolve, and it is possible that the australopithecines (see Australopithecus), the first creatures that can be termed human, developed late in the Pliocene.

Plisetskaya \pli-'set-skə-yə**, Maya (Mikhaylovna)** (b. Nov. 20, 1925, Moscow, Russia, U.S.S.R.) Russian prima ballerina. She studied at the Bolshoi Ballet's school in Moscow and joined the company as a soloist in 1943. Noted for her technical virtuosity and ability to integrate acting with dancing, she toured worldwide with the Bolshoi Ballet and appeared as a guest artist with several companies, including the Paris Opéra. She also danced in several films, including *Swan Lake* (1957). In the 1980s she was a guest ballet director in Rome and then in Madrid.

PARIS MATCH-PICTORIAL PARADE

PLO See Palestine Liberation Organization

ploidy \'plȯi-dē\ Number of sets of chromosomes in the nucleus of a cell. In normal human body cells, chromosomes exist in pairs, a condition called diploidy. During meiosis the cell produces sex cells (gametes), each containing half the normal number of chromosomes, a condition called haploidy. When an egg and a sperm unite in fertilization, the diploid condition is restored. Polyploid cells have three or more times the number of chromosomes found in haploid cells; polyploid organisms usually cannot reproduce. Aneuploid cells have an abnormal number of chromosomes that is not a multiple of the haploid number. Aneuploidy is most often caused by an error leading to an unequal distribution of chromosomes during division.

Plotinus \plō-'tī-nəs\ (b. AD 205, Lyco, or Lycopolis, Egypt?—d. 270, Campania) Egyptian-Roman philosopher. At age 27 he traveled to Alexandria, where he studied philosophy for 11 years. In about 242 he joined the expedition of the Roman emperor Gordian III against Persia in order to learn about the philosophies of the Persians and Indians. He went to Antioch and then to Rome, where he settled at age 40, becoming the centre of an influential circle of intellectuals. His attempt to form a Platonic republic in Campania c. 265 was halted by the emperor Gallienus. He was the founder of the school of philosophy known as Neoplatonism; his collected works, the *Enneads* (from Greek, *enneas*: "set of nine"), arranged by his disciple Porphyry (232?–c. 305), are the first and greatest collection of Neoplatonic writings. For Plotinus, philosophy was not only a matter of abstract speculation but also a way of life and a religion. His works strongly influenced early Christian theology, and his philosophy was widely studied and emulated for many centuries.

Plovdiv \'plȯv-ˌdif\ City (pop., 2001: 340,638), south-central Bulgaria. It is situated on the Maritsa River, north of the Rhodope Mountains. In 341 BC it fell to Philip II and was renamed Philippopolis. From AD 46 it was called Trimontium and was the capital of the Roman province of Thrace. It changed hands repeatedly during the Middle Ages until 1364, when it was captured by the Turks. After the Russo-Turkish Wars (1877–78), it became the capital of Turkish Eastern Rumelia, which united with Bulgaria in 1885. It officially assumed its present name after World War I. It is a major railroad junction and a food-processing centre with diversified industries.

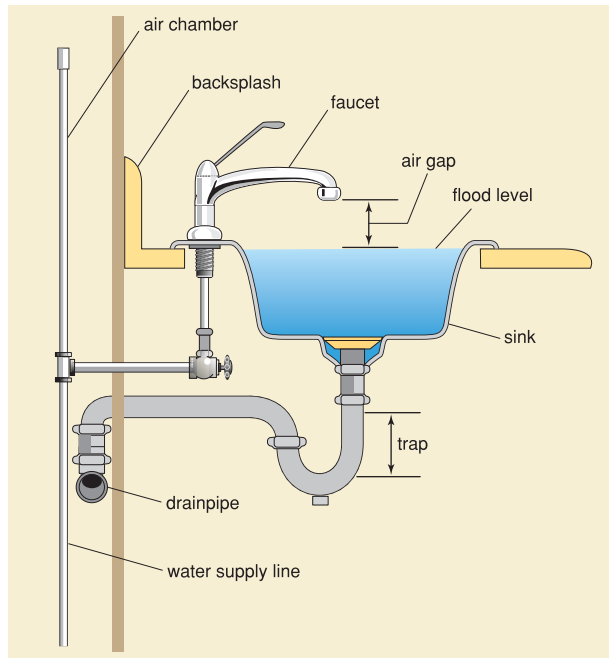
plover \'plə-vər, 'plō-vər\ Any of about 36 species (family Charadriidae, order Charadriiformes) of plump-breasted shorebirds found almost worldwide. Plovers are 6–12 in. (15–30 cm) long and have long wings, long-

© 2006 Encyclopædia Britannica, Inc.

ish legs, a short neck, and a straight, short bill. Many species are plain brown, gray, or sandy above and whitish below. Others, including the golden and black-bellied plovers, are finely patterned above and black below in breeding season. Many species run along the shoreline, snapping up small aquatic invertebrates. They have a melodious whistled call. Both parents incubate the two to five eggs and care for the young. See also KILLDEER.

Golden plover (*Pluvialis apricaria*).
KENNETH W. FINK—ROOT RESOURCES

plow *or* **plough** Most important agricultural implement since the beginning of history, used to turn and break up SOIL, to bury CROP residues, and to help control WEEDS. The forerunner of the plow is the prehistoric digging stick. The earliest plows were undoubtedly digging sticks with handles for pulling or pushing. By Roman times, plows were pulled by oxen or horses, and today they are drawn by TRACTORS.



plum Any of various trees in the genus *Prunus* of the ROSE family, and their edible fruits. In the U.S. and Europe, plums are the most extensively distributed of the stone (drupe) fruits, most varied in native and cultivated kinds, and most adapted to a wide range of soils and climatic conditions. The fruits show a wide range of size, flavour, colour, and texture. They are widely eaten fresh, cooked, or baked in pastries. In full bloom, plum trees are covered with densely packed, showy flower clusters. The smooth-skinned fruit has a fleshy, juicy exterior and a hard interior stone or pit. Plum varieties that can be or have been dried without resulting in fermentation are called prunes.

plumbago See GRAPHITE

plumbing System of pipes and fixtures installed in a building for the distribution of potable water and the removal of waterborne wastes. Plumbing is usually distinguished from water and sewage systems, which serve a group of buildings or a city. Improvement in plumbing systems was very slow, with virtually no progress made from the time of the Roman system of AQUEDUCTS and lead pipes until the 19th century. Eventually the development of separate, underground water and sewage systems eliminated open sewage ditches. Present-day water pipes are usually made of steel, copper, brass, plastic, or other nontoxic material. A building's waste-disposal system has two parts: the drainage system and the venting system. The drainage portion comprises pipes leading from various fixture drains to the central main, which is connected to the sewage system. The venting system consists of pipes leading from an air inlet (usually on the roof) to various points within the drainage system; by providing the circulation of air within the system, it protects the trap seals of fixtures from siphonage and back pressure. See also SEWAGE SYSTEM, WATER POLLUTION, WATER-SUPPLY SYSTEM. See illustration opposite.

Plunket, Saint Oliver (b. 1629, Loughcrew, County Meath, Ire.—d. July 1, 1681, London, Eng.; canonized 1975; feast day July 11) Irish prelate, the last man to suffer martyrdom for the Catholic faith in England. He was ordained in Rome, where he taught theology and represented the Irish bishops at the Holy See. In 1669 he was appointed archbishop of Armagh and primate of Ireland, and he worked to restore the disorganized church in Ireland. Renewed persecution forced him into hiding in 1673. In the anti-Catholic hysteria caused by the TITUS OATES plot (1678), he was betrayed and imprisoned in Dublin in 1679. After a farcical trial in London, he was convicted of treason and was hanged, drawn, and quartered. His head, originally sent to Rome, is preserved at Drogheda, and his body is at Downside Abbey, near Bath.

pluralism In political science, the view that in liberal democracies power is (or should be) dispersed among a variety of economic and ideological pressure groups and is not (or should not be) held by a single elite or group of elites. Pluralism assumes that diversity is beneficial to society and that the disparate functional or cultural groups of which society is composed—including religious groups, trade unions, professional organizations, and ethnic minorities—should be autonomous. Pluralism was stressed most vigorously during the early 20th century by a group of English writers that included FREDERIC W. MAITLAND and HAROLD J. LASKI; it was defended in the later 20th century by the American scholars Robert Dahl and David B. Truman.

The basic components of a plumbing fixture include the water-supply pipes, a valve or faucet for controlling the flow of water, and a drainpipe to carry wastewater away. An air chamber may be added to the supply line to cushion the effects of water hammer. A trap in the drain line leaves a plug of water in the pipe to prevent unwanted sewer gases from entering the room via the drain.
© MERRIAM-WEBSTER INC.

pluralism In METAPHYSICS, the doctrine opposed to MONISM. Whereas monists such as PARMENIDES, BENEDICT DE SPINOZA, and G.W.F. HEGEL maintain that reality consists of only one ultimate substance, pluralists assert that reality consists of manifold entities of many different types and that the diversity of things is more striking and important than their unity. In *A Pluralistic Universe* (1909), WILLIAM JAMES held that it is characteristic of empirically minded thinkers to note the changeability of things, the multiplicity of their being and their relations with one another, and the unfinished character of the world.

plurality system Electoral process in which the candidate who polls more votes than any other candidate is elected. It is distinguished from the majority system, in which, to win, a candidate must receive more votes than all other candidates combined. It is the most common method of selecting candidates for public office. Its chief advantage is that it avoids the need for runoffs to produce a winner. Its chief disadvantage is that it may result in a winner who has received a minority of the votes cast. It operates best in a two-party system, where the small vote for any third party will rarely result in an outcome seriously at odds with the voters' will.

Plutarch \'plü-ˌtärk\ *Greek* **Plutarchos** *Latin* **Plutarchus** (b. AD 46, Chaeronea, Boeotia—d. after 119) Greek biographer and author. The son of a biographer and philosopher, Plutarch studied in Athens, taught in Rome, traveled widely, and made many important friends before returning to his native town in Boeotia. His literary output was immense, but his popularity rests primarily on his *Parallel Lives*, a series of pairs of biographies of famous Greeks and Romans. Displaying impressive learning and research, the *Lives* exhibit noble deeds and characters and provide model patterns of behaviour. The *Moralia*, or *Ethica*, contains his surviving writings on ethical, religious, physical, political, and literary topics. His works profoundly influenced the evolution of the essay, biography, and historical writing in 16th–19th-century Europe, especially through translations such as Sir Thomas North's *Lives of the Noble Grecians and Romanes* (1579), WILLIAM SHAKESPEARE's source for his Roman history plays.

Pluto Ninth planet from the Sun. It was discovered in 1930 by Clyde W. Tombaugh (1906–97) and named after the Greek god of the underworld. It is usually the outermost of the known planets, averaging about 3.7 billion

© 2006 Encyclopædia Britannica, Inc.

mi (5.9 billion km) from the Sun (within the KUIPER BELT), but its eccentric orbit brings it closer to the Sun than NEPTUNE for 22 years during its 248-year orbit. Its axis is tipped 120°, so it rotates nearly on its side and "backward" (see RETROGRADE MOTION) once every 6.39 days, locked synchronously with the orbit of its largest moon, Charon, discovered in 1978. Two additional, small moons were discovered in 2005. Pluto has a diameter of about 1,455 mi (2,340 km), roughly two-thirds that of the Moon, and has less than 1% of Earth's mass and only about 6% of its surface gravity. Its estimated average surface temperature is near –390 °F (–235 °C). Its thin atmosphere contains nitrogen, methane, and perhaps other heavier gases. Pluto is thought to be made of frozen gases with a significant fraction of rocky material. Its size, composition, and orbital location in the Kuiper belt have sparked debate over its classification as a major planet.

plutonium Radioactive (see RADIOACTIVITY) metallic chemical ELEMENT, chemical symbol Pu, atomic number 94. A member of the ACTINIDE series of TRANSITION ELEMENTS, it is the most important TRANSURANIUM ELEMENT because of its use in certain types of nuclear reactors (see NUCLEAR POWER) and in NUCLEAR WEAPONS. It is found in nature only in traces produced by natural NEUTRON irradiation in URANIUM ores. It is produced artificially by neutron irradiation of uranium-238. Plutonium is a silvery METAL that tarnishes in air; it is warm because of energy released in ALPHA DECAY. Its ISOTOPES, all radioactive, are highly toxic radiological poisons (see RADIATION INJURY) because they give off alpha particles and are specifically absorbed by bone marrow.

Plymouth City (pop., 1999 est.: 255,800) in DEVON, southwestern England. Located on Plymouth Sound southwest of London, the city was named Sudstone in DOMESDAY BOOK (1086); its harbour is called Sutton Harbour. It was the port from which the English fleet sailed against the Spanish ARMADA in 1588. In 1690 its dockyard was built on the western bank of the River Tamar. During World War II Plymouth suffered bomb damage from air raids. The rebuilt city has some of the finest commercial, shopping, and civic centres in Britain and new bridges over the Rivers Plym and Tamar.

Plymouth City (pop., 2000: 51,701), southeastern Massachusetts, U.S. Located on Plymouth Bay, it was the site of the first permanent European settlement in New England, the Colony of New Plymouth, founded by the PILGRIMS in 1620 and governed under the MAYFLOWER COMPACT until 1691, when it became part of MASSACHUSETTS BAY COLONY. Its seaside location and historic associations make Plymouth an outstanding summer resort. A tourist-based economy is supplemented by light industry, fishing, and cranberry growing. Historical attractions include Plimoth Plantation (a recreation of the original Pilgrim village) and many restored early colonial houses.

Plymouth Company (1606–09) Commercial trading company chartered by the English crown to colonize the eastern coast of North America in present-day New England. Also called the Virginia Colony of Plymouth, its shareholders were merchants of Plymouth, Bristol, and Exeter. Its twin company was the more successful LONDON COMPANY. The Plymouth Company established a colony on the coast of Maine in 1607 but soon abandoned it. Inactive after 1609, it was reorganized under a new charter in 1620 as the Council for New England. See also CHARTERED COMPANY.

plywood Manufactured panel made up of three or more thin plies (layers) of wood. Each ply is laid down with its grain running perpendicular to the one before it. Like other glued-wood products, plywood provides a strong, inexpensive alternative to solid wood. It is widely used both in cabinetmaking (for chests, dressers, wardrobes, and tables) and in house construction (for walls, ceilings, subfloors, doors, and in forms for casting concrete).

PMS See PREMENSTRUAL SYNDROME

pneumatic device \nü-'ma-tik\ Any of various TOOLS and instruments that generate and use COMPRESSED AIR. Examples include rock drills, pavement breakers, riveters, forging presses, paint sprayers, blast cleaners, and atomizers. Compressed-air power is flexible, economical, and safe. In general, pneumatic systems have relatively few moving parts, contributing to high reliability and low maintenance costs.

pneumatic structure MEMBRANE STRUCTURE that is stabilized by the pressure of compressed air. Air-supported structures are supported by internal air pressure. A network of cables stiffens the fabric, and the assembly is supported by a rigid ring at the edge. The air pressure within this bubble is increased slightly above normal atmospheric pressure and maintained by compressors or fans. Air locks are required at entrances to prevent loss of internal air pressure. Air-supported membranes were first devised by Walter Bird in the late 1940s and were soon put to use as covers for swimming pools, temporary warehouses, and exhibition buildings. Air-inflated structures are supported by pressurized air within inflated building elements that are shaped to carry loads in a traditional manner. Pneumatic structures are perhaps the most cost-effective type of building for very long spans.

pneumococcus \ˌnü-mə-'kä-kəs\ Spheroidal bacterium (*Streptococcus pneumoniae*) that causes human diseases including pneumonia, sinusitis, ear infection, and meningitis. Usually occurring in the upper respiratory tract, this gram-positive (see GRAM STAIN) COCCUS is often found in a chain configuration and surrounded by a POLYSACCHARIDE capsule. Pneumococci are separated into types depending on the specific capsular polysaccharide formed. Their disease-causing ability resides in the capsule, which delays or prevents their destruction by cells in the bloodstream that normally engulf foreign material.

pneumoconiosis \ˌnü-mə-ˌkō-nē-'ō-səs\ Any LUNG disease caused by inhalation of organic or inorganic dusts or chemical irritants, usually over time. Some dusts (e.g., SILICA MINERALS, ASBESTOS) produce grave reactions in small quantities. Dust collects in the PULMONARY ALVEOLI, causing inflammation that scars lung tissue, reducing its elasticity. Chest tightness and shortness of breath may progress to chronic BRONCHITIS and EMPHYSEMA. Cigarette smoking worsens many types. The most common cause of severe disease is silica (see SILICOSIS). Asbestos (see ASBESTOSIS), beryllium, and aluminum dusts can cause worse disease, often on brief exposure. Organic causes include mold spores (see ALLERGY) and textile fibres. Chemical irritants such as ammonia, acid, and sulfur dioxide are soon absorbed by the lung lining; their irritant effect can cause pulmonary EDEMA, and they can lead to chronic bronchitis.

pneumonia \nü-'mōn-yə\ INFLAMMATION and solidification of LUNG tissue caused by infection, foreign particle inhalation, or irradiation but usually by BACTERIA. *Mycoplasma pneumoniae* is the most common cause in healthy individuals. The bronchi and alveoli may be inflamed. Coughing becomes severe and may bring up flecks of blood. It can be serious but is rarely fatal. *Streptococcus pneumoniae* is more common and generally more severe but usually affects only those with low resistance, especially in hospitals. A highly lethal form caused by *Klebsiella pneumoniae* is almost always confined to hospitalized patients with low immunity. Other bacterial pneumonias include *Pneumocystis carinii* pneumonia (rare except in AIDS) and LEGIONNAIRE DISEASE. Most respond to ANTIBIOTIC treatment. VIRUSES set the stage for bacterial pneumonia by weakening the individual's immune system more often than they cause pneumonia directly. Fungal pneumonia usually occurs in hospitalized persons with low resistance, but contaminated dusts can cause it in healthy individuals. It can develop rapidly and may be fatal. X-RAY treatment (see RADIATION THERAPY) of structures in the chest may cause temporary lung inflammation.

pneumothorax Condition in which air accumulates in the pleural sac, causing it to expand and thus compress the underlying LUNG, which may then collapse. (The pleural sac is a cavity formed by the two pleural membranes that line the thoracic cavity and cover the lungs.) Traumatic pneumothorax is the accumulation of air caused by penetrating wounds (knife stabbing, gunshot) or other injuries to the chest wall, after which air is sucked through the opening and into the pleural sac. Spontaneous pneumothorax is the passage of air into the pleural sac from an abnormal connection created between the pleura and the bronchial system as a result of tuberculosis or some other lung disease. The symptoms of spontaneous pneumothorax are a sharp pain in one side of the chest and shortness of breath.

Po Chü-i See BO JUYI

Po Hai See BO HAI

Po River *ancient* **Padus** River, northern Italy. The country's longest river, it is about 405 mi (652 km) long. It rises in the Cottian Alps on the western frontier and flows northeast to TURIN, then east across PIEDMONT and LOMBARDY into the ADRIATIC SEA. Its delta is one of the most complex of any European river, with at least 14 mouths. It is navigable from its mouth to PAVIA. Industrial cities in its valley include MILAN, PADUA, and VERONA. It has suffered devastating autumn floods, including those in 589, 1438, 1951, and 1966.

Pobedonostsev \pə-byi-də-'nôst-syif**, Konstantin (Petrovich)** (b. May 21, 1827, Moscow, Russia—d. March 23, 1907, St. Petersburg)

© 2006 Encyclopædia Britannica, Inc.

Russian government administrator. He wrote and lectured on civil law at Moscow University (1859–65), tutored the sons of Tsar Alexander II, and later became a close adviser to Alexander III, influencing him to adopt reactionary policies. As director general of the Holy Synod of the Russian Orthodox church (1880–1905), he assumed great power over domestic policy in education, religion, and censorship. Nicknamed "the Grand Inquisitor," he became the symbol of Russian monarchical absolutism.

Pocahontas \ˌpō-kə-ˈhän-təs\ (b. c. 1596, near present-day Jamestown, Va. [U.S.]—d. March 1617, Gravesend, Kent, Eng.) Powhatan Indian woman. Daughter of the powerful chief Powhatan, Pocahontas helped maintain peace between English colonists and Native Americans by befriending the settlers at Jamestown, Va. By the account of colonial leader John Smith, Pocahontas intervened to save his life after he had been taken prisoner by her father's men. She subsequently converted to Christianity and wedded the colonist John Rolfe, which furthered efforts toward peace. She traveled to England, where she was received at court, but soon afterward she died, probably of lung disease.

Pocahontas, detail of a portrait by an unknown artist, 1616.
LIBRARY OF CONGRESS, WASHINGTON, D.C.

pocket billiards See pool

pocket gopher See gopher

pocket mouse Any of about 30 species of nocturnal North American rodents constituting the genus *Perognathus* (family Heteromyidae), having fur-lined, external cheek pouches that open alongside the mouth. Pocket mice are yellowish brown to dark gray and are 2.5–5 in. (6–13 cm) long, excluding a tail of about the same length. They are usually solitary and inhabit dry and desert regions. They carry food (mainly seeds) in their pouches and store it in their burrows. Spiny pocket mice (most in the genera *Liomys* and *Heteromys*; family Heteromyidae), found from Mexico through Central America, are gray, brown, or black nocturnal burrowers that inhabit wet, forested regions as well as dry country.

podesta \ˌpō-də-ˈstä\ (Italian: "power") In medieval Italian communes, the highest judicial and military magistrate. The office was instituted by Frederick I Barbarossa in an attempt to govern rebellious Lombard cities. From the late 12th century the communes usually elected their own podesta, often a nobleman with legal training. Serving for six months or a year, the podesta summoned councils, led the communal army, and administered civil and criminal jurisdiction.

Podgorica \ˈpȯd-ˌgȯr-ēt-sä\ *formerly (1946–92)* **Titograd** City (pop., 1999 est.: 130,875), capital of Montenegro, southern Serbia and Montenegro. As a feudal state capital in the early Middle Ages, it was known as Ribnica; it was called Podgorica from 1326. It fell to the Turks in 1474 but was restored to Montenegro in 1878. It was occupied in 1916 by Austria, in 1941 by Italy, and in 1943 by Germany. In 1946 it became Titograd in honour of Marshal Tito, but its former name was restored in 1992 after the collapse of communism. It is the site of a university (founded 1974).

Podgorny \pȯd-ˈgȯr-nē**, Nikolay (Viktorovich)** (b. Feb. 18, 1903, Karlovka, Ukraine, Russian Empire—d. Jan. 12, 1983, Moscow, Russia, U.S.S.R.) Soviet politician. He worked in engineering jobs in the sugar industry, then was appointed deputy commissar of the Soviet food-processing industry in 1940. He rose through the Communist Party hierarchy to become chair of the Ukraine party committee (1957–63), a full member of the Politburo (1960), and head of the party's Central Committee (1963–65). In a power struggle with Leonid Brezhnev, Podgorny was demoted to the ceremonial post of chairman of the Presidium of the Supreme Soviet (1965–77).

podiatry \pə-ˈdī-ə-trē\ *or* **chiropody** \ˌkə-ˈräp-əd-ē\ Medical specialty dealing with the foot. Podiatrists diagnose and treat foot diseases, disabilities, and deformities by means of physical medicine and rehabilitation, special shoes and other mechanical devices, drugs, and minor surgery.

podium In architecture, a pedestal on a large scale. It may be any of various elements that form the base of a structure, such as the platform forming the floor and substructure of a Classical temple, a low wall supporting columns, or the structurally or decoratively emphasized lowest portion of a wall. The term is also applied to other types of raised platform, such as an orchestra conductor's dais.

Poe, Edgar Allan (b. Jan. 19, 1809, Boston, Mass., U.S.—d. Oct. 7, 1849, Baltimore, Md.) U.S. poet, critic, and short-story writer. Poe was raised by foster parents in Richmond, Va., following his mother's death in 1811. He briefly attended the University of Virginia and then returned to Boston, where in 1827 he published a pamphlet of youthful, Byronic poems. By 1835 he was in Richmond as editor of the *Southern Literary Messenger*, the first of several periodicals he was to edit or write for. There he married a 13-year-old cousin, who died in 1847. At various times he lived in Baltimore, New York, and Philadelphia. Alcohol, the bane of his irregular and eccentric life, caused his death at age 40. His works are famous for his cultivation of mystery and the macabre. Among his tales are "The Fall of the House of Usher," "The Masque of the Red Death," "The Black Cat," "The Tell-Tale Heart," and "The Pit and the Pendulum." "The Murders in the Rue Morgue" and "The Purloined Letter" initiated the modern detective story. His poems (less highly regarded now than formerly) are musical and sensuous, as in "The Bells," a showcase of sound effects; they include touching lyrics inspired by women (e.g., "Annabel Lee") and the uncanny (e.g., "The Raven").

poet laureate Title first granted in England for poetic excellence. Begun in 1616, the office was formally established in 1668 and has been continuous since then. Its holder, a salaried member of the British royal household, was formerly expected to compose poems for court or national occasions, but since the appointment of William Wordsworth in 1843 the office has been a reward for eminence in poetry and has carried no specific duties. In 1985 the U.S. government created the title of poet laureate, to be held by the consultant in poetry to the Library of Congress.

poetry Writing that formulates a concentrated imaginative awareness of experience in language chosen and arranged to create a specific emotional response through its meaning, sound, and rhythm. It may be distinguished from prose by its compression, frequent use of conventions of metre and rhyme, use of the line as a formal unit, heightened vocabulary, and freedom of syntax. Its emotional content is expressed through a variety of techniques, from direct description to symbolism, including the use of metaphor and simile. See also prose poem; prosody.

Poetry U.S. poetry magazine founded in Chicago in 1912 by Harriet Monroe, who became its longtime editor. It became the principal organ for modern poetry of the English-speaking world and survived through World War II. Because its inception coincided with the Chicago literary renaissance, it is often associated with the raw, local-colour poetry of Carl Sandburg, Edgar Lee Masters, Vachel Lindsay, and Sherwood Anderson, but it also championed new formalistic movements, including Imagism. Ezra Pound was its European correspondent; among the authors it published were T.S. Eliot, Wallace Stevens, Marianne Moore, D.H. Lawrence, and William Carlos Williams.

Poggio Bracciolini \ˈpȯd-jō-ˌbrät-chō-ˈlē-nē**, Gian Francesco** (b. Feb. 11, 1380, Terranuova, Tuscany—d. Oct. 30, 1459, Florence) Italian humanist and calligrapher. While working as a copyist of manuscripts, Poggio invented the humanist script, which later became the prototype for Roman fonts in printing. He traveled to various monasteries in Europe, uncovering lost, forgotten, or neglected classical Latin manuscripts, including works by Cicero and Lucretius. He also translated works by Lucian, Xenophon, and others into Latin. His own writings include moral dialogues and *Facetiae* (1438–52), a collection of humorous tales containing satires of his contemporaries.

pogrom \pə-ˈgräm\ *Russian* **"devastation" or "riot"** Mob attack, condoned by authorities, against persons and property of a religious, racial, or national minority. The term is usually applied to attacks on Jews in Russia in the late 19th and early 20th centuries. After the assassination of Tsar Alexander II (1881), false rumours associating Jews with the murder aroused Russian mobs in more than 200 cities and towns to attack Jews and destroy their property. Mob attacks diminished in the 1890s, but they again became common in 1903–06. Although the government did not organize pogroms, its anti-Semitic policy (1881–1917) and reluctance to stop the attacks led many anti-Semites to believe that their violence was legitimate. Pogroms also occurred in Poland and in Germany during Adolf Hitler's regime.

Poincaré \pwa^{n}-kä-'rā**, (Jules-) Henri** (b. April 29, 1854, Nancy, France—d. July 17, 1912, Paris) French mathematician, theoretical astronomer, and philosopher of science. Born into a distinguished family of civil servants (see RAYMOND POINCARE), he excelled at mental calculation and possessed an unusually retentive memory. He wrote a doctoral dissertation on DIFFERENTIAL EQUATIONS (1879), then joined the University of Paris (1881), where he remained the rest of his life. Working in celestial mechanics and mathematical analysis, he independently obtained many of ALBERT EINSTEIN's results relating to the special theory of relativity and published them in a paper on the dynamics of the electron (1906). He later wrote books for the general public on the meaning and importance of science and mathematics.

Henri Poincaré, 1909.
H. ROGER-VIOLLET

Poincaré \pwa^{n}-kä-'rā**, Raymond** (b. Aug. 20, 1860, Bar-le-Duc, France—d. Oct. 15, 1934, Paris) French politician. A lawyer, he served in the Chamber of Deputies (1887–1903) and the Senate (1903–12) and as minister of education (1893, 1895) and finance minister (1894, 1906). As prime minister and foreign minister (1912–13), he strengthened France's ties with Russia and Britain. As president of the THIRD REPUBLIC (1913–20), he vigorously supported national unity. As prime minister again in 1922–24 and 1926–29, he was credited with solving France's financial crisis by stabilizing the franc, enabling a period of new prosperity.

poinsettia \pȯin-'se-tē-ə\ Popular flowering plant (*Euphorbia pulcherrima*), best-known member of the diverse SPURGE family. Native to Mexico and Central America, it grows in moist, wet, wooded ravines and on rocky hillsides. What appear to be flower petals are actually coloured leaflike BRACTS that surround a central cluster of tiny yellow flowers. Cultivated varieties are available with white, pink, mottled, and striped bracts, but the solid red varieties are in greatest demand during the Christmas season. Milky latex in the stems and leaves can be irritating to sensitized persons or animals, but the claim that poinsettias are deadly poisonous is greatly exaggerated.

Poinsettia (*Euphorbia pulcherrima*).
GRANT HEILMAN-EB INC.

Point Four Program U.S. policy of technical assistance and economic aid to less-developed countries. Pres. HARRY S. TRUMAN proposed the plan as the fourth point of his 1949 inaugural address. It was approved by Congress and administered by a special State Department agency until it was merged with other foreign-aid programs in 1953. Technical assistance, mainly in agriculture, public health, and education, was provided through contracts with U.S. business and educational organizations. Organizations such as the INTER-AMERICAN DEVELOPMENT BANK were created to help develop the program.

Pointe-Noire \ˌpwa^{n}t-'nwär\ City (pop., 1992 est.: 576,206) and port, southwestern Republic of the Congo. It was the capital (1950–58) of the Middle Congo region of FRENCH EQUATORIAL AFRICA. With independence in 1958, it was replaced by BRAZZAVILLE as the national capital, but it remained important for trade. Its port facilities were completed in 1939 and expanded during World War II. The country's second largest city, it is a principal port and commercial centre, especially for the oil industry.

pointer Dog breed, of HOUND, SPANIEL, and SETTER ancestry, first recorded c. 1650 in Great Britain and named for the dog's rigid posture in the direction of quarry. Pointers were originally used to point out hares and were later trained as bird dogs. The pointer stands 23–28 in. (58–71 cm) tall and weighs 50–75 lb (23–34 kg); it has a long muzzle, hanging ears, tapered tail, and a short, smooth coat, usually white with dark markings. The German short-haired pointer, another sporting breed, tracks, points, and retrieves; it is about the size of a pointer and has a short coat of solid liver colour or liver and gray-white.

German short-haired pointer

pointillism \'pwa^{n}-tē-ˌyi-zəm, 'pȯin-tᵊl-ˌi-zəm\ In painting, the practice of applying small strokes or dots of contrasting colour to a surface so that from a distance they blend together. The term (and its synonym, divisionism) was first used to describe the paintings of GEORGES SEURAT. See also CAMILLE PISSARRO; PAUL SIGNAC.

Poiret \pwȧ-'re**, Paul** (b. April 20, 1879, Paris, Fr.—d. April 30, 1944, Paris) French fashion designer. After working in the Parisian fashion house of CHARLES FREDERICK WORTH, he opened his own shop in 1902. In 1908 he revived the Empire style, popular in France during the reign of Napoleon I. Seeking to restore naturalness to female garb, he was principally responsible for the decline of the corset. He is best known for the hobble skirt, to which he later added draped and belted knee-length tunics. Fringed and tasseled capes, multicoloured feathers, and fox stoles imparted a theatrical look to his designs. His flowing Greek costumes were extremely popular in the prewar era, but his popularity faded in the 1920s and he died in poverty.

poison Any substance (natural or synthetic) that, at a certain dosage, damages living tissues and injures or kills. Poisons spontaneously produced by living organisms are often called TOXINS, VENOMS if produced by animals. Poisons may be ingested, inhaled, injected, or absorbed through the skin. They do not always have an all-or-none effect; degrees of poisoning may occur, and at a given dose some substances are far more toxic than others (e.g., a pinch of potassium CYANIDE can kill, whereas a single dose of ordinary table salt must be massive to kill). Poisoning may be acute (a single dose does significant damage) or chronic (repeated or continuous doses produce an eventual effect, as with chemical CARCINOGENS). The effects produced by poisons may be local (hives, blisters, inflammation) or systemic (hemorrhage, convulsions, vomiting, diarrhea, clouding of the senses, paralysis, respiratory or cardiac arrest). Agricultural PESTICIDES are often poisonous to humans. Some industrial chemicals can be very toxic or carcinogenic. Most therapeutic drugs and health-care products can be poisons if taken inappropriately or in excess. Most forms of RADIATION can be toxic (see RADIATION INJURY). See also ANTIDOTE; ARSENIC POISONING; FISH POISONING; FOOD POISONING; LEAD POISONING; MEDICINAL POISONING; MERCURY POISONING; MUSHROOM POISONING.

poison hemlock Any of several poisonous herbaceous plants of the PARSLEY family, especially *Conium maculatum*, believed to be the plant that killed SOCRATES. It is now common in the U.S. as well as in Europe. A tall biennial, this plant has green stems spotted with red or purple, large compound leaves, and white flowers. Though the poison is concentrated in the seeds, the entire plant is dangerous to livestock when fresh. Despite their common name, poison hemlocks are not CONIFERS (see HEMLOCK). Water hemlocks (*Cicuta* species) are similar and also dangerous.

poison ivy Either of two North American species of white-fruited woody vines or shrubs of the SUMAC, or cashew, family. The species found

© 2006 Encyclopædia Britannica, Inc.

in eastern North America (*Toxicodendron radicans*) is abundant; a western species, known as POISON OAK, is less common. Both species are sometimes classified as genus *Rhus*. A key identifier is leaves with three mitten-shaped leaflets. Contact with urushiol, an oil produced by the plant, can cause severe inflammation and blistering of human skin. Urushiol may be carried from the plant on clothing, shoes, tools, or soil; by animals; or by smoke from burning plants. Because urushiol is nonvolatile, a reaction may result from wearing clothing a year or more after its contact with the plant.

Poison ivy (*Toxicodendron radicans*)
WALTER CHANDOHA

poison oak Species of POISON IVY (*Toxicodendron diversilobum*) native to western North America and classified in the SUMAC (or cashew) family. Like many other lobe-leafed plants commonly called oak, poison oak is not an OAK tree (genus *Quercus*).

poison sumac *also called* **poison elder** Attractive, narrow shrub or small tree (*Rhus vernix* or *Toxicodendron vernix*) of the SUMAC, or cashew, family. It is native to swampy acidic soils of eastern North America. Unlike the upright reddish, fuzzy fruit clusters of other sumacs, whitish waxy berries droop loosely from its stalks. The clear sap, which blackens on exposure to air, is extremely irritating to the skin for many people.

Poitier \'pwä-tē-ˌā**, Sidney** (b. Feb. 20, 1927?, Miami, Fla., U.S.) U.S. actor. He was raised in The Bahamas, then studied and acted with the American Negro Theatre in New York City. He made his film debut in *No Way Out* (1950) and gave notable performances in *Blackboard Jungle* (1955) and *The Defiant Ones* (1958). He won acclaim on Broadway for his role in *A Raisin in the Sun* (1959). He became the first African American actor to win an Academy Award, for his role in *Lilies of the Field* (1963). He used his critical and commercial success to push for integrated film crews. He went on to star in notable films such as *In the Heat of the Night* (1967), *To Sir with Love* (1967), and *Guess Who's Coming to Dinner* (1967). He also directed several films, including *Buck and the Preacher* (1972), *Let's Do It Again* (1975), and *Stir Crazy* (1980). In 1997 he was appointed The Bahamian ambassador to Japan.

Poitiers, Battle of (732) See Battle of TOURS/POITIERS

Poitiers \pwä-'tyā**, Battle of** (September 19, 1356) Catastrophic defeat of the French king JOHN II in the HUNDRED YEARS' WAR between France and England. English troops under EDWARD THE BLACK PRINCE were under pursuit from the probably superior French forces. South of Poitiers the English secured themselves in thickets and marshes, where the French knights became bogged down and made easy targets for the English archers. John II was taken prisoner and for his freedom had to consent to the disadvantageous Treaties of BRETIGNY and Calais.

Poitou \pwä-'tü\ Historical region, western central France. It was bounded by BRITTANY, ANJOU, TOURAINE, Marche, and the Atlantic Ocean. It was inhabited by the ancient Gallic tribe of Pictones and became part of Roman Aquitania. A meeting place of northern and southern cultures, its golden age (11th–12th century) was characterized by great ROMANESQUE ART and architecture. The counts of Poitiers were succeeded by the Angevin kings of England, but by 1375 the French had won the region back. It was a province of France until the FRENCH REVOLUTION, when it was divided into three departments. It is predominantly a rural area; regional specialties include seafood and white wine.

poker Any of several card games in which a player bets that the value of his or her hand is greater than that of the hands held by others. Each subsequent player must either equal or raise the bet or drop out. The pot is eventually won by either the player showing the best hand when it comes to a showdown or the only player left when everyone else has dropped out, or "folded." In this case the winner need not show his hand and could conceivably have won the pot with a lower hand than any other at the table. It is for this reason that poker is described as a game of bluff. Three principal forms of the game have developed: straight poker, in which all cards of the standard five-card hand are dealt facedown; stud poker, in which some but not all of a player's cards are dealt faceup; and community-card poker, in which some cards are exposed and used by all the players to form their best hand. In draw poker, the main variant of straight poker, cards may be discarded and additional cards drawn. The traditional ranking of hands is (1) straight flush (five cards of the same suit in sequence, the highest sequence—ace, king, queen, jack, ten—being called a royal flush), (2) four of a kind, (3) full house (three of a kind, plus a pair), (4) flush (five of a single suit), (5) straight (five in sequence), (6) three of a kind, (7) two pair, (8) one pair.

pokeweed *also called* **pokeberry** *or* **poke** Strong-smelling shrublike plant (*Phytolacca americana*) with a poisonous root resembling the shape of horseradish, native to wet or sandy areas of eastern North America. It has white flowers, reddish black berries, and dark green leaves that often are red-veined or borne on red leafstalks. The berries contain a red dye used to colour wine, candies, cloth, and paper. Like the roots, the red or purplish mature stalks are poisonous. Very young green shoots (up to about 6 in. [15 cm]), however, are edible.

Pokrovsky Cathedral See SAINT BASIL THE BLESSED

Pol Pot *orig.* **Saloth Sar** (b. May 19, 1925/28, Kompong Thom province, Cambodia—d. April 15, 1998, near Anlong Veng) Prime minister of Cambodia. He joined the anti-French resistance under HO CHI MINH in the 1940s and became a member of the Cambodian Communist Party in 1946. After studying radio technology in Paris, he returned to Cambodia in 1953 and taught French until he fell under police suspicion in 1963. For the next 12 years he built up the Communist Party. U.S. anticommunist activity in Cambodia in the early 1970s, including helping to depose NORODOM SIHANOUK and a bombing campaign in the countryside, drove many to join him. In 1975 his KHMER ROUGE forces captured Phnom Penh, which he ordered entirely evacuated. Even the sick were wheeled out in hospital beds, and in the first weeks it is estimated that tens of thousands died. The ruthlessness with which he pursued his intention to return to "year zero" and create an ethnically pure, agrarian, communist state resulted in the deaths of one to two million people. Overthrown by the Vietnamese in 1979, he led an anti-Vietnamese guerrilla war until he was repudiated by the Khmer Rouge and sentenced to life imprisonment (1997); he died the next year.

Poland *officially* **Republic of Poland** Country, central Europe. Area: 120,728 sq mi (312,685 sq km). Population (2005 est.): 38,164,000. Capital: WARSAW. Most of the people are Polish; there are minorities of Ukrainians, Germans, and Belarusians. Language: Polish (official). Religion: Christianity (predominantly Roman Catholic; also Eastern Orthodox). Currency: zloty. Poland consists almost entirely of lowlands in the northern and central regions; the southern border is largely formed by the Sudeten

© 2006 Encyclopædia Britannica, Inc.

and the Carpathian Mountains. The Vistula and Oder, the principal river systems, both drain into the Baltic Sea. Industries include mining, manufacturing, and public utilities. Poland is a republic with two legislative houses; its chief of state is the president, and its head of government is the prime minister. Established as a kingdom in 922 under Mieszko I, Poland was united with Lithuania in 1386 under the Jagiellon dynasty (1386–1572) to become the dominant power in east-central Europe, enjoying a prosperous golden age. In 1466 it wrested western and eastern Prussia from the Teutonic Order, and its lands eventually stretched to the Black Sea. Wars with Sweden (see First Northern War; Second Northern War) and Russia beginning in the late 17th century led to the loss of considerable territory. In 1697 the electors of Saxony became kings of Poland, virtually ending Polish independence. In the late 18th century Poland was divided between Prussia, Russia, and Austria (see partitions of Poland) and ceased to exist. After 1815 the former Polish lands came under Russian domination, and from 1863 Poland was a Russian province, subjected to intensive Russification. After World War I an independent Poland was established by the Allies. The invasion of Poland in 1939 by the U.S.S.R. and Germany precipitated World War II, during which the Nazis sought to purge Poland's culture and its large Jewish population in the Holocaust. Reoccupied by Soviet forces in 1945, Poland was controlled by a Soviet-dominated government from 1947. In the 1980s the Solidarity labour movement led by Lech Wałęsa achieved major political reforms, and free elections were held in 1989. An economic austerity program instituted in 1990 sped the transition to a market economy. Poland became a member of NATO in 1999 and the European Union in 2004.

Poland, partitions of (1772, 1793, 1795) Territorial divisions of Poland by Russia, Prussia, and Austria that progressively reduced its territory until it ceased to exist as a state. In the First Partition (1772), a Poland weakened by civil war and Russian intervention agreed to a treaty signed by Russia, Prussia, and Austria that deprived it of half its population and almost one-third of its land area. In the Second Partition (1793), Poland was forced to cede additional lands to Prussia and Russia. To quell a nationalist uprising led by Tadeusz Kościuszko, Russia and Prussia invaded Poland and divided the remnants of the state among themselves and Austria in the Third Partition (1795). Only with the establishment of the Polish Republic in 1918 were the results of the partitions reversed.

Polanski \pə-'lan-skē**, Roman** (b. Aug. 18, 1933, Paris, France) Polish-French film director. He grew up in Poland and survived a traumatic wartime childhood under the Nazis. His first feature film, *Knife in the Water* (1962), brought him international fame. He left Poland that year for Britain, where he made *Repulsion* (1965), and later the U.S., where his *Rosemary's Baby* (1968) was highly successful. In 1969 his new wife, the actress Sharon Tate, was murdered by followers of Charles Manson. He directed a graphic adaptation of *Macbeth* (1971) and the acclaimed film noir *Chinatown* (1974). In 1977 Polanski was arrested and eventually pleaded guilty to a charge of statutory rape. He subsequently jumped bail and fled to France, where he remained active in both the theatre and motion pictures. His subsequent films include *Tess* (1979), *Frantic* (1988), *Bitter Moon* (1992), *Death and the Maiden* (1994), and *The Pianist* (2002), which won the Gold Palm for best film at the Cannes International Film Festival and earned a best director Academy Award for Polanski.

polar bear White semiaquatic bear (*Ursus maritimus*) found throughout Arctic regions, generally on drifting oceanic ice floes. A swift, wide-ranging traveler and a good swimmer, it stalks and captures its prey. It primarily eats seal but also fish, seaweed, grass, birds, and caribou. The male weighs 900–1,600 lbs (410–720 kg) and is about 5.3 ft (1.6 m) tall at the shoulder and 7–8 ft (2.2–2.5 m) long. It has a short tail. The hairy soles of its broad feet protect it from the cold and help it move across the ice. Though shy, it is dangerous when confronted.

Polar bear (*Ursus maritimus*)
FRANCOIS GOHIER/ARDEA LONDON

polar wandering Migration of the magnetic poles of the Earth through geologic time. Scientific evidence indicates that the magnetic poles have slowly and erratically wandered across the surface of the Earth. Pole locations calculated from measurements on rocks younger than about 20 million years do not depart from the present pole locations by very much, but successively greater "virtual pole" distances are revealed for rocks older than 30 million years, indicating that substantial deviations occurred. Calculations of polar wandering formed one of the first important pieces of evidence for continental drift.

Polaris \pə-'lar-əs\ *or* **North Star** Earth's present northern polestar (the star visible from the Northern Hemisphere toward which Earth's axis points), at the end of the "handle" of the Little Dipper in the constellation Ursa Minor. Polaris is actually a triple star, composed of a binary star and a Cepheid variable. Precession of Earth's axis made the star Thuban, in the constellation Draco, the North Star in ancient Egyptian times; it will cause the North Pole to point toward Vega, in the constellation Lyra, 12,000 years from now.

polarization Property of certain types of electromagnetic radiation in which the direction and magnitude of the vibrating electric field are related in a specified way. The electric vector representing the magnitude and direction of the electric field in a wave of light is perpendicular to the direction in which the wave is moving. Unpolarized light consists of waves moving in the same direction with their electric vectors pointing in random orientations about the axis of propagation. Plane-polarized light consists only of waves that vibrate in one direction. In circular polarization the electric vector rotates about the propagation direction. Light may be polarized by reflection or by passing it through polarizing filters, such as certain crystals, that transmit vibrations in one plane but not in others. Polarized light has useful applications in crystallography, liquid-crystal displays, optical filters, and the identification of optically active chemical compounds.

Polaroid Corp. Major U.S. manufacturer of photographic equipment and supplies. The company was established as Land-Wheelwright Laboratories in 1932 by Edwin Land and George Wheelwright to produce Land's first invention, an inexpensive plastic-sheet light polarizer (see polarization). By 1936 Land was using polarized material in sunglasses and other optical devices, and in 1937 the company was incorporated under the Polaroid name. After World War II Land invented the first instant camera, marketed in 1947 as the Polaroid Land camera, which delivered a finished sepia-toned print 60 seconds after exposure. The company introduced colour film for its Polaroid cameras in the 1960s and instant motion pictures in 1977. Other Polaroid products include film, digital cameras, and identification systems.

Pole, Reginald (b. March 3, 1500, Stourton Castle, Staffordshire, Eng.—d. Nov. 17, 1558, London) English Catholic prelate. A cousin of Henry VII, Pole was sent by Henry VIII to study in Italy (1521–27) and given minor offices in the church. Critical of Henry's antipapal policies, he wrote *In Defense of Ecclesiastical Unity* (1536) to defend the pope's spiritual authority. As cardinal, he was sent by Pope Paul III on missions to persuade Catholic monarchs to depose Henry. These efforts angered Henry, who executed Pole's brother, Lord Montague (1538), and his mother, Margaret, countess of Salisbury (1541). Pole was named papal governor of the Patrimony of St. Peter and later was presiding legate at the Council of Trent. When the Catholic Mary Tudor became queen as Mary I in 1553, he was appointed legate for England; there he instituted church reforms and was a strong influence on the queen. He was appointed archbishop of Canterbury (1556), but a conflict between the papacy and England's ally Spain caused the pope to cancel Pole's authority and declare him a heretic. Demoralized, he died 12 hours after the death of Queen Mary.

pole construction Method of building that dates back to the Stone Age. Excavations in Europe show rings of stones that may have braced huts made of wooden poles or weighted down the walls of tents made of animal skins supported by central poles. Two types of Native American pole structures were the wigwam and longhouse. Pole-and-thatch dwellings are common in the Caribbean, Mesoamerica, and the Pacific Islands; bamboo-pole dwellings constructed on piles are found in many wet areas of Asia. A southern African method utilizes a ring of poles that is inserted into the ground, brought together in a crest, and expertly thatched. Today, pole construction employs a vertical structure of pressure-treated wood poles firmly embedded in the ground as a pier foundation. See also tent structure.

pole vault Track-and-field event consisting of a vault for height over a crossbar with the aid of a long pole. It became a competitive sport in the mid-19th century and was included in the first modern Olympic Games.

© 2006 Encyclopædia Britannica, Inc.

In competition, each vaulter is given three chances to clear a specific height. The bar is raised progressively until a winner emerges.

polecat Any of several CARNIVORES of the WEASEL family (Mustelidae), found in Eurasia and Africa. The polecat hunts at night, principally on the ground, feeding on small mammals, birds, reptiles, frogs, fishes, and eggs. Species differ in size and colour. The European, or common, polecat (*Mustela putorius*), also called foul MARTEN for its odour, weighs 1–3 lb (0.5–1.4 kg) and is 14–21 in. (35–53 cm) long, excluding the 5–8-in. (13–20-cm) bushy tail. Its long, coarse fur is brown above, black below. In the U.S., SKUNKS are often called polecats. See also FERRET.

European polecat (*Mustela putorius*)
RUSS KINNE—PHOTO RESEARCHERS

police Body of agents organized to maintain civil order and public safety, enforce the law, and investigate crime. Characteristics common to most police forces include a quasi-military organization, a uniformed patrol and traffic-control force, plainclothes divisions for criminal investigations, and a set of enforcement priorities that reflects the community's way of life. Administration may be centralized at the national level downward, or decentralized, with local police forces largely autonomous. Recruits usually receive specialized training and take an exam. The modern metropolitan police force began with SIR ROBERT PEEL in Britain c. 1829. SECRET POLICE are often separate, clandestine organizations established by national governments to maintain political and social orthodoxy, which typically operate with little or no restraint.

police power Power of a government to exercise reasonable control over people and property within its jurisdiction in the interest of general security, health, safety, morals, and welfare. It is generally regarded as one of the powers reserved to the states under the U.S. Constitution. In considering cases involving the exercise of police power, the courts have applied a doctrine called "balance of interests" to determine when the public's right to health and well-being outweighs private or individual concerns. Of equal concern is that DUE PROCESS of law be observed.

poliomyelitis \ˌpō-lē-ō-ˌmī-ə-ˈlī-təs\ *or* **polio** *or* **infantile paralysis** Acute infectious viral disease that can cause flaccid PARALYSIS of MUSCLES. Severe epidemics killed or paralyzed many people, mostly children and young adults, until the 1960s, when JONAS SALK's injectable killed VACCINE and ALBERT B. SABIN's oral attenuated live vaccine controlled polio in the developed world. Flulike symptoms with diarrhea may progress to back and limb pain, muscle tenderness, and stiff neck. Destruction of SPINAL CORD motor cells causes paralysis, ranging from transient weakness to complete, permanent paralysis, in fewer than 20% of patients. Patients may lose the ability to use their limbs, to breathe, or to swallow and speak. They may need PHYSICAL MEDICINE AND REHABILITATION, mechanical breathing assistance, or tracheal suction to remove secretions. A "postpolio syndrome" occurs decades later in some cases, with weakness of muscles that had recovered.

polis \ˈpä-ləs\ In ancient Greece, an independent city and its surrounding region under a unified government. A polis might originate from the natural divisions of mountains and sea and from local tribal and cult divisions. Usually the town was walled and contained a citadel on raised ground (ACROPOLIS) and a marketplace (AGORA). Government was centred in the town; usually there was an assembly of citizens, a council, and magistrates. Ideally, all citizens participated in the government and in the cults, as well as in defense and economy. Women, minors, METICS, and slaves were not citizens. Hellenism spread many of the institutions into the Middle East. See also ATHENS; CITY-STATE; SPARTA; THEBES.

Polisario \ˌpō-li-ˈsä-rē-ō\ *officially* **Popular Front for the Liberation of Saguia el Hamra and Río de Oro** Sahrawi political and military group. Initially an insurgent against Spanish control of WESTERN SAHARA, it turned to agitation against Morocco and Mauritania when the Spanish withdrew in 1976 and those two countries partitioned the country. Mauritania made peace with the group in 1979, whereupon Morocco annexed the whole territory. Polisario continued its resistance, mostly from bases in Algeria. In 1991 it agreed to a ceasefire and a referendum, which has been repeatedly postponed by Morocco, to determine the state's fate. See also SAHARAN ARAB DEMOCRATIC REPUBLIC.

Polish Corridor Strip of land that gave Poland access to the Baltic Sea. Transferred to the newly constituted state of Poland as part of the Treaty of VERSAILLES (1919), the corridor, 20 to 70 mi (30 to 110 km) wide, separated eastern Prussia from the main part of Germany. The Germans resented the transfer, though the region had been historically Polish before the partitions of POLAND and was inhabited by a Polish majority. When Poland refused to accede to ADOLF HITLER's demands for extraterritorial highways across the corridor and cession of the free port city of Danzig (Gdańsk), Germany seized the pretext to invade Poland (1939), beginning World War II.

Polish language West SLAVIC LANGUAGE of Poland, spoken by more than 41 million people, including 2–3 million in North America and perhaps 1.5 million in the former Soviet Union. The earliest continuous text in Polish dates from the 14th century. The standard language, formulated in the 16th century, combines features of western and southeastern dialects. Polish is written in the LATIN ALPHABET and utilizes both digraphs (combinations of letters) and diacritics to distinguish its fairly elaborate repertory of consonants. Stress is fixed on the next-to-last syllable.

Polish Succession, War of the (1733–38) European conflict waged ostensibly to determine the successor to AUGUSTUS II. Austria and Russia supported his son AUGUSTUS III, while most Poles, France, and Spain supported STANISŁAW I, a former Polish king (1704–09) and father-in-law of France's LOUIS XV. Stanisław was elected king in 1733, but a Russian threat forced him to flee, and Augustus was elected in his place. France, with Sardinia and Spain, declared war on Austria (1733), seeking to reclaim territory in Italy held by Austria. An inconclusive campaign ended in the preliminary Peace of Vienna (1735), which redistributed the disputed Italian territory and recognized Augustus as king. A final treaty was signed in 1738.

Politburo \ˈpä-lət-ˌbyůr-ō\ Supreme policy-making body of the COMMUNIST PARTY OF THE SOVIET UNION, the model for the politburos in other countries. The first Politburo, created in 1917 to provide leadership during the BOLSHEVIK uprising, was dissolved when the coup was accomplished. The party congress of 1919 instructed the Central Committee to elect a new Politburo, which soon overshadowed the Central Committee in power. In 1952 it was replaced by a larger Presidium of the Central Committee; after JOSEPH STALIN's death, stress was placed on "collective leadership" to correct for his abuses. The name Politburo was revived in 1966. Its members included the general secretary of the Communist Party, the minister of defense, the head of the KGB, and the heads of the most important republics or urban party branches. It was dissolved with the breakup of the Soviet Union in 1991.

Politian \pō-ˈli-shən\ *orig.* **Angelo Poliziano** *or* **Angelo Ambrogini** (b. July 14, 1454, Montepulciano, Tuscany—d. Sept. 28/29, 1494, Florence) Italian poet and humanist. He demonstrated his poetic abilities early and became a friend and protégé of Lorenzo de' MEDICI. One of the foremost classical scholars of the Renaissance, he produced between 1473 and 1478 Latin and Greek verses that are among the best examples of humanist poetry. He was also, with Lorenzo, a leader in the revaluation of literature in Italian. His vernacular works include *Stanzas Begun for the Tournament of the Magnificent Giuliano de' Medici* (1475–78), a masterpiece in OTTAVA RIMA, and the drama *Orfeo* (1480).

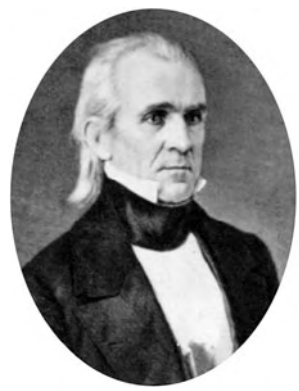
political action committee (PAC) In U.S. politics, an organization whose purpose is to raise and distribute campaign funds to candidates seeking political office. PACs rose to prominence after the Federal Election Campaign Act (1971) limited the amount of money any corporation, union, or private individual could give to a candidate. PACs were able to circumvent these limits by soliciting smaller contributions from a much

© 2006 Encyclopædia Britannica, Inc.

larger number of individuals. During the late 20th and early 21st centuries the vast amounts of money raised by PACs greatly increased the cost of running for office and led to efforts to reform this method of financing campaigns.

political convention *or* **party conference** In politics, a meeting of members of a POLITICAL PARTY at the local, state, or national level to select party leaders and candidates for office and to determine party policy. During presidential election years in the U.S., the main parties hold conventions that serve to showcase their presidential and vice presidential candidates and to boost the morale of party members for the campaigns that follow. Conventions were instituted in the U.S. in the 1830s to replace the often exclusive and secretive caucus system; it was hoped that the conventions' openness would make them less vulnerable to control by party bosses. Most candidates for political office at all levels in the U.S. are now nominated through PRIMARY ELECTIONS, and the conventions merely ratify the candidates already selected by the voters. Political parties in other countries (e.g., Great Britain) often hold annual party conferences.

political economy Academic discipline that explores the relationship between individuals and society and between markets and the state, using methods drawn from economics, political science, and sociology. The term is derived from the Greek terms *polis* (city or state) and *oikonomos* (one who manages a household). Political economy is thus concerned with how countries are managed, taking into account both political and economic factors. The field today encompasses several areas of inquiry, including the politics of economic relations, domestic political and economic issues, the comparative study of political and economic systems, and the study of international political economy.



political machine In U.S. politics, a political organization that controls enough votes to maintain political and administrative control of its community. The rapid growth of cities in the 19th century created huge problems for city governments, which were often poorly organized and unable to provide services. Enterprising politicians were able to win support by offering favours, including patronage jobs and housing, in exchange for votes. Though machines often helped to restructure city governments to the benefit of their constituents, they just as often resulted in poorer service (when jobs were doled out as political rewards), corruption (when contracts or concessions were awarded in return for kickbacks), and aggravation of racial or ethnic hostilities (when the machine did not reflect the city's diversity). Reforms, suburban flight, and a more mobile population with fewer ties to city neighbourhoods have weakened machine politics. Famous machines include those of WILLIAM MARCY TWEED (New York), JAMES MICHAEL CURLEY (Boston), THOMAS PENDERGAST (Kansas City, Mo.), and RICHARD J. DALEY (Chicago). See also CIVIL SERVICE.

political party Group of persons organized to acquire and exercise political power. Formal political parties originated in their modern form in Europe and the U.S. in the 19th century. Whereas mass-based parties appeal for support to the whole electorate, cadre parties aim at attracting only an active elite; most parties have features of both types. All parties develop a political program that defines their ideology and sets out the agenda they would pursue should they win elective office or gain power through extraparliamentary means. Most countries have single-party, two-party, or multiparty systems (see PARTY SYSTEM). In the U.S., party candidates are usually selected through PRIMARY ELECTIONS at the state level.

political philosophy Branch of philosophy that analyzes the state and related concepts such as political obligation, law, social justice, and constitution. The first major work of political philosophy in the Western tradition was PLATO's *Republic*. ARISTOTLE's *Politics* is a detailed empirical study of political institutions. The Roman tradition is best exemplified by CICERO and POLYBIUS. St. AUGUSTINE's *City of God* began the tradition of Christian political thinking, which was developed by THOMAS AQUINAS. NICCOLÒ MACHIAVELLI studied the nature and limits of political power. THOMAS HOBBES's *Leviathan* (1651) raised the problem of political obligation in its modern form. Hobbes was followed by BENEDICT DE SPINOZA, JOHN LOCKE, and JEAN-JACQUES ROUSSEAU in the exposition of a SOCIAL-CONTRACT theory. This was rejected by DAVID HUME and also by G.W.F. HEGEL, whose *Philosophy of Right* (1821) was fundamental for 19th-century political thought. Hegel's defense of private property stimulated KARL MARX's critique of it. JOHN STUART MILL developed JEREMY BENTHAM's utilitarian theory of law and political institutions, so as to reconcile them with individual liberty. In the 20th century JOHN DEWEY sought to counteract the dehumanizing aspects of modern capitalist society through a freer form of education. Until the end of the Cold War, the field of political philosophy was characterized by a division between Marxists and more traditional liberal thinkers, as well as by disagreements between left- and right-leaning liberals, such as JOHN RAWLS and Robert Nozick (1938–2002), respectively. From the 1970s, feminist political philosophy drew attention to the apparent gendered nature of many concepts and problems in Western political philosophy, especially autonomy, rights, liberty, and the public-private distinction.

political science Academic discipline concerned with the empirical study of government and politics. Political scientists have investigated the nature of states, the functions performed by governments, voter behaviour, political parties, political culture, POLITICAL ECONOMY, and public opinion, among other topics. Though it has roots in the political philosophies of PLATO and ARISTOTLE, political science in the modern sense did not begin until the 19th century, when many of the SOCIAL SCIENCES were established. Its empirical and generally scientific orientation is traceable to the work of HENRI DE SAINT-SIMON and AUGUSTE COMTE. The first institution dedicated to its study, the Free School of Political Science, was founded in Paris in 1871.

Polk, James K(nox) (b. Nov. 2, 1795, Mecklenburg county, N.C., U.S.—d. June 15, 1849, Nashville, Tenn.) 11th president of the U.S. (1845–49). He was a friend and supporter of ANDREW JACKSON, who helped Polk win election to the U.S. House of Representatives in 1825. He left the House in 1839 to become governor of Tennessee. At the deadlocked 1844 Democratic Party convention Polk was nominated as the compromise candidate; he is considered the first dark-horse presidential candidate. A proponent of western expansion, he openly laid claim to the whole territory that extended as far north as latitude 54° 40' with the slogan "Fifty-four Forty or Fight" (see OREGON QUESTION). Elected at the age of 49, the youngest president to that time, he successfully concluded the Oregon border dispute with Britain (1846) and secured passage of the Walker Tariff Act (1846), which lowered import duties and helped foreign trade. He led the prosecution of the MEXICAN WAR, which resulted in large territorial gains but reopened debate over the extension of slavery. His administration also established the Department of the Interior, the U.S. NAVAL ACADEMY, and the SMITHSONIAN INSTITUTION; oversaw revision of the treasury system; and proclaimed the validity of the MONROE DOCTRINE. Though an efficient and competent president and deft in his handling of Congress, he was exhausted by his efforts and did not seek reelection; he died three months after leaving office.

James K. Polk, daguerreotype by Mathew Brady, 1849.
LIBRARY OF CONGRESS, WASHINGTON, D.C.

polka Lively couple dance of Bohemian folk origin. The polka (Czech for "Polish woman") is characterized by three quick steps and a hop and is danced to music in ¾, or duple, time. It originated in the early 19th century and became popular in ballrooms across Europe and in North and South America. It has remained popular into the 21st century as both a folk dance and a ballroom dance.

poll tax Tax of a uniform amount levied on each individual. The most famous British poll tax was the one levied in 1380, a main cause of the 1381 PEASANTS' REVOLT. In the U.S., poll taxes were used as a voting prerequisite in the southern states; when payment was made a prerequisite to voting, impoverished blacks (and often poor whites) were effectively denied the vote. In 1966 the U.S. Supreme Court ruled that states could not levy a poll tax as a prerequisite for voting in state and local elections.

pollack *or* **pollock** \'pä-lək\ Either of two commercially important North Atlantic species of food fish in the COD family (Gadidae). *Pollachius* (or *Gadus*) *virens*, called saithe or coalfish in Europe, is deep green with a pale belly. It has a small chin barbel (fleshy protuberance) and three dorsal and two anal fins. A carnivorous, lively, usually schooling fish, it grows to about 3.5 ft (1.1 m) long and weighs up to 35 lbs (16 kg). The other species, *Theragra chalcogramma*, or walleye pollack, closely resembles *P. virens*.

Pollaiuolo \ˌpōl-lī-ˈwȯ-lō**, Antonio and Piero del** *orig.* **Antonio and Piero di Jacopo d'Antonio Benci** (respectively b. Jan. 17, 1432/33, Florence, Republic of Florence—d. Feb. 4, 1498, Rome; b. 1443, Florence—d. 1496, Rome) Italian sculptors, painters, engravers, and goldsmiths. Antonio probably trained in goldsmithing and metalworking with Lorenzo Ghiberti, while Piero may have studied painting with Andrea del Castagno. The brothers collaborated consistently after 1460, producing their works under a combined signature, and their individual contributions are hard to determine. Antonio is recognized as a superb draftsman and was among the first to practice anatomical dissection in the study of the human form; Piero's individual work is less artistically significant. In Florence they created an altarpiece in San Miniato al Monte and *The Martyrdom of St. Sebastian* (1475) in the Pucci Chapel of the Church of the Santissima Annunziata. In Rome their works included the tombs of Popes Sixtus IV and Innocent VIII. Antonio's famous *Battle of Nudes* is one of the largest and most important Italian engravings of the 15th century.

pollen Mass of microscopic spores in a seed plant that appears usually as a fine dust. Each pollen grain is tiny, varies in shape and structure, is formed in the stamens in seed plants, and is transported by various means (see pollination) to the pistil, where fertilization occurs. The outer layer of a pollen grain is very resistant to disintegration; treatment with intense heat, strong acids, or strong bases has little effect on it. Because the grains often are very distinctive, some plant species may be identified by their pollen grains alone. Common components of both recent and ancient geologic sediments, pollen grains have provided much information on the origin and geologic history of plant life on land. Pollen is produced in such quantities that it is a significant part of the airborne components of earth's atmosphere. The protein-containing substance in many pollen grains (e.g., ragweed and many grasses) causes the allergic reaction commonly known as hay fever.

pollination Transfer of pollen grains in seed plants from the stamens, where they form, to the pistil. Pollination is required for fertilization and the production of seeds. On the surface of the pistil the pollen grains germinate (see germination) and form pollen tubes that grow downward toward the ovules. During fertilization, a sperm cell in a pollen tube fuses with the egg cell of an ovule, giving rise to the plant embryo. The ovule then grows into a seed. Since the pollen-bearing parts of the stamens are rarely in direct contact with the pistil, plants commonly rely on external agents for pollen transport. Insects (especially bees) and wind are the most important pollinators; other agents include birds and a few mammals (notably certain bats). Water transport of pollen is rare. An egg may be fertilized by self-pollination (when the sperm comes from pollen produced by the same flower or by another flower on the same plant) or by cross-pollination (when the sperm comes from the pollen of a different plant).

Pollini, Maurizio (b. Jan. 5, 1942, Milan, Italy) Italian pianist. He made his debut at age nine and won the Warsaw Chopin Competition in 1960. He first played in the U.S. in 1968. His recordings and performances range from works by Johann Sebastian Bach to Ludwig van Beethoven to Karlheinz Stockhausen. His combination of intellectual seriousness and extraordinary technical brilliance have given him a unique standing in the concert world.

pollock See pollack

Pollock, Sir Frederick, 3rd Baronet (b. Dec. 10, 1845, London, Eng.—d. Jan. 18, 1937, London) British legal scholar. He taught at the University of Oxford (1883–1903) and was made a king's counsel in 1920. He was noted for his *History of English Law Before the Time of Edward I* (1895; written with Frederic W. Maitland) and several standard textbooks. He maintained a 60-year correspondence with Oliver Wendell Holmes, Jr.; the *Holmes-Pollock Letters* were published in 1941.

Pollock \ˈpä-lək**, (Paul) Jackson** (b. Jan. 28, 1912, Cody, Wyo., U.S.—d. Aug. 11, 1956, East Hampton, N.Y.) U.S. painter. He grew up in California and Arizona. In the early 1930s he studied in New York City under Thomas Hart Benton, and later he was employed on the WPA Federal Art Project. In 1945 he married the artist Lee Krasner. Two years later, after several years of semiabstract work stimulated by psychotherapy, Pollock began to lay his canvas on the floor and pour or drip paint onto it in stages. This process permitted him to record the force and scope of his gestures in trajectories of enamel or aluminum paint that "veiled" the figurative elements found in his earlier work. The results were huge areas covered with complex and dynamic linear patterns that fuse image and form and engulf the vision of the spectator in their scale and intricacy. Pollock believed that art derived from the unconscious and judged his work and that of others on its inherent authenticity of personal expression. He became known as a leading practitioner of Abstract Expressionism, particularly the form known as action painting. Championed by critic Clement Greenberg and others, he became a celebrity. When he died in a car crash at 44, he was one of the few American painters to be recognized during his lifetime and afterward as the peer of 20th-century European masters of modern art.

Pollock v. Farmers' Loan and Trust Company (1895) U.S. Supreme Court ruling that declared the federal income tax unconstitutional, thus voiding portions of an 1894 act that imposed a direct tax on the incomes of U.S. citizens and corporations. The decision was mooted in 1913 when ratification of the 16th Amendment to the U.S. Constitution gave Congress the power "to lay and collect taxes on incomes."

Pollux, Castor and See Dioscuri

polo Game played by teams of players on horseback. Players use mallets with long flexible handles to drive a wooden ball through goalposts. It was first played in Persia in the 6th century BC; from there it spread to Arabia, Tibet (*polo* is Balti for "ball"), South Asia, and the Far East. The first British polo clubs were formed in India in the mid-19th century; the game came to the U.S. a few decades later. Polo has long been primarily played by the wealthy, because of the expense of acquiring and maintaining a stable of polo "ponies" (actually full-sized adult horses, bred for docility, speed, endurance, and intelligence). The standard team is made up of four players whose positions are numbered 1–4. A game consists of six 7.5-minute periods called chukkers or chukkas. The field is 300 yards (274.3 m) long by 160 yards (146.3 m) wide; an indoor version of the game is played on a smaller field.

Polo, Marco (b. c. 1254, Venice or Curzola, Venetian Dalmatia—d. Jan. 8, 1324, Venice) Venetian merchant and traveler who journeyed from Europe to Asia (1271–95). Born into a Venetian merchant family, he joined his father and uncle on a journey to China, traveling along the Silk Road and reaching the court of Kublai Khan c. 1274. The Polos remained in China for about 17 years, and the Mongol emperor sent Marco on several fact-finding missions to distant lands. Marco may also have governed the city of Yangzhou (1282–87). The Polos returned to Venice in 1295, after sailing from eastern China to Persia and then journeying overland through Turkey. Captured by the Genoese soon after his return, Marco was imprisoned along with a writer, Rustichello, who helped him to write the tale of his travels. The book, *Il milione*, was an instant success, though most medieval readers considered it an extravagant romance rather than a true story.

Marco Polo, title page of the first printed edition of *The Travels of Marco Polo*, 1477.

polonaise \ˌpä-lə-ˈnāz\ Dignified ceremonial dance in ¾ time, frequently employing dotted rhythms, that often opened court balls in the 17th–19th century. It likely began as a

© 2006 Encyclopædia Britannica, Inc.

warrior's triumphal dance and had been adopted by the Polish court as a formal march as early as 1573. The dancers promenaded with gliding steps accented by bending the knee slightly on every third step. It often appeared in ballets, and it was used as a musical form by composers such as George Frideric Handel, Ludwig van Beethoven, and especially Frédéric Chopin, whose piano polonaises were martial and heroic.

Poltava \pəl-'tä-və**, Battle of** (June 1709) Decisive victory of Russia over Sweden in the Second Northern War. The battle was fought near Poltava, Ukr., between 80,000 Russian troops under Peter I the Great and Aleksandr Menshikov and 17,000 Swedish troops under Charles XII. Despite the lack of reinforcements for his depleted forces, Charles besieged Poltava in May 1709. The Russians set up a countersiege line and forced the Swedes to attack. Charles planned a daring charge through the Russian line, but he had been injured, and his commanders failed to execute the attack. The Russian counterattack killed or captured the entire Swedish army except for Charles and 1,500 followers. Sweden's defeat ended its status as a major power and marked the beginning of Russian supremacy in eastern Europe.

Polybius \pə-'lib-ē-əs\ (b. c. 200, Megalopolis, Arcadia, Greece—d. c. 118 BC) Greek statesman and historian. Son of an Achaean statesman, Polybius was one of 1,000 eminent Achaeans deported to Rome in 168 BC for supposed disloyalty to the Romans. There he became mentor to Scipio Africanus the Younger, with whom he witnessed the destruction of Carthage soon after his political detention had ended. When hostilities broke out between Achaea and Rome, he negotiated for his countrymen and sought to reestablish order. His reputation rests on his history of the rise of Rome; of its 40 volumes, only 5 survive in their entirety.

polychaete \'pä-lē-ˌkēt\ Any of about 5,400 species of marine worms of the annelid class Polychaeta, having a segmented body with many setae (bristles) on each segment. Species, often brightly coloured, range from less than 1 in. (2.5 cm) to about 10 ft (3 m) long. Most body segments bear two bristly parapodia (lobelike outgrowths). The head has short sensory projections and tentacles. Adults may be free-swimming or sedentary; larvae are free-swimming. Found worldwide, polychaetes are important for turning over sediment on the ocean bottom. One species, the bloodworm, is a popular saltwater fish bait. See also tube worm.

Polyclitus *or* **Polycleitus** *or* **Polykleitos** \ˌpä-li-'klī-təs\ (fl. 5th century BC, Greece) Greek sculptor. His *Spear Bearer* (c. 440 BC) was known as "the Canon" because it illustrated his book of that name, which set forth his theory of the ideal mathematical proportions of the human body and proposed that the sculptor strive for a dramatic counterbalance between the relaxed and tense body parts and the directions in which they move. His balanced and rhythmical bronze statues of young athletes, such as *Man Tying on a Fillet* (c. 420 BC), demonstrated his principles and freed Greek sculpture from its tradition of rigid frontal poses. With Phidias, Polyclitus was the most important Greek sculptor of his age.

Polycrates \pə-'lik-rə-ˌtēz\ (fl. 6th century BC) Tyrant of the Aegean island of Samos c. 535–522 BC. He seized sole control during a festival of Hera, eliminating his two brothers, who shared his power. He quickly became notorious for piracy, as he sought to dominate nearby islands and Ionia. Initially a supporter of Egypt, he joined the Persians against Egypt in 525. Attempts by his opponents to remove him were unsuccessful until the Persian governor of Sardis lured him to the mainland and had him crucified. Polycrates brought wealth and prominence to Samos and was a patron of writers, including Anacreon.

polycystic ovary syndrome *or* **Stein-Leventhal syndrome** Endocrine disorder in women, characterized by high androgen levels and infrequent or absent ovulation (see reproductive system). It causes a high proportion of female infertility cases. Symptoms vary but often include hirsutism, acne, and obesity. Menstruation may be irregular, absent, or excessive. The ovaries are usually enlarged and contain cysts. The disease may remain undiagnosed until a woman tries to conceive. The underlying cause is not fully understood. Treatment attempts to reduce androgen production. Infertility may be treated with clomiphene citrate or gonadotropins to induce ovulation or with laparoscopy.

polyester Organic compound, any of a class of polymers formed by ester linkages between monomers. They are usually prepared from equivalent amounts of glycols and dibasic carboxylic acids, which undergo condensation polymerization to produce the polyester and water. Polyesters are strong, colourfast, and resistant to corrosion and chemical attack but tend to build up a static electric charge. In addition to the familiar fibres and films (e.g., Dacron, Mylar), polyesters are used to make reinforced plastics, automotive parts, boat hulls, foams, laminates, tapes, piping, bottles, disposable filters, encapsulations, and coatings.

polyethylene (PE) Any of the polymers of ethylene, the largest class of plastics. Its simple basic structure, of ethylene monomers, can be linear (high-density and ultrahigh-molecular-weight polyethylene; HDPE and UHMWPE, respectively) or branched to a greater or lesser degree (low-density and linear low-density polyethylene; LDPE and LLDPE, respectively). The branched polyethylenes have similar structural characteristics (e.g., low crystalline content), properties (high flexibility), and uses (packaging film, plastic bags, mulch, insulation, squeeze bottles, toys, and housewares). HDPE has a dense, highly crystalline structure of high strength and moderate stiffness; uses include beverage bottles, liquid detergent jugs, crates, barrels, and luggage. UHMWPE is made with molecular weights 6–12 times that of HDPE; it can be spun and stretched into stiff, highly crystalline fibres with a tensile strength many times that of steel; uses include bulletproof vests.

polygamy \pə-'li-gə-mē\ Marriage to more than one spouse at a time. Although the term may also refer to polyandry (marriage to more than one man) it is often used as a synonym for polygyny (marriage to more than one woman), which appears to have once been common in most of the world and is still found widely in some cultures. Polygyny seems to offer the husband increased prestige, economic stability, and sexual companionship in cultures where pregnancy and lactation dictate abstinence, while offering the wives a shared labour burden and an institutionalized role where a surplus of unmarried women might otherwise exist. The polygynous family is often fraught with bickering and sexual jealousy; to preserve harmony, one wife may be accorded seniority, and each wife and her children may have separate living quarters. Polyandry is relatively rare; in Tibet and Nepal, where brothers may marry a single woman, the practice serves to limit the number of descendants and keep limited land within the household.

Polygnotus *or* **Polygnotos** \ˌpä-lig-'nō-təs\ (b. c. 500, Thasos, Thrace—d. c. 440 BC, Athens, Greece) Greek painter. None of his works are extant, but accounts exist of monumental wall paintings in a severely Classical style at the hall of the Cnidians at Delphi: *Sack of Troy* and *Ulysses Visiting Hades*. His compositions were noted for the expression of emotion on faces and for the distribution of figures throughout the composition rather than on a single base line, as was the convention of the day.

polygon In geometry, any closed curve consisting of a set of line segments (sides) connected such that no two segments cross. The simplest polygons are triangles (three sides), quadrilaterals (four sides), and pentagons (five sides). If none of the sides, when extended, intersects the polygon, it is a convex polygon; otherwise it is concave. A polygon with all sides equal is equilateral. One with all interior angles equal is equiangular. Any polygon that is both equilateral and equiangular is a regular polygon (e.g., equilateral triangle, square).

polygraph See lie detector

polyhedron \ˌpä-lē-'hē-drən\ In Euclidean geometry, a three-dimensional object composed of a finite number of polygonal surfaces (faces). Technically, a polyhedron is the boundary between the interior and exterior of a solid. In general, polyhedrons are named according to number of faces. A tetrahedron has four faces, a pentahedron five, and so on; a cube is a six-sided regular polyhedron (hexahedron) whose faces are squares. The faces meet at line segments called edges, which meet at points called vertices. See also Platonic solid; Euler's formula.

Polykleitos See Polyclitus

polymer \'pä-lə-mər\ Any of a class of natural or synthetic substances composed of macromolecules that are multiples of monomers. The monomers need not all be the same or have the same structure. Polymers may consist of long chains of unbranched or branched monomers or may be cross-linked networks of monomers in two or three dimensions. Their backbones may be flexible or rigid. Some natural inorganic materials (e.g., the minerals diamond, graphite, and feldspar) and certain man-made inorganic materials (e.g., glass) have polymer-like structures. Many important natural materials are organic polymers, including cellulose (from sugar monomers; see polysaccharide), lignin, rubber, proteins (from amino acids), and nucleic acids (from nucleotides). Synthetic organic polymers

© 2006 Encyclopædia Britannica, Inc.

include many PLASTICS, including POLYETHYLENE, the NYLONS, POLYURETHANES, POLYESTERS, vinyls (e.g., PVC), and synthetic RUBBERS. The SILICONE polymers, with an inorganic backbone of silicon and oxygen atoms and organic side groups, are among the most important mixed organic-inorganic compounds.

polymerase \pä-'lə-mə-ˌrās\ **chain reaction (PCR)** Laboratory technique used to make numerous copies of specific DNA segments quickly and accurately. These are needed for various experiments and procedures in MOLECULAR BIOLOGY, forensic analysis (DNA FINGERPRINTING), evolutionary biology (to amplify DNA fragments found in ancient specimens), and medicine (to diagnose genetic disease or detect low viral counts). Invented by KARY MULLIS, PCR requires a DNA template (as little as one molecule) to copy, NUCLEOTIDES to build the copies, and the ENZYME DNA polymerase to catalyze the formation of bonds between the nucleotide monomers. Each three-step cycle (separating the two strands of the DNA double helix, marking the ends of the segment to be copied, and catalyzing the formation of bonds), which takes only minutes to complete, doubles the number of DNA strands present in the reaction medium. Repetition of this cycle many times results in an exponential increase in the amount of DNA.

polymerization \pə-ˌli-mə-rə-'zā-shən\ Any process in which MONOMERS combine chemically to produce a POLYMER. The monomer molecules—which in the polymer usually number from at least 100 to many thousands—may or may not all be the same. In nature, ENZYMES carry out polymerization under ordinary conditions to form PROTEINS, NUCLEIC ACIDS, and CARBOHYDRATE polymers; in industry, the reaction is usually done with a CATALYST, often under high pressure or heat. In addition polymerization, monomers are added successively to the reactive ends of a growing polymer molecule, similar to adding links to a chain; during the reactions, no by-products are formed. In condensation polymerization, growth of the polymer advances stepwise—monomers having reactive FUNCTIONAL GROUPS combine into larger molecules with their own functional groups; each reaction splits off a small molecule, often water, as a by-product.

polymorphism Discontinuous genetic VARIATION that results in the occurrence of several different forms or types of individuals among the members of a single species. The most obvious example of polymorphism is the separation of most higher organisms into male and female sexes. Another example is the different blood types in humans. A polymorphism that persists over many generations is usually maintained because no one form has an overall advantage or disadvantage over the others in terms of NATURAL SELECTION. Some polymorphisms have no visible manifestations. The CASTES that occur in social insects are a special form of polymorphism that results from differences in nutrition rather than from genetic variation.

Polynesia \ˌpä-lə-'nē-zhə\ Island group, scattered across a huge triangular area of the east-central Pacific Ocean. A subdivision of OCEANIA, Polynesia includes NEW ZEALAND, HAWAII, SAMOA, the LINE ISLANDS, FRENCH POLYNESIA, the COOK ISLANDS, the PHOENIX ISLANDS, TUVALU, TONGA, and EASTER ISLAND. FIJI is sometimes included because of its Polynesian population. The islands are mostly small coral atolls; some are of volcanic origin. Most of the inhabitants are Polynesians, some of whom might be related to the Malay. Their languages belong to a subfamily of the AUSTRONESIAN LANGUAGES. Contact with European culture began in the late 1700s with the arrival of Spanish explorers and radically altered life in Polynesia. Colonizers, imposing Western belief systems and cultural ways, effectively wiped out local traditions and customs. Samoa and Tonga retain more of the traditional culture than the other islands.

polynomial In algebra, an expression consisting of numbers and variables grouped according to certain patterns. Specifically, polynomials are sums of monomials of the form ax^n, where a (the coefficient) can be any real number and n (the degree) must be a whole number. A polynomial's degree is that of its monomial of highest degree. Like whole numbers, polynomials may be prime or factorable into products of primes. They may contain any number of VARIABLES, provided that the power of each variable is a nonnegative integer. They are the basis of algebraic equation solving. Setting a polynomial equal to zero results in a polynomial EQUATION; equating it to a variable results in a polynomial FUNCTION, a particularly useful tool in modeling physical situations. Polynomial equations and functions can be analyzed completely by methods of ALGEBRA and CALCULUS. See also ORTHOGANAL POLYNOMIAL.

polynomial, orthogonal See ORTHOGANAL POLYNOMIAL

polyoma \ˌpä-lē-'ō-mə\ **virus** Minute infectious agent normally present in extremely small amounts in wild mice without causing obvious ill effects. It may induce cancerous tumours if grown in tissue culture and injected in large quantities into newborn mice or young hamsters, guinea pigs, and rabbits. It belongs to the Papovaviridae family of VIRUSES.

polyp \'pä-ləp\ Growth projecting from the wall of a cavity lined with a mucous membrane. Shape varies widely; it may have a stalk or many lobes. Polyps most often occur in the nose, urinary bladder, and digestive tract, especially in the rectum and colon. Symptoms, if any, depend on location and size; they may result from pressure or from blockage of a passage. Polyps occasionally bleed. Because a small percentage are precursors to cancers or actually contain cancers, it is advisable to have them removed and examined microscopically and to undergo routine colonoscopy after age 50.

polyp In zoology, one of two principal CNIDARIAN body forms and, sometimes, an individual in a BRYOZOAN colony. The cnidarian polyp body is a hollow cylindrical structure. The lower end attaches to another body or surface. The upper, or free, end is directed upward and has a mouth surrounded by extensible tentacles that bear stinging structures called nematocysts. The tentacles capture prey, which is then drawn into the mouth. The polyp may be solitary (see SEA ANEMONE) or colonial (see CORAL). The body wall consists of three dermal layers. The other cnidarian body form is the MEDUSA.

Polyphemus \ˌpä-lə-'fē-məs\ In GREEK MYTHOLOGY, a CYCLOPS. He was the son of POSEIDON and the nymph Thoösa. When ODYSSEUS and his companions were cast ashore on the coast of Sicily, Polyphemus imprisoned them in his cave with the intention of eating them. Odysseus got the giant drunk and then blinded him by plunging a burning stake into his single eye. When Polyphemus opened his cave in the morning, Odysseus and the six men the giant had not yet devoured made their escape by clinging to the bellies of sheep let out to pasture.

polyphony See COUNTERPOINT

polyploidy See PLOIDY

polysaccharide \ˌpä-lē-'sa-kə-ˌrīd\ Any of a large class of long-chain SUGARS composed of MONOSACCHARIDES. Because the chains may be unbranched or branched and the monosaccharides may be of one, two, or occasionally more kinds, polysaccharides can be categorized in various ways. CELLULOSE, STARCH, GLYCOGEN, and dextran are all polysaccharides of GLUCOSE, with different CONFIGURATIONS. PECTINS are composed of a GALACTOSE derivative, CHITIN of a glucose derivative. Connective tissues, joint fluid, and cartilage contain two-component polysaccharides, including HEPARIN. See also OLIGOSACCHARIDE.

polysiloxane See SILICONE

polytheism Belief in many gods. Though Judaism, Christianity, and Islam are monotheistic (see MONOTHEISM), most other religions throughout history have been polytheistic. The numerous gods may be dominated by a supreme god or by a small group of powerful gods. The gods originated as abstractions of the forces of nature such as the sky or the sea and of human and social functions such as love, war, marriage, or the arts. In many religions the sky god is powerful and all-knowing (e.g., DIEVS), and the earth goddess is maternal and associated with fertility. Gods of death and the underworld (e.g., OSIRIS and HEL) are also important. In addition to many gods, polytheistic religions generally also include malevolent or benevolent spiritual forces or powers. See also GOD AND GODDESS.

polyurethane Any of a class of very versatile POLYMERS that are made into flexible and rigid foams, fibres, elastomers (elastic polymers), surface coatings, and adhesives. They are produced by reacting a diisocyanate (a compound with two FUNCTIONAL GROUPS of the type —NCO) with a diol (a compound with two hydroxyl, or —OH, groups). Foamed polyurethanes, used for insulation and mattress and upholstery filler, are made with organic compounds containing carboxyl groups, causing a reaction that liberates carbon dioxide bubbles throughout the product. Spandex fibres are highly elastic and have replaced natural and synthetic rubber fibres for many textile purposes. Polyurethane elastomers are made into auto parts, rollers, flexible molds, medical equipment, and shoe soles. Polyurethane surface coatings are applied as sealants to wood, concrete, and machine parts and as linings for tanks and pipes; moisture-curing polyurethane resin is used as a general-purpose waterproof glue.

polyvinyl chloride See PVC

© 2006 Encyclopædia Britannica, Inc.

Pombal \pə-'bäl**, Sebastião de Carvalho, marquess de** (b. May 13, 1699, Lisbon, Port.—d. May 8, 1782, Pombal) Portuguese reformer. After serving as ambassador to England and Vienna, he became chief minister to King Joseph and came to dominate Portuguese politics (1750–77). He encouraged industry and commerce and stimulated trade with Brazil. After the 1755 earthquake that devastated Lisbon, he organized aid and reconstruction efforts. He restricted the power of the nobility, had the Jesuits imprisoned or deported to Rome (1759), reorganized Portugal's army, and reformed the university educational system. After Joseph's death (1777), Pombal's power disappeared; under Queen Maria I, he was accused of abuse of power and banished from Lisbon to his estates.

pomegranate \'pä-mə-ˌgra-nət\ Fruit of *Punica granatum*, a bush or small tree of Asia, which with a little-known species from the island of Socotra constitutes the family Punicaceae. Native to Iran and long cultivated around the Mediterranean and in India, it also grows in the warmer parts of the New World. The orange-sized and obscurely six-sided fruit has smooth, leathery, brownish yellow to red skin. Several chambers contain many thin, transparent vesicles of reddish, juicy pulp, each containing an angular, elongated seed. The fruit is eaten fresh, and the juice is the source of the grenadine syrup used in flavourings and liqueurs. The plant grows 16–23 ft (5–7 m) tall and has elliptical, bright green leaves and handsome orange-red flowers. Throughout the Orient, the pomegranate has since earliest times occupied a position of importance alongside the grape and the fig. It is mentioned in the Bible, by the Prophet Muhammad, and in Greek mythology.

Pomerania \ˌpä-mə-'rā-nē-ə\ Historical region, northeastern Europe, on the Baltic Sea between the Oder and Vistula rivers. Occupied by Slavs and other peoples, it was ruled by Polish princes in the 10th century. German immigration into western and central Pomerania began in the late 12th century, and Polish dukes ruled this area under the suzerainty of the Holy Roman Empire until the 17th century. Eastern Pomerania was held by the Knights of the Teutonic Order from 1308 until it was reconquered by Poland in 1454. The elector of Brandenburg acquired the duchies in 1637. Prussia united western and central Pomerania in 1815 as the province of Pommern. Most of the area is now in Poland; its westernmost section is in eastern Germany.

Pomeranian \ˌpä-mə-'rā-nē-ən\ Breed of toy dog developed from the same sled-dog ancestors as the Keeshond, Samoyed, and Norwegian elkhound. It is said to have been bred down in size from a 30-lb (14-kg) dog in the duchy of Pomerania in the early 19th century. Spirited but docile, it has a foxlike head and small, erect ears. Its long coat, especially full on the neck and chest, is white, black, brown, or reddish brown. It stands about 6–7 in. (14–18 cm) and weighs about 3–7 lbs (1.5–3 kg).

Pomeranian.
SALLY ANNE THOMPSON-EB INC.

pommel horse *or* **side horse** Gymnastics event for men. It uses a padded rectangular apparatus supported by legs and with two pommels (U-shaped handles) on the top. The gymnast performs various swinging and balancing feats, holding himself over the horse by means of the pommels or by grasping the front (neck), centre (saddle), or rear (croup) of the horse. The apparatus stems from a wooden horse used by the Romans to teach mounting and dismounting.

Pomo North American Indian people living in northern California, U.S. The name Pomo, which may have been derived from the name of a village, was given to seven distinct Hokan-speaking peoples who inhabited the Russian River valley. Fish, waterfowl, deer, and wild plant foods were plentiful in this region. Coastal Pomo constructed dwellings of heavy timber and bark; inland Pomo used poles, brush, and grass. Pomo religion involved secret societies, dances, rituals, and impersonations of spirits. Pomo basketry is often considered among the finest in the world. About 3,000 Pomo live in some 20 communities within their original territory.

Pomona \pə-'mō-nə\ Ancient Roman goddess of fruit. Vertumnus, god of the seasons, fell in love with her, but she rejected him and all other suitors, preferring to cultivate her orchards. Refusing to give up, Vertumnus came to her in the form of an old woman and pleaded his case so effectively that Pomona changed her mind and agreed to be his.

Pompadour \'päm-pə-ˌdōr**, Jeanne-Antoinette Poisson, marchioness de** *known as* **Madame de Pompadour** (b. Dec. 29, 1721, Paris, France—d. April 15, 1764, Versailles) French mistress of Louis XV. Educated in art and literature, she married Charles-Guillaume Le Normant d'Étoiles in 1741 and became admired by Parisian society and by the king, who installed her at Versailles as his mistress in 1745. She obtained a separation from her husband and was created marchioness de Pompadour. She, the king, and her brother, appointed director of the king's buildings, planned and built the École Militaire and the Place de la Concorde in Paris, the Petit Trianon Palace at Versailles, and many other buildings. She and Louis also encouraged painters, sculptors, and craftsmen, making her 20 years in power the height of artistic taste. Her political influence was less astute; the alliance with Austria against the German Protestant princes that she urged led to the disastrous Seven Years' War.

Madame de Pompadour, detail of a portrait by François Boucher; in the National Gallery of Scotland, Edinburgh.
COURTESY OF THE NATIONAL GALLERIES OF SCOTLAND, EDINBURGH

pompano \'päm-pə-ˌnō\ Any of several species of deep-bodied, toothless, silvery fishes in the order Perciformes (especially in the genus *Trachinotus*, family Carangidae) inhabiting warm coastal waters worldwide. Some are highly prized as food. Pompanos have small scales, a narrow tail base, and a forked tail. The Florida, or common, pompano (*T. carolinus*), of the U.S. Atlantic and Gulf coasts, is about 18 in. (45 cm) long and weighs about 2 lbs (1 kg). The African pompano, or threadfish (*Alectis crinitis*), of the Atlantic and eastern Pacific, is 35 in. (90 cm) long and has long, threadlike rays extending from the dorsal and anal fins. The Pacific pompano (*Peprilus simillimus*) is in the family Stromateidae.

Florida pompano (*Trachinotus carolinus*).
ROBERT REDDEN-ANIMALS ANIMALS

Pompeii \päm-'pā\ Ancient city, southern Italy, southeast of Naples. Founded in the 6th century BC (or earlier) by Oscan-speaking descendants of the Neolithic inhabitants of Campania, Pompeii came under Greek and Etruscan influence and then was occupied by the Samnites, an Italic tribe, in the late 5th century BC. The city was allied with Rome and colonized by 80 BC. It was damaged by an earthquake in AD 63 and was completely destroyed by the eruption of Mount Vesuvius in 79. Volcanic debris buried the town and protected the ruins for years. Archaeological excavations, begun in 1748, have uncovered much of the city, including forums, temples, baths, theatres, and hundreds of private homes. See also Herculaneum.

Temple of Apollo, Pompeii, Italy, with Mount Vesuvius in the background.
EDWIN SMITH

Pompeius Magnus Pius \päm-'pē-əs-'mag-nəs-'pī-əs**, Sextus** *or* **Pompey the Younger** (b. c. 67—d. 35 BC, Miletus) Son of Pompey the Great and an opponent of Pompey's rivals. After his father was killed

© 2006 Encyclopædia Britannica, Inc.

fighting Julius Caesar in 48, Pompeius fled to Spain to continue the struggle. Mark Antony gave him a naval command after Caesar's assassination (44), but he was outlawed in 43 under a law targeting those complicit in Caesar's death. He ravaged the coast of Italy, helped Antony against Octavian (later Augustus), and tried in vain to force both to make him governor of Sicily (39). Finally defeated by Octavian's forces, he fled to Asia Minor but was caught and executed.

Pompey \'päm-pē\ **the Great** *in full* **Gnaeus Pompeius Magnus** (b. Sept. 29, 106, Rome—d. Sept. 28, 48 BC, Pelusium, Egypt) Statesman and general of the Roman republic. His early military career was illustrious. He fought effectively for Sulla against Marius in the Social War, reconquered Spain (76–71), destroyed utterly the army of Spartacus (71), destroyed the pirates of the eastern Mediterranean (from 67), defeated Mithradates (63), and consolidated and extended the eastern provinces and frontier kingdoms. In 61 he formed the First Triumvirate with Julius Caesar and Marcus Licinius Crassus. After Crassus's death in 53, Pompey and Caesar fell out. By 52, with Rome in a state of anarchy, Pompey was named sole consul. In 49 Caesar defied the Senate and provoked the civil war by crossing the Rubicon in pursuit of Pompey, who fled east with his navy. Defeated at the Battle of Pharsalus (48), Pompey fled with his fleet to Egypt, not realizing the Egyptians would take Caesar's side, and was killed as he prepared to step on land from the boat they had sent to bring him ashore.

Pompidou \'päm-pi-ˌdü**, Georges (-Jean-Raymond)** (b. July 5, 1911, Montboudif, France—d. April 2, 1974, Paris) French premier (1962–68) and president (1969–74). He taught school before serving in World War II and was an aide to Charles de Gaulle (1944–46). After joining the Rothschild bank in Paris, he rose rapidly to become director general (1959). As de Gaulle's chief aide (1958–59), he helped draft the constitution of the Fifth Republic. He secretly negotiated a cease-fire in the Algerian War in 1961 and was appointed premier the following year. In 1968 he skillfully negotiated an end to the French student-worker strikes. Elected president of France in 1969, he continued de Gaulle's policies. The Pompidou Centre is named for him.

Pompidou
DENNIS BRACK-BLACK STAR/EB INC.

Pompidou \'päm-pi-ˌdü\ **Centre** *or* **Beaubourg** \bō-'bür\ **Centre** French national cultural centre, on the rue Beaubourg in the Marais section of Paris. Its full name, the Georges Pompidou National Art and Cultural Centre, recognizes the president of the Republic under whose administration it was commissioned. When formally opened in 1977, the building attracted notoriety for its brightly coloured exterior pipes, ducts, and other exposed architectural elements, and it soon became one of the most visited cultural sites in the world. Though primarily a museum for 20th-century visual arts, it also houses temporary exhibitions, a library, a centre for industrial design, a film museum, and a Centre for Musical and Acoustical Research.

Ponce de León \ˌpän-sə-ˌdā-lē-'ōn**, Juan** (b. 1460, Tierra de Campos Palencia, Leon—d. 1521, Havana, Cuba) Spanish explorer. He may have accompanied Christopher Columbus's expedition in 1493 and later fought in the West Indies (1502), becoming governor of eastern Hispaniola. He colonized Puerto Rico (1508–09) and founded a settlement near modern San Juan. Rumours of a fountain of youth in the Bahamas inspired him to lead an expedition in 1513, but he landed instead on the northern coast of Florida near modern St. Augustine. He sailed along Florida's southern and western coasts, then returned to Spain to secure the title of military governor (1514). He sailed again to colonize Florida in 1521 but was wounded in an Indian attack and died in Cuba.

Pondicherry Union territory (pop., 2001: 974,345), India. It was formed in 1962 from the four former French colonies of Pondicherry, Karikal, and Yanam, on the eastern seaboard, and Mahe, on the western seaboard. With a total area of 190 sq mi (492 sq km), it is united by little other than its colonial past and focus on tourism. The city of Pondicherry is the administrative capital.

Pondicherry City (pop., 2001: 220,865), seaport, and capital of Pondicherry union territory, southeastern India. Lying on the Coromandel Coast, it originated as a French trade centre in 1674, when it was purchased from a local ruler. The scene of fighting between the French and Dutch, it was occupied by the British several times from 1761 before becoming a French possession (1816–1954). A seaside tourist resort, it contains an international study centre at a Hindu religious retreat, or ashram.

Pondoland Region, Eastern Cape province, southern Republic of South Africa, on the coast of the Indian Ocean. It was settled at the end of the 16th century by the Pondo (Mpondo), a Bantu-speaking people. It was annexed to Cape Colony in 1894. It occupies a narrow strip from the coast to the interior plateaus in the west. The interior is rich cattle country with fertile farmlands.

Pont-Aven \ˌpōⁿ-tə-'ven\ **school** Group of young painters who espoused a style known as Synthetism and united under the tutelage of Paul Gauguin at Pont-Aven, Brittany, France, in the late 1880s and early 1890s. The artists included Émile Bernard, Charles Laval, Maxime Maufra, Paul Sérusier, Charles Filiger, Jacob Meyer de Haan, Armand Séguin, and Henri de Chamaillard. Their paintings showed an overall simplification, a highly expressive use of colour, and an intensely spiritual subject matter. When Gauguin left for Tahiti, members of the school became increasingly involved in developing the theories and techniques of Symbolism.

Pontchartrain \'pän-chər-ˌtrān**, Lake** Lake, southeastern Louisiana, U.S. It is 40 mi (64 km) long and 25 mi (40 km) wide, with an area of 630 sq mi (1,631 sq km). More a tidal lagoon than a lake, it is brackish and teems with game fish. It is connected through Lake Borgne with the Gulf of Mexico and by canal with the Mississippi River. It is spanned by the Pontchartrain Causeway, two parallel road bridges which cross the lake north of New Orleans and, at nearly 24 mi (39 km) in length, are the longest overwater bridges in the world.

Pontecorvo \ˌpän-tə-'kȯr-vō**, Guido** (b. Nov. 29, 1907, Pisa, Italy—d. Sept. 24, 1999, near Zermatt, Switz.) Italian-born British geneticist. In 1938, influenced by Hermann Joseph Muller, he designed a method for studying genetic differences among species that usually produce sterile hybrids when interbred. His technique permitted him to study evolutionary divergence in the fruit fly. His conviction that research in microbial genetics could lead to increased production of penicillin, much needed in World War II, led him to the genetics of fungi, and in 1950 he found that recombination of genes can occur in the fungus *Aspergillus nidulans* without sexual reproduction. Nonsexual gene recombination became a useful technique in exploring the nature of gene action.

Pontiac (b. c. 1720, on the Maumee River in present-day Ohio, U.S.—d. April 20, 1769, near the Mississippi River at present-day Cahokia, Ill.) Ottawa Indian chief. At first friendly with whites, Pontiac realized that his people would lose their ancestral lands in the Great Lakes area if white encroachment were not stopped. With a series of actions that came to be known as Pontiac's War (1763–64), he coordinated the attack on 12 fortified British posts by a confederacy of tribes, winning a great victory. He himself led the attack on the fort at Detroit, in what is now Michigan, U.S. Continuing British action took its toll, however, and in 1766 Pontiac finally agreed to a peace treaty. His murder in 1769 by an Illinois Indian provoked the vengeance of several northern Algonquian tribes, resulting in the virtual destruction of the Illinois.

Pontifex See Quintus Mucius Scaevola

pontifex Member of a council of priests in ancient Rome. The pontifices were responsible for administration of the *jus divinum* (laws concerning religious practices). There were 3 pontifices under the monarchy, but by the time of Julius Caesar the number had grown to 16, of which 1 was designated chief priest, or *pontifex maximus*. Also included in the *collegium* (college) of pontifices were the Vestal Virgins. Among the duties of the pontifices were regulation of the calendar and of expiatory rituals, consecration of temples and sacred objects, superintendence of marriage and the family, and administration of the laws of adoption and succession.

Pontoppidan \pȯn-'tȯp-ē-dan**, Henrik** (b. July 24, 1857, Fredericia, Den.—d. Aug. 21, 1943, Ordrup, near Copenhagen) Danish realist writer of novels and short stories. He studied engineering and worked as a

© 2006 Encyclopædia Britannica, Inc.

teacher before taking up writing. His works, typically written in a cold, aloof, epic style, present a comprehensive picture of his country and his epoch. His earlier works are informed with a desire for social progress; his later ones despair of its realization. His major novels include the semiautobiographical *Lucky Peter* (1898–1904) and the five-volume cycle *The Realm of the Dead* (1912–16). He shared the 1917 Nobel Prize for Literature with Karl Gjellerup.

Pontormo \pōn-'tȯr-mō**, Jacopo da** *orig.* **Jacopo Carrucci** (b. May 24, 1494, Pontormo, Republic of Florence—buried Jan. 2, 1557, Florence) Florentine painter. The son of a painter, he was apprenticed to Leonardo da Vinci and later to Piero di Cosimo and Andrea del Sarto (who exerted the greatest influence on him). The agitated, almost neurotic emotionalism of his work reflects a departure from the balance and tranquillity of the High Renaissance. His expressive style is sometimes considered an early manifestation of Mannerism. Primarily a religious painter, he also did sensitive portraits and was employed by the Medici family to decorate their villa at Poggio a Caiano with mythological subjects.

Pontus Ancient district, northeastern Anatolia adjoining the Black Sea. An independent kingdom with its capital at Amasia, it was established in the 4th century BC. It continued expanding its borders until 66 BC, when its last king, Mithradates VI Eupator, was defeated by the Roman general Pompey the Great. It was incorporated into the Roman Empire in 63 BC.

pony Any of several breeds of small horses standing less than 14.2 hands (57 in., 144 cm) high and noted for gentleness and endurance. Among the common pony breeds are the Shetland; the stylish and hardy Welsh; the high-stepping Welsh Cob; the Exmoor and Dartmoor, natives of the English moors that are used to breed polo ponies; and the Highland, a thick, gray saddle animal.

Pony Express (1860–61) U.S. system of mail delivery by horse and rider relays. The 1,800-mi (2,900-km) route between St. Joseph, Mo., and Sacramento, Calif., included 157 stations. Riders changed horses every 10 to 15 miles, and it took about 10 days to complete the route. The sponsoring company of Russell, Majors, Wadell employed riders such as William F. Cody and Pony Bob Haslam. The system provided an important mail link with the West, but it was a financial failure and became obsolete after 18 months with the completion of the transcontinental telegraph system.

poodle German water retriever. Poodles have a long muzzle, hanging ears, and docked tail. The dense, solid-coloured, wiry topcoat covers a woolly undercoat. Poodles' hair was traditionally clipped to permit them to swim efficiently when retrieving; today they are usually clipped in ornamental patterns. A dog with unclipped hair, which forms ropelike cords, is called a corded poodle. The standard poodle is more than 15 in. (38 cm) tall and weighs up to 70 lb (32 kg); the miniature stands 10–15 in. (25.5–38 cm); the toy is under 10 in. (25.5 cm) and weighs about 7 lb (3 kg). The poodle is the national dog of France, where it was once trained to scent and dig up truffles. Poodles are regarded as the most intelligent of all domestic dog breeds.

Standard poodle

pool *or* **pocket billiards** Billiards game played on an oblong table having six pockets with 15 object balls and a white cue ball. At the beginning of play, the balls are arranged (racked) in a pyramid formation with its apex on a spot near the foot of the table. The first player breaks the formation by driving the cue ball into it; to continue play, he or she must hit a ball into a pocket. In the popular "8-ball" game, the first player (or team) to sink either the seven solid-coloured balls (numbered 1–7) or the seven banded (striped) balls (9–15), finishing with the black 8-ball, wins. In "9-ball," only the balls numbered 1–9 are used, and they must be sunk sequentially; the player who sinks the 9-ball wins. Pool probably reached its present form in England and France by c. 1800; today it is most popular in North America.

Poona See Pune

Poor Law In British history, a body of laws undertaking to provide relief for the poor, developed in 16th-century England and maintained, with various changes, until after World War II. The original laws provided relief, including care for the elderly, sick, and infant poor as well as work for the able-bodied through local parishes. Their scope was curtailed in the 1830s, when poverty among the able-bodied was considered a moral failing. The new law provided no relief for the able-bodied poor except employment in the workhouse, with the object of stimulating workers to seek regular employment rather than charity. In the 1930s and '40s the Poor Laws were replaced by a comprehensive system of public welfare services.

Pop art Art in which commonplace objects (such as comic strips, soup cans, road signs, and hamburgers) were used as subject matter. The Pop art movement was largely a British and American cultural phenomenon of the late 1950s and '60s. Works by such Pop artists as the Americans Roy Lichtenstein, Andy Warhol, Claes Oldenburg, Tom Wesselman, James Rosenquist, and Robert Indiana and the Britons David Hockney and Peter Blake, among others, were characterized by their portrayal of any and all aspects of popular culture that had a powerful impact on contemporary life; their iconography—taken from television, comic books, movie magazines, and all forms of advertising—was presented emphatically and objectively and by means of the precise commercial techniques used by the media from which the iconography itself was borrowed. Some of the more striking forms that Pop art took were Lichtenstein's stylized reproductions of comic strips and Warhol's meticulously literal paintings and silk-screen prints of soup-can labels and Marilyn Monroe. Pop art represented an attempt to return to a more objective, universally acceptable form of art after the dominance in both the United States and Europe of the highly personal Abstract Expressionist movement. Its effects—including its decisive destruction of the boundary between "high" and "low" art—have continued to be powerfully felt throughout the visual arts to the present day.

Popé \pō-'pā\ (d. 1692, San Juan Pueblo, New Spain) Tewa Pueblo medicine man. Believing he was guided by tribal ancestral spirits (kachinas), Popé led an Indian revolt in 1680 against the Spanish invaders in what is now the southwestern U.S. The rebellion, known as the Pueblo Revolt, drove the Spanish out of Santa Fe and temporarily restored the old Pueblo way of life. Popé was accorded great honours, but success made him despotic. Although he was eventually deposed, he was reelected Pueblo leader in 1688.

pope Ecclesiastical title of the bishop of Rome, head of the Roman Catholic church. In the early church, especially in the 3rd–5th century, it was a title of affectionate respect for any bishop. It is still used for the Eastern Orthodox patriarch of Alexandria and for Orthodox priests, but around the 9th century it came to be reserved in the West exclusively for the bishop of Rome. Catholic doctrine regards the pope as the successor of St. Peter the Apostle and accords him supreme jurisdiction over the church in matters of faith and morals, as well as in church discipline and government. Papal infallibility in matters of doctrine was asserted by the First Vatican Council in 1870. See also papacy, Roman Catholicism. See tables on following pages.

Pope, Alexander (b. May 21, 1688, London, Eng.—d. May 30, 1744, Twickenham, near London) English poet and satirist. A precocious boy precluded from formal education by his Roman Catholicism, Pope was mainly self-educated. A deformity of the spine and other health problems limited his growth and physical activities, leading him to devote himself to reading and writing. His first major work was *An Essay on Criticism* (1711), a poem on the art of writing that contains several brilliant epigrams (e.g., "To err is human, to forgive, divine"). His witty mock-epic *The Rape of the Lock* (1712, 1714) ridicules fashionable society. The great labour of his life was his verse translation of Homer's *Iliad* (1720) and *Odyssey* (1726), whose success made him financially secure. He became involved in many literary battles, prompting him to write poems such as the scathing mock-

Popes and Antipopes[1] (antipopes in italics) (continued)

Pius VIII	1829–30	Pius XII	1939–58
Gregory XVI	1831–46	John XXIII	1958–63
Pius IX	1846–78	Paul VI	1963–78
Leo XIII	1878–1903	John Paul I	1978
Pius X	1903–14	John Paul II	1978–2005
Benedict XV	1914–22	Benedict XVI	2005–
Pius XI	1922–39		

[1]Until the 4th cent., the popes were usually known only as bishops of Rome.
[2]The higher number is used if Felix (II), who reigned 355–58 and is ordinarily classed as an antipope, is counted as a pope.
[3]Though elected on March 23, 752, Stephen (II) died two days later before he could be consecrated and thus is ordinarily not counted. The issue has made the numbering of subsequent Stephens somewhat irregular.
[4]Either Leo VIII or Benedict V may be considered an antipope.
[5]A confusion in the numbering of popes named John after John XIV (r.983–84) resulted because some 11th-cent. historians mistakenly believed that there had been a pope named John between antipope Boniface VII and the true John XV (r.985–86). Therefore they mistakenly numbered the real popes John XV to XIX as John XVI to XX. These popes have since customarily been renumbered XV to XIX, but John XXI and John XXII continue to bear numbers that they themselves formally adopted on the assumption that there had indeed been 20 Johns before them. In current numbering, there thus exists no pope by the name of John XX.
[6]In the 13th cent. the papal chancery misread the names of the two popes Marinus as Martin, and as a result of this error Simon de Brie in 1281 assumed the name of Pope Martin IV instead of Martin II. The enumeration has not been corrected, and thus there exist no Martin II and Martin III.

epic *The Dunciad* (1728) and *An Epistle to Dr. Arbuthnot* (1735). The philosophical *An Essay on Man* (1733–34) was intended as part of a larger work that he never completed.

Pope, John (b. March 16, 1822, Louisville, Ky., U.S.—d. Sept. 23, 1892, Sandusky, Ohio) U.S. army officer. A graduate of West Point, he served in the Mexican War. At the outbreak of the American Civil War, he was appointed brigadier general of volunteers, and he commanded operations that secured Union navigation of the Mississippi River almost to Memphis. In 1862 he was given command of the Army of Virginia. At the Second Battle of Bull Run, his forces were defeated. Though he tried to blame the rout on his subordinates, including Fitz-John Porter, he was relieved of his command and sent to Minnesota to quell a Sioux uprising. After the war he commanded the Department of the Missouri (1870–83).

Popish Plot (1678) In English history, a fictitious but widely believed rumour that Jesuits planned to assassinate Charles II and replace him with his brother, the Catholic duke of York (later James II). The rumour was fabricated by Titus Oates, who gave a sworn deposition of his "evidence" to a London justice of the peace. When the latter was found murdered, a panic among the people was followed by accusations and trials, leading to the execution of about 35 innocent people. When Oates was finally discredited, the panic subsided.

poplar Any of at least 35 species and many natural hybrids of trees that make up the genus *Populus* (willow family). Poplars grow throughout northern temperate regions, some even beyond the Arctic Circle. They are rapid-growing but relatively short-lived. Their leaves flutter in the slightest breeze because of their laterally compressed petioles (leafstalks). The relatively soft wood is used to make cardboard boxes, crates, paper, and veneer. North America has three groups of native poplars: cottonwoods, aspens, and balsam poplars.

poplar, yellow See tulip tree

Popocatépetl \ˌpō-pə-ˈka-tə-ˌpe-tᵊl\ Volcano, Puebla state, southeast-central Mexico, west of the city of Puebla. The perpetually snowcapped, symmetrical cone reaches 17,930 ft (5,465 m). The first Spanish ascent is thought to have been made in 1519. After being inactive for more than 50 years, Popocatépetl erupted in 1994, with frequent recurrences in the years that followed.

Popol Vuh \ˈpō-pōl-ˈvü\ Mayan document that provides valuable information on ancient Maya mythology and culture. It was written between 1554 and 1558 in the Quiche language using Spanish letters. It tells of the creation of man, the acts of the gods, and the origin and history of the Quiche people and also gives a chronology of their kings. The book was discovered early in the 18th century by Francisco Jiménez, a parish priest in the Guatemalan highlands, who copied out the original, now lost, and translated it into Spanish.

popolo \ˈpō-pō-lō\ (Italian: "people") In the communes (city-states) of 13th-century Italy, a pressure group instituted to protect the interests of the commoners against the nobility. Until then noblemen had exclusively controlled the commune governments, and the popolo was the means by which wealthy merchants sought to extend their power. The popolo in Florence controlled the government 1250–60 and again after 1282. By the beginning of the 14th century, its elders formed the supreme executive of the commune.

Popper, Sir Karl (Raimund) (b. July 28, 1902, Vienna, Austria—d. Sept. 17, 1994, Croydon, Greater London, Eng.) Austrian-British philosopher of natural and social science. In *The Logic of Scientific Discovery* (1934), he rejected the traditional conception of induction, which held that a scientific hypothesis may be verified through the accumulation of confirming observations, arguing instead that scientific hypotheses can at best only be falsified. His later works include *The Open Society and Its Enemies* (1945), *The Poverty of Historicism* (1957), and *Postscript to the Logic of Scientific Discovery* (3 vol., 1981–82).

poppy family Family Papaveraceae, containing about 200 species of mostly herbaceous plants and some woody small trees and shrubs. Most species of this family, which is outstanding for its many garden ornamentals (largely of the genus *Papaver*) and for pharmaceutically important plants, are found in the Northern Hemisphere. All have cup-shaped flowers, a capsule fruit, leaves that are usually deeply cut or divided into leaflets, and coloured sap. Members include the opium poppy and the corn, or Flanders, poppy (*P. rhoeas*), the seeds of which may lie dormant for years. The latter became a symbol of World War I because it bloomed in fields that had been disturbed by battle. See also California poppy.

popular front In European politics, any coalition of working-class and middle-class political parties united to defend democracy against an expected fascist assault. The policy of a "united front" against fascism was announced at the communist Third International (1935); it was to include not only communists and socialists but also liberals, moderates, and even conservatives. Popular-front governments were formed in France and Spain in 1936, but the financial consequences of the reforms undertaken by the French government, under Léon Blum, proved its undoing, and the Spanish government was brought down by Francisco Franco in the Spanish Civil War.

Popular Front for the Liberation of Oman (PFLO) *orig.* **Dhofar Liberation Front** Resistance group founded in 1963 by Arab nationalists and religious conservatives to depose Sultan Saʿīd ibn Taymūr (r. 1932–70). In 1968 its leadership was taken over by Marxists. In 1970 the sultan was deposed by his son, Qābūs ibn Saʿīd, who softened the resistance with a combination of military pressure and economic development.

Popular Front for the Liberation of Saguia el Hamra and Rio de Oro See Polisario

popular music Any music intended to be received and appreciated by ordinary people in a literate, technologically advanced society dominated by urban culture. Unlike traditional folk music, popular music is written by known individuals, usually professionals, and does not evolve through the process of oral transmission. Historically, popular music was any nonfolk form that acquired mass popularity—from the songs of the medieval minstrels and troubadours to those elements of fine art music originally intended for a small, elite audience but that became widely popular. After the Industrial Revolution, true folk music began to disappear, and the popular music of the Victorian era and the early 20th century was that of the music hall and vaudeville, with its upper reaches dominated by waltz music and operettas. In the U.S., minstrel shows performed the composi-

tions of songwriters such as Stephen Foster. In the 1890s Tin Pan Alley emerged as the first popular song-publishing industry, and over the next half century its lyricism was combined with European operetta in a new kind of play known as the musical. Beginning with ragtime in the 1890s, African Americans had begun combining complex African rhythms with European harmonic structures, a synthesis that would eventually create jazz. The music audience greatly expanded, partly because of technology. By 1930, phonograph records had replaced sheet music as the chief source of music in the home. The microphone enabled more intimate vocal techniques to be commercially adapted. The ability of radio broadcasting to reach rural communities aided the dissemination of new styles, notably country music. U.S. popular music achieved international dominance in the decades after World War II. By the 1950s, the migration of African Americans to cities in the North had resulted in the cross-fertilization of elements of blues with the uptempo rhythms of jazz to create rhythm and blues. Rock and roll, with figures such as Elvis Presley, soon developed as an amalgam of rhythm and blues with country music and other influences (see rock music). In the 1960s, British rock groups, including the Beatles, became internationally influential. Rock quickly attracted the allegiance of Western teenagers, who replaced young adults as the chief audience for popular music. From the late 1960s black pop (see Motown) achieved greater sophistication and a wide audience. The history of pop through the 1990s was basically that of rock and its variants, including disco, heavy metal, punk rock, and rap, which spread throughout the world and became the standard musical idiom for young people in many countries.

Popular Party (Italy) See Italian Popular Party

Popular Republican Movement (MRP) French social reform party. Founded in 1944, the MRP was a strong centre party of the Fourth Republic and the French expression of Christian Democracy. After winning about 25% of the vote, it declined in the 1950s, losing strength to both right and left factions. In 1966 it was merged with other right-centre parties to become the Centre Démocrate, which won only 13% of the vote. By 1968 it had become little more than a political club.

popular sovereignty Political doctrine that allowed the settlers of U.S. federal territories to decide whether to enter the Union as free or slave states. It was applied by Sen. Stephen A. Douglas as a means to reach a compromise through passage of the Kansas-Nebraska Act. Critics of the doctrine called it "squatter sovereignty." The resulting violence between pro- and antislavery factions (see Bleeding Kansas) showed its failure as a workable compromise. See also Dred Scott decision.

Populares See Optimates and Populares

Populations I and II Two broad classes of stars and stellar groupings, whose members differ primarily in age, chemical composition, and location in galaxies. They were distinguished and named by Walter Baade (1893–1960). Population I consists of younger stars, clusters, and associations. These occur in and near the arms of the Milky Way Galaxy and other spiral galaxies and have been detected in irregular galaxies (such as the Magellanic Clouds). Population I objects are thought to have originated from interstellar gas that underwent various processes, including supernova explosions, which enriched their constituent matter with heavier elements. Population II consists of older (generally 1 billion–15 billion years old) stars and clusters, presumably formed from interstellar gas clouds that emerged very early in a galaxy's history. Consisting almost entirely of hydrogen and helium, they are found in the galactic halos of spiral galaxies, in globular clusters, and, in large numbers, in elliptical galaxies. Astronomers sometimes refer to a Population III as the very first generation of stars to emerge after the big bang.

populism Political program or movement that champions the common person, usually by favourable contrast with an elite. Populism usually combines elements of the left and right, opposing large business and financial interests but also frequently being hostile to established socialist and labour parties. In the U.S. the term was applied to the program of the Populist movement of the 1890s.

Populist See Narodnik

Populist Movement Coalition of U.S. agrarian reformers in the Midwest and South in the 1890s. The movement developed from farmers' alliances formed in the 1880s in reaction to falling crop prices and poor credit facilities. The leaders organized the Populist, or People's, Party (1892), which advocated a variety of measures to help farmers. They also demanded an increase in the circulating currency (to be achieved by the unlimited coinage of silver), a graduated income tax, government ownership of the railroads, a tariff for revenue only, and the direct election of U.S. senators. The party's presidential candidate in 1892, James B. Weaver (1833–1912), received more than one million votes. Many state and local Populist candidates were elected in the Midwest. In 1896 the Populists joined with the Democratic Party to support the Free Silver Movement and the unsuccessful presidential candidacy of William Jennings Bryan. The movement declined thereafter, though some of its causes were later embraced by the Progressive Party.

Populonia *ancient* **Pupluna** Ancient Roman city, western coast of central Italy. It was originally Etruscan. Silver and iron ores from the nearby island of Elba supplied its metal-manufacturing industry. During the 5th century BC it became wealthy as the first city in Etruria to coin silver. It was conquered by Romans and suffered during the wars between Sulla and Marius in the 1st century BC.

porcelain Vitrified pottery with a white, fine-grained body that is usually translucent. It was first made in China during the Tang dynasty (618–907) and in its advanced form during the Yuan dynasty (1279–1368). The three main types are true (or hard-paste) porcelain, artificial (or soft-paste) porcelain, and bone china. Attempts by medieval European potters to imitate true porcelain led to the discovery of soft-paste porcelain, which can be cut with a file. The secret of true porcelain was discovered c. 1707 in Saxony. Standard English bone china was produced c. 1800 when Josiah Spode II (1754–1827) added calcined bones to the hard-paste porcelain formula. Hard-paste porcelain, though strong, chips more readily than bone china. See also Bow porcelain; Chantilly porcelain; Chelsea porcelain; Meissen porcelain; Nymphenburg porcelain; Saint-Cloud porcelain; Sèvres porcelain; stoneware.

porch Roofed structure, usually open at front and sides, projecting from the face of a building and used to protect an entrance. If colonnaded, it may be called a portico. A veranda is typically a long porch surrounded by a railing, often extending along more than one side of a building. Simple porches were exceedingly common in the domestic architecture of Britain and the U.S. from the late 18th century. In Gothic cathedrals the porch was often a small gabled structure projecting from the northern or southern walls of the nave. See also loggia, narthex.

porcupine Heavy-bodied, solitary, slow-moving, nocturnal rodent with quills (modified hairs) along the back, tail, and, on certain crested species, the neck and shoulders. The quills are easily detached when touched. The New World species (four genera in family Erethizontidae) are arboreal and have barbed quills; the Old World species (four genera in family Hystricidae) are terrestrial and have unbarbed quills. The North American porcupine (*Erethizon dorsatum*), about 31 in. (80 cm) long with a tail about 12 in. (30 cm) long and quills about 3 in. (8 cm) long, drives its powerful tail against an assailant. For food, it favours the tender tissue beneath tree bark. Crested porcupines, the typical Old World porcupines, run backward, quills erect, into the enemy. They eat roots, fruit, and other vegetation. The African crested porcupine, the largest terrestrial rodent in Europe and Africa, may weigh 60 lb (27 kg) and have quills 14 in. (35 cm) long.

porgy \'pȯr-jē\ Any of about 100 species (family Sparidae) of generally shallow-water fishes found throughout tropical and temperate seas. Porgies, sometimes called sea breams, are typically high-backed, with a single dorsal fin, a small mouth, and teeth strong enough to handle fishes and hard-shelled invertebrates. Most species do not exceed 1 ft (30 cm) long, but some may grow to 4 ft (120 cm). The South African musselcrackers, popular sport fishes, grow to 100 lbs (45 kg). In Australia and Japan, several species of *Chrysophrys* are important food fish (called snappers in Australia). The red sea bream inhabits deep European waters. See also sheepshead.

Northern porgy (*Stenotomus chrysops*). RUNK/SCHOENBERGER FROM GRANT HEILMAN

pork Flesh of hogs, usually slaughtered between the ages of six months and one year. The world's most popular meat, it is consumed fresh in various cuts or preparations, including chops and sausage, or cured or smoked for ham, bacon, dry sausage, or other products. Because pigs may be infected by the parasitic disease trichinosis, fresh pork must be cooked

© 2006 Encyclopædia Britannica, Inc.

to an internal temperature of 160 °F (71 °C) to destroy the parasite. Pork is proscribed by the dietary laws of Islam and Judaism.

pornography Depiction of erotic behaviour intended to cause sexual excitement. The word originally signified any work of art or literature depicting the life of prostitutes. Though pornography is clearly ancient in origin, its early history is obscure because it was customarily not thought worthy of transmission or preservation. Nevertheless, in the artwork of many historic societies, including ancient India, ancient Greece, and Rome, erotic imagery was commonplace and often appeared in religious contexts. *The Art of Love*, by OVID, is a treatise on seduction and sensual arousal. The invention of printing led to the production of ambitious works of pornographic writing intended to entertain as well as to arouse. In 18th-century Europe, pornography became a vehicle for social and political protest through its depiction of the misdeeds of royalty and other aristocrats, as well as those of clerics, a traditional target. The development of photography and motion pictures in the 19th and 20th centuries contributed greatly to the proliferation of pornography, as did the advent of the INTERNET in the late 20th century. During the 20th century, restrictions on pornography were relaxed throughout much of Europe and North America, though regulations remained strict in Asia, the Middle East, and Africa. Child pornography is almost universally prohibited.

porphyrin \'pȯr-fə-rən\ Any of a class of biologically important HETEROCYCLIC COMPOUNDS of a characteristic chemical structure that includes four pyrrole groups (five-membered organic rings each containing a nitrogen atom) linked by additional carbon atoms to form a large flat ring. As biological PIGMENTS, they and closely related molecules are responsible for many of the vivid colours in living organisms, where they often occur combined with METAL IONS and various substituents as coordination complexes (see COMPOUND). These include the magnesium-containing CHLOROPHYLLS and the iron-containing heme group, a constituent (along with protein) of, e.g., HEMOGLOBIN, the CYTOCHROMES, and the ENZYME catalase. In medicine, porphyrins are used in conjunction with light, often a LASER beam, to induce reactions in the body against cancer and other diseases.

porphyry copper deposit \'pȯr-fə-rē\ A large body of igneous rock, having distinct crystals in a relatively fine-grained base, that contains CHALCOPYRITE and other sulfide minerals. These deposits contain vast amounts of ore that averages a fraction of 1% copper by weight; although low-grade, the deposits are important because they can be worked on a large scale at low cost. Large porphyry copper deposits are worked in the southwestern U.S. (where molybdenum may be produced as a by-product), the Solomon Islands, Canada, Peru, Chile, Mexico, and elsewhere.

porpoise Any TOOTHED WHALE in the family Phocoenidae (or, by some authorities, part of the DOLPHIN family Delphinidae). The four species (genus *Phocoena*) of the common, or harbour, porpoise are primarily fish eaters that travel in pairs or large groups. They are gray or black above and white below. The shy *P. phocoena,* found throughout the Northern Hemisphere, rarely leaps. The other species of *Phocoena* are found along Californian and South American coasts. The active, gregarious Dall porpoise (*Phocoenoides dalli*) of the North Pacific and the True porpoise (*P. truei*) of Japan often swim with ships, usually in groups of 2 to 20. Both eat cephalopods and fishes and are black with a large white patch on each side. The black finless porpoise (*Neomeris phocoenoides*), a small, slow animal, inhabits the Pacific and Indian oceans. At most 7 ft (2 m) long, porpoises are shorter and chubbier than dolphins and have a blunt snout. Like the dolphins, they are known for their high intelligence.

port Input/output conduit for PERSONAL COMPUTERS. The serial port was created as an interface between data terminal equipment and data-communications equipment. It processes data sequentially, as a series of BITS, and is used to connect equipment (e.g., a MODEM or MOUSE) to the computer. The parallel port processes several data bits in parallel and is used to connect peripherals such as computer PRINTERS and optical SCANNERS to the computer. The parallel port is faster, but the serial port is cheaper and requires less power. See also USB.

port Sweet, fortified WINE of rich taste and aroma made in Portugal. The name derives from PORTO, the town where it is traditionally aged and bottled. Most port is red, but lesser amounts of tawny and white are produced. Peculiar to the manufacture of port is a large dose of BRANDY given to the still-fermenting liquid (called must). Much time, often decades, is needed for the maturing of fine ports.

Port Arthur See LÜSHUN

Port-au-Prince \ˌpōr-tō-'prins\ City (metro. area pop., 1997: 1,556,000), seaport, and capital of Haiti, West Indies, on the southeastern shore of the Golfe de la Gonâve. Founded by the French in 1749, it was destroyed by earthquakes in 1751 and 1770 and has frequently suffered from fires and civil strife. In 1807 the port was opened to foreign commerce. It is the country's principal port and commercial centre, producing sugar, flour, cottonseed oil, and textiles.

Port Blair City (pop., 2001 prelim.: 100,186), capital of ANDAMAN AND NICOBAR ISLANDS union territory, India, in the Bay of BENGAL. It was occupied by the British in 1789 but soon abandoned. The town was made a penal colony in 1858. It was occupied by the Japanese in 1942–45. The penal colony was abolished in 1945. Port Blair is a market town with several local museums and an airport.

Port-de-France See NOUMÉA

Port Jackson Inlet of the South Pacific Ocean, NEW SOUTH WALES, southeastern Australia. It is one of the world's finest natural harbours. It was sighted in 1770 by Capt. JAMES COOK. Its entrance is between North and South Heads, where naval and military stations are located. SYDNEY is on its southern shore and the northern suburbs of Sydney are on its northern shore; the shores are joined by the Sydney Harbour Bridge, which was built in 1932.

Port Louis City (pop., 2000: 148,506), capital, and main port of Mauritius. It was founded c. 1736 by the French as a port for ships rounding the Cape of GOOD HOPE to and from Asia and Europe. With the completion of the SUEZ CANAL in 1869, the city's importance declined. It is the principal commercial centre of the island; its primary export is sugar.

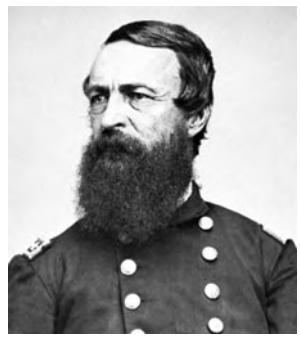
Port Moresby City (pop., 1997: 271,813), capital of Papua New Guinea, on the southeastern coast of the Gulf of Papua. Its large, sheltered harbour was explored by British Capt. John Moresby in 1873. The British annexed the area in 1883–84. The town became a main Allied base in World War II. The National Capital District, established in 1974, includes all of Port Moresby; it became the capital when Papua New Guinea became independent in 1975. A commercial centre, the city is also the site of a university.

Port of Spain City (pop., 1996 est.: 43,396), seaport, and capital of Trinidad and Tobago. Formerly the capital of the West Indies Federation, it is located in the northwestern part of the island of Trinidad on the Gulf of PARIA. It is an air transport centre for the Caribbean and has a diversified economy, producing rum, beer, and lumber. It is also a principal port and shipping centre; exports include oil, sugar, citrus, and asphalt.

Port Said \sä-'ēd, 'sīd\ Seaport city (pop., 1996 est.: 470,000), northeastern Egypt. It is on the Mediterranean Sea at the northern end of the SUEZ CANAL. Founded in 1859 on a narrow, sandy strip separating the Mediterranean from Lake Manzilah, it became the world's most important coaling station. It was the landing point of French and British troops during the SUEZ CRISIS (1956) that followed Egypt's nationalization of the Suez Canal. In the SIX-DAY WAR of 1967, Israeli forces occupied the eastern bank of the canal, which was closed until 1975. The city was revitalized after 1975, and its industries include textiles, clothing, cosmetics, and glass.

Port-Vila See VILA

porte cochere \ˌpōrt-kō-'sher\ (French: "coach door") Passageway through a building, or gateway in an outer wall, designed to let vehicles pass from the street to an interior courtyard. Such gateways are common features of homes and palaces built in the grand style of Louis XIV and Louis XV. The term also applies to a roofed structure extending from the entrance of a building over an adjacent driveway.



Porter, Cole (Albert) (b. June 9, 1891, Peru, Ind., U.S.—d. Oct. 15, 1964, Santa Monica, Calif.) U.S. composer and lyricist. Porter was born to an affluent family and studied violin and piano as a child and composed an operetta at age 10. As a student at Yale University he composed about 300 songs, including "Bulldog"; he went on to study law and then music at Harvard. He made his Broadway debut with the musical comedy *See America First* (1916). In 1917 he went to France and became an itinerant playboy; though rather openly homosexual, he married a wealthy divorcée. He wrote songs for the Broadway success *Paris* (1928), and this led to a series of his own hit musicals, including *Anything Goes* (1934), *Red, Hot and Blue* (1934), *Kiss Me, Kate* (1948), *Can-Can* (1953), and *Silk Stockings* (1955). Porter also worked on a number of films, such as *High Society* (1956). His witty, sophisticated songs, for which he wrote

© 2006 Encyclopædia Britannica, Inc.

both words and music, include "Night and Day," "I Get a Kick Out of You," "Begin the Beguine," and "I've Got You Under My Skin." Porter's large output might have been even more vast had not a riding accident in 1937 necessitated 30 operations and eventually the amputation of a leg.

Porter, David (b. Feb. 1, 1780, Boston, Mass., U.S.—d. March 3, 1843, Pera, Tur.) U.S. naval officer. He joined the navy (1798) and served in the Tripolitan War. In the War of 1812 he commanded the *Essex*, the first U.S. warship to operate in the Pacific Ocean; he captured several British whaling vessels and took possession of Nuku Hiva, the largest of the Marquesas Islands (1813). He was blockaded by British frigates in Valparaíso, Chile, where he surrendered (1814). He served on the board of naval commissioners (1815–23) and commanded a squadron to suppress piracy in the West Indies (1823–25). For unauthorized action against Spanish authorities in Puerto Rico, he was court-martialed and suspended from duty. He resigned in 1826 and became commander of the Mexican navy (1826–29).

Porter, David Dixon (b. June 8, 1813, Chester, Pa., U.S.—d. Feb. 13, 1891, Washington, D.C.) U.S. naval officer. He served under his father, David Porter, in the West Indies and in the Mexican navy before joining the U.S. Navy in 1829. Promoted to commander in the American Civil War, he served under his foster brother, David Farragut, to help win the Battle of New Orleans. In 1863 he succeeded in running his fleet past the Confederate fort at Vicksburg to meet Ulysses S. Grant's troops and complete the effort to open the Mississippi River to Union forces. After the war he served as superintendent of the U.S. Naval Academy (1865–69) and was promoted to admiral (1870).

Porter, Fitz-John (b. Aug. 31, 1822, Portsmouth, N.H., U.S.—d. May 21, 1901, Morristown, N.J.) U.S. army officer. He graduated from West Point and later taught there (1849–55). In the American Civil War he was made a brigadier general of volunteers. In the Second Battle of Bull Run he served under Gen. John Pope, who blamed Porter for the Union's defeat. At his court-martial, Porter claimed that Pope's orders were confusing and impossible to execute, but he was found guilty and cashiered. In 1879 he won a review of his case, which supported his claim of innocence. In 1886 he was reappointed an army officer and placed, at his own request, on the retired list.

Porter, Katherine Anne (b. May 15, 1890, Indian Creek, Texas, U.S.—d. Sept. 18, 1980, Silver Spring, Md.) U.S. writer. She worked as a journalist in Chicago and Denver, Colo., before leaving in 1920 for Mexico, the setting of several of her stories. Her collections include *Flowering Judas* (1930), her first and most popular; *Pale Horse, Pale Rider* (1939), a set of three novellas; and *Collected Short Stories* (1965, Pulitzer Prize, National Book Award). Her stories have a richness of texture and complexity of character delineation usually achieved only in the novel. *Ship of Fools* (1962) is her only novel.

portico Colonnaded porch or entrance to a structure, or a covered walkway supported by regularly spaced columns. The portico is a principal feature of Greek temple architecture and thus a prominent element in Roman and all subsequent Classically inspired structures.

Portillo, José López See José López Portillo

Portland Seaport city (pop., 2000: 64,249), southwestern Maine, U.S. First settled in 1633, it was raided by Indians in 1676 and by French and Indians in 1690. It was incorporated as a town in 1786 and was the state capital 1820–31. A fire destroyed much of the city centre in 1866, but Portland was again rebuilt. The state's largest city, it is the hub of a metropolitan area that includes the cities of South Portland and Westbrook and many towns. It is built largely on two hilly peninsulas overlooking Casco Bay. The city's diversified manufactures include semiconductors, food products, stainless steel, and printed materials. Ship modernization and commercial fishing also are important. It was the birthplace of Henry Wadsworth Longfellow.

Portland City (pop., 2000: 529,121) and port, northwestern Oregon, U.S. Situated on the Willamette River, southeast of its confluence with the Columbia River, Portland was settled in 1829 on the site of an early Indian campground. It was laid out in 1844 and incorporated in 1851. Early growth was stimulated by gold rushes and the flow of immigrants along the Oregon Trail. It is the state's largest city and principal port. Exports include lumber, aluminum, and wheat. Shipbuilding and meat-packing are important industries. It is the site of many educational institutions, including Lewis and Clark College (1867) and Reed College.

portland cement Binding agent of present-day concrete. It is a finely ground powder made by burning and grinding a limestone mixed with clay or shale. Its inventor, Joseph Aspdin (1799–1855), patented the process in 1824, naming the material for its resemblance to the limestone of the Isle of Portland, England. The cement combines chemically with the water it is mixed with, then hardens and strengthens.

Portland Vase Roman vase (1st century AD) of dark-blue glass decorated with white figures, the finest surviving Roman example of cameo glass. It came into the possession of the duke of Portland in the 18th century. The vase has been extensively copied, particularly in the Victorian period. The most accurate copies were made in jasperware with white figures in relief (by Josiah Wedgwood, 1790) and in glass (1876). In 1845, while in the British Museum (where it still resides), the original vase was smashed, necessitating painstaking restoration.

Portland Vase, Roman cameo glass, 1st century AD; in the British Museum

Porto \'pōr-tü\ *Portuguese* **Oporto** Seaport city (pop., 2001 prelim.: 262,928), northwestern Portugal. On the right (north) bank of the Douro River, Porto was called Portus Cale in Roman times and was earlier a flourishing settlement on the Douro's south bank. Held successively by the Alani, Visigoths, Moors, and Christians, it became an important port in the 14th century. Henry the Navigator was born there in 1394. It was the site of a British victory over the French in the 1809 Peninsular War. World-famous for its port wine, Porto is Portugal's second largest city and the region's commercial and industrial centre.

Pôrto Alegre \'pōr-tü-ä-'lā-grē\ Port and city (pop., 2002: city, 1,342,900; metro. area, 3,765,500), southern Brazil. Located along the Guaíba River near the Atlantic Ocean coast, it was founded c. 1742 by immigrants from the Azores. It was first known as Pôrto dos Casais. It received many German and Italian settlers in the 19th century. It is a centre of inland navigation and is the most important Brazilian commercial city south of São Paulo; exports include rice, tobacco, and hides. Industries include shipbuilding and the manufacture of textiles, pharmaceuticals, and chemicals. It is also an educational centre.

Porto-Novo \ˌpōr-tō-'nō-vō\ City (pop. 2004 est.: 234,300), seaport, and capital of Benin, on the Gulf of Guinea, western Africa. Situated on a coastal lagoon in the southeastern part of the country, it was probably founded in the late 16th century as the centre of the kingdom of Porto-Novo. The Portuguese established a trading post in the 17th century, and it became a centre of the Atlantic slave trade. It became a short-lived French protectorate in 1863 and attained that status again in 1882. The ruins of old African palaces remain, and there are many colonial-style buildings, including the old Portuguese cathedral. Porto-Novo was established as the official capital of the country by the constitution, but only the legislature is found there; the president, most government ministers, and the judiciary reside in Cotonou.

Portsmouth \'pōrt-smәth\ City and unitary authority (pop., 2001: 186,704), geographic and historic county of Hampshire, southern England. The seaport city is a major naval base and, with Southsea, a popular holiday resort. Located on the island of Portsea in the English Channel, Portsmouth was founded and received its first charter in 1194. A naval dockyard was established in 1496 and greatly expanded after 1698. Covering more

© 2006 Encyclopædia Britannica, Inc.

than 300 acres (120 hectares), the dockyard is the city's main source of employment. Portsmouth suffered extensive damage from German bombing in World War II. Important industries are shipbuilding and aircraft engineering. The city was the birthplace of Charles Dickens.

Portsmouth City (pop., 2000: 100,565) and seaport, southeastern Virginia, U.S. Located on the Elizabeth River opposite Norfolk, with Norfolk and Newport News, Portsmouth makes up the Port of Hampton Roads. Founded in 1752 and named after Portsmouth, Eng., it was occupied by both British and American troops during the American Revolution. It was incorporated as a city in 1858. During the American Civil War the U.S. Navy Yard was evacuated by Union troops, allowing Southern troops access to stores of equipment; Portsmouth was recaptured in 1862. It is part of the U.S. military complex at Hampton Roads. Shipbuilding and ship repair are the main economic activities, augmented by various manufactures.

Portsmouth, Treaty of (1905) Peace settlement that ended the Russo-Japanese War. It was mediated by Pres. Theodore Roosevelt and signed at the U.S. naval base near Portsmouth, N.H. By its terms, Russia recognized Japan as the dominant power in Korea and ceded its leases to Port Arthur (now Lüshun) and the Liaodong Peninsula, as well as the southern half of Sakhalin, to Japan. Both powers agreed to restore Manchuria to China.

Portugal *officially* **Portuguese Republic** Country, on the west coast of the Iberian Peninsula, southwestern Europe. Area: 35,580 sq mi (92,152 sq km). Population (2005 est.): 10,513,000. Capital: Lisbon. Most of the

people are Portuguese. Language: Portuguese (official). Religion: Christianity (predominantly Roman Catholic). Currency: euro. Administratively, the Atlantic islands of the Azores and Madeira are part of Portugal. Portugal is divided roughly in half by the Tagus River; the highlands rise mostly north of the Tagus and stretch northeast into Spain. Portugal has an industrialized economy in which both public and private sectors participate. Major industries were nationalized after a military coup in 1974, but many were returned to the private sector beginning in the late 1980s. Although motor vehicle manufacture is significant, light industries predominate; important products include textiles and clothing, paper and wood products, and chemicals. Portugal is a republic with a unicameral legislature; the chief of state is the president, and the head of government is the prime minister. In the 1st millennium BC, Celtic peoples settled the Iberian Peninsula. They were conquered c. 140 BC by the Romans, who ruled until the 5th century AD, when the area was invaded by Germanic tribes. A Muslim invasion in 711 left only the northern part of Portugal in Christian hands. In 1179 it became the kingdom of Portugal and expanded as it reconquered the Muslim-held sectors. The boundaries of modern continental Portugal were completed under King Afonso III (reigned 1248–79). From 1580 to 1640 Portugal was united with Spain. In the 15th and 16th centuries the monarchy encouraged exploration that took Portuguese navigators to Africa, India, Indonesia, China, the Middle East, and South America. Although Portugal established several colonies, they achieved independence over the years (see Brazil; Goa; Cape Verde; East Timor; Angola; Guinea-Bissau; Mozambique; Macau). António de Oliveira Salazar ruled Portugal as a dictator from 1932 to 1968. The country's dictatorship was overthrown in the April 25, 1974, Revolution of the Carnations. A new constitution was adopted in 1976, and civilian rule resumed. Portugal was a charter member of NATO and is a member of the European Union (EU). In 1999 the government adopted the euro as the country's official monetary unit and returned Macau, its last overseas territory, to Chinese rule.

Portuguese East Africa See Mozambique

Portuguese Guinea See Guinea-Bissau

Portuguese language Romance language spoken by about 170 million people in Portugal, Brazil, and other former Portuguese colonies. The first literary works in Portuguese date from the 13th–14th century. Standard Portuguese is based on the dialect of Lisbon. Dialectal variation in Portugal is limited, but the differences between Brazilian and European Portuguese are more extensive, including changes in phonology, verb conjugation, and syntax. The four major dialect groups are Northern (Galician, spoken in northwestern Spain), Central, Southern (including the Lisbon dialect), and Insular (including Brazilian and Madeiran) Portuguese.

Portuguese man-of-war Any of various floating, warm-water marine cnidarians (genus *Physalia*, class Hydrozoa) found worldwide but mostly in the Gulf Stream and the Indian and Pacific oceans. The medusa-form body consists of a translucent, jellylike, gas-filled float, which may be 3–12 in. (9–30 cm) long. Polyps beneath the float bear hanging tentacles up to 165 ft (50 m) long. Nematocysts on some polyps paralyze fish and other prey. Other polyps then attach to, spread over, and digest the victim. A third type of polyp is involved in reproduction. The painful sting of *Physalia* can cause fever, shock, or disruption of heart and lung function.

Portuguese West Africa See Angola

Poseidon \pə-'sī-dən\ Greek god of water and the sea, son of Cronus and Rhea. His brothers were Zeus and Hades. When the three brothers deposed their father, the kingdom of the sea fell by lot to Poseidon. Unpredictable and sometimes violent, he was also god of earthquakes, and he was closely associated with horses. Most of his offspring were giants and savage creatures. By Medusa he was the father of the winged horse Pegasus. The Isthmian Games were held in his honor. In art he was often shown holding a trident and accompanied by a dolphin and tuna. The Romans identified him with Neptune.

Poseidon, marble statue from Melos, 2nd century BC; in the National Archaeological Museum, Athens.

Posen See Poznań

positivism Any philosophical system that confines itself to the data of experience, excludes a priori or metaphysical speculations, and emphasizes the achievements of science. Positivism is closely connected with empiricism, pragmatism, and logical positivism. More narrowly, the term designates the philosophy of Auguste Comte, who held that human thought had passed inevitably through a theological stage into a metaphysical stage and was passing into a positive, or scientific, stage. Believing that the religious impulse would survive the decay of revealed religion, he projected a worship of mankind, with churches, calendar, and hierarchy.

© 2006 Encyclopædia Britannica, Inc.

positron \'pä-zə-ˌträn\ SUBATOMIC PARTICLE having the same MASS as an ELECTRON but with an electric charge of +1 (an electron has a charge of −1). It constitutes the antiparticle (see ANTIMATTER) of an electron. The existence of the positron was a consequence of the electron theory of P. A. M. DIRAC (1928), and the particle was discovered in COSMIC RAYS by Carl D. Anderson (1905–1991) in 1932. Though they are stable in a vacuum, positrons react quickly with the electrons of ordinary matter, producing GAMMA RAYS by the process of ANNIHILATION. They are emitted in positive BETA DECAY of proton-rich radioactive nuclei and are formed in PAIR PRODUCTION.

positron emission tomography (PET) Imaging technique used in diagnosis and biomedical research. A chemical compound labeled with a radioactive ISOTOPE (see RADIOACTIVITY) that emits POSITRONS is injected into the body, and detectors measure their activity in the tissues as they combine with ELECTRONS and are annihilated. Computers analyze, integrate, and reconstruct the data to produce images of the organs scanned. PET is particularly useful for studying BRAIN and HEART functions.

possession, adverse See ADVERSE POSSESSION

possible world Conception of a total way the universe might have been. It is often contrasted with the way things actually are. In his *Theodicy* (1710), G.W. LEIBNIZ used the concept of a possible world in his proposed solution to the theological problem of the existence of evil, arguing that an all-perfect God would actualize the best of all possible worlds; this idea was later satirized by VOLTAIRE in his comic novel *Candide* (1759). Philosophers have since constructed several different formalizations of the concept of a possible world.

possum *or* **phalanger** \fə-'lan-jər, 'fā-ˌlan-jər\ Any of several species (family Phalangeridae) of nocturnal, arboreal MARSUPIALS of Australia and New Guinea. They are 22–50 in. (55–125 cm) long, including the long prehensile tail, and have woolly fur. All species eat fruits, leaves, and blossoms; some also eat insects and small vertebrates. Possums grasp branches with their hind feet. Most species bear their young in tree hollows and unused birds' nests; a few build leafy nests. Several species are endangered because of predation, fur trapping, or habitat loss, but the common brush-tailed possum is considered a pest. See also OPOSSUM.

Post, C(harles) W(illiam) (b. Oct. 26, 1854, Springfield, Ill., U.S.—d. May 9, 1914, Santa Barbara, Calif.) U.S. manufacturer of breakfast CEREALS. In the 1880s Post became a patient of JOHN H. KELLOGG at a health sanitarium in Battle Creek, Mich., where he became interested in producing healthful foods like those Kellogg served. In 1895 he founded Postum Cereal Co., the precursor to GENERAL FOODS CORP. His first product, the cereal beverage Postum, was followed by Grape Nuts and Post Toasties.

Post, Emily *orig.* **Emily Price** (b. Oct. 27, 1872 or Oct. 3, 1873, Baltimore, Md., U.S.—d. Sept. 25, 1960, New York, N.Y.) U.S. authority on etiquette. She was educated in private schools in New York City. At the turn of the century her straitened circumstances compelled her to begin writing light fiction and magazine articles. At her publisher's suggestion, she undertook her major work, *Etiquette: The Blue Book of Social Usage* (originally *Etiquette in Society, in Business, in Politics and at Home*), in 1922; unlike earlier writers on the subject, she directed her commonsense views to the ordinary person of moderate means. The book appeared in 10 editions and 90 printings in her lifetime. The outpouring of letters it provoked inspired her newspaper column, which became widely syndicated.

Emily Post.
BROWN BROTHERS

post-and-beam system In building construction, a system in which two upright members, the posts, hold up a third member, the beam, laid horizontally across their top surfaces. In Britain it is called post-and-lintel system, but in the U.S. "lintel" is usually reserved for a short beam that spans a window or door opening. The post and beam formed the basis of architecture from prehistoric to Roman times, and is illustrated by such ancient structures as STONEHENGE. All structural openings evolved from this system, which is seen in pure form only in COLONNADES and in FRAMED STRUCTURES, the posts of doors, windows, ceilings, and roofs usually being hidden in walls. The beam must bear loads that rest on it as well as its own load without deforming or breaking. Post-and-beam construction has largely been supplanted by the modern steel frame.

Post-Impressionism Movement in Western painting that represented both an extension of IMPRESSIONISM and a rejection of its limitations. The term was coined by ROGER FRY for the works of PAUL CÉZANNE, GEORGES SEURAT, VINCENT VAN GOGH, PAUL GAUGUIN, HENRI DE TOULOUSE-LAUTREC, and others. Most of these painters first pursued Impressionism, a style based, in its strictest sense, on the objective recording of nature in terms of the fugitive effects of colour and light. The Post-Impressionists rejected this aim in favour of more ambitious expression, admitting their debt, however, to the pure, brilliant colours of Impressionism, its freedom from traditional subject matter, and its technique of defining form with short brushstrokes of broken colour. Each painter in the movement pursued unique, personal subject matter and, while sharing stylistic goals with the other Post-Impressionists, had a personal form of expression. For example, Cézanne abandoned the Impressionists' virtuoso depiction of evanescent light effects in order to pursue his preoccupation with the underlying structures of natural forms and the problem of unifying surface patterns with spatial depth. Both Gauguin and van Gogh rejected the indifferent objectivity of Impressionism in favour of a more personal, spiritual expression. The Post-Impressionists often exhibited together but, unlike the Impressionists, who were a close-knit and convivial group, they painted mainly alone. In general, Post-Impressionism led away from a naturalistic approach and toward the two major movements of early 20th-century art that followed it: CUBISM and FAUVISM. See also NEO-IMPRESSIONISM.

post-traumatic stress disorder (PTSD) Psychological reaction occurring after a highly stressful event and typically characterized by flashbacks, recurrent nightmares, and avoidance of reminders of the event; DEPRESSION and ANXIETY are often present. Traumatic events that can lead to PTSD include automobile accidents, rape or assault, military combat, torture, and such natural disasters as floods, fires, or earthquakes. Long-term effects can include marital and family problems, difficulties at work, and abuse of alcohol and other drugs. Antidepressant medication and PSYCHOTHERAPY, including GROUP THERAPY, are used in treating the disorder.

postal system System that allows persons to send letters, parcels, or packages to addressees in the same country or abroad. Postal systems are usually government-run and paid for by a combination of user charges and government subsidies. There are early references to postal services in Egypt c. 2000 BC and in Zhou-dynasty China c. 1000 BC. The Roman Empire developed various centralized methods of relaying messages. In the Middle Ages there were no centralized postal services. Private postal systems developed with the rise of nation-states during the Renaissance; subsequently, postal services became government monopolies. Charges based on weight rather than distance and the use of prepaid stamps were first proposed in 1837. The General Postal Union (1875; later Universal Postal Union) improved international mail delivery by allowing member countries to retain the postage they collected on outgoing international mail and requiring them to treat incoming international mail as they did domestic mail. Airmail and automated mail handling were developed in the 20th century. See also E-MAIL.

poster Eye-catching printed paper announcement or advertisement that is exhibited to promote a product, event, or idea. Posters were popularized by the mid-19th-century invention of LITHOGRAPHY, which allowed coloured posters to be produced cheaply and easily. HENRI DE TOULOUSE-LAUTREC was noted for his poster art, which often advertised Parisian cabaret performers. Poster art flourished with the rise of the ART NOUVEAU style, as seen in the work of ALPHONSE MUCHA. During World War I posters were used for recruiting and propaganda, and the industrial boom of the early 20th century gave rise to advertising posters for every conceivable product and event. The later rise of film and television advertising led to an eclipse in poster art.

postmodernism Any of several artistic movements since about the 1960s that have challenged the philosophy and practices of modern arts or literature. In literature this has amounted to a reaction against an ordered view of the world and therefore against fixed ideas about the form and meaning of texts. In its reaction against Modernist ideals (see MODERNISM) such as autotelic art and the original masterpiece, postmodern writing and art emphasize devices such as pastiche and parody and the stylized tech-

© 2006 Encyclopædia Britannica, Inc.

nique of the antinovel and magic realism. Postmodernism has also led to a proliferation of critical theories, most notably DECONSTRUCTION and its offshoots, and the breaking down of the distinction between "high" and "low" culture.

postmortem See AUTOPSY

poststructuralism Movement in LITERARY CRITICISM and philosophy begun in France in the late 1960s. Drawing upon the linguistic theories of FERDINAND DE SAUSSURE, the anthropology of CLAUDE LÉVI-STRAUSS (see STRUCTURALISM), and the deconstructionist theories of JACQUES DERRIDA (see DECONSTRUCTION), it held that language is not a transparent medium that connects one directly with a "truth" or "reality" outside it but rather a structure or code, whose parts derive their meaning from their contrast with one another and not from any connection with an outside world. Writers associated with the movement include ROLAND BARTHES, JACQUES LACAN, JULIA KRISTEVA, and MICHEL FOUCAULT.

Potala Palace \'pō-tə-lə\ Religious and administrative complex, near LHASA, Tibet, China. It covers 5 sq mi (13 sq km) atop a hill 425 ft (130 m) above the Lhasa River valley. Potrang Karpo (the White Palace, completed 1648) once served as the seat of the Tibetan government and the main residence of the DALAI LAMA; from the mid-18th century it was used as a winter palace. Potrang Marpo (the Red Palace, 1694) houses several chapels, sacred statues, and the tombs of eight Dalai Lamas; it remains a major pilgrimage site for Tibetan Buddhists. The complex, which has a total of 1,000 rooms, was declared a WORLD HERITAGE SITE in 1994.

potash \'pät-ˌash\ Name used for various inorganic compounds of POTASSIUM, chiefly the CARBONATE (K_2CO_3), a white crystalline material formerly obtained from wood ashes. They are used to make special types of glass, potassium silicate (a dehydrating agent), pigments, printing inks, and soft soaps; for washing raw wool; and as a lab reagent and general-purpose food additive. Potassium hydroxide is frequently called caustic potash, and in the fertilizer industry, potassium oxide is called potash.

potash mica See MUSCOVITE

potassium Chemical ELEMENT, one of the ALKALI METALS, chemical symbol K, atomic number 19. It is a soft, silvery white METAL, not found free in nature and rarely used as the metal (except as a chemical reagent) because of its extreme reactivity. Potassium is essential for life and is present in all soils. Potassium IONS (K^+) and SODIUM ions act at cell membranes in electrochemical impulse transmission and in TRANSPORT. Potassium in compounds has VALENCE 1. The chloride is used as a fertilizer and a raw material for producing other compounds, and the HYDROXIDE for making liquid soaps and detergents and in preparing various SALTS. The iodide is added to table salt to protect against IODINE DEFICIENCY. The NITRATE is also called SALTPETRE, and the CARBONATE is called POTASH.

potassium-argon dating Method for determining the age of igneous rocks based on the amount of argon-40 in the rock. Radioactive potassium-40 decays to argon-40 with a half-life of about 1.3 billion years, making this method useful for dating rocks that are billions of years old. A more sophisticated method, called argon-argon dating, provides a more accurate estimate of the original potassium-40 content by means of the ratio of argon-40 to argon-39 in the rock, thus yielding a more accurate age determination. See also DATING.

potato Herbaceous annual (*Solanum tuberosum*) in the NIGHTSHADE FAMILY. One of the world's main food crops, the potato differs from other food crops in that the edible portion is a TUBER. Highly digestible, potatoes are prepared for eating in many ways and are a major source of starch as well as amino acids, protein, vitamin C, and B vitamins. The stem grows 20–40 in. (50–100 cm) tall, sprouting spirally arranged compound leaves. Underground, stems extend as STOLONS, the ends of which enlarge into 1–20 tubers of variable shape and size. The tubers have spirally arranged buds (eyes) that may remain dormant after the tuber is fully grown for up to 10 weeks or more; they grow into plants identical to the parent plant. A native of the Andes, the potato (also known as the common potato, white potato, or Irish potato) was carried by Spaniards into Europe during the 16th century. A century later, it had become the major food crop in Ireland; disastrous damage to the crop by a fungal blight caused the IRISH POTATO FAMINE in the mid-1800s. See also SWEET POTATO.

Potato (*Solanum tuberosum*).
GRANT HEILMAN

potato beetle Destructive species (*Lema trilineata*) of leaf BEETLE (family Chrysomelidae). Less than 0.25 in. (6 mm) long, it is yellow and has three black stripes on its wing covers. Eggs are laid on the underside of a potato leaf, on which both larvae and adults feed. The larvae are camouflaged by excrement the beetles pile on their back. Two generations are produced each year; the second overwinters in the ground in the pupal stage. See also COLORADO POTATO BEETLE.

potato bug See COLORADO POTATO BEETLE

Potemkin \pə-'tyem-kin**, Grigory (Aleksandrovich)** (b. Sept. 24, 1739, Chizovo, Russia—d. Oct. 16, 1791, near Iaşi, Moldavia) Russian army officer. He entered the horseguards (1755) and helped bring CATHERINE II to power (1762). He fought with distinction in the RUSSO-TURKISH WAR (1768–74), then became Catherine's lover (1774–76) and was made governor-general of "New Russia" (southern Ukraine). In 1783 she made him prince of Tauris. As a field marshal from 1784, he introduced reforms in the army, built the harbour of Sevastopol, and constructed a fleet in the Black Sea. He attempted to colonize the Ukrainian steppes, but he underestimated the costs, leaving many projects half-complete; his successful disguising of the weak points of his administration led to the claim that he erected mere facades—"Potemkin villages"—to show Catherine on her tour of the region. He commanded the Russian army in the second Russo-Turkish War.

Grigory Potemkin, engraving by James Walker, 1789, after a portrait by Johann Baptist Lampi.

potential, electric See ELECTRIC POTENTIAL

potential energy Energy stored by an object by virtue of its position. For example, an object raised above the ground acquires potential energy equal to the WORK done against the force of gravity; the energy is released as KINETIC ENERGY when it falls back to the ground. Similarly, a stretched spring has stored potential energy that is released when the spring is returned to its unstretched state. Other forms of potential energy include electrical potential energy, CHEMICAL ENERGY, and NUCLEAR ENERGY.

Potenza \pō-'tent-sä\ *ancient* **Potentia** City (pop., 2001 prelim.: 69,295), capital of the BASILICATA region, southern Italy. Located at 2,684 ft (819 m) above sea level in the APENNINES, the Roman city Potentia was founded in the 2nd century BC and became an important road junction and flourishing community. In medieval times it had a succession of feudal overlords. In 1860 it was the first town in southern Italy to expel the Bourbon rulers of the Kingdom of the TWO SICILIES. The town has been rebuilt several times after earthquake damage. It is an agricultural centre and ships fruit and vegetables.

potestas patria See PATRIA POTESTAS

potlatch Ceremonial distribution of property and gifts practiced among the American Indians of the Northwest Pacific coast, particularly the KWAKIUTL. A potlatch is given by an heir or successor to assert and validate his newly assumed social position. Ceremonial formalities are observed in inviting guests, in speech making, and in distributing goods according to the social rank of the recipients. Great feasts and generous hospitality accompany the potlatch. The ceremony has been much studied by anthropologists for the light it sheds on the nature of property, wealth, prestige, and SOCIAL STATUS. See also GIFT EXCHANGE.

Potok \'pō-täk**, Chaim** *orig.* **Herman Harold Potok** (b. Feb. 17, 1929, New York, N.Y., U.S.—d. July 23, 2002, Merion, Pa.) U.S. rabbi and novelist. The son of Polish immigrants, he was reared in an Ortho-

© 2006 Encyclopædia Britannica, Inc.

dox Jewish home and was ordained a Conservative rabbi. He taught until he began a career as an editor and writer of scholarly and popular articles and reviews in the 1960s. His novels, which have introduced to American fiction the spiritual and cultural life of Orthodox Jews, include *The Chosen* (1967; film, 1981), *The Promise* (1969), and *My Name Is Asher Lev* (1972). Three connected novellas, *Old Men at Midnight*, appeared in 2001. Notable among Potok's nonfiction writings are *Wanderings: Chaim Potok's History of the Jews* (1978), in which the author combines impressive scholarship with dramatic narrative, and *The Gates of November* (1996), a chronicle of a Soviet Jewish family and the rise and fall of the Soviet Union.

Potomac \pə-'tō-mək\ **River** River, east-central U.S. Rising in the Appalachian Mountains of West Virginia, it is about 287 mi (462 km) long. It flows southeast through the District of Columbia into Chesapeake Bay. It is navigable by large vessels to Washington, D.C., above which it descends in a series of rapids and falls, including Great Falls. Noted for its beauty, the Potomac is also rich in history. Mount Vernon, home of George Washington, is on its banks below Washington, D.C. The Chesapeake and Ohio Canal National Historical Park parallels the river.

Potosí \ˌpō-tō-'sē\ City (pop., 2001: 132,966), southwestern Bolivia. Founded in 1545 after the discovery of silver in a neighbouring mountain, it grew to be the most populous city in Latin America. After the mid-17th century, its population declined drastically when silver production waned but expanded in the 19th–20th century with the introduction of other industries, including tin mining. One of the highest cities in the world, at an elevation of about 13,700 ft (4,200 m), it is a major Bolivian industrial centre. The historic city was designated a UNESCO World Heritage site in 1987.

Potsdam City (pop., 2002 est.:130,435), capital of Brandenburg state, Germany. It is located on the Havel River southwest of Berlin. First mentioned in 993 as a Slav settlement, it was chartered in 1317. It became the electoral residence of the margrave of Brandenburg in 1640 under Frederick William, the Great Elector. It was the Prussian royal residence under Frederick II, during whose reign it was a military and intellectual centre. It was severely damaged during World War II, but many monuments survived and others have been restored. In 1945 it was the site of the Potsdam Conference. Its large, beautifully landscaped parks were named a World Heritage site by UNESCO in 1990. Industries include administration, retailing, education, film production, and tourism. It is the site of several scientific and technical institutions.

Potsdam Conference (July 17–Aug. 2, 1945) Allied conference held in the Berlin suburb of Potsdam after Germany's surrender in World War II. Harry Truman, Joseph Stalin, and Winston Churchill (later replaced by Clement R. Attlee) met to discuss European peace settlements, the administration of defeated Germany, the demarcation of the boundaries of Poland, the occupation of Austria, the definition of the Soviet Union's role in eastern Europe, the determination of reparations, and the further prosecution of the war against Japan. The four occupation zones of Germany conceived at the Yalta Conference were set up, each to be administered by the commander-in-chief of the Soviet, British, U.S., or French army of occupation. Poland's boundary became the Oder and Neisse rivers in the west, and the country received part of former East Prussia. Stalin refused to let the Western powers interfere with his control of eastern Europe.

Potter, (Helen) Beatrix (b. July 28, 1866, South Kensington, Middlesex, Eng.—d. Dec. 22, 1943, Sawrey, Lancashire) English author and illustrator of children's books. In her childhood Potter spent holidays in Scotland and the English Lake District, which inspired her love of animals and stimulated her imaginative and technically superb watercolour drawings. The illustrated animal stories she sent to a sick child when she was 27 were published as *The Tale of Peter Rabbit* (1902), which became one of the best-selling children's books of all time. More than 20 sequels followed, featuring such original characters as Jeremy Fisher, Squirrel Nutkin, Jemima Puddle-Duck, and Mrs. Tiggy-Winkle.

Potter, Dennis (Christopher George) (b. May 17, 1935, Berry Hill, Gloucestershire, Eng.—d. June 7, 1994, Ross-on-Wye, Herefordshire) British dramatist. Educated at Oxford, he thereafter devoted himself to writing, especially of television plays. His innovative serial *Pennies from Heaven* (1978) combined fantasy sequences and musical interludes in which actors lip-synched to old recordings of period songs. His best-known teleplay, the eight-part *The Singing Detective* (1986), an autobiographical account of his crippling bouts of psoriatic arthropathy, combined humour, pathos, and fantastic musical numbers. His other teleplays include the allegedly sacrilegious *Brimstone and Treacle* (1976, televised 1987) and *Lipstick on Your Collar* (1993). His movie screenplays include *Gorky Park* (1983) and *Dreamchild* (1985).

pottery One of the oldest and most widespread of the decorative arts, consisting of objects (mostly useful ones, such as vessels, plates, and bowls) made of clay and hardened with heat. Earthenware is the oldest and simplest form; stoneware is fired at a high temperature to cause it to vitrify and harden; and porcelain is a fine, generally translucent form of pottery. The Chinese began their sophisticated production of pottery in the Neolithic period and produced porcelain as early as the 7th century AD. Chinese porcelain, or "china," was widely exported to Europe and had a profound influence on European manufacturers and on taste. Classical Greece and Islamic cultures are also known for their artistic and technical innovations in pottery.

Poujade \pü-'zhäd**, Pierre (-Marie)** (b. Dec. 1, 1920, Saint-Céré, France—d. Aug. 27, 2003, La Bastide-l'Évêque) French political leader. The owner of a bookstore in Saint-Céré, in 1953 he organized a local shopkeepers' strike to protest high taxation. Expanding his activities to other towns, he enrolled 800,000 members in his Union for the Defense of Tradesmen and Artisans. His right-wing movement, known as Poujadism, attracted discontented farmers and merchants; in 1956 it won 52 seats in the National Assembly. Poujade's influence soon waned, but in the 1970s he founded an organization for nonunion workers.

Poulenc \'pü-ˌlaŋk**, Francis (Jean Marcel)** (b. Jan. 7, 1899, Paris, Fr.—d. Jan. 30, 1963, Paris) French composer. In his teens he studied piano with Ricardo Viñes (1875–1943). Influenced by Erik Satie, Poulenc and five other like-minded young composers became known as Les Six. Poulenc wrote piano compositions, orchestral music, and chamber music, but he is best known for his vocal music, including many admired songs, the operas *The Breasts of Tiresias* (1944), *Dialogues of the Carmelites* (1956), and *La voix humaine* (1958), and such sacred choral works as *Mass in G Major* (1937), the *Stabat Mater* (1950), and the *Gloria* (1959), reflecting his devout Catholicism.

poultry farming Raising birds commercially or domestically for meat, eggs, and feathers. Chickens, ducks, turkeys, and geese are the birds of primary commercial importance. Guinea fowl and squabs are chiefly of local interest. Though chickens have been domesticated for at least 4,000 years, their meat and eggs have been mass-production commodities only since c. 1800.

pound Unit of weight in the avoirdupois system, the traditional European system of weight (incorporated into the British Imperial system and the U.S. system of weights and measures), equal to 16 oz, 7,000 grains, or 0.4536 kg. It is also a unit of weight in the troy and apothecaries' systems (two other traditional systems of weight), equal to 12 troy or apothecaries' oz, 5,760 grains, or 0.37 kg. Its Roman ancestor, the *libra*, is the source of the abbreviation lb. The troy pound is used for precious metals, the apothecaries' pound for drugs. The British monetary pound is linked historically with the minting of silver coins (sterlings). Large payments were reckoned in "pounds of sterlings," later shortened to "pounds sterling." See also gram; International System of Units; measurement; metric system; ounce.

Pound, Ezra (Loomis) (b. Oct. 30, 1885, Hailey, Idaho, U.S.—d. Nov. 1, 1972, Venice, Italy) U.S. poet and critic. Pound attended Hamilton College and the University of Pennsylvania, where he studied various languages. In 1908 he sailed for Europe, where he would spend most of his life. He soon became a leader of Imagism and a dominant influence in Anglo-American verse, helping promote writers such as William Butler Yeats, James Joyce, Hilda Doolittle, Ernest Hemingway, Robert Frost, D.H. Lawrence, and T.S. Eliot, whose *The Waste Land* he brilliantly edited. After

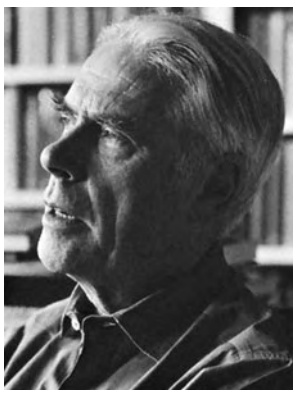
© 2006 Encyclopædia Britannica, Inc.

World War I he published two of his most important poems, "Homage to Sextus Propertius" (1919) and "Hugh Selwyn Mauberley" (1920). He also began publishing *The Cantos*, an attempt at an epic sequence of poems, which would remain his major poetic occupation throughout his life. With the onset of the Great Depression, he increasingly pursued his interest in history and economics, became obsessed with monetary reform, and declared his admiration for Benito Mussolini. In World War II he made pro-fascist radio broadcasts; detained by U.S. forces for treason in 1945, he was initially held at Pisa; *The Pisan Cantos* (1948, Bollingen Prize), written there, are notably moving. He was subsequently held in an American mental hospital until 1958, when he returned to Italy. *The Cantos* (1970) collects his 117 completed cantos.

Pound, Roscoe (b. Oct. 27, 1870, Lincoln, Neb., U.S.—d. July 1, 1964, Cambridge, Mass.) U.S. legal educator and botanist. After studying botany at the University of Nebraska and law at Harvard University (1889–90), he was admitted to the Nebraska bar, and he practiced law while also teaching at the state university (1890–1903). At the University of Nebraska he directed the state botanical survey (1892–1903) and discovered a rare fungus (*Roscopoundia*). He later taught at several law schools, most notably Harvard (1910–37), where he also served as dean (1916–36), instituting many reforms. He was perhaps the chief U.S. advocate of sociological jurisprudence, which holds that statutes and court decisions are affected by social conditions; his ideas apparently influenced the New Deal programs of Pres. Franklin D. Roosevelt. After World War II he helped reorganize the judicial system of Taiwan.

Roscoe Pound.
COURTESY OF THE LIBRARY OF CONGRESS, WASHINGTON, D.C.

Poussin \pü-'sa^{n}**, Nicolas** (b. 1594, Villers, France—d. Nov. 19, 1665, Rome, Papal States) French painter. Except for two years as court painter to Louis XIII, he spent his entire career in Rome, where he became an admirer of ancient Roman civilization. In early works, he depicted themes from Classical mythology in a painterly style reminiscent of such Venetian masters as Titian. Turning to Raphael for inspiration, he began in the mid 1630s to develop a style marked by Classical clarity and monumentality. His late masterworks, such as *Holy Family on the Steps* (1648), employ a style calculated to express virtue and rectitude, featuring only a few figures painted in harsh colours against a severe background. In his landscapes, such as *Landscape with Polyphemus* (1649), the disorder of nature is reduced to the order of geometry. His austere and highly ordered compositions influenced generations of French painters, including Jacques-Louis David, J.-A.-D. Ingres, and Paul Cézanne.



powder metallurgy Fabrication of metal objects from a powder rather than casting from molten metal or forging at softening temperatures. In some cases the powder method is more economical, as in making metal parts such as gears for small machines, in which casting would involve considerable scrap loss. In other cases, melting is impractical (e.g., because the melting point of the metal is too high). Powder metallurgy is also used to produce a porous product that will allow a liquid or gas to pass through it. See also metallurgy, sintering.

Powder River River, northern Wyoming and southeastern Montana, U.S. It rises in the foothills of the Bighorn Mountains in Wyoming and flows north 486 mi (782 km) to join the Yellowstone River near Terry, Mont. Tributaries include the Little Powder River and Crazy Woman Creek.

Powderly, Terence V(incent) (b. Jan. 22, 1849, Carbondale, Pa., U.S.—d. June 24, 1924, Washington, D.C.) U.S. labour leader. The son of Irish immigrants, he became a railroad worker at age 13 and a machinist's apprentice at 17. He joined the Machinists' and Blacksmiths' Union in 1871. Three years later he joined the secret order of the Knights of Labor, and in 1879 he was chosen for its highest post, grand master workman. He presided over the union in its period of greatest membership, but attacks by opponents such as Jay Gould caused membership to decline. Powderly became absorbed in internal disputes and finally resigned in 1893. See also labour union; Uriah Smith Stephens.

Powell, Adam Clayton, Jr. (b. Nov. 29, 1908, New Haven, Conn., U.S.—d. April 4, 1972, Miami, Fla.) U.S. politician. In 1937 he succeeded his father as pastor of the Abyssinian Baptist Church in Harlem, New York City, and built its membership to 13,000. Elected to the New York City Council in 1941, he became the first African American to serve on that body. In the U.S. House of Representatives (1945–67, 1969–71), he sponsored much social-welfare legislation, including a minimum wage act, antipoverty acts, and bills providing federal aid to education. Known for his flamboyance and his lack of concern for House decorum, he was the target of a libel suit and was investigated for financial misconduct. In 1967 the House voted to exclude him, but the U.S. Supreme Court later ruled that the House's action was unconstitutional.

Powell \'pō-əl, 'paù(-ə)l**, Anthony (Dymoke)** (b. Dec. 21, 1905, London, Eng.—d. March 28, 2000, near Frome, Somerset) British novelist. He published his first novel, *Afternoon Men* (1931), while working in a London publishing house. He worked in journalism and served in World War II before publishing the first of 12 novels in the autobiographical and satiric series *A Dance to the Music of Time* (1951–75). His best-known work, it reflects his outlook and experiences of English society in the decades before and after the war. His later novels include *The Fisher King* (1986).

Anthony Powell, 1974
FAY GODWIN

Powell, Bud *orig.* **Earl Powell** (b. Sept. 27, 1924, New York, N.Y., U.S.—d. Aug. 1, 1966, New York City) U.S. jazz pianist and composer. Powell played in Cootie Williams's big band (1942–44) before becoming part of the burgeoning activity of bebop in the late 1940s. His style became the predominant approach for post-swing era pianists: he did away with most accepted functions of the left hand, reducing it to playing brief, syncopated chords supporting long melody lines by the right hand. He moved to Paris in 1959 and returned to the U.S. in 1964. His career was interrupted several times due to nervous breakdowns thought to derive from head injuries sustained in a racially motivated attack in 1945.

Powell, Colin (Luther) (b. April 5, 1937, New York, N.Y., U.S.) U.S. general and statesman. The son of Jamaican immigrants, he entered the U.S. Army after college and served in the Vietnam War (1962–63, 1968–69). After holding various posts in the Pentagon and elsewhere, he was appointed senior military assistant to the secretary of defense in 1983. In 1987 he joined the staff of the National Security Council; in that same year Pres. Ronald Reagan appointed him assistant to the president for national security affairs. In 1989 Powell was promoted to four-star general and, appointed by Pres. George Bush, became the first African American to serve as chairman of the Joint Chiefs of Staff. He helped plan the invasion of Panama (1989) and the military operations of the First Persian Gulf War. Under Pres. George W. Bush he served as secretary of state (2001–05), the first African American to hold that post.

Powell, John Wesley (b. March 24, 1834, Mount Morris, N.Y., U.S.—d. Sept. 23, 1902, Haven, Maine) U.S. geologist and ethnologist. Powell took many expeditions (1871–79) down the Colorado River, describing the earliest of these in *Exploration of the Colorado River of the West and Its Tributaries* (1875). He developed the first comprehensive classification of American Indian languages (1877) and was the first director of the Smithsonian Institution's Bureau of American Ethnology (1879–1902). In 1881 he became director of the U.S. Geological Survey, where he worked extensively on mapping water sources and advancing irrigation projects.

Powell, Lewis F(ranklin), Jr. (b. Sept. 19, 1907, Suffolk, Va., U.S.—d. Aug. 25, 1998, Richmond, Va.) U.S. jurist. After studying law at Washington and Lee University and Harvard University, he returned to practice law in Virginia. As chairman of the Richmond school board, he oversaw peaceful school integration in 1959; he later chaired the state

© 2006 Encyclopædia Britannica, Inc.

board of education and served as president of the American Bar Association. Widely respected in legal circles, he was nominated to the Supreme Court of the United States by Pres. Richard Nixon in 1971; he took his seat in 1972 and served until 1987. He adopted moderate-to-liberal positions on civil rights, affirmative action, and separation of church and state, though his views on law enforcement were conservative.

Powell, Michael (Latham) (b. Sept. 30, 1905, Bekesbourne, Kent, Eng.—d. Feb. 19, 1990, Avening, Gloucestershire) British film director. He directed his first movie, *Two Crowded Hours*, in 1931 and made over 20 low-budget films before Alexander Korda teamed him with screenwriter Emeric Pressburger (1902–88) to make the successful *U-Boat 29* (1939). Forming their own production company, they made movies such as *The Thief of Bagdad* (1940), *The Life and Death of Colonel Blimp* (1943), *Stairway to Heaven* (1946), *Black Narcissus* (1947), *The Red Shoes* (1948), and *The Tales of Hoffmann* (1951). Powell made the controversial *Peeping Tom* (1960) without Pressburger. Powell's films were notable for their use of brilliant colour, fantasy, and experimental cinematography.

Powell, Robert Baden- See Robert S. Baden-Powell

Powell, William (b. July 29, 1892, Pittsburgh, Pa., U.S.—d. March 5, 1984, Palm Springs, Calif.) U.S. film actor. He acted on Broadway from 1912 and made his screen debut in *Sherlock Holmes* (1922). Powell played villains in the silent movies, and with the coming of sound he moved into light mysteries, playing his first detective in *The Canary Murder Case* (1929). An intelligent, debonair leading man, he became a top star as the sophisticated, bemused detective Nick Charles, opposite Myrna Loy, in the hit *The Thin Man* (1934) and its successful sequels. His later notable films include *The Great Ziegfeld* (1936), *My Man Godfrey* (1936), and *Life with Father* (1947).

power In science and engineering, the time rate of doing work or delivering energy. Power (*P*) can be expressed as the amount of work done (*W*), or energy transferred, divided by the time interval (*t*): $P = W/t$. A given amount of work can be done by a low-powered motor in a long time or by a high-powered motor in a short time. Units of power are those of work (or energy) per unit time, such as foot-pounds per minute, joules per second (called watts), or ergs per second. Power can also be expressed as the product of the force (*F*) applied to move an object and the speed (*v*) of the object in the direction of the force: $P = Fv$. See also horsepower.

Power, Charles Gavan (1888–1968) Canadian politician. Born in Sillery, Quebec, he was seriously wounded in World War I. He served in the Canadian House of Commons 1917–55. In W.L. Mackenzie King's government he served as minister for pensions and national health (1935–39) and postmaster general (1939–40). As minister for national defense for air (1940–44), he promoted the interests of Canadian air forces serving under British command and created Canadian squadrons in Europe.

Power, Tyrone (Edmund) (b. May 5, 1914, Cincinnati, Ohio, U.S.—d. Nov. 15, 1958, Madrid, Spain) U.S. actor. The descendant of a long line of actors, he toured with a Shakespearean repertory company before making his Broadway debut in *Romeo and Juliet* (1935). His first film hit was *Lloyds of London* (1936). He became noted for his action-adventure roles in movies such as *The Rains Came* (1939), *The Mark of Zorro* (1940), *Blood and Sand* (1941), *Nightmare Alley* (1947), and *The Mississippi Gambler* (1953), while continuing to act on stage in plays such as *Saint Joan* (1936), *Mister Roberts* (1950), and *Back to Methuselah* (1958).

power of attorney See power of attorney

Powers, Hiram (b. June 29, 1805, Woodstock, Vt., U.S.—d. June 27, 1873, Florence, Italy) U.S.-born Italian sculptor. He worked as an artist-assistant in a waxworks museum in Cincinnati, Ohio, then moved to Washington, D.C., where he modeled busts of such figures as Andrew Jackson (1834). In 1837 he settled permanently in Florence. He attracted international notoriety with his marble *Greek Slave* (1843), an image of a nude young woman in chains, which caused a sensation at London's Crystal Palace Exposition in 1851. An artist of outstanding technical ability, he was one of the most popular sculptors of his time. See photograph opposite.

Powhatan \ˌpau̇-ə-ˈtan, pau̇-ˈha-tᵊn\ (d. April 1618, Virginia) American Indian leader, father of Pocahontas. At the peak of his power, he ruled the 13,000 to 34,000 people of the Powhatan empire. He initially acted ambivalently toward the English settlement at Jamestown, Va., and sometimes permitted attacks against the colonists. After Pocahontas married an English settler in 1614, however, Powhatan maintained peaceful relations with the colonists until the end of his life.

Powhatan Confederacy of more than 30 North American Indian tribes living in Oklahoma, New Jersey, and Virginia, U.S., and in Canada. Powhatan languages belong to the Algonquian language family. They once occupied most of Tidewater Virginia and the eastern shore of Chesapeake Bay. The confederacy was named for its powerful chief, Powhatan, to whom the tribes provided military support and paid taxes in the form of goods. Many of the villages, consisting of long dwellings covered with bark or reed mats, were palisaded. Powhatan women cultivated corn, beans, and squash; the men hunted and waged war, chiefly against the Iroquois. The intermittent hostilities with the English settlers, often called the Powhatan War (1622–44), ended with the breaking of the confederacy.

powwow American Indian ceremony or gathering of various kinds. Powwows originally were healing ceremonies, but the word could also refer to exuberant celebrations, with dancing and singing, of success in hunting or victory in battle. Meetings of tribal councils were also called powwows. Today the word is used for large-scale Indian social gatherings, often representing more than one tribe, with traditional drumming, singing, and dancing. Modern powwows draw tourists as well as participants, and craft items and souvenirs are offered for sale.

Powys \ˈpō-əs\ County (pop., 2001: 126,344), east-central Wales. The county seat is at Llandridod Wells. It is named after the Welsh princedom of Powys, located in the border country between Wales and England. At its most powerful in the 12th century, the princedom was unable to gain ascendancy in Wales because it was so close to the border area where the cultures of Wales and England intermingled. Main elements in the landscape are the valley lowlands leading to Shrewsbury and Hereford. There are remains of Iron Age and Roman settlements.

"Greek Slave," marble statue by Hiram Powers, 1843; in the Corcoran Gallery of Art, Washington, D.C.
COURTESY OF THE CORCORAN GALLERY OF ART, WASHINGTON, D.C.

poxvirus Any of a group of viruses responsible for a wide range of pox diseases in humans and other animals. Poxvirus was the cause of smallpox. (Human chickenpox is caused by varicella-zoster virus.) The virus particle is somewhat brick-shaped, and its surface is studded with hollow spikes. It contains DNA. Unlike other DNA viruses, poxviruses appear to develop entirely within the cytoplasm of affected cells. The virus of rabbitpox has been used with mixed success in Australia to control the wild rabbit population.

Poynings \ˈpȯi-ˌniŋz\, **Sir Edward** (b. 1459, Southwark?, near London, Eng.—d. October 1521, Westenhanger, Kent) English soldier and administrator. A supporter of Henry Tudor (later Henry VII), he served as the king's lord deputy of Ireland (1494–95), where he enacted legislative measures ("Poynings' Laws") that applied all English public laws to Ireland and required every act of the Irish parliament to be approved by the king and privy council.

Poznań \ˈpȯz-ˌnän\ *German* **Posen** \ˈpōz-ᵊn\ City (pop., 2000 est.: 574,896), west-central Poland. Located on the Warta River, Poznań is one of the oldest cities in Poland,

© 2006 Encyclopædia Britannica, Inc.

dating from the 9th century AD. It reached the height of prosperity as a trade centre from the 15th to the 17th century but declined after the Second Northern War. In 1793 Poznań was annexed to Prussia, intensifying a Germanization that had begun in the 13th century. In 1918 it reverted to Poland. During World War II it was occupied by the Germans and suffered extensive damage. Rebuilt after the war, it has become the administrative, industrial, and cultural centre of western Poland. It is also an academic centre with scientific and literary institutes. Its varied industries include textile mills, metallurgical works, and chemical plants.

Practical Learning School *or* **Silhak** School of thought that arose in 18th-century Korea, dedicated to a practical approach to statecraft. It attacked Neo-Confucianism, particularly its formalism and concern with ritual. Members of the school originated many ideas for social reform and the development of farming. Notable contributors include Yi Ik (1681–1763), who wrote on land reform and the abolition of class barriers, and Pak Chi-won (1737–1805), who advocated the development of commerce and technology. The school contributed to the wave of modernization that occurred after the introduction of Western culture into Korea in the late 19th century.

practical reason Rational capacity by which (rational) agents guide their conduct. In Immanuel Kant's moral philosophy, it is defined as the capacity of a rational being to act according to principles (i.e., according to the conception of laws). Unlike the ethical intuitionists (see intuitionism), Kant never held that practical reason intuits the rightness of particular actions or moral principles. For him, practical reason was basically formal rather than material, a framework of formative principles rather than a source of specific rules. This is why he put such stress on his first formulation of the categorical imperative. Lacking any insight into the moral realm, humans can only ask themselves if what they are proposing to do has the formal character of law, namely, the character of being the same for all persons similarly circumstanced.

Prado \'prä-dō\ **Museum** Spain's national art museum, housing the world's greatest collection of Spanish painting as well as other European works. Founded in Madrid in 1818 by Ferdinand VII, it was opened to the public in 1819 as the Royal Museum of Painting. Its holdings were formed over three centuries from the various royal collections of the Habsburg and Bourbon monarchs in Spain. In 1868 it became the National Museum of the Prado after the exile of Isabella II. In 1872 it acquired many notable paintings formerly owned by Spanish convents and monasteries. It owns the outstanding collections of the works of El Greco, Diego Velázquez, and Francisco de Goya and numerous works by other Spanish masters such as José de Ribera and Francisco Zurbarán. Among its other holdings are collections of Greco-Roman statuary and many Flemish and Italian masterpieces.

Praeneste \prē-'nes-tē\ *modern* **Palestrina** Ancient city, Latium, central Italy. Praeneste was located on a spur of the Apennines. Founded before the 8th century BC, it saw many battles with Rome before becoming part of the Roman Empire. It was a major centre for the cult of the goddess Fortuna, whose sanctuary and temple oracle were surrounded by an immense complex of buildings. It became a favourite summer resort of wealthy Romans, including Augustus, Hadrian, and Pliny the Younger. The modern town is the birthplace of composer Giovanni Pierluigi da Palestrina.

praetor \'prē-tər\ In ancient Rome, a judicial officer who had broad authority in cases of equity, was responsible for producing public games, and, in the absence of a consul, exercised extensive authority in the government. After a one-year term, a praetor typically went on to govern a province. Originally only a patrician magistrate could be a praetor, but from c. 337 BC, the position was also open to plebeians. The number of praetors increased to eight by the 1st century BC, two for civil matters and six for specific courts. It continued to vary under different government leaders and emperors; by the late empire, only the city praetor for public games remained.

Praetorian \prē-'tōr-ē-ən\ **Guard** (Latin, *cohors praetoria*) Household troops of the Roman emperors. In the 2nd century BC they were bodyguards for Roman generals, their name taken from the general's tent (*praetorium*). During the civil wars military leaders had personal bodyguards, but in 27 BC Augustus created a permanent corps to guard the emperor and stationed its members around Rome. In AD 23, with Sejanus as commander, they gained political influence; from then on, they usually had an important voice in the appointment of emperors. They were responsible for the accession of Claudius (41), the disorders of 68–69, the lynching of Domitian's murderers (97), and the murder of Elagabalus (222). Constantine I disbanded the Praetorian Guard in 312.

Pragmatic Sanction (1713) Decree by Emperor Charles VI requiring the undivided descent of his Habsburg domains. It stipulated that his heritage go to his eldest son or, in the absence of a son, to his eldest daughter. It became law in 1720 within the Habsburg states, and much of Charles's later reign was directed toward securing acceptance of the sanction from the other European powers. Since his son died soon after birth (1716), his daughter Maria Theresa became his heir. On Charles's death (1740), the sanction was contested by Prussia and Bavaria, which led to the War of the Austrian Succession.

Pragmatic Sanction of Bourges \'bürzh\ (July 7, 1438) Decree issued by King Charles VII of France after the Council of Basel, confirming the supremacy of a council over the pope. The decree also confirmed the Council's assertion of the "liberties" of the Gallican Church, restricting the rights of the pope and in many cases making his jurisdiction subject to the king's. Revoked by Louis XI in 1461, the Pragmatic Sanction was reasserted periodically until the 16th century.

pragmatics In linguistics and philosophy, the study of the use of natural language in communication; more generally, the study of the relations between languages and their users. It is sometimes defined in contrast with linguistic semantics, which can be described as the study of the rule systems that determine the literal meanings of linguistic expressions. Pragmatics is then the study of how both literal and nonliteral aspects of communicated linguistic meaning are determined by principles that refer to the physical or social context (broadly construed) in which language is used. Among these aspects are conversational and conventional "implicatures" (e.g., "John has three sons" conversationally implicates that John has no more than three sons; "He was poor but honest" conventionally implicates an unspecified contrast between poverty and honesty). Other aspects include metaphor and other tropes and speech acts.

pragmatism Philosophical movement first given systematic expression by Charles Sanders Peirce and William James and later taken up and transformed by John Dewey. Pragmatists emphasize the practical function of knowledge as an instrument for adapting to reality and controlling it. Pragmatism agrees with empiricism in its emphasis on the priority of experience over a priori reasoning. Whereas truth had traditionally been explained in terms of correspondence with reality or in terms of coherence (see coherentism), pragmatism holds that truth is to be found in the process of verification. Pragmatists interpret ideas as instruments and plans of action rather than as images of reality; more specifically, they are suggestions and anticipations of possible conduct, hypotheses or forecasts of what will result from a given action, or ways of organizing behaviour. See also W.V.O. Quine; Richard Rorty.

Prague \'präg\ City (pop., 2001 est.: 1,178,576), capital of the Czech Republic. Situated on both sides of the Vltava River, the site was settled as early as the 9th century AD. By the 14th century it was one of Europe's leading cultural and trade centres. It was the focal point of opposition to the Habsburgs in the early 17th century (see Defenestration of Prague). The treaty ending the Austro-Prussian War was signed there in 1866. It became the capital of an independent Czechoslovakia in 1918. Prague was occupied by Germany during World War II and by the U.S.S.R. and other Warsaw Pact military forces in 1968 (see Prague Spring). In 1989 it was the centre of a movement that led to the peaceful overthrow of the communist government. Prague is the country's major economic and cultural centre, famous for its music, literature, and architecture.

Prague, Defenestration of (May 23, 1618) Incident of Bohemian resistance to Habsburg authority. In 1617 Catholic officials in Bohemia closed Protestant chapels in violation of the religious-liberty guarantee of 1609. At an assembly called by the Protestants, the imperial regents were found guilty of violating the guarantee and were thrown from the windows of the council room of Prague Castle. Though the victims were not seriously hurt, the incident sparked the Bohemian revolt against Emperor Ferdinand II and led to the Thirty Years' War.

Prague Spring (1968) Brief period of liberalization in Czechoslovakia under Alexander Dubček. In April 1968 he instituted agricultural and industrial reforms, a revised constitution to guarantee civil rights, autonomy for Slovakia, and democratization of the government and the Communist Party. By June, many Czechs were calling for more rapid

© 2006 Encyclopædia Britannica, Inc.

progress toward real democracy. Although Dubček believed he could control the situation, the Soviet Union and the Warsaw Pact countries, alarmed by the threat of a social-democratic Czechoslovakia, invaded the country in August, deposed Dubček, and gradually restored control by reinstalling hard-line communists as leaders.

Praia \'prī-ə\ City (pop., 2000: 94,757), port, and capital of Cape Verde. It is located on the southern shore of São Tiago (Santiago) Island, in the Atlantic Ocean, about 400 mi (640 km) off the western African bulge. It ships agricultural products, including bananas, coffee, and sugarcane, and it is a submarine cable station.

prairie Level or rolling grassland, especially that found in central North America. Decreasing amounts of rainfall, from 40 in. (100 cm) at the forested eastern edge to less than 12 in. (30 cm) at the desertlike western edge, affect the species composition of the prairie grassland. The vegetation is composed primarily of perennial grasses, with many species of flowering plants of the pea and composite families. The three main types of prairie are the tallgrass prairie; midgrass, or mixed-grass, prairie; and shortgrass prairie, or shortgrass plains. Coastal prairie, Pacific or California prairie, Palouse prairie, and desert plains grassland are covered primarily with combinations of mixed-grass and shortgrass species.

prairie chicken Either of two species of North American grouse (genus *Tympanuchus*) noted for lek displays (group courtship displays). The greater prairie chicken is about 18 in. (45 cm) long and may weigh almost 2 lbs (1 kg). Its brown plumage is strongly barred below, and it has a short, rounded, dark tail. It occurs locally from Saskatchewan to coastal Texas and Louisiana; northernmost birds are somewhat migratory. The eastern subspecies, the heath hen, is extinct. The lesser prairie chicken, smaller and paler, inhabits the arid western central Great Plains. The sharp-tailed grouse (*Pedioecetes*) is locally called prairie chicken.

prairie dog Any of five species (genus *Cynomys*) of short-legged, terrestrial squirrels, named for their barklike call. Once abundant throughout the plains of the western U.S., part of southern Canada, and northern Mexico, they are now found mostly in isolated or protected areas. They are 12–17 in. (30–43 cm) long, including a 1–5-in. (3–12-cm) tail. Their main diet is grass. Colonies consist of well-defined territories defended by a male, several females, and young. The burrows of the black-tailed prairie dog have carefully tended funnel-shaped entry mounds that prevent flooding and serve as lookout posts. The white-tailed prairie dog inhabits higher altitudes, hibernates, and is less colonial.

Prairie school Group of architects, including Frank Lloyd Wright, who created low-lying "prairie houses" in the U.S. Midwest c. 1900–17. Prairie houses were generally built of brick, wood, and plaster, with stucco walls and bands of casement windows. The Prairie architects emphasized horizontal lines by using low roofs with wide, projecting eaves. They discarded elaborate floor plans and detailing for flowing internal spaces organized around a central fireplace or hearth. The resulting low, spreading structures are characterized by light, crossing volumes and spaces; they reach out to nature, not to other buildings. Other architects working in the style included George Grant Elmslie (1871–1952) and Barry Byrne (1883–1967).

Prajapati \prə-'jä-pə-tē\ Creator figure in the Vedic period of India. In early Vedic literature (see Veda), the name was applied to various primal figures. Later it signified one deity, the "lord of all creatures," who was said to have produced the universe and all its beings after preparing himself through ascetic practices. Other stories allude to his own creation from the primal waters. His female emanation was Vac, the personification of the sacred word; Usas, the dawn, was identified as his female partner or his daughter. In the post-Vedic age, Prajapati came to be identified with Brahma.

Prajnaparamita \'prəg-ˌnyä-'pär-ə-mē-ˌtä\ Body of sutras and their commentaries in Mahayana Buddhism. The main texts, written 100 bce–150 ce, represent *prajna* (wisdom) as the supreme perfection and the primary avenue to nirvana. The content of this wisdom is the realization that all phenomena are illusory. The name Prajnaparamita also refers to the personification of the literature or of wisdom, often depicted as a woman with her hands in the teaching gesture or holding a lotus and sacred book. See photograph opposite.

prakriti and purusha \'prə-kri-tē...'pù-rù-shə\ In the Samkhya school of Indian philosophy, material nature and the soul. Prakriti is material nature in its germinal state, eternal and beyond perception. When it comes into contact with the soul or self (purusha), it starts a process of evolution that leads through several stages to the creation of the existing material world. In the Samkhya view, only prakriti is active; the self, trapped in materiality, does nothing but observe and experience. The self escapes from prakriti by recognizing its total difference from and noninvolvement in the material world.

Pramoedya Ananta Toer *or* **Pramudya Ananta Tur** \prä-'müd-yä-ä-'nän-tä-'tür\ (b. Feb. 20, 1925, Blora, Java, Indon.) Javanese novelist and short-story writer. While imprisoned by the Dutch (1947–49) for his role in the Indonesian revolt against renewed colonial rule, Pramoedya wrote his first published novel, *The Fugitive* (1950). After Indonesia gained independence in 1949, he began to produce works written in a rich style that incorporates everyday speech and images from classical Javanese culture. Imprisoned (1965–79) for his role in an attempted communist coup, he wrote a series of four novels —*This Earth of Mankind* (1980), *Child of All Nations* (1980), *Footsteps* (1985), and *House of Glass* (1988)—that depict Javanese society under Dutch rule. He is the preeminent prose writer of postindependence Indonesia.

Prandtl \'prän-tᵊl**, Ludwig** (b. Feb. 4, 1875, Freising, Ger.—d. Aug. 15, 1953, Göttingen, W.Ger.) German physicist, considered the father of aerodynamics. He taught at the University of Göttingen (1904–53). His 1904 discovery of the boundary layer at the surface of a body moving in air or water led to an understanding of skin friction drag and of the way streamlining (see streamline) reduces the drag of airplane wings and other moving bodies. His work on wing theory explained the process of airflow over airplane wings.

prasada \prə-'sä-də\ In Hinduism, consecrated food offered to the deity and then distributed to worshipers, who consume it as a sign of the god's favour. *Prasada* is used both in temple ceremonies, where it may be offered to a god such as Krishna and then distributed by the priests, and at household shrines, where it is offered to the god and then handed out to household members. See also puja.

pratitya-samutpada \prə-'tēt-yə-ˌsə-mùt-'pä-də\ In Buddhism, the chain of causation that leads from rebirth to death. Existence is seen as an interrelated flux of transient events that occur in a series, one producing another, usually described as a chain of 12 links: (1) ignorance, which leads to (2) faulty perceptions of reality, which provide the structure of (3) knowledge, which addresses (4) name and form, or the principle of individual identity and the sensory perception of an object, experienced through (5) the six domains (the five senses and their object, along with the mind), whose presence leads to (6) contact (between objects and the senses), followed by (7) sensation, which, being pleasant, leads to (8) thirst and then (9) grasping (as of sex partners), which leads to (10) the process of becoming, culminating in (11) birth, and at last (12) old age and death.

Pratt, E(dwin) J(ohn) (b. Feb. 4, 1883, Western Bay, Nfd., Can.—d. April 26, 1964, Toronto, Ont.) Canadian poet. He trained for the ministry and later taught for many years at the University of Toronto. The early collection *The Titans* (1926) contains his widely read "The Cachalot," an account of a whale hunt. *Brébeuf and His Brethren* (1940), perhaps his best work, chronicles the martyrdom of Jesuit missionaries. Later collections include *Dunkirk* (1941), *They Are Returning* (1945), *Behind the Log* (1947), and *Towards the Last Spike* (1952).

Prajnaparamita, 13th-century stone sculpture from Singosari, East Java; in the Museum Pusat, Jakarta, Indonesia
COURTESY OF THE RIJKSMUSEUM VOOR VOLKENKUNDE, LEIDEN, NETH.

Pratt, Francis Ashbury (b. Feb. 15, 1827, Woodstock, Vt., U.S.—d. Feb. 10, 1902, Hartford, Conn.) U.S. inventor. With Amos Whitney he founded the Pratt & Whitney Co. in Hartford to manufacture machine tools. He was instrumental in bringing about adoption of a standard system of gauges. He also invented a metal-planing machine (1869), a gear cutter (1884), and a milling machine (1885).

© 2006 Encyclopædia Britannica, Inc.

Pratt Institute Private institution of higher learning in Brooklyn, New York, New York, U.S. It was founded as a trade school in 1887 by the industrialist Charles Pratt (1830–91). It comprises schools of architecture, art and design (for which it is especially renowned), liberal arts and sciences, professional studies, and information and library science. It has both bachelor's and master's degree programs.

pratyaya \prət-'yä-yə\ In BUDDHISM, an auxiliary, indirect cause, as distinguished from a direct cause (*hetu*). A seed, for example, is the direct cause of a plant, whereas sunlight, water, and earth are the auxiliary causes. Sometimes *pratyaya* is used to refer to cause in general. The idea of causation is important in the Buddhist concept of the cycle of death and rebirth (see PRATITYA-SAMUTPADA).

pratyeka-buddha \prət-'yā-kə\ In BUDDHISM, one who attains enlightenment through his own efforts rather than by listening to the teachings of a buddha. The way of the self-enlightened buddha was retained only in the THERAVADA tradition. MAHAYANA Buddhism rejects the path of self-enlightenment as too limiting and embraces the ideal of the BODHISATTVA, who postpones final enlightenment to work for the salvation of others.

Pravda \'präv-də\ *Russian* **"Truth"** Former daily newspaper published in Moscow and distributed nationwide, the official organ of the Communist Party of the Soviet Union (1918–91). It was founded in St. Petersburg as an underground paper by VLADIMIR ILICH LENIN and two colleagues in 1912. As a Soviet state newspaper and central source of information and education, it offered well-written articles and analyses on science, economics, cultural topics, and literature as well as materials to indoctrinate and inform readers on communist theory and programs. Topics concerning international relations were largely left to the government paper *IZVESTIYA*. After communist power ended in 1991, most of its readership evaporated; it became the voice of the conservative-nationalist opposition and ceased publication in 1996.

Praxiteles \prak-'si-tᵊl-ˌēz\ (fl. c. 370–330 BC, Greece) Greek sculptor. His only known surviving work, the marble *Hermes Carrying the Infant Dionysus*, displays delicate modeling and exquisite surface finish. A few other works survive in Roman copies. His most celebrated work was the *Aphrodite of Cnidus*, which PLINY THE ELDER considered the best statue in the world. Through Praxiteles' influence, figures were increasingly shown standing in graceful, sinuous poses, leaning lightly on some support, a pose further developed by sculptors of the HELLENISTIC AGE. Greatest and most original of the 4th-century Attic sculptors, he profoundly influenced the later course of Greek sculpture.

Prayag Raj See ALLAHABAD

prayer Silent or spoken petition made to God or a god. Prayer has been practiced in all religions throughout history. Its characteristic postures (bowing the head, kneeling, prostration) and position of the hands (raised, outstretched, clasped) signify an attitude of submission and devotion. Prayer may involve confessions of SIN, requests, thanks, praise, offerings of SACRIFICE, or promises of future acts of devotion. In addition to spontaneous private prayer, most religions have fixed formulas of prayer (e.g., the LORD'S PRAYER), often recited in group worship. The four prophetic religions (JUDAISM, CHRISTIANITY, ISLAM, and ZOROASTRIANISM) prescribe a daily set form of individual prayer, such as the Shema, to be recited twice a day by every male Jew, and the Islamic salat, performed five times a day.

prayer wheel In TIBETAN BUDDHISM, a mechanical device used as an equivalent to the recitation of a MANTRA. The prayer wheel consists of a hollow metal cylinder, often beautifully embossed, mounted on a rod and containing a consecrated paper bearing a mantra. Each turn of the wheel by hand is considered equivalent to orally reciting the prayer. Variants to the handheld prayer wheel are large cylinders that can be set in motion by hand or attached to windmills or waterwheels and thus kept in continuous motion.

Tibetan prayer wheel, gilt silver, 18th–19th century; in the Seattle (Washington) Art Museum.

praying mantis See MANTIS

Pre-Raphaelites \ˌprē-'rä-fē-ə-ˌlīts\ Group of young British painters, led by DANTE GABRIEL ROSSETTI, WILLIAM HOLMAN HUNT, and JOHN EVERETT MILLAIS, who banded together in 1848 in reaction against what they considered the unimaginative and artificial historical painting of the 18th and early 19th centuries, seeking to express a new moral seriousness and sincerity in their works. Their name, the Pre-Raphaelite Brotherhood, honoured the simple depiction of nature in Italian art before RAPHAEL; the symbolism, imagery, and mannered style of their paintings often suggest a faux-medieval world. Later members included EDWARD BURNE-JONES and George Frederic Watts (1817–1904). The group also functioned as a school of writers who often used medieval settings, sometimes with shocking effect, as in WILLIAM MORRIS's *The Defence of Guenevere* (1858), which deals with issues of love and sex. Though active less than 10 years, the group had a profound influence on the arts.

pre-Socratics Earliest Greek philosophers (those who preceded SOCRATES) whose attention to questions about the origin and nature of the physical world has led to their being called cosmologists or naturalists. Among the most significant were the Milesians THALES, ANAXIMANDER, and ANAXIMENES, XENOPHANES OF COLOPHON, PARMENIDES, HERACLEITUS of Ephesus, EMPEDOCLES, ANAXAGORAS, DEMOCRITUS, ZENO OF ELEA, and PYTHAGORAS.

Preakness Stakes One of the three classic U.S. horse races making up the TRIPLE CROWN. It is held annually in mid-May at Baltimore's Pimlico Race Course. The course distance is 1 3/16 mi (1.9 km). The field is limited to 3-year-old Thoroughbreds.

Prebisch \'prā-bish**, Raúl** (b. April 17, 1901, Tucumán, Arg.—d. April 29, 1986, Las Vertientes, near Santiago, Chile) Argentine economist and statesman. Serving in various positions in Argentine government and academia, he advised developing countries to stimulate domestic manufacturing to reduce their reliance on imports and thus their dependence on the industrialized nations. He also advocated the economic integration of Latin America to achieve economies of scale and LAND REFORM to reduce the income inequalities that impeded the growth of the domestic market. As the influential head of the UN's Economic Commission for Latin America, he addressed inequities in the trade relationships between wealthy and poor nations.

Precambrian time Interval of geologic time from c. 3.8 billion years ago, the age of the oldest known rocks, to 544 million years ago, the beginning of the CAMBRIAN PERIOD. This interval represents more than 80% of the geologic record and thus provides important evidence of how the continents evolved. The Precambrian is divided into the ARCHEAN and PROTEROZOIC eons, with the boundary between them at 2.5 billion years ago. It was originally defined as the era that predated the emergence of life in the Cambrian Period. It is now known, however, that life on Earth had begun by the early Archean. Soft-bodied organisms without skeletons began to appear toward the end of the Precambrian.

precast concrete Concrete cast into structural members under factory conditions and then brought to the building site. A 20th-century development, precasting increases the strength and finish durability of the member and decreases time and construction costs. Concrete cures slowly; the design strength is usually reached 28 days after initial setting. Using precast concrete eliminates the lag between the time on-site concrete is placed and the time it can carry loads. Precast concrete components include slabs, beams, columns, walls, stairways, modular boxes, and even kitchens and bathrooms with precast fixtures. See also PREFABRICATION.

precession Phenomenon associated with the action of a GYROSCOPE or a spinning top and consisting of a comparatively slow rotation of the axis of rotation of a spinning body about a line intersecting the spin axis. It arises as a result of external TORQUE acting on the body. One example of precession is the smooth, slow circling of a spinning top (the uneven wobbling is called nutation). Precession of the earth's axis of rotation is the reason that the positions of celestial bodies appear to drift systematically with the passage of time. See also precession of the EQUINOXES.

© 2006 Encyclopædia Britannica, Inc.

precipitation All liquid and solid water particles that fall from clouds and reach the ground, including drizzle, RAIN, SNOW, ice crystals, and HAIL. The essential difference between a precipitation particle and a cloud particle is size; an average raindrop has a mass equivalent to that of about one million cloud droplets. Precipitation elements (ice crystals or droplets that form around soluble particles such as salt) form directly from the vapour state and get larger through collision and coalescence. Eventually they become large enough to respond to gravity, and they fall to the ground.

Precisionism Smooth, precise technique used primarily in the 1920s by several U.S. painters in representational canvases depicting sharply defined forms, such as urban skylines; the industrial landscape of factories and smokestacks, buildings, and machinery; and country landscapes with grain elevators and barns or empty desert and sky. The scenes are always devoid of people or signs of human activity. Precisionism is a "cool" art, which keeps the viewer at a distance. It had its origins in CUBISM, FUTURISM, and ORPHISM; in turn it influenced POP ART. Though it was not a school or movement with a formal program, the Precisionist artists, including CHARLES DEMUTH and GEORGIA O'KEEFFE, often exhibited together.

predation Form of food getting in which one animal, the predator, eats an animal of another species, the prey, immediately after killing it or, in some cases, while it is still alive. Most predators are generalists; they eat a variety of prey species. Specialist predators, such as ANTEATERS, eat only one or a few prey species. Cannibalism is a type of predation in which an animal eats another of its own species. Seed consumption is also considered predation because the entire living embryo of a plant is destroyed.

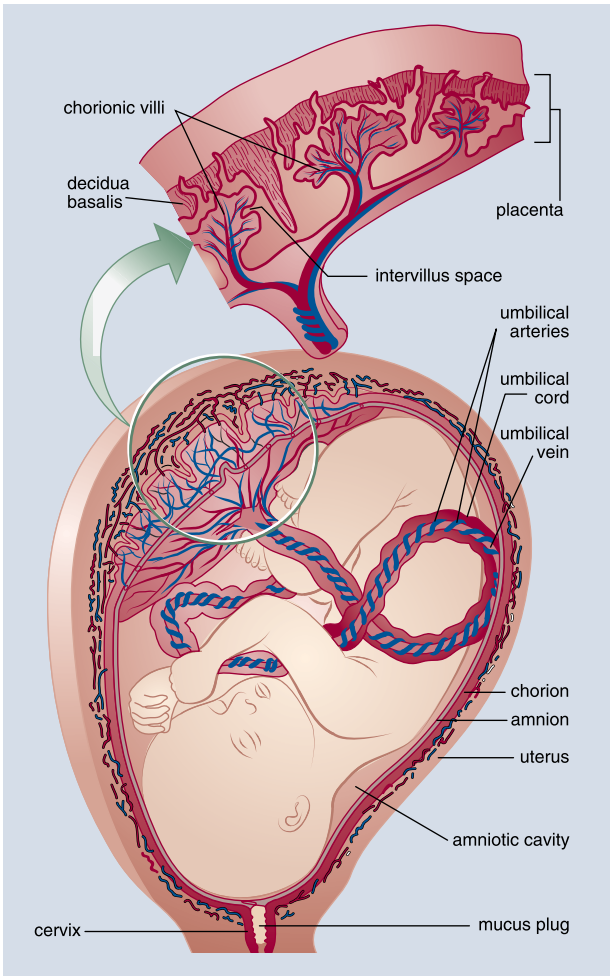
predestination In CHRISTIANITY, the doctrine that God has long ago determined who will be saved and who will be damned. Three types of predestination doctrine have developed. One doctrine holds that God singled out the saved because he foresaw their future merits. A second doctrine (often identified with JOHN CALVIN) states that from eternity God has determined the saved and the damned, regardless of their merit or lack thereof. A third doctrine, set forth by THOMAS AQUINAS and MARTIN LUTHER, ascribes salvation to the unmerited GRACE of God but links the lack of grace to SIN. In ISLAM, issues of predestination and free will were argued extensively. The MUTAZILA held that God would be unjust if he predestined all human actions; the ASHARIYA advocated a strict predestination that became the mainstream Islamic view.

predicate calculus Part of modern symbolic logic which systematically exhibits the logical relations between propositions involving quantifiers such as "all" and "some." The predicate calculus usually builds on some form of the PROPOSITIONAL CALCULUS and introduces quantifiers, individual variables, and predicate letters. A sentence of the form "All F's are either G's or H's" is symbolically rendered as $(\forall x)[Fx \supset (Gx \vee Hx)]$, and "Some F's are both G's and H's" is symbolically rendered as $(\exists x)[Fx \wedge (Gx \wedge Hx)]$. Once conditions of truth and falsity for the basic types of propositions have been determined, the propositions formulable within the calculus are grouped into three mutually exclusive classes: (1) those that are true on every possible specification of the meaning of their predicate signs, such as "Everything is F or is not F"; (2) those false on every such specification, such as "Something is F and not F"; and (3) those true on some specifications and false on others, such as "Something is F and is G." These are called, respectively, the valid, inconsistent, and contingent propositions. Certain valid proposition types may be selected as axioms or as the basis for rules of inference. There exist multiple complete axiomatizations of first-order (or lower) predicate calculus ("first-order" meaning that quantifiers bind individual variables but not variables ranging over predicates of individuals). See also LOGIC.

preeclampsia \ˌprē-i-'klamp-sē-ə\ **and eclampsia** Hypertensive conditions unique to PREGNANCY. Preeclampsia is marked by HYPERTENSION, PROTEIN in the urine, and hand and face EDEMA, which develop late in pregnancy or soon after. Persistent hypertension compromises the fetus's blood supply and damages the mother's kidneys. Monitoring of blood pressure and weight gain may detect it before symptoms (headaches, visual disturbances, stomach pain) begin. Eclampsia follows in about 5% of cases, with convulsions that pose a serious threat to mother and child. It can usually be prevented by special diets, drugs, and limited activity or early delivery.

preemption \prē-'emp-shən\ U.S. policy that allowed the first settlers, or squatters, on public land to buy the land they had improved. Since improved land, coveted by speculators, was often priced too high for squatters to buy at auction, temporary preemptive laws allowed them to acquire it without bidding. The Pre-Emption Act (1841) gave squatters the right to buy 160 acres at $1.25 per acre before the land was auctioned. The Homestead Act (1862) made preemption an accepted part of U.S. land policy. See also HOMESTEAD MOVEMENT.

prefabrication Assembly of standardized building components at a location other than the building site. Units may include doors, stairs, window walls, wall panels, floor panels, roof trusses, room-sized components, and even entire buildings. Prefabrication requires the cooperation of architects, suppliers, and builders regarding the size of basic modular units. In the U.S. building industry, the 4-by-8-ft (1.2-by-2.4-m) panel is a standard unit; the architect's drafted building plans and the supplier's prefabricated wall units are based on multiples of that MODULE. Advantages of prefabrication include the cost savings of mass production, the opportunity to use specialized equipment to produce components, and standardization of parts for quick assembly and erection. The major drawback is in assigning responsibility for quality control. See also PRECAST CONCRETE.



prefect In ancient Rome, any of various high officials with primarily judicial and administrative responsibilities. In the early republic, a prefect of the city (*praefectus urbi*) took over the CONSUL's duties during their absence from Rome. The office lost some importance after the introduction of PRAETORS (mid 4th century BC). AUGUSTUS revitalized the office when he appointed five prefects to supervise the city government, the fire brigade, the grain supply, and the PRAETORIAN GUARD. The praetorian prefects acquired great power and often became virtual prime ministers.

pregnancy Process of human gestation that takes place in the female's body as a FETUS develops, from FERTILIZATION to birth (see PARTURITION). It begins when a viable SPERM from the male and EGG from the OVARY merge in the fallopian tube (see FERTILITY; FERTILIZATION). The fertilized egg (zygote) grows by cell division as it moves toward the UTERUS, where it implants in the lining and grows into an EMBRYO and then a fetus. A PLACENTA and umbilical cord develop for nutrient and waste exchange between the circulations of mother and fetus. A protective fluid-filled amniotic sac encloses and cushions the fetus. Early in pregnancy, higher ESTROGEN and PROGESTERONE levels halt MENSTRUATION, cause nausea, often with vomiting (morning sickness), and enlarge the breasts and prepare them for LACTATION. As the fetus grows, so does the uterus, displacing other organs. Normal weight gain in pregnancy is 20–25 lbs (9–11.5 kg). The fetus's nutritional needs require the mother to take in more calories and especially protein, water, calcium, and iron. FOLIC-ACID supplements are recommended during early pregnancy to prevent NEURAL TUBE DEFECTS. Smoking, alcohol, and many legal and illegal drugs can cause CONGENITAL DISORDERS and should be avoided during pregnancy. ULTRASOUND imaging is often used to monitor structural and functional progress of the growing fetus. The due date is estimated as 280 days from the time of last menstruation; 90% of babies are born within two weeks of the estimated date. See also AMNIOCENTESIS; PREECLAMPSIA AND ECLAMPSIA; PREMATURE BIRTH. See illustration on opposite page.

prehistoric religion Religious practices and beliefs of prehistoric peoples, as inferred from archaeological findings. The oldest burials that attest to a belief in life after death date from 50,000–30,000 BC. Corpses were buried with goods such as stone tools and parts of animals, suggesting an attempt to placate the dead or equip them for the next world. The Middle PALEOLITHIC PERIOD provides the first evidence of animal SACRIFICES, which may have been offerings to the dead, to a higher power, or to the fertility of the animal species. Prehistoric human sacrifices have also been found, usually of women and children. From the BRONZE AGE on, weapons and jewelry were often thrown into springs, wells, and other bodies of water as sacrifices (probably of war booty). Animals such as bears were important in prehistoric religion from the Upper Paleolithic Period on, probably seen as guardian spirits and associated with magical powers. Fertility rites were also practiced, as evidenced by small, corpulent female figures, known as Venus statuettes, with highly emphasized breasts and buttocks.

prelude Musical composition, usually brief, generally played as an introduction to another piece. The prelude originated as short pieces that were improvised by an organist to establish the key of a following piece or to fill brief interludes in a church service. Their improvisatory origins were often reflected in rhythmic freedom and virtuosic runs. A section in this style would often lead to a closing fugal section; in time this turned into a separate movement, and preludes came to be paired with FUGUES.

© 2006 Encyclopædia Britannica, Inc.

Full-term fetus in the uterus. The amnion, formed from the inner embryonic membrane, encloses the fetus. The space between the amnion and fetus (amniotic cavity) is filled with the watery amniotic fluid. The outermost embryonic membrane, the chorion, has developed fingerlike projections (villi) on its outer surface, which have enlarged and penetrated the decidua basalis layer of the uterus. The chorionic villi and the decidua basalis form the placenta. Maternal blood fills the spaces around the villi (intervillous spaces); oxygen and nutrients diffuse into the villi and pass on to the fetus via the umbilical vein. Waste materials that leave the fetus via the umbilical arteries diffuse out of the villi into the mother's blood.
© MERRIAM-WEBSTER INC.

In the 17th century, preludes began to be frequently written for lute or harpsichord. In later years the term came to be used for short piano pieces, often in sets, by composers such as Frédéric Chopin, Aleksandr Scriabin, and Claude Debussy.

premature birth Birth less than 37 weeks after conception. Infants born as early as 23–24 weeks may survive but many face lifelong disabilities (e.g., cerebral palsy, blindness, deafness). Premature infants account for 8–9% of live births but two-thirds of infant deaths. 40–50% of cases have no explanation; other cases can be attributed to such causes as maternal hypertension or diabetes, multiple pregnancy, or placental separation. With good care, about 85% of live-born premature infants should survive. Infants born very early (before 32–34 weeks) lack fully developed lungs and often develop respiratory distress syndrome. They also have problems maintaining body temperature and fighting infection. Most deaths result from breathing problems, infections, and brain or lung hemorrhages. Premature infants are characterized by low birth weight, small size, irregular breathing, absence of subcutaneous fat, and thin skin.

premenstrual syndrome (PMS) Variable group of symptoms occurring before menstruation in 40% of women, severe in about 10% of those. Physical symptoms may include headache, cramps, bloating, and constipation or diarrhea. Emotional symptoms range from irritability, lethargy, and mood swings to hostility, confusion, and depression. Theories as to the cause centre on hormones, nutrition, and stress (known to affect severity). Depending on the symptoms, treatment may involve exercise, stress management, nutritional therapy, or drugs. Dietary measures include low sodium and high protein and complex carbohydrate intake and avoidance of xanthines (including caffeine). Increasing calcium intake has been shown to prevent or reduce cramps, which are best treated with ibuprofen.

premier See prime minister

Preminger \'pre-min-jər**, Otto (Ludwig)** (b. Dec. 5, 1906, Vienna, Austria—d. April 23, 1986, New York, N.Y., U.S.) Austrian-born U.S. film director. While studying law in his native Vienna, he worked with Max Reinhardt's theatre and soon became its director. In 1935 he went to the U.S. to direct *Libel* on Broadway. Invited to Hollywood, he made the successful thriller *Laura* (1944), which helped establish film noir. Forming his own production company, he defied Hollywood's Production Code with a series of controversial films and brought about the relaxation of censorship regulations. His landmark films include *The Moon Is Blue* (1953); the all-African American *Carmen Jones* (1954); and *The Man with the Golden Arm* (1955), a tale of drug addiction. His later films include *Anatomy of a Murder* (1959), *Exodus* (1960), *The Cardinal* (1963), and *Hurry Sundown* (1967). He also worked as a character actor, most notably in Billy Wilder's *Stalag 17* (1953).

Prendergast, Maurice (Brazil) (b. Oct. 10, 1859, St. John's, Nfd., Can.—d. Feb. 1, 1924, New York, N.Y., U.S.) Canadian-born U.S. painter. He moved with his family to Boston in 1868. After study in Paris (1891–94), he spent much of his career traveling and painting abroad. He was the first U.S. artist to fully absorb French Impressionism and Post-Impressionism. His lively street scenes feature floating geometric areas of brilliant decorative colour with a mosaiclike effect. He produced his most outstanding works in watercolour. In his later years he lived in New York City and exhibited with The Eight and in the 1913 Armory Show.

Prensa \'pren-sä**, La** *Spanish* **"The Press"** Argentine daily newspaper, widely regarded as the finest Spanish-language newspaper in the world. Founded in Buenos Aires in 1869, it soon broke with the traditional emphasis on propaganda to stress professional, accurate news reporting and independence in editorial opinion. It displayed a concern for human welfare that persisted in the face of government harassment, notably in the 1940s under the regime of Juan Perón. In 1951 it was seized and became a Peronist propaganda organ; after Perón's overthrow, it reappeared as an independent daily in 1956.

Preobrajenska, Olga *orig.* **Olga Yosifovna Preobrazhenskaya** (b. Feb. 2, 1871, St. Petersburg, Russia—d. Dec. 27, 1962, Saint-Mandé, Fr.) Russian ballerina and teacher. She joined the Mariinsky Ballet (see Mariinsky Theatre) in 1889 and earned the title of prima ballerina in 1900. Her lyrical creativity and love of improvisation were praised by audiences and critics. She also taught at the Imperial Theatre School (1901–02 and 1914–21, during which time the school was renamed the Petrograd State Ballet School). As an instructor, she helped to form the next generation of Russian dancers. In 1922 she emigrated from Russia and taught at her own ballet school in Paris (1923–60).

preparatory school School that prepares students for entrance to a higher school. In Europe, where secondary education has been selective, preparatory schools have been those that catered to pupils wishing to enter the academic secondary schools. In North America, where access to secondary education has been less competitive, the term usually refers to private secondary schools that prepare students for college.

Preparedness Movement Pre-World War I campaign to increase U.S. military capabilities and convince the public of the need for U.S. involvement in a future European conflict. Leaders such as Theodore Roosevelt and Gen. Leonard Wood sought to persuade Pres. Woodrow Wilson to strengthen U.S. national defenses, and various organizations sponsored preparedness parades to build public awareness and support. The campaign resulted in passage of the National Defense Act (1916); the U.S. entered World War I the following year.

prerogative court \pri-'rä-gə-tiv\ In English law, a court through which the powers, privileges, and immunities reserved to the sovereign

© 2006 Encyclopædia Britannica, Inc.

were exercised. Such courts were originally formed during the period when the sovereign's power was greater than the Parliament's. The Star Chamber, the High Commission, and the Court of Chancery all achieved importance in the 16th century. By the 17th century they were being challenged by the common law courts and competing political interests, and they were soon put out of business. See also Privy Council.

Presbyterianism Form of church government based on rule by elders, or presbyters. The presbyters who govern the church are grouped in a hierarchy of courts, the highest of which is the general assembly. They are elected by the members of the congregation for fixed terms, in a system intended to affirm the equality of all Christians. The term Presbyterianism also refers to a denomination, the Presbyterian Church. The modern Presbyterian churches trace their origins to the Calvinist churches of the British Isles; in continental Europe such congregations were known as Reformed churches. The Presbyterian Church is strongest in Scotland, where it was founded by John Knox in 1557, but it is also well established in England, Wales, and the U.S. See also Calvinism.

preschool education Childhood education during the period from infancy to age five or six. Institutions for preschool education vary widely around the world, as do their names (e.g., infant school, day care, maternal school, nursery school, crèche, kindergarten). The first systematic theory of early childhood pedagogy was propounded by Friedrich Froebel, the founder of the kindergarten. Other influential theorists include Maria Montessori and Jean Piaget. Of major concern in preschool education is language development; teachers often conduct listening and language games. See also elementary education.

Prescott, Edward C. (b. Dec. 26, 1940, Glens Falls, N.Y., U.S.) U.S. economist. Prescott studied at Swarthmore College (B.A., 1962), Case Western Reserve University (M.S., 1963), and Carnegie Mellon University (Ph.D., 1967), where he later taught and advised Finn E. Kydland on his doctorate. Working with Kydland, he demonstrated how a declared commitment to a low inflation rate by policy makers might create expectations of low inflation and unemployment rates. The two men also established the microeconomic foundation for business cycle analyses, demonstrating that technology changes or supply shocks, such as oil price hikes, could be reflected in investment and relative price movements and thereby create short-term fluctuations around the long-term economic growth path. In 2004 Prescott shared the Nobel Prize for Economics with Kydland.

Prescott, William H(ickling) (b. May 4, 1796, Salem, Mass., U.S.—d. Jan. 28, 1859, Boston, Mass.) U.S. historian. Born to a prosperous family, Prescott graduated from Harvard University in 1814 but was prevented by poor health and eyesight from a career in law or business. His friends, including Washington Irving, led him to his life's work: recounting the history of 16th-century Spain and its colonies. He is best known for his *History of the Conquest of Mexico* (1843) and *History of the Conquest of Peru* (1847), for which he made rigorous use of original sources, and which earned him a reputation as the first scientific U.S. historian.

prescription In property law, the effect of the lapse of time in creating and destroying rights. Acquisitive prescription allows an individual, after unequivocal possession for a specific period, to acquire an interest in real property, such as an easement, but not the property itself. See also adverse possession.

prescriptivism In metaethics, the view that moral judgments are prescriptions and therefore have the logical form of imperatives. Prescriptivism was first advocated by Richard M. Hare (born 1919) in *The Language of Morals* (1952). Hare argued that it is impossible to derive any prescription from a set of descriptive sentences, but tried nevertheless to provide a foothold for moral reasoning in the constraint that moral judgments must be "universalizable": that is, that if one judges a particular action to be wrong, one must also judge any relevantly similar action to be wrong. Universalizability is not a substantive moral principle but a logical feature of the moral terms: anyone who uses such terms as "right" and "ought" is logically committed to universalizability.

preservation, food See food preservation

preservative Any of numerous chemical additives used to prevent or slow food spoilage caused by chemical changes (e.g., oxidation, mold growth) and maintain a fresh appearance and consistency. Antimycotics (e.g., sodium and calcium propionate, sorbic acid) inhibit mold growth; antioxidants (e.g., butylated hydroxytoluene or BHT) delay rancidity in foods containing fats and oils; antibiotics (e.g., tetracyclines) prevent bacterial growth; humectants retain moisture in products like shredded coconut; and antistaling agents (e.g., glyceryl monostearate) maintain moisture and softness in baked goods. Some preservatives also improve the appearance of the product (e.g., sodium nitrate and nitrite in meats).

president In government, the officer who serves as head of state and sometimes also as chief executive. In countries where the president is chief of state but not of government, the role is largely ceremonial, with few or no political powers. Presidents may be elected directly or indirectly, for a limited or unlimited number of terms. In the U.S., the president's chief duty is to ensure that the laws are faithfully executed, which he does through various executive agencies and with the aid of his cabinet. He also serves as commander in chief of the armed forces, nominates judges to the Supreme Court, and makes treaties with foreign governments (contingent on Senate approval). The office of president is used in governments in South and Central America, Africa, and elsewhere. In western Europe executive power is generally vested in a prime minister and his cabinet, and the president, where the office exists, has few responsibilities (though France is a significant exception).

Presley, Elvis (Aaron) (b. Jan. 8, 1935, Tupelo, Miss., U.S.—d. Aug. 16, 1977, Memphis, Tenn.) U.S. popular singer, the "King of Rock and Roll." Presley was raised in Memphis, where he sang Pentecostal church music and listened to black bluesmen and Grand Ole Opry broadcasts. In 1954 he began to record for the producer Sam Phillips, who had been searching for a white singer who sounded like a black man. In 1956, under his new manager, "Colonel" Tom Parker, he released "Heartbreak Hotel," the first of numerous million-selling hits that included "Hound Dog" and "All Shook Up." In the same year, he appeared in *Love Me Tender*, the first of 33 mediocre films, and on several TV shows, notably the *Ed Sullivan Show*. Presley's intensely charismatic style—including his sexy hip shaking, ducktail haircut, and characteristic sneer—excited young fans, especially females, to wild adulation. After a stint in the army (1958–60) he resumed recording and acting, but his earlier raucous style was moderated. In 1968 he introduced a Las Vegas-based touring act with orchestra and gospel-type choir. Battling public pressures, weight gain, and drug dependence, he underwent a personal decline. His death at age 42, attributed to natural causes, was mourned by hundreds of thousands of fans at Graceland, his Memphis estate, which remains a place of international pilgrimage.

Prespa, Lake Lake on the boundary between Macedonia, Albania, and Greece. It is 14 mi (23 km) long, 8 mi (13 km) wide, 2,800 ft (853 m) above sea level, and it drains northwest into Lake Ohrid through a subterranean channel. South of it is Little Prespa Lake, which contains the island of St. Achilius; the island was an early capital of Bulgarian Tsar Samuel in the 10th century. It became a tourist and fishing centre in the 1970s.

Pressburg See Bratislava

Pressburg, Treaty of (Dec. 26, 1805) Agreement signed by Austria and France at Pressburg (now Bratislava, Slvk.) after Napoleon's victories at the Battles of Ulm and Austerlitz. Austria gave up Venetia to Napoleon's kingdom of Italy and the Tirol and Vorarlberg to Bavaria. Austria agreed to admit the electors of Bavaria and Württemberg, allied with Napoleon, to the rank of kings, which further reduced Austrian influence in Germany. Austria's influence was also excluded from Italy. The treaty enabled Napoleon to create a ring of French client states beyond France.

pressure Perpendicular force per unit area, or stress at a point within a confined fluid. A solid object exerts pressure on a floor equal to its weight divided by the area of contact. The weight of the Earth's atmosphere on the surface constitutes atmospheric pressure, which varies from place to place but always decreases with altitude. The pressure exerted by a confined gas results from the average effect of the forces produced on the walls of the container by the continual, numerous collisions by gas molecules. Hydrostatic pressure is the stress, or pressure, exerted equally in all directions at points within a confined fluid. Lithostatic pressure is the stress exerted on a body of rock in the Earth's crust by surrounding rock, which increases with depth below the surface. The SI unit of pressure is the pascal (Pa), which is equal to one newton of force per square metre.

pressure gauge Instrument for measuring the condition of a fluid (liquid or gas) that is specified by the force the fluid would apply, when

© 2006 Encyclopædia Britannica, Inc.

at rest, to a unit area, such as pounds per square inch (psi) or PASCALS (Pa). The reading on the gauge, called the gauge pressure, is always the difference between two PRESSURES. When the lower of the pressures is that of the atmosphere, the total (or absolute) pressure is the sum of the gauge and atmospheric pressures.

Prester John Legendary Christian ruler of the East. He was believed to be a NESTORIAN and a king-priest (prester being short for presbyter, "elder" or "priest") reigning in an unspecified part of the Far East. The legend arose during the CRUSADES in the 12th century, among European Christians who hoped that Prester John would prove an ally in the effort to regain the Holy Land from the SARACENS. In the 13th–14th century various missionaries and travelers, including Marco POLO, searched for his kingdom in Asia. After the mid-14th century, Ethiopia was the centre of the quest, as Prester John became identified with the emperor of that African Christian nation.

Prestes \'prās-tās**, Luís Carlos** (b. Jan. 3, 1898, Pôrto Alegre, Rio Grande do Sul, Braz.—d. March 7, 1990, Rio de Janeiro) Brazilian revolutionary. Beginning in 1924, he led a rebel force on a three-year trek through Brazil's interior in an effort to spark a rebellion in the countryside. Although the effort failed, he became a romantic hero. He went on to lead the Brazilian Communist Party, which advocated ending payments on the national debt, nationalization of foreign-owned companies, and LAND REFORM. Imprisoned after a violent uprising in 1935, he was released after World War II and later served briefly as a senator.

Preston City and borough (pop., 2001: 129,642), county seat of LANCASHIRE, England. On the River RIBBLE, Preston grew near the site of a Roman fort and received its first charter in 1179. As a market centre, it became known for its wool and linen weaving and its cotton mills. It was the site of the Lancashire Royalist headquarters during the ENGLISH CIVIL WARS. The Royalists were defeated there by OLIVER CROMWELL in 1648. Despite the decline of the cotton textile industry, the economy has remained strong through diversification, and it produces aircraft and motor vehicles.

prestressed concrete Concrete reinforced by either pretensioning or posttensioning, allowing it to carry a greater load or span a greater distance than ordinary REINFORCED CONCRETE. In pretensioning, lengths of steel wire or cables are laid in the empty mold and stretched. The concrete is placed and allowed to set, and the cables are released, placing the concrete into compression as the steel shrinks back to its original length. In posttensioning, the steel in the concrete is stretched after the curing process. Prestressing places a concrete member in compression; these compressive stresses counteract the tensile bending stresses of an applied load. The process was developed by the French engineer Eugène Fressinet in the early 20th century.

Pretoria \pri-'tōr-ē-ə\ City (pop., 2005 est.: metro. area, 1,282,000), administrative capital of the Republic of South Africa. Founded in 1855, it became the capital of the TRANSVAAL in 1860, the administrative capital of South Africa in 1910, and a city in 1931. In 1899, during the SOUTH AFRICAN WAR (1899–1902), WINSTON CHURCHILL was imprisoned there until his escape. Pretoria is primarily a seat of government, and most people are employed in the service sector. It is also an important rail centre, with an industrial economy based on iron and steel. Its educational institutions include the University of South Africa (1873) and the University of Pretoria (1908). Pretoria became part of the Tshwane Metropolitan Municipality in 2000. See also BLOEMFONTEIN; CAPE TOWN.

Pretorius \prə-'tü-rē-ēs**, Andries (Wilhelmus Jacobus)** (b. Nov. 27, 1798, near Graaff-Reinet, Cape Colony—d. July 23, 1853, Magaliesberg, Transvaal) Boer leader in the GREAT TREK. Pretorius's forces defeated the ZULU at Blood River in 1838 and at Magono in 1840. In 1842 he led an unsuccessful fight with the British over the annexation of Natal. Following British annexation of Transvaal in 1848, his forces again attacked and were again defeated. In 1852 he participated in the Sand River Convention, where Transvaal independence was recognized. He led negotiations for independence of the Orange River Sovereignty, finally guaranteed by the Bloemfontein Convention of 1854. His son Marthinus Wessel Pretorius (1819–1901) was the first president of the South African Republic (1857, 1864, 1869) and president of the Orange Free State (1859–63). After British annexation of the Transvaal, Marthinus joined insurgent Boer leaders and helped win recognition of its independence. He was a member of the ruling triumvirate until the election of PAUL KRUGER as president in 1883.

preventive medicine Efforts toward disease prevention in the community and the individual. It covers patient interviews and testing to detect risk factors; sanitary measures in homes, communities, and medical facilities; patient education; and diet and exercise programs as well as preventive drugs and surgery. It has three levels: primary (e.g., prevention of coronary heart disease in a healthy person), secondary (e.g., prevention of heart attack in a person with heart disease), and tertiary (e.g., prevention of disability and death after a heart attack). The first is by far the most economical. Important advances in preventive medicine include vaccination (see VACCINE), ANTIBIOTICS, DIAGNOSTIC IMAGING, and recognition of psychological factors. See also EPIDEMIOLOGY, IMMUNOLOGY, INDUSTRIAL MEDICINE, QUARANTINE.

Prévert \prā-'ver**, Jacques (-Henri-Marie)** (b. Feb. 4, 1900, Neuilly-sur-Seine, France—d. April 11, 1977, Omonville-la-Petite) French poet and screenwriter. A shop worker, he began writing after his military service. Influenced by the SYMBOLIST MOVEMENT, he renewed the ancient tradition of oral poetry, creating "song poems" about Paris street life, collected in the anthology *Words* (1945). Many were put to music and became extremely popular. His excellent screenplays for MARCEL CARNÉ include *The Children of Paradise* (1945), *Spectacle* (1951), and *Things and Other Things* (1972). He also worked for French television and on animated films for children.

Previn \'pre-vin**, André (George)** *orig.* **Andreas Ludwig Priwin** (b. April 6, 1929, Berlin, Ger.) German-born U.S. pianist, composer, and conductor. He fled Nazi persecution with his family and moved to Los Angeles in 1939. He orchestrated and arranged music for MGM in the 1940s and '50s and thereafter scored films for several studios. Meanwhile he had become a noted classical and jazz pianist and started conducting. He served as principal conductor of the Houston Symphony, London Symphony, Pittsburgh Symphony, Los Angeles Philharmonic, and Royal Philharmonic orchestras. He also composed a symphony, concertos, and the opera *A Streetcar Named Desire* (1998), as well as popular songs. He was knighted in 1996.

Prévost d'Exiles \prā-ˌvō-dāg-'zēl**, Antoine-François, Abbé** *known as* **Abbé Prévost** (b. April 1, 1697, Hesdin, France—d. Nov. 25, 1763, Chantilly) French novelist. From an early age Prévost alternated between enlistments in the army and entries into the religious life, which he eventually fled in 1728. Subsequent years were marked by numerous love affairs and debt. His fame rests entirely on one work—*Manon Lescaut* (1731), a sentimental novel about a young man of good family who ruins his life for a courtesan, which became the basis of two famous operas, Jules Massenet's *Manon* and GIACOMO PUCCINI's *Manon Lescaut*.

PRI See INSTITUTIONAL REVOLUTIONARY PARTY

Priam \'prī-əm\ In GREEK MYTHOLOGY, the last king of TROY. He succeeded his father Laomedon as king and gradually expanded Troy's control over the Hellespont. By his wife, HECUBA, he had many children, including HECTOR and PARIS. He reigned during the TROJAN WAR; in its final year he lost 13 sons, three of whom were killed by ACHILLES in a single day. Hector's death broke his spirit, and he went humbly to Achilles to ask for the corpse. When Troy fell, Achilles' son Neoptolemus killed the elderly Priam on an altar.

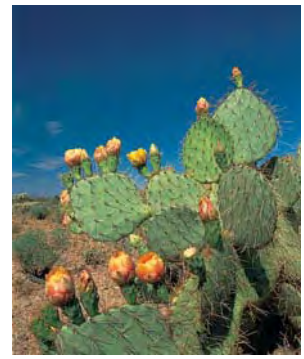
Priapus \prī-'ā-pəs\ Greek god of animal and vegetable fertility. He was represented in a caricature of the human form, grotesquely misshapen, with an enormous phallus. The ass was sacrificed in his honor, probably because it symbolized lecherousness and was associated with the god's sexual potency. His father was DIONYSUS and his mother was either a local nymph or APHRODITE. In Hellenistic times the worship of Priapus spread throughout the ancient world, and he was adopted as the god of gardens.

Pribilof \'pri-bə-ˌlȯf\ **Islands** Group of islands, southeastern BERING SEA, Alaska, U.S. It includes St. Paul, St. George, and three islets, and it lies about 300 mi (500 km) west of the mainland. Control of the islands was transferred from Russia to the U.S. with the ALASKA PURCHASE (1867). The islands are hilly and treeless with no harbours. They are breeding grounds from April to November for most of the world's fur seals. Commercial harvesting of seals was discontinued in 1986. The islands are also home to enormous numbers of birds and both blue and white phases of Arctic foxes. The indigenous population is made up of ALEUTS.

price Amount of MONEY that has to be paid to acquire a given good, service, or resource. Operating as a measure of value, prices perform a significant economic function, distributing the scarce supply of goods,

© 2006 Encyclopædia Britannica, Inc.

services, and resources to those who most want them through the adjustments of SUPPLY AND DEMAND. Prices of resources are called wages, interest, and rent. This system, known as the price mechanism, is based on the principle that only by allowing prices to move freely will the supply of any given commodity match demand. If supply is excessive, prices will be low and production will be reduced; this will cause prices to rise until there is a balance of demand and supply. If supply is inadequate, prices will be high, prompting an increase in production that in turn will lead to a reduction in prices until supply and demand are in equilibrium. A totally free price mechanism does not exist in practice; even in free-market economies, MONOPOLIES or government regulation may limit the efficiency of price as a determinant of supply and demand. In centrally planned economies, the price mechanism may be supplanted by centralized government control. Attempts to operate an economy without a price mechanism usually result in surpluses of unwanted goods, shortages of desired products, BLACK MARKETS, and stunted economic growth.



Price, (Mary Violet) Leontyne (b. Feb. 10, 1927, Laurel, Miss., U.S.) U.S. soprano. She was trained at the Juilliard School. After her debut in a revival of *Four Saints in Three Acts* in 1952, she made her name in the international tour of *Porgy and Bess* (1953–55). She sang in *Aïda* at Milan's La Scala in 1960 and made her Metropolitan Opera debut in 1961. Price was one of the Met's most popular stars for more than two decades and was the first African American singer to achieve an international reputation in opera. She gave her farewell performance of *Aïda* at the Met in 1985 but continued to give recitals.

Price, Vincent (Leonard) (b. May 27, 1911, St. Louis, Mo., U.S.—d. Oct. 25, 1993, Los Angeles, Calif.) U.S. actor. He first appeared onstage in a London production of the play *Chicago* and then played the leading role as Prince Albert in *Victoria Regina* (1935), which he reprised on Broadway. In 1938 he went to Hollywood, where he became known for his cultivated manner and silken voice. He played historical roles in *The Private Lives of Elizabeth and Essex* (1939), *Hudson's Bay* (1941), and *The Three Musketeers* (1948). He was the menacing villain in horror movies such as *House of Wax* (1953) and *The Abominable Dr. Phibes* (1971) as well as a series of ROGER CORMAN movies adapted from EDGAR ALLAN POE stories, including *The Masque of the Red Death* (1964). He accepted occasional film and television roles throughout his later years; his performances in *The Whales of August* (1987) and *Edward Scissorhands* (1990) were particularly memorable.

price discrimination Practice of selling goods or services at different prices to different buyers, even though sales costs are the same for all the transactions. Buyers may be discriminated against on the basis of income, ethnicity, age, or geographic location. For price discrimination to succeed, other entrepreneurs must be unable to purchase goods at the lower price and resell them at a higher one.

price index Measure of change in a set of PRICES, consisting of a series of numbers arranged so that a comparison of the values for any two periods or places will show the change in prices between periods or the difference in prices between places. Price indexes were first developed to measure changes in the cost of living in order to determine the wage increases necessary to maintain a constant STANDARD OF LIVING. There are two basic types. Laspeyres-type indexes define a market basket of goods in a base period, then use the prices for those goods to examine change over space and time. In its simplest form, this is simply the ratio of what those goods cost today to what they cost in the base period. The two most familiar indexes of this type are the CONSUMER PRICE INDEX (CPI) and the producer price index (PPI). The CPI measures changes in retail prices in such component parts as food, clothing, and shelter. The PPI (formerly called the wholesale price index) measures changes in the prices charged by manufacturers and wholesalers. Paasche-type indexes define a market basket of goods in the current period, then use the prices of those goods from past periods. The most familiar index of this type is the GDP deflator, used in the U.S. in the NATIONAL INCOME ACCOUNTING to differentiate amounts in constant dollars from those in current dollars.

prickly pear Any of a group of flat-stemmed, spiny OPUNTIA cacti (see CACTUS), native to the Western Hemisphere, or the edible fruit of certain species. Engelmann prickly pear (*Opuntia engelmannii*) and beaver tail cactus (*O. basilaris*) commonly occur in the southwestern U.S. The Indian fig (*O. ficus-indica*) is an important food in tropical and subtropical countries. Because their stems have a high water content, prickly pears can be used as forage crops and emergency stock feed during drought. Some species are cultivated as ornamentals and valued for their large flowers.

Engelmann prickly pear (*Opuntia engelmannii*)
GRANT HEILMAN PHOTOGRAPHY

Pride, Sir Thomas (b. Somerset?, Eng.—d. Oct. 23, 1658, Worcester House, Surrey) English soldier. Joining the Parliamentary army in the ENGLISH CIVIL WARS, he commanded a regiment in the Battle of NASEBY (1645), then served with OLIVER CROMWELL and helped rout the invading Scots at Preston (1648). When the army, dominated by the Independents, occupied London later that year, Pride arrested or expelled about 140 Presbyterian members from the House of Commons ("Pride's Purge"). He was a member of the commission that tried King CHARLES I.

Pridi Phanomyong \'prē-dē-'pä-nōm-ˌyōŋ\ *or* **Luang Pradist Manudharm** \lü-'äŋ-prä-'dist-ˌmä-nù-'därm\ (b. May 11, 1900, Ayutthaya, Siam—d. May 2, 1983, Paris, France) Thai political leader and prime minister. He earned a doctorate in law in France, where he was influenced by socialism and where, with LUANG PHIBUNSONGKHRAM and others, he plotted to overthrow the absolute monarchy in Siam (Thailand). Pridi participated in the PROMOTERS REVOLUTION and helped write the constitution of December 1932. He engineered the downfall of Phibunsongkhram's pro-Japanese government (1944) and in 1946 became Thailand's first popularly elected prime minister. Unjustly held responsible for the assassination of King Ananda that year, he was forced to resign and flee the country in 1947. He lived in China until 1970, when he moved to France.

Priene \prī-'ē-nē\ Ancient city of IONIA, north of the MENDERES (Maeander) River, southwestern Anatolia. According to STRABO, it was founded by Ionians and Thebans. It was sacked in the 7th century BC but regained its position in the 6th century BC. It prospered under the Romans and Byzantines but gradually declined. After passing into Turkish hands in the 13th century AD, it was abandoned. Archaeological excavations revealed a Greek town built on terraces; atop a nearby hill is a temple of Athena Polias that was dedicated by ALEXANDER THE GREAT in 334 BC.

priesthood Office of a spiritual leader expert in the ceremonies of worship and the performance of religious rituals. Though chieftains, kings, and heads of households have sometimes performed priestly functions, in most civilizations the priesthood is a specialized office. The priest's duties are concerned less with magic than with the right performance of ritual acts required by the divine powers. Many African societies, for example, differentiated between SHAMANS and the priests responsible for the worship of tribal ancestors. SACRIFICE is often one of the most important duties of the priesthood. Not every highly developed religion possesses a priesthood, the most notable exception being ISLAM. The idea of the "priesthood of all believers" was also a cardinal doctrine of the REFORMATION, and the Protestant belief that priests are not needed as intermediaries between church members and the HOLY SPIRIT is seen most clearly in sects such as the Society of FRIENDS.

Priestley, Joseph (b. March 13, 1733, Birstall Fieldhead, near Leeds, Yorkshire, Eng.—d. Feb. 6, 1804, Northumberland, Pa., U.S.) English theologian, political theorist, and physical scientist. He worked as a teacher and lecturer in various subjects before joining the ministry in 1767. His early scientific studies resulted in his *History and Present State of Electricity* (1767), which became a fundamental text in the field. His *Essay on Government* (1768) influenced later UTILITARIANISM. He did important work in the field of chemical reactions and change. He is considered the discoverer of nitrogen, carbon monoxide, ammonia, and several other gases, and in 1774 he became the first to identify oxygen; his report led ANTOINE LAVOISIER to repeat the experiment, deduce oxygen's nature and role, and name it. His theological works include *History of the Corruptions of the Christian Church* (1782), burned as sacrilegious in 1785, and *A General History of the Christian Church*, 6 vol. (1790–1802). His nonconformist religious views and his political activities, particularly in sup-

port of the French Revolution, made him increasingly controversial in England, and he immigrated to the U.S. in 1794.

primary education See ELEMENTARY EDUCATION

primary election Electoral device for choosing a party's candidates for public office. The formal primary system is peculiar to the U.S., where it came into widespread use in the early 20th century. Most U.S. states use it for elections to statewide offices and to the national presidency; in presidential elections, delegates are selected to attend a national convention, where they vote for the candidate to whom they are pledged. A closed-vote primary is restricted to party members; an open-vote primary is open to all voters in the district. Names can be placed on a ballot by an eligible citizen's declaration of candidacy, by nomination at a pre-primary convention, or by a petition signed by a required number of voters. In the late 20th and early 21st centuries political parties in some countries (e.g., the United Kingdom and Israel) adopted similar procedures for the election of the national party leader. See also ELECTORAL SYSTEM; PARTY SYSTEM.

primate Any of more than 300 species of the order Primates, including monkeys, apes, humans, and others. Primates are distinguished from other MAMMALS by one or more of the following traits: unspecialized structure, specialized behaviour, a short muzzle, comparatively poor sense of smell, prehensile five-digit hands and feet possessing flat nails instead of claws, acute vision with depth perception due to forward-facing eyes, a large brain, and prolonged pre- and postnatal development. Most species bear a single young and live in troops headed by a male. The primates are one of the most diverse orders of mammals on Earth. They include the LEMURS (more than 70 species in six families), the LORISES (three or more species in one subfamily), the TARSIERS (six or more species in one family), the NEW WORLD MONKEYS (almost 100 species in five families), the OLD WORLD MONKEYS (more than 100 species in one family), and the APES and humans (about 20 species in two families). The oldest known fossil remains of primates are about 60 million years old.

Primaticcio \ˌprē-mə-'tēt-chō**, Francesco** (b. April 30, 1504, Bologna, Emilia—d. 1570, Paris, France) Italian-born French painter, sculptor, and architect. In 1532 FRANCIS I invited him to help redecorate the FONTAINEBLEAU Palace, and Primaticcio became one of the principal artists in France; he remained there the rest of his life, making only brief trips to Italy. His decorative style in painting and stucco sculpture stressed the human figure; the exaggerated musculature and active, elongated forms of his figures greatly influenced 16th-century French art. One of the first artists in France to replace religious themes with those of Classical mythology, he brought a quiet French elegance to Italian MANNERISM.

prime minister *or* **premier** \pri-'mir, pri-'myir\ Head of the executive branch of government in states with a parliamentary system (see PARLIAMENTARY DEMOCRACY). The prime minister is the leader of the POLITICAL PARTY or coalition with a governing majority, and is formally appointed by the head of state. The office was developed in Britain by ROBERT WALPOLE; its powers were consolidated by WILLIAM PITT the Younger. The British prime ministry has served as a model for the heads of government in many Commonwealth countries, Europe, and Japan. The prime minister has appointive powers and is responsible for the government's legislative program, budget, and other policies. His term of office lasts until the next scheduled election or until he loses legislative support. In France, which has both a PRESIDENT and a prime minister, the president wields greater power but the prime minister controls the domestic legislative agenda. See also CHANCELLOR.

prime number Any positive INTEGER greater than 1 and exactly divisible only by 1 and itself. The sequence of prime numbers begins 2, 3, 5, 7, 11, 13, 17, 19, 23, 29… but follows no discernible pattern. The issues of the regularities and irregularities in the distribution of primes are among the most important questions in NUMBER THEORY. Primes have been recognized at least since PYTHAGORAS. It has been known that there are infinitely many of them at least since EUCLID. The prime-number FACTORS of an integer are the prime numbers whose product is that integer (see FUNDAMENTAL THEOREM OF ARITHMETIC).

Primo de Rivera \'prē-mō-ᵺā-ri-'ver-ə**, José Antonio** (b. April 24, 1903, Madrid, Spain—d. Nov. 20, 1936, Alicante) Spanish politician. Son of the dictator Miguel PRIMO DE RIVERA, he began a legal career in 1925. In 1933 he founded the Spanish fascist party, the FALANGE, and was elected to the Cortes (parliament). He expounded his views in his periodicals *F.E.* (1934) and *Arriba* (1935) and made speeches across Spain. After the leftist Popular Front came to power (1936), he was arrested, given a summary trial, and executed at age 33. He was treated as a martyr by FRANCISCO FRANCO's Nationalist movement.

Primo de Rivera, Miguel (b. Jan. 8, 1870, Cádiz, Spain—d. March 16, 1930, Paris, France) Spanish general and dictator of Spain (1923–30). A military officer from 1888, he served as military governor of Cádiz (1915–19), Valencia (1919–22), and Barcelona (1922–23), where he firmly suppressed disorder. Believing the parliamentary system to be corrupt, he took power in a coup in 1923, dissolved the Cortes (parliament), and suspended constitutional guarantees. He successfully ended the Moroccan War (1927), settled labour disputes, and undertook public works, but he failed to implement agrarian reforms. Increasing discontent with his repressive government and lack of support from the army forced him to resign in 1930. José Antonio PRIMO DE RIVERA was his son.

primogeniture \ˌprī-mō-'je-nə-ˌchůr\ Preference in INHERITANCE that is given by law or custom to the eldest son and his issue. The motivation for such a practice has usually been to keep the estate of the deceased, or some part of it, whole and intact, and to acknowledge the importance of age-seniority within the social hierarchy. It is no longer a recognized principle of inheritance in most jurisdictions.

primrose Any flowering plant of the genus *Primula*, one of 28 genera of the family Primulaceae. *Primula* includes more than 500 species, which occur chiefly in the Northern Hemisphere in cool or mountainous regions. The plants are low-growing, usually perennial herbs; a few are biennials. Most species grow 25–50 cm (10–20 inches) tall, but some are as short as 5 cm and others as tall as 120 cm. Many species are cultivated for their attractive, five-petaled flowers, which may be red, pink, purple, blue, white, or yellow. Other plants in the primrose family include CYCLAMENS and pimpernels. The EVENING PRIMROSE (family Onagraceae) is not a true primrose.

Primus \'prī-məs**, Pearl** (b. Nov. 29, 1919, Port of Spain, Trin.—d. Oct. 29, 1994, New Rochelle, N.Y., U.S.) U.S. dancer, choreographer, and anthropologist. Her family moved to New York City when she was two years old. She made her dance debut as the first black member of the New Dance Group in 1943 and formed her own company the next year. Her anthropological research in Africa and the Caribbean led her to choreograph works such as *African Ceremonial* (1944) and *The Wedding* (1961), and she obtained a Ph.D. from Columbia University.

Prince *orig.* **Prince Rogers Nelson** (b. June 7, 1958, Minneapolis, Minn., U.S.) U.S. singer and songwriter. The son of a jazz pianist, he taught himself several instruments and formed his own bands as a teenager. At age 19 he released his first album, on which he played all the instruments. His second album, *Prince* (1979), was followed by many others, including the best-selling *1999* (1982), the soundtrack of the film *Purple Rain* (1983), in which he also starred, and *Diamonds and Pearls* (1991). In 1993 he changed his name to an unpronounceable symbol and became known as "the artist formerly known as Prince," but in 2000 he resumed his previous name. In 2004 he was inducted into the Rock and Roll Hall of Fame.

prince European title of rank, usually denoting a person exercising complete or almost complete sovereignty or a member of a royal family. The wife of a prince is a princess. In Britain, the title was not used until 1301, when EDWARD I invested his son, the future EDWARD II, as prince of Wales. From EDWARD III's time, the king's (or queen's) eldest son and heir has usually been so invested.

Prince, Hal *orig.* **Harold Smith Prince** (b. Jan. 30, 1928, New York, N.Y., U.S.) U.S. theatrical producer and director. He worked for the producer GEORGE ABBOTT before coproducing the successful musical *The Pajama Game* (1954). He went on to produce or coproduce over 30 hit musicals, including *Damn Yankees* (1955), *West Side Story* (1957), *A Funny Thing Happened on the Way to the Forum* (1962), and *Fiddler on the Roof* (1964). Frequently working with STEPHEN SONDHEIM, he won Tony Awards for his direction of the musicals *Cabaret* (1966), *Company* (1970), *Follies* (1971), *Candide* (1974), *Sweeney Todd* (1979), *Evita* (1979), *The Phantom of the Opera* (1986), and *Show Boat* (1995).

Prince Albert National Park Park, central Saskatchewan, Canada. Its main entrance is northwest of the city of Prince Albert. Established in 1927, it has an area of 1,496 sq mi (3,875 sq km) and is mostly woodland and lakes, interlaced with streams and nature trails. It is a sanctuary for birds, moose, elk, caribou, and bears.

© 2006 Encyclopædia Britannica, Inc.

Prince Edward Island Province (pop., 2000 est.: 138,900), Canada. One of the Maritime Provinces and Canada's smallest province, it is an island in the southern Gulf of St. Lawrence, separated from Nova Scotia and New Brunswick by the Northumberland Strait. Its capital is Charlottetown. Discovered by Jacques Cartier in 1534, it was used by Micmac Indians for fishing and hunting. It was colonized by the French in 1720, then ceded to the British in 1763. Known as the "Cradle of Confederation," it was the site of the Charlottetown Conference of 1864, which led to the federation of Canada. It became a province in 1873. It has good natural harbours on its eastern and southern sides. There has been little industrial development, and more than half of the island is used for agriculture. Fishing and tourism are also of economic importance. In 1997 a bridge opened between Prince Edward Island and the mainland.

Prince of Wales Strait Narrow channel between Banks Island and northwestern Victoria Island in the southwestern Arctic Archipelago of the Northwest Territories, Canada. It is about 170 mi (274 km) long and forms part of the Northwest Passage between the Atlantic and Pacific oceans. It was discovered in 1850 by the Irish explorer Robert McClure.

Prince Rupert's Land See Rupert's Land

Prince William Sound Inlet of the Gulf of Alaska, southern Alaska, U.S. It lies east of the Kenai Peninsula and spans 90–100 mi (145–160 km). It was named by the British captain George Vancouver in 1778 to honour a son of George III. In 1989 one of the most disastrous oil spills in history occurred when the tanker *Exxon Valdez* ran aground on Bligh Reef and lost 10.9 million gallons of crude oil into the sound.

princeps *Latin* **"first one," "leader"** Unofficial title used by Roman emperors from Augustus (r. 27 BC–AD 14) to Diocletian (r. 284–305), a period called the principate. The title originated during the Roman republic, when it was held by the leading member of the Senate. Its use by Augustus strengthened his claim to be the restorer of republican institutions and virtues, though he and his successors were in fact autocrats. See also prince.

Princeton, Battles of Trenton and See Battles of Trenton and Princeton

Princeton University Private university in Princeton, New Jersey, U.S., a traditional member of the Ivy League. Founded as the College of New Jersey in 1746, it is the fourth oldest university in the U.S. and one of the most prestigious. Woodrow Wilson served as university president (1902–10). In addition to an undergraduate college and a graduate school, Princeton has a school of engineering and applied science and a school of architecture and urban planning. Its Woodrow Wilson School of Public and International Affairs continues a long Princeton tradition of training government officials. The university has admitted women since 1969.

Princip \'prēnt-sēp**, Gavrilo** (b. July 25, 1894, Obljaj, Bosnia—d. April 28, 1918, Theresienstadt, Austria) Serbian nationalist and assassin of Archduke Francis Ferdinand. A Bosnian Serb, he sought to unite the southern Slavic peoples and destroy Austro-Hungarian rule in the Balkans and was trained in terrorism by the Black Hand society. When the Austro-Hungarian archduke made an official visit to Sarajevo in June 1914, Princip shot him and his wife, Sophie. The assassinations precipitated World War I. Princip was sentenced to 20 years in prison, where he died after the amputation of his arm.

Príncipe See São Tomé and Príncipe

Pringle, Sir John (b. April 10, 1707, Stitchel, Roxburgh, Scot.—d. Jan. 18, 1782, London, Eng.) British physician. As physician general to the British armed forces (1740–48), he applied his knowledge to hospitals and army camps. In *Observations on the Diseases of the Army* (1752), he outlined procedures for hospital ventilation and camp sanitation. He recognized the various forms of dysentery as one, equated hospital and jail fevers, and coined the term *influenza*. His suggestion that military hospitals be respected as sanctuaries by both sides in a conflict led to the establishment of the Red Cross.

printed circuit Electrical device in which the wiring and certain components consist of a thin coat of electrically conductive material applied in a pattern on an insulating substrate. Printed circuits replaced conventional wiring after World War II in much electronic equipment, greatly reducing size and weight while improving reliability and uniformity over the hand-soldered circuits formerly used. They are commonly used to mount integrated circuits on boards for use as plug-in units in computers, televisions, and other electronic devices. Mass-produced printed circuit boards allow automated assembly of electronic components, considerably reducing their cost.

printer, computer Electronic device that accepts text files or images from a computer and transfers them to a medium such as paper or film. It can be connected directly to the computer or indirectly via a network. Printers are classified as impact printers (in which the print medium is physically struck) and non-impact printers. Most impact printers are dot-matrix printers, which have a number of pins on the print head that emerge to form a character. Non-impact printers fall into three main categories: laser printers use a laser beam to attract toner to an area of the paper; ink-jet printers spray a jet of liquid ink; and thermal printers transfer wax-based ink or use heated pins to directly imprint an image on specially treated paper. Important printer characteristics include resolution (in dots per inch), speed (in sheets of paper printed per minute), colour (full-colour or black-and-white), and cache memory (which affects the speed at which a file can be printed).

printing Process for reproducing text and illustrations, traditionally by applying ink to paper under pressure, but today including various other methods. In modern commercial printing, three basic techniques are used. Letterpress printing relies on mechanical pressure to transfer a raised inked image to the surface to be printed. Gravure printing transfers ink from recessed cells of varying depths. In offset printing the printing and non-printing areas of the plate differ not in height but in wettability.

printmaking Art form consisting of the production of images, usually on paper but occasionally on fabric, parchment, plastic, or other support, by various techniques of multiplication, under the direct supervision of or by the hand of the artist. Such fine prints are considered original works of art, even though they can exist in multiple copies. The major techniques are relief printing, where the background is cut away, leaving a raised image; intaglio printing, where the image is incised directly into the plate; surface printing such as lithography, where the image is painted or drawn onto a stone; and stencil printing, where the design is cut out and printed by spraying paint or ink through the stencil. The history of printmaking parallels the history of art and is one of the oldest art forms. Though he had several predecessors, the first important engraver was a 15th-century German, Martin Schongauer. In the 16th century Albrecht Dürer created prints of the highest quality, and in the 17th century the etchings of Rembrandt were especially fine. Japanese printmaking originated in the 17th century with the ukiyo-e school of woodcuts; the best-known artists were Hokusai and Hiroshige. Important 18th-century Western artists who made prints include William Hogarth, Francisco Goya, and Giambattista Piranesi. Among the works of 19th-century printmakers, those of Honoré Daumier and of many of the French Impressionists are notable. Experimentation in new styles and new directions proliferated in the 20th century, with artists from the century's major movements—including Expressionism, Surrealism, Pop art, Minimalism, and Neo-Expressionism—all pursuing printmaking. See also engraving; etching; mezzotint; woodcut.

prion \'prē-ˌän\ Disease-causing agent, discovered by Stanley Prusiner, responsible for various fatal neurodegenerative diseases called transmissible spongiform encephalopathies. An abnormal form of a normally harmless protein found in mammals and birds, the disease-causing prion can enter the brain through infection, or it can arise from a mutation in the gene that encodes the protein. Once present in the brain it causes normal proteins to refold into the abnormal shape. As prion proteins multiply, they accumulate within nerve cells, destroying them and eventually causing brain tissue to become riddled with holes. Diseases caused by prions include Creutzfeldt-Jakob disease, mad cow disease, and scrapie. Prions are unlike all other known disease-causing organisms in that they appear to lack nucleic acid (DNA or RNA).

Pripet \'pri-ˌpet\ **Marshes** Vast marsh region, southern Belarus and northwestern Ukraine. The largest swamp of the European continent, the marshes lie in the thickly forested basin of the Pripet River. They cover an area of about 104,000 sq mi (270,000 sq km). Densely wooded and largely uninhabited, the region has supported a diversified lumber industry. A vast amount of land reclamation took place during the 20th century, including the regulation of water drainage, permitting the development of agricultural areas.

Pripet \'pri-ˌpet\ **River** *Belarusian* **Prypyats' River** *Ukrainian* **Pryp'yat River** River, northwestern Ukraine and southern Belarus. Rising in northwestern Ukraine near the Polish border, it flows east

© 2006 Encyclopædia Britannica, Inc.

through the Pripet Marshes to Mazyr, then joins the Dnieper River in the Kiev Reservoir after a course of 480 mi (775 km). It is navigable for 300 mi (483 km) and is connected by canals with the Bug and Neman rivers.

Priscian \'pri-shən\ *Latin* **Priscianus Caesariensis** (b. c. 500, Caesarea, Mauretania) Latin grammarian. He used the writings of Apollonius Dyscolus on Greek grammar as a guide in producing his own classic works on Latin grammar. His *Institutiones grammaticae* ("Grammatical Foundations"), with citations from Latin authors, became the standard work for teaching grammar in the Middle Ages. His other writings include treatises on weights and measures and on the metres of Terence.

prism Piece of glass or other transparent material cut with precise angles and plane faces. Prisms are useful for analyzing and refracting light (see refraction). A triangular prism can separate white light into its constituent colours by refracting each different wavelength of light by a different amount. The longer wavelengths (those at the red end of the spectrum) are bent the least, the shorter ones (those at the violet end) the most. The result is the spectrum of visible light, or the rainbow. Prisms are used in certain kinds of spectroscopy and in various optical systems.

prison Institution for the confinement of people convicted of crimes. Prisons are administered by state, provincial, or national governments and house inmates for relatively long terms. They thus differ from jails, which usually are under local jurisidiction and house inmates serving short sentences. Until the late 18th century, prisons were used mainly for the confinement of debtors who could not meet their obligations, of accused persons waiting to be tried, and of convicts who were waiting for their sentences of death or banishment to be put into effect. Later, imprisonment itself came to be accepted as a means of punishing convicted criminals. In early U.S. prisons, prisoners were kept in isolation; in the 19th century, they were permitted to work together, but only in silence. At the end of the 19th century, prison reformers successfully advocated segregation of criminals by type of crime, age, and sex; rewards for good behaviour; indeterminate sentencing; vocational training; and parole. In the late 20th century, prison populations in many countries began to explode as arrests for violent offenses and for possession of small amounts of illegal drugs increased.

prisoner's dilemma Imaginary situation employed in game theory. One version is as follows. Two prisoners are accused of a crime. If one confesses and the other does not, the one who confesses will be released immediately and the other will spend 20 years in prison. If neither confesses, each will be held only a few months. If both confess, they will each be jailed 15 years. They cannot communicate with one another. Given that neither prisoner knows whether the other has confessed, it is in the self-interest of each to confess himself. Paradoxically, when each prisoner pursues his self-interest, both end up worse off than they would have been had they acted otherwise. See egoism.

Priština \'prēsh-tē-ˌnä\ City (pop., 2000 est.: 186,611), Kosovo region, Serbia, Serbia and Montenegro. It is the capital of the Kosovo region (administered by the UN from mid-1999). Priština was the capital of the Serbian state before the Turks defeated the Balkan Christian armies in 1389 at the Battle of Kosovo. It is also a cultural centre for Kosovar Albanians, though it lost many of its ethnic Albanian inhabitants in 1999 when they were driven out by the Serbian campaign of "ethnic cleansing" (see Kosovo conflict). Many returned after a peace accord was signed in June 1999, however.

Pritchett, Sir V(ictor) S(awdon) (b. Dec. 16, 1900, Ipswich, Suffolk, Eng.—d. March 20, 1997, London) British novelist, short-story writer, and critic. A full-time journalist from 1922 and a literary critic for the *New Statesman* (1928–65), Pritchett became known for his perceptive essays and reviews and for his penetrating and finely crafted short stories. His collections, which offer lively, ironic portraits of middle-class life, include *You Make Your Own Life* (1938), *Blind Love* (1969), and *A Careless Widow* (1989). He also wrote novels, travel books, and the admired memoirs *A Cab at the Door* (1968) and *Midnight Oil* (1971).

Prithvi Narayan \'prit-vē-'nä-rä-yän\ **Shah** (b. 1723?—d. 1775) Founder of the modern state of Nepal. A member of the ruling Shah family of Gurkha (Gorkha) principality, he conquered the three Malla kingdoms (see Malla era) and consolidated them. After unifying Nepal, he annexed territory in northern India, as well as large portions of the Plateau of Tibet and of the valleys of the Inner Himalayas. He sealed Nepal's border and maintained peaceful but distant relations with the British.

Pritzker Architecture Prize World's most prestigious honour in the field of architecture. Established through the philanthropic efforts of the Pritzkers, a prominent Chicago business family, the prize, first awarded in 1979, bestows an annual award of $100,000 on an architect whose built contributions to the field and to society are judged worthiest. The international jury has included architects, artists, historians, academicians, critics, and business executives.

privacy, right of Right of a person to be free from intrusion into matters of a personal nature. Although not explicitly mentioned in the U.S. Constitution, a right to privacy has been held to be implicit in the Bill of Rights, providing protection from unwarranted government intrusion into areas such as marriage and contraception. A person's right to privacy may be overcome by a compelling state interest. In tort law, privacy is a right not to have one's intimate life and affairs exposed to public view or otherwise invaded. Less broad protections of privacy are afforded public officials and others defined by law as "public figures" (e.g., movie stars).

privateer Privately owned vessel commissioned by a state at war to attack enemy ships, usually merchant vessels. All nations engaged in privateering from the earliest times until the 19th century. Crews were not paid by the government but were entitled to receive portions of the value of any cargo they seized. Limiting privateers to the activities laid down in their commissions was difficult, and the line between privateering and piracy was often blurred. In 1856, by the Declaration of Paris, Britain and other major European countries (except Spain) declared privateering illegal; the U.S. finally repudiated it at the end of the 19th century, and Spain agreed to the ban in 1908. See also buccaneer, Francis Drake, William Kidd, Jean Laffite.

privatization Transfer of government services or assets to the private sector. State-owned assets may be sold to private owners, or statutory restrictions on competition between privately and publicly owned enterprises may be lifted. Services formerly provided by government may be contracted out. The objective is often to increase government efficiency; implementation may affect government revenue either positively or negatively. Privatization is the opposite of nationalization, a policy resorted to by governments that want to keep the revenues from major industries, especially those that might otherwise be controlled by foreign interests.

privet \'pri-vət\ Any of about 40–50 species of shrubs and small trees in the genus *Ligustrum* of the olive family that are widely used for hedges, screens, and ornamental plantings. Native to Europe, Asia, Australia, and the Mediterranean, these evergreen or deciduous plants have usually oval, smooth-edged leaves; creamy-white, often odorous clusters of flowers; and black berries. The hardy common privet (*L. vulgare*), native to northeastern Europe and Britain and naturalized in northeastern North America, is used widely as a hedge plant. Mock privets belong to the genus *Phillyrea* (same family) and bear small, bright-red fruits that turn purple-black as they mature.

privileged communication *or* **confidential communication** In law, communication between parties to a confidential relation such that the communication's recipient is exempted from disclosing it as a witness. Communications between attorney and client are privileged and do not have to be disclosed to the court. The right to privileged communication also exists between husbands and wives, as neither is required to testify against the other in court, and between physicians and patients, though doctors may be required to disclose such information if the right of the defendant to receive a fair trial outweighs the patient's right to confidentiality. Members of the clergy have limited rights to refuse to testify in court, and reporters have been accorded a limited right to privileged communication concerning the sources of their information, though they can be ordered to divulge information in certain circumstances.

Privy \'pri-vē\ **Council** Historically, the British sovereign's private council. Once powerful, the Privy Council has long ceased to be an active body, having lost most of its judicial and political functions since the middle of the 17th century. It grew out of the medieval curia (*curia regis*), which comprised the king's tenants in chief, household officials, and other advisers. The curia performed all the functions of government in either small groups, which became the king's council, or large groups, which grew into the great council and Parliament. It now is chiefly concerned with issuing royal charters, conducting government research, and serving as an appeals body for ecclesiastical and other lesser courts. See also prerogative court.

Prix de Rome \'prē-də-'rȯm\ *in full* **Grand Prix de Rome** Art scholarship awarded by the French government. First established in 1666 by Louis XIV and Charles Le Brun, it enables young French painters, sculptors, architects, engravers, and musicians to study in Rome. Grand-prize winners in each artistic category study at the Académie de France in Rome for four years. Many of the greatest French artists and musicians of past centuries have been prizewinners, including Jean-Honoré Fragonard, Jacques-Louis David, Hector Berlioz, and Claude Debussy. The prizes are still being awarded, though their prestige has diminished.

prize cases (1863) Legal dispute in which the U.S. Supreme Court upheld Pres. Abraham Lincoln's seizure of ships (prizes). In April 1861, three months before Congress declared a state of war, Lincoln authorized a blockade of Confederate ports. In that three-month period, several merchant ships ran the blockade and were captured by the Union navy. The legality of the seizures was challenged in court; on appeal, the Supreme Court ruled that the president had acted legally to resist insurrection, sanctioning presidential use of emergency powers.

probability theory Branch of mathematics that deals with analysis of random events. Probability is the numerical assessment of likelihood on a scale from 0 (impossibility) to 1 (absolute certainty). Probability is usually expressed as the ratio between the number of ways an event can happen and the total number of things that can happen (e.g., there are 13 ways of picking a diamond from a deck of 52 cards, so the probability of picking a diamond is $13/52$, or $1/4$). Probability theory grew out of attempts to understand card games and gambling. As science became more rigorous, analogies between certain biological, physical, and social phenomena and games of chance became more evident (e.g., the sexes of newborn infants follow sequences similar to those of coin tosses). As a result, probability became a fundamental tool of modern genetics and many other disciplines. Probability theory is also the basis of the insurance industry, in the form of actuarial statistics.

probate In law, the process of proving in a court (probate court) that an instrument is the valid last will and testament of a deceased person. The term also refers broadly to the process of administering an estate. Unless it is contested or shown to contain obvious anomalies, a document purporting to be a will requires little authenticating proof for certification (admission to probate). Probate courts also often supervise the administration of estates by executors and oversee the guardianship of minors and others lacking capacity under the law.

probation Conditional suspension of an offender's sentence upon the promise of good behaviour and agreement to accept supervision and abide by specified requirements. It differs from parole in that the offender is not required to serve any of his sentence. Those convicted of serious offenses and those previously convicted of other offenses are usually not considered for probation. Studies in several countries show that 70 to 80% of probationers successfully complete their probation; additional limited evidence suggests that recidivism may be less than 30%.

problem play *or* **thesis play** Type of drama that developed in the 19th century to deal with controversial social issues in a realistic manner, expose social ills, and stimulate thought and discussion. It is exemplified by the works of Henrik Ibsen, who exposed hypocrisy, greed, and hidden corruption of society in a number of masterly plays. His influence encouraged others to use the form. George Bernard Shaw brought it to an intellectual peak with his plays and their long, witty prefaces. More recent examples include works of Sean O'Casey, Athol Fugard, Arthur Miller, and August Wilson.

problem solving Process involved in finding a solution to a problem. Many animals routinely solve problems of locomotion, food finding, and shelter through trial and error. Some higher animals, such as apes and cetaceans, have demonstrated more complex problem-solving abilities, including discrimination of abstract stimuli, rule learning, and application of language or languagelike operations. Humans use not only trial and error but also insight based on an understanding of principles, inductive and deductive reasoning (see deduction; induction; and logic), and divergent or creative thinking (see creativity). Problem-solving abilities and styles may vary considerably by individual.

proboscis monkey \prə-'bä-səs, prə-'bäs-kəs\ Species (*Nasalis larvatus*, family Cercopithecidae) of long-tailed arboreal Old World monkey of swampy mangrove forests on Borneo. Diurnal vegetarians, they live in groups of about 20. They are red-brown with pale underparts; the young monkey has a blue face. The male's nose is long and pendulous, the female's is smaller, and the young's is upturned. Males are 22–28 in. (56–72 cm) long, have a 26–29-in. (66–75-cm) tail, and weigh 26–53 lbs (12–24 kg); females are smaller and much lighter.

procedural law Law that prescribes the procedures and methods for enforcing rights and duties and for obtaining redress (e.g., in a suit). It is distinguished from substantive law (i.e., law that creates, defines, or regulates rights and duties). Procedural law is a set of established forms for conducting a trial and regulating the events that precede and follow it. It prescribes rules relative to jurisdiction, pleading and practice, jury selection, evidence, appeal, execution of judgments, representation of counsel, costs, registration (e.g., of a stock offer), prosecution of crime, and conveyancing (transference of deeds, leases, etc.), among other matters.

process philosophy 20th-century school of philosophy that emphasizes the elements of becoming, change, and novelty in experienced reality and opposes the traditional Western philosophical stress on being, permanence, and uniformity. Reality, including both the natural world and the human sphere, is essentially historical in this view, emerging from (and bearing) a past and advancing into a novel future. Hence, it cannot be grasped by old static spatial concepts that ignore the temporal and novel aspects of the universe given in human experience. The foremost contributors to process philosophy have been Henri Bergson and Alfred North Whitehead.

Proclamation of 1763 Proclamation by Britain at the end of the French and Indian War that prohibited settlement by whites on Indian territory. It established a British-administered reservation from west of the Appalachians and south of Hudson Bay to the Floridas and ordered white settlers to withdraw. It formalized Indian land titles and forbade land patents without a purchase from, or treaty agreement with, the title-holding tribe. After American colonists and pioneers objected, the proclamation was replaced by the Treaties of Fort Stanwix.

proconsul In the ancient Roman republic, a consul whose powers had been extended for a definite period beyond his regular one-year term. These extensions were necessitated by such events as long periods of war. The extension of a chief magistrate's term was originally voted by the people, but the power was soon assumed by the Senate. Provincial governors were usually magistrates whose terms had been extended. Under the empire (after 27 BC), governors of senatorial provinces were called proconsuls.

Procopius \prə-'kō-pē-əs\ (b. probably between 490 and 507, Caesarea, Palestine) Byzantine historian. He advised Belisarius on his first Persian campaign (527–531) and fought the Vandals in Africa until 536. He was in Sicily with Belisarius and fought the Goths in Italy until 540, and he described the plague in Constantinople in 542. His books *Polemon* ("Wars"), *Peri Ktismaton* ("Buildings"), and *Anecdota* ("Secret History") are valuable sources for his period's history.

Procter, William (Cooper) (b. Aug. 25, 1862, Glendale, near Cincinnati, Ohio, U.S.—d. May 2, 1934, Cincinnati) U.S. manufacturer. A grandson of the founder of Procter & Gamble Co., he started working at the company in 1883. He served as president from 1907 to 1930, during which time sales rose from $20 million to over $200 million. Under his leadership the company pioneered in labour relations: he introduced a profit-sharing plan for employees (1887), guaranteed them 48 weeks of work a year (1920), and introduced a disability pension plan, a life-insurance plan, and employee representation on the board of directors.

Procter & Gamble Co. Major U.S. manufacturer of soaps, cleansers, and other household products. It was formed in 1837 when William C. Procter, a British candlemaker, and James Gamble, an Irish soapmaker, merged their businesses in Cincinnati. The company supplied soap and candles to the Union Army in the Civil War and continued to prosper when the war was over. Among its products were Ivory soap (1879), Crisco shortening (1911), Tide, the first synthetic laundry detergent (1946), and Joy, the first liquid synthetic detergent (1949). In 1932 Procter & Gamble also sponsored the first radio soap opera. The company later began to make personal-care items such as toothpaste, shampoo, and deodorant; food products such as cake mixes and coffee; and miscellaneous products such as cellulose pulp and chemicals.

proctoscope \'präk-tə-ˌskōp\ Lighted tube used to inspect the rectum and lower colon. It is 10 in. (25 cm) long, allowing the entire rectal lining to be examined for evidence of disease. It is inserted into the anal

© 2006 Encyclopædia Britannica, Inc.

CANAL and advanced as far as is comfortable for the patient. Modern fibre-optic proctoscopes allow more extensive observation with less discomfort. Proctoscopy is standard in physical examinations of older persons. See also ENDOSCOPY.

Prodi, Romano (b. Aug. 9, 1939, Scandiano, Italy) Italian prime minister (1996–98) and president of the European Commission (1999–2004), one of the governing bodies of the EUROPEAN UNION (EU). Prodi graduated from Catholic University in Milan in 1961 and did postdoctoral work at the London School of Economics. After serving as a professor of economics at the University of Bologna, he entered government as minister of industry in 1978. In 1996, after two productive stints as chairman of the Institute for Industrial Reconstruction (1982–89 and 1993–94), he was narrowly elected prime minister as head of the centre-left Olive Tree coalition. During his 28 months in office, Prodi privatized telecommunications and reformed the government's employment and pension policies. Budget disputes with members of his own party led to his resignation in October 1998. During his five-year term as president of the European Commission, the EU expanded beyond its western European roots to include Malta, Cyprus, and eight eastern and central European members.

producer goods *or* **capital goods** *or* **intermediate goods** Goods manufactured and used in further manufacturing, processing, or resale. Intermediate goods either become part of the final product or lose their distinct identity in the manufacturing stream, while capital goods are the plant, equipment, and inventories used to produce final products. The contribution of intermediate goods to a country's GROSS DOMESTIC PRODUCT may be determined through the value-added method, which calculates the amount of value added to the final CONSUMER GOOD at each stage of production. This series of values is summed to estimate the total value of the final product.

product rule Rule for finding the DERIVATIVE of a product of two FUNCTIONS. If both f and g are differentiable, then $(fg)' = fg' + f'g$.

production function Equation that expresses the relationship between the quantities of productive factors (such as LABOUR and CAPITAL) used and the amount of product obtained. It states the amount of product that can be obtained from every combination of factors, assuming that the most efficient available methods of production are used. The production function can thus measure the MARGINAL PRODUCTIVITY of a particular factor of production and determine the cheapest combination of productive factors that can be used to produce a given output.

production management *or* **operations management** Planning, implementation, and control of industrial production processes to ensure smooth and efficient operation. Production management techniques are used in both manufacturing and SERVICE industries. Production management responsibilities include the traditional "five M's": men and women, machines, methods, materials, and money. Managers are expected to maintain an efficient production process with a workforce that can readily adapt to new equipment and schedules. They may use INDUSTRIAL ENGINEERING methods, such as TIME-AND-MOTION studies, to design efficient work methods. They are responsible for managing both physical (raw) materials and information materials (paperwork or electronic documentation). Of their duties involving money, INVENTORY control is the most important. This involves tracking all component parts, work in process, finished goods, packaging materials, and general supplies. The production cycle requires that sales, financial, engineering, and planning departments exchange information—such as sales forecasts, inventory levels, and budgets—until detailed production orders are dispatched by a production-control division. Managers must also monitor operations to ensure that planned output levels, cost levels, and quality objectives are met. See also PRODUCTIVITY.

productivity In economics, a measure of productive EFFICIENCY calculated as the ratio of what is produced to what is required to produce it. Any of the traditional factors of production—LAND, LABOUR, or CAPITAL—can be used as the denominator of the ratio, though productivity calculations are actually seldom made for land or capital since their capacity is difficult to measure. Labour is in most cases easily quantified—for example, by counting workers engaged on a particular product. In industrialized nations, the effects of increasing productivity are most apparent in the use of labour. Productivity can be seen not only as a measure of efficiency but also as an indicator of ECONOMIC DEVELOPMENT. Productivity increases as a primitive extractive economy develops into a technologically sophisticated one. The pattern of increase typically exhibits long-term stability interrupted by sudden leaps that represent major technological advances. Productivity in Europe and the U.S. made great strides following the development of such technologies as steam power, the railroad, and the gasoline motor. Later in the 20th century, advances in productivity stemmed from a number of innovations, including ASSEMBLY LINES and AUTOMATION, COMPUTER-INTEGRATED MANUFACTURING, DATABASE MANAGEMENT SYSTEMS, JUST-IN-TIME MANUFACTURING, and just-in-time INVENTORY management. Increases in productivity have tended to lead to long-term increases in real wages.

proenzyme See ZYMOGEN

profiler Machine tool for cutting complex, irregular shapes, invented by Frederick W. Howe. A rapidly rotating cutter is guided by a finger that traces around the outline of a pattern. The profiler was an important component of the AMERICAN SYSTEM OF MANUFACTURE that made mass production possible.

profit In business usage, the excess of total revenue over total COST during a specific period of time. In economics, profit is the excess over the returns to CAPITAL, LAND, and LABOUR. Since these resources are measured by their OPPORTUNITY COSTS, economic profit can be negative. There are various sources of profit: an innovator who introduces a new production technique can earn entrepreneurial profits; changes in consumer tastes may bring some firms windfall profits; or a firm may restrict output to prevent prices from falling to the level of costs (monopoly profit).

profit sharing System by which employees are paid a share of the PROFITS of the business enterprise in which they are employed, in keeping with a plan outlined in advance. These payments, which may vary according to salary or wage, are in addition to regular earnings. Profit-sharing plans were probably first developed in France in the early 19th century as worker incentives. Today such plans are used by businesses in Western Europe, the U.S., and parts of Latin America. Profit shares may be distributed on a current or deferred basis or through some combination of the two. Under current distribution, profits are paid out to employees immediately in the form of cash or company stock. In deferred-payment plans, profit shares may be paid into a TRUST FUND from which employees can draw ANNUITIES in later years.

progeria \prō-'jir-ē-ə\ Disorder with characteristics of premature aging. Affected persons have thin skin, go bald or gray early, and develop diseases of aging decades earlier than normal individuals. Not all systems are affected; there is no senility, no aging in the central nervous system. There are two major types. In the extremely rare Hutchinson-Gilford syndrome, children look 60 years old by age 10 and die at an average age of 13. The unrelated Werner syndrome is a recessive hereditary disease that begins in young adulthood and makes patients look 30 years older than they are; their average life span is 47 years.

progesterone \prō-'jes-tə-ˌrōn\ STEROID HORMONE secreted by the female REPRODUCTIVE SYSTEM that functions mainly to regulate the condition of the endometrium (see UTERUS), preparing it to accept a fertilized egg. If the egg is not fertilized, the level of progesterone drops, the uterine lining breaks down, and MENSTRUATION ensues. If the egg is fertilized (see PREGNANCY), the placenta produces progesterone, whose effects include preparing the MAMMARY GLANDS for LACTATION. Many forms of oral CONTRACEPTION use a synthetic progesterone.

program, computer Set of ordered instructions that enable a computer to carry out a specific task. A program is prepared by first formulating the task and then expressing it in an appropriate PROGRAMMING LANGUAGE. Programmers may work in MACHINE LANGUAGE or in ASSEMBLY LANGUAGES. But most applications programmers use one of the high-level languages (such as BASIC or C++) or FOURTH-GENERATION LANGUAGES that more closely resemble human communication. Other programs then translate the instructions into machine language for the computer to use. Programs are stored on permanent media (such as a HARD DISK), and loaded into RAM to be executed by the computer's processor, which executes each instruction in the program, one at a time. Programs are often divided into applications and system programs. Applications perform tasks such as WORD PROCESSING, DATABASE functions, or accessing the INTERNET. System programs control the functioning of the computer itself; an OPERATING SYSTEM is a very large program that controls the operations of the computer, the transfer of files, and the processing of other programs.

programming language Language in which a computer programmer writes instructions for a computer to execute. Some languages, such

© 2006 Encyclopædia Britannica, Inc.

as COBOL, FORTRAN, PASCAL, and C, are known as procedural languages because they use a sequence of commands to specify how the machine is to solve a problem. Others, such as LISP, are functional, in that programming is done by invoking procedures (sections of CODE executed within a program). Languages that support OBJECT-ORIENTED PROGRAMMING take the data to be manipulated as their point of departure. Programming languages can also be classified as high-level or low-level. Low-level languages address the computer in a way that it can understand directly, but they are very far from human language. High-level languages deal in concepts that humans devise and can understand, but they must be translated by means of a COMPILER into language the computer understands.

Progressive Conservative Party of Canada Former Canadian political party. It was formed as the Liberal-Conservative Party in 1854 from a union of conservative and moderate-liberal political factions; except for a period during and after World War I, the party kept this name until 1942, when it adopted the name Progressive Conservative Party of Canada. Its first leader was JOHN MACDONALD. The party led the government from 1854 to 1873 and again from 1878 to 1896. It regained power in coalition with the Quebec nationalists in 1911 but went down to severe defeat in 1921. From then until 1957 the party held power only twice, briefly in 1926 and from 1930 to 1935. The party held power from 1958 to 1963 under JOHN G. DIEFENBAKER, from 1979 to 1980 under Joe Clark, and from 1984 to 1989 under BRIAN MULRONEY. In 1993 it was reduced to only two seats in the Canadian House of Commons. In 2003 the Progressive Conservative Party merged with the Canadian Alliance to form the Conservative Party of Canada. The party favoured reducing government intervention in both the economy and social affairs; strongly federalist, it also was less accommodating than other parties to Quebec separatism.

progressive education Movement that took form in Europe and North America during the late 19th century as a reaction to the alleged narrowness and formalism of traditional education. A main objective was to educate the "whole child"—that is, to attend to physical and emotional as well as intellectual growth. Creative and manual arts gained importance in the curriculum, and children were encouraged toward experimentation and independent thinking. Progressive educational ideas and practices were most powerfully advanced in the U.S. by JOHN DEWEY. See also SUMMERHILL SCHOOL.

Progressive Party U.S. independent political party. The first Progressive Party, known as the BULL MOOSE PARTY, was organized in 1911. The second was assembled in 1924; it nominated as its presidential candidate ROBERT LA FOLLETTE, who received 17% of the national vote on a platform calling for a "housecleaning" of executive departments, public control of natural resources, public ownership of the railways, and tax reduction. The party dissolved upon La Follette's death in 1925. The third Progressive Party, founded in 1947 by HENRY WALLACE, differed from the previous groups in its focus on foreign affairs; it favoured a conciliatory policy toward the Soviet Union. Though Wallace received more than one million votes in the 1948 election, the party was never again influential.

progressive tax Tax levied at a rate that increases as the quantity subject to taxation increases. Designed to collect a greater proportion of tax revenue from wealthy people, progressive taxes reflect the view that those who are able to pay more should carry a heavier share of the tax burden. Progressive INCOME TAXES may provide for exemption from tax liability for incomes under a specified amount, or they may establish progressively greater rates for larger and larger incomes. The presence of deductions can also make a tax progressive. Progressive taxes are a stabilizing force in periods of INFLATION or RECESSION because the amount of tax revenue changes more than proportionately with an increase or decrease in income. For example, in an inflationary economy, as prices and incomes rise, a greater percentage of taxpayers' income goes toward taxes. Government revenues increase, and the government has more leverage over the economy. A side effect of this system is that lower-income taxpayers have an especially difficult time making ends meet when inflation is high. To compensate, many economists advocate INDEXATION; several countries adjust their tax rates annually in times of inflation, usually in line with the CONSUMER PRICE INDEX. See also REGRESSIVE TAX.

Prohibition Legal prevention of the manufacture, sale, or transportation of alcoholic beverages. In the U.S., the Prohibition movement arose out of the religious revivalism of the 1820s. Maine passed the first state Prohibition law in 1846, ushering in a wave of such state legislation. The drive toward national Prohibition was fueled by the Anti-Saloon League, founded in 1893. With Prohibition already adopted in 33 states, the 18th Amendment to the U.S. Constitution went into effect in 1920. Prohibition was embraced with varying degrees of enthusiasm in different parts of the country, and enforced accordingly. In urban areas, BOOTLEGGING gave rise to ORGANIZED CRIME, with such gangsters as AL CAPONE. In part because of the rise in crime, its supporters gradually became disenchanted with it. The 21st Amendment repealed the 18th in 1933, and by 1966 all states had also abandoned Prohibition.

Prohibition Party Oldest minor U.S. political party still in existence. It was founded in 1869 to campaign for legislation to prohibit the manufacture and sale of liquor. The party was strong in rural regions and among small-town voters affiliated with Protestant evangelical churches. It nominated candidates for state and local offices and attained national strength in the 1888 and 1892 presidential elections, when its candidates polled 2.2% of the vote. Since 1900 it has been active mainly on local levels.

projective geometry Branch of mathematics that deals with the relationships between geometric figures and the images (mappings) of them that result from projection. Examples of projections include motion pictures, maps of the Earth's surface, and shadows cast by objects. One stimulus for the subject's development was the need to understand PERSPECTIVE in drawing and painting. Every point of the projected object and the corresponding point of its image must lie on the projection ray, a line that passes through the centre of projection. Modern projective geometry emphasizes the mathematical properties (such as straightness of lines and points of intersection) preserved in projections despite the distortion of lengths, angles, and shapes.

prokaryote \prō-'kar-ē-ˌōt\ Any cellular organism that lacks a distinct NUCLEUS. BACTERIA (including blue-green algae, or CYANOBACTERIA) are prokaryotes; all other organisms are EUKARYOTES. Prokaryotic cells lack a nuclear membrane and most of the components of eukaryotic cells. The cytoplasm includes ribosomes that carry out protein synthesis and a double-stranded DNA chromosome, usually circular. Many prokaryotes also contain additional circular DNA molecules called plasmids. The flagella are distinct from those of eukaryotes in design and movement.

Prokofiev \prə-'kō-fyif**, Sergey (Sergeyevich)** (b. April 23, 1891, Sontsovka, Ukraine, Russian Empire—d. March 5, 1953, Moscow, Russia, U.S.S.R.) Russian composer and pianist. Son of a pianist, he began writing piano pieces at age five and wrote an opera at nine. He studied at the St. Petersburg Conservatory (1904–14) with NIKOLAY RIMSKY-KORSAKOV and others. Prolific and arrogant, from 1910 he made a living by performing as a virtuoso. He played his own first concerto at his graduation recital. During World War I he wrote his *Scythian Suite* (1915) and *First* ("Classical") *Symphony* (1917). His opera *The Love for Three Oranges* premiered in 1921 in Chicago. Paris was his base from 1922, and during the 1920s he produced three new symphonies and the operas *The Fiery Angel* (1927) and *The Gambler* (1928). In the 1930s he was drawn back to his homeland; there he wrote the score for the ballet *Romeo and Juliet* (1936), the symphonic children's tale *Peter and the Wolf* (1936), and striking national music for SERGEY EISENSTEIN's film *Alexander Nevsky* (1938). World War II inspired the score to Eisenstein's *Ivan the Terrible* (1942–45) and the opera *War and Peace* (1943). The government's denunciation of his work in 1948 was a harsh blow; his health failed, and he died on the same day as JOSEPH STALIN.

prolapse Protrusion of an internal organ out of its normal place, usually of the RECTUM or UTERUS outside the body when supporting muscles weaken. The membrane lining the rectum can push out through the anus, most often in old people with constipation who strain during defecation. Chronic rectal prolapse requires surgical repair. The uterus may prolapse into the vagina after gravity adds to weakness from childbirth injuries. Temporary supports and pelvic exercises can relieve mild uterine prolapse, but severe prolapse may require HYSTERECTOMY.

proletariat \ˌprō-lə-'ter-ē-ət\ The lowest, or one among the lowest, economic and social classes in a society. In ancient Rome, the proletariat were poor landless freemen who, crowded out of the labour market by the extension of slavery, became parasites on the economy. KARL MARX used the term to refer to the class of wage earners engaged in industrial production only (the broader term *working class* included all those obliged to work for a living). Another of Marx's categories, the *lumpenproletariat* (*lumpen* meaning "rags"), comprised marginal and unemployable workers, paupers, beggars, and criminals. Marxian theory predicted a transitional phase between the abolition of capitalism and the establish-

© 2006 Encyclopædia Britannica, Inc.

ment of communism during which a "dictatorship of the proletariat" would suppress resistance to the socialist revolution by the bourgeoisie, destroy the social relations of production underlying the class system, and create a new, classless society.

proline \'prō-ˌlēn\ One of the nonessential AMINO ACIDS, found in many PROTEINS, especially COLLAGEN. Because the nitrogen atom of its amino group is part of a ring structure (making it a HETEROCYCLIC COMPOUND), its chemical properties differ from those of the other amino acids in proteins. It is used in biochemical, nutritional, and microbiological research and as a dietary supplement.

promenade \ˌprä-mə-'nād, ˌprä-mə-'näd\ Public place where people walk (or, in the past, rode) at leisure for pleasure, exercise, or display. Promenades are pedestrian avenues pleasingly landscaped or commanding a view, often located along waterfronts and in parks. Vehicular traffic may or may not be restricted.

Prometheus \prə-'mē-thē-əs\ In GREEK RELIGION, one of the TITANS and a god of fire. He was a master craftsman and a supreme trickster, and he was sometimes associated with the creation of humans. According to legend, Prometheus stole fire from the gods and gave it to humans. In vengeance, ZEUS created PANDORA, who married Prometheus's brother and set loose all the evils of the world. Another tale held that ZEUS had Prometheus chained to a mountain and sent an eagle to devour his liver, which regenerated every night so that he could suffer the same torment the next day.

promissory note Short-term credit instrument consisting of a written promise by one person to pay a specified amount of money to another on demand or at a given future date. Promissory notes were in use in Europe as early as the Renaissance. They are often negotiable and may be secured by the pledge of collateral. The instrument changed substantially during the 20th century, when various clauses were added regarding payment and other provisions—for example, authorizing the sale of collateral, permitting extensions of time, and allowing acceleration of payment in the event of default. See also BILL OF EXCHANGE.

Promoters Revolution (1932) Bloodless coup that put an end to absolute monarchy in Siam (Thailand) and initiated the Constitutional Era. The coup was headed by the Promoters, a group that included members of the Thai elite, noted intellectuals, and disaffected army officers. Their first constitution, the Temporary Constitution, stripped the king of power and put it in the hands of the Promoters themselves. The Permanent, or December, Constitution restored some of the royal prestige and dignity and introduced some liberal, Western-style reforms. None of Thailand's subsequent constitutions effectively limited political power or provided a means by which political contests could be decided. See also LUANG PHIBUNSONGKHRAM; PRIDI PHANOMYONG.

pronghorn RUMINANT (*Antilocapra americana*) of North American plains and semideserts, the only living member of the family Antilocapridae. The pronghorn stands 30–40 in. (80–100 cm) tall. It is reddish brown with a short, dark-brown mane, white underparts, two white bands on the throat, and a circular white patch on the rump. Both sexes bear erect, two-pronged horns; the longer prong curves backward, the shorter prong forward. Pronghorns live alone or in small bands in summer, and in large herds in winter. The fastest mammal of North America, the pronghorn can run 45 mph (70 kph) and can bound up to 20 ft (6 m). Though tens of millions once roamed the West, they were nearly exterminated by hunters in the early 20th century; conservation efforts have since allowed their populations to increase.

Pronghorn (*Antilocapra americana*). LEONARD LEE RUE III

proof In logic and mathematics, an argument that establishes a proposition's validity. Formally, it is a finite sequence of formulas generated according to accepted rules. Each formula either is an AXIOM or is derived from a previously established THEOREM, and the last formula is the statement that is to be proven. The essence of deductive reasoning (see DEDUCTION), this is the basis of EUCLIDEAN GEOMETRY and all scientific methods inspired by it. An alternative form of proof, called mathematical INDUCTION, applies to propositions defined through processes based on the counting numbers. If the proposition holds for $n = 1$ and can be shown to hold for $n = k + 1$ whenever $n = k$ (a constant) is also true, then it holds for all values of n. An example is the assertion that the sum of the first n counting numbers is $n(n + 1)/2$.

propaganda Manipulation of information to influence public opinion. The term comes from Congregatio de Propaganda Fide (Congregation for the Propagation of the Faith), a missionary organization established by the pope in 1622. Propagandists emphasize the elements of information that support their position and deemphasize or exclude those that do not. Misleading statements and even lies may be used to create the desired effect in the public audience. LOBBYING, advertising, and missionary activity are all forms of propaganda, but the term is most commonly used in the political arena. Prior to the 20th century, pictures and the written media were the principal instruments of propaganda; radio, television, motion pictures, and the Internet later joined their ranks. Authoritarian and totalitarian regimes use propaganda to win and keep the support of the populace. In wartime, propaganda directed by a country at its own civilian population and military forces can boost morale; propaganda aimed at the enemy is an element of PSYCHOLOGICAL WARFARE.

propane Colourless, easily liquefied HYDROCARBON GAS (C_3H_8 or, more fully, $CH_3CH_2CH_3$). Separated in large quantities from natural gas, light crude oil, and oil-refinery gases, it is available as liquefied propane or as a major constituent of liquefied petroleum gas (LPG). It is an important raw material for the manufacture of ETHYLENE and for the PETROCHEMICAL industry. It is also used as a refrigerant, extractant, solvent, AEROSOL propellant, and fuel for portable cooking appliances, torches, and lighters.

propeller Device with a central hub and radiating blades placed so that each forms part of a helical (spiral) surface, used to propel a vehicle such as a SHIP or AIRPLANE. By its rotation in water or air, the propeller produces thrust on the blades, which gives forward motion to the vehicle.

proper motion Apparent motion of a star across the CELESTIAL SPHERE at right angles to the observer's line of sight, generally measured in seconds of arc per year. Any radial motion (toward or away from the observer) is not included. EDMOND HALLEY was the first to detect proper motions; the largest known is that of BARNARD'S STAR, about 10 seconds yearly.

Propertius \prō-'pər-shəs, prō-'pər-shē-əs**, Sextus** (b. 55/43, Assisi, Umbria—d. after 16 BC, Rome) Roman poet. Very few details of his life are known. The first and best known of his four books of elegies (see ELEGY), *Cynthia*, was published in 29 BC, the year he met its heroine (his mistress, whose real name was Hostia). She emerges from his poems as beautiful, uninhibited, jealous, and irresistible. In Book II his main theme is still love, but he also contemplates writing an epic, is preoccupied with thoughts of death, and attacks the materialism of his time. Books III and IV demonstrate a bold command of language and various literary forms; among the subjects are Roman mythology and history.

property In law, something that is owned or possessed. Concepts of property vary widely among cultures. In the West, property is generally regarded as either tangible (e.g., land or goods) or intangible (e.g., STOCKS and BONDS or a PATENT). Individual ownership of property is emphasized in Western societies, whereas in many non-Western societies property ownership is deemphasized or conceived on a more strictly communal basis. The use of property is extensively regulated throughout the West. Landowners injured by adjoining land uses may sue in NUISANCE in Anglo-American countries; similar actions exist in CIVIL-LAW countries. Throughout the West, landowners may agree to allow others to use their land in ways that would otherwise be actionable, and such agreements may be made to bind those to whom the land is conveyed. Anglo-American law tends to divide these grants of use rights into categories that reflect their common-law origins: EASEMENTS (such as rights of way), PROFITS (such as the right to take minerals or timber), real covenants (such as a promise to pay a homeowners' association fee), and equitable SERVITUDES (such as a promise to use the property for residential purposes only). The civil law has fewer categories, the general category "servitudes" tending to cover for them all, and is a bit more restrictive. A common means of acquiring property is by transfer from the previous owner or owners. Such transfers include sales, donations, and INHERITANCE. See also ADVERSE POSSESSION; COMMUNITY PROPERTY; INTELLECTUAL PROPERTY; PRESCRIPTION; REAL AND PERSONAL PROPERTY.

property tax Levy imposed on real estate (land and buildings) and in some jurisdictions on personal property such as automobiles, jewelry, and

© 2006 Encyclopædia Britannica, Inc.

furniture. Some countries also levy property taxes on farm equipment, business equipment, and inventories as well as intangibles such as stocks and bonds. Property taxes are usually levied by local or state governments rather than national governments, and they are a major source of tax revenue. Property taxes existed in the ancient world first as land taxes and later as taxes on farmhouses, livestock, and so on. The administration of a property tax involves identifying the property to be taxed, assessing its value, determining the appropriate tax rate, and collecting the requisite sum of money. Though sometimes burdensome to the poor, property taxes generally tend to redistribute the benefits of wealth from higher to lower income groups, since they often pay for schools and other services used by low-income groups. See also CAPITAL-GAINS TAX; CONSUMPTION TAX; INCOME TAX; PROGRESSIVE TAX; REGRESSIVE TAX.

prophet Person who speaks by divine inspiration, revealing or interpreting the will of a god. Prophets have appeared in many religions throughout history. The most familiar in the West are such OLD TESTAMENT leaders as MOSES, ISAIAH, and DANIEL, along with the Prophet MUHAMMAD. In contrast to the diviner or interpreter of omens (see DIVINATION), who may answer private questions, prophets often address the destiny and moral life of a whole people. Some prophets seek to create a new society that will realize their message and thus found new religions. Others may look only to reform or purify an existing society and religion. The tone of prophecy ranges widely, from ecstasy, inspired utterance, and ethical fervor to passionate social criticism, prediction of the future, and expectation of APOCALYPSE.

Prophet, The *orig.* **Tenskwatawa** (b. c. March 1768, Old Chillicothe, Ohio—d. 1834, Argentine, Kan., U.S.) North American Indian leader. The brother of TECUMSEH, he maintained a strong following among the SHAWNEE on the strength of his 1805 declaration that he had received a message from the "Master of Life" and had contact with the supernatural. Advocating a return to traditional ways of life, he rejected the white man's introduction of alcohol, textile clothing, and individual ownership of property, and he worked with Tecumseh for an Indian confederacy to resist U.S. encroachment on Indian land. In Tecumseh's absence he allowed the Shawnee to be drawn into and defeated at the Battle of TIPPECANOE (1811).

Prophet's Mosque House of worship built on the site of MUHAMMAD's house in MEDINA, considered one of the three holiest places of ISLAM. It was originally a simple brick structure surrounding an enclosed courtyard where people gathered to hear Muhammad. Muhammad later built roofed galleries to shelter his visitors, and in 628 a pulpit was added to raise him above the crowd. In 706 Caliph al-Walīd I pulled down the original building and built a MOSQUE on the site, which contains Muhammad's tomb. The mosque served as the model for later Islamic architecture.

proportion/proportionality In algebra, equality between two RATIOS. In the expression $a/b = c/d$, a and b are in the same proportion as c and d. A proportion is typically set up to solve a word problem in which one of its four quantities is unknown. It is solved by multiplying one numerator by the opposite denominator and equating the product to that of the other numerator and denominator. The term *proportionality* describes any relationship that is always in the same ratio. The number of apples in a crop, for example, is proportional to the number of trees in the orchard, the ratio of proportionality being the average number of apples per tree.

proportional representation ELECTORAL SYSTEM in which the share of seats held by a POLITICAL PARTY in the LEGISLATURE closely matches the share of popular votes it received. It was devised in Europe in the mid-19th century to guarantee minority groups more representation than was possible under the majority or PLURALITY SYSTEMS. Its supporters claim that it creates a more accurate reflection of public opinion; its opponents argue that by allowing more parties in a legislature, it may result in weaker, less stable governments. Two methods for apportioning seats are the single-transferable-vote method, under which voters rank candidates by preference, and the list system, under which voters select a party's list of candidates rather than individuals. Some countries (e.g., Germany and Russia) use a combination of plurality and proportional methods for allocating seats in the lower house of the national legislature. See also LEGISLATIVE APPORTIONMENT.

propositional attitude Psychological state expressed by a verb that may take a subordinate clause beginning with "that" as its complement. Verbs such as "believe," "hope," "fear," "desire," "intend," and "know" all express propositional attitudes. The linguistic contexts created by their use are typically referentially opaque (see INTENTIONALITY) in the sense that the substitution of co-referential expressions within them may change the "truth value" (true or false) of the containing sentence. Thus, to use BERTRAND RUSSELL's example, though it is true that Peter believes that WALTER SCOTT was a Scotsman, it may be false that he believes that the author of *Waverley* (who is Scott) was a Scotsman.

propositional calculus FORMAL SYSTEM of propositions and their logical relationships. As opposed to the PREDICATE CALCULUS, the propositional calculus employs simple, unanalyzed propositions rather than predicates as its atomic units. Simple (atomic) propositions are denoted by lowercase Roman letters (e.g., p, q), and compound (molecular) propositions are formed using the standard symbols $\wedge$ for "and," $\vee$ for "or," $\supset$ for "if . . . then," and $\neg$ for "not." As a formal system, the propositional calculus is concerned with determining which formulas (compound proposition forms) are provable from the axioms. Valid inferences among propositions are reflected by the provable formulas, because (for any formulas A and B) $A \supset B$ is provable if and only if B is a logical consequence of A. The propositional calculus is consistent in that there exists no formula A in it such that both A and $\neg$ A are provable. It is also complete in the sense that the addition of any unprovable formula as a new axiom would introduce a contradiction. Further, there exists an effective procedure for deciding whether a given formula is provable in the system. See also LOGIC, PREDICATE CALCULUS, laws of THOUGHT.

propositional function Sentencelike expression that may be thought of as obtained from a sentence by substituting variables for constants occurring in the sentence. For example, "x was a parent of y" may be thought of as obtained from "Adam was a parent of Abel." A propositional function therefore has no truth-value, becoming true or false only when its free variables are replaced by constants of appropriate syntactic categories (e.g., "Abraham was a parent of Isaac").

proprietary colony Type of settlement in British North America (1660–90). To repay political and financial debts, the British crown, beginning with CHARLES II, awarded supporters vast tracts of land in colonial New York, New Jersey, Pennsylvania, Maryland, and the Carolinas. The proprietors were to supervise and develop the colonies, which became successful enterprises. By 1690 concern about the colonies' growing independence from control by British officials led to the end of proprietary grants.

proprioception \ˌprō-prē-ō-'sep-shən\ Perception of stimuli relating to position, posture, equilibrium, or internal condition. Receptors (nerve endings) in skeletal MUSCLES and on TENDONS provide constant information on limb position and muscle action for coordination of limb movements. Awareness of equilibrium changes usually involves perception of gravity. In humans, gravity, position, and orientation are registered by tiny grains called otoliths moving within two fluid-filled sacs in the INNER EAR in response to any change in position or orientation. Their motion is detected by sense hairs. Rotation is detected by the inertial lag of fluid in the semicircular canals acting on the sense hairs. The central NERVOUS SYSTEM integrates signals from the canals to perceive rotation in three dimensions. See also SENSE.

propylaeum \ˌprä-pə-'lē-əm, ˌprō-pə-'lē-əm\ In ancient Greek architecture, a structure forming an entrance or gateway to a sacred enclosure, usually consisting, at the least, of a porch supported by columns both outside and within the actual gate. The term is often used in the plural (propylaea). The most famous example is the great Propylaea designed by Mnesicles for the Athenian ACROPOLIS. The name propylaea was also applied to various 18th–19th-century Neoclassical and Romantic monumental gateways.

proscenium \prō-'sē-nē-əm\ In a THEATRE, the frame or arch separating the stage from the AUDITORIUM, through which the action of a play is viewed. In ancient Greek theatres, the *proskenion* was an area in front of the SKENE that eventually functioned as the stage. The first permanent proscenium in the modern sense was built in 1618 at the Farnese Theatre in Parma. Though the arch contained a stage curtain, its main purpose was to provide a sense of spectacle and illusion; scene changes were carried out in view of the audience. Not until the 18th century was the curtain commonly used to hide scene changes. The proscenium opening was of particular importance to 19th-century realist playwrights, for whom it served as a picture frame or an invisible wall through which the audience experienced the illusion of spying on the characters.

© 2006 Encyclopædia Britannica, Inc.

prose Literary medium distinguished from POETRY especially by its greater irregularity and variety of rhythm and its closer correspondence to the patterns of everyday speech. Though it is readily distinguishable from poetry in that it does not treat a line as a formal unit, the significant differences between prose and poetry are of tone, pace, and sometimes subject matter.

prose poem Work in prose that has some of the technical or literary qualities of POETRY (such as regular rhythm, definitely patterned structure, or emotional or imaginative heightening) but that is set on a page as PROSE. The form took its name from CHARLES BAUDELAIRE's *Little Poems in Prose* (1869). Other writers of prose poems include, in the 19th century, STÉPHANE MALLARMÉ, ARTHUR RIMBAUD, FRIEDRICH HÖLDERLIN, NOVALIS, and RAINER MARIA RILKE, and in the 20th, AMY LOWELL (in her "polyphonic prose") and such contemporary poets as JOHN ASHBERY.

prosecutor Government attorney who presents the state's case against the defendant in a criminal prosecution. In some countries (France, Japan), public prosecution is carried out by a single office. In the U.S., states and counties have their own prosecutors. Only at the federal level is the system unitary; the U.S. attorney general's office appoints a U.S. attorney for each federal district. In most state and local jurisdictions, prosecutors are elected to office. Whether elected or appointed, prosecutors are often subject to political pressures. A prosecutor takes charge of the investigation once a crime has been committed, presents evidence at a hearing before a grand jury, and questions witnesses during the trial. See also INDEPENDENT COUNSEL.

Proserpina See PERSEPHONE

prosody \'prä-sə-dē, 'prä-zə-dē\ Study of the elements of language, especially METRE, that contribute to rhythmic and acoustic effects in poetry. The basis of "traditional" prosody in English is the classification of verse according to the syllable stress of its lines. Effects such as RHYME scheme, ALLITERATION, and assonance further influence a poem's "sound meaning." Nonmetrical prosodic study is sometimes applied to modern poetry, and visual prosody is used when verse is "shaped" by its typographical arrangement. Prosody also involves examining the subtleties of a poem's rhythm, its "flow," the historical period to which it belongs, the poetic genre, and the poet's individual style.

Prosser, Gabriel See GABRIEL

prostaglandin \ˌpräs-tə-'glan-dən\ Any of a class of organic compounds that occur in many animal tissues and have diverse hormonelike effects in animals (see HORMONE). Their common chemical structure is derived from a FATTY ACID with 20 carbon atoms. They have important effects on BLOOD PRESSURE, blood clotting, pain sensation, and reproduction mechanisms, but one prostaglandin may have different and even opposite effects in different tissues. They hold promise for treating HEART DISEASE and VIRAL DISEASES and may be useful in CONTRACEPTION. Some substances that inhibit prostaglandin synthesis (see ASPIRIN) are useful in controlling pain, asthma attacks, or anaphylactic shock or as ANTICOAGULANTS.

prostate cancer Malignant TUMOUR of the PROSTATE GLAND. Prostate cancer commonly occurs in men over age 50. Symptoms include frequent or painful urination, blood in the urine, sexual dysfunction, swollen lymph nodes in the groin, and pain in the pelvis, hips, back, or ribs. The likelihood of developing prostate cancer doubles if there is a family history. Treatment may include surgery, radiation therapy, hormone therapy, chemotherapy, or a combination of two or more of these approaches.

prostate gland \'präs-ˌtāt\ Chestnut-shaped male reproductive organ, located under the bladder, which adds secretions to the SPERM during ejaculation of SEMEN. It surrounds the urethra (see URINARY SYSTEM) and is rounded at the top, narrowing to a blunt point. The prostate consists of 30–50 GLANDS, supported by CONNECTIVE TISSUE, that discharge fluids into the urethra and two ejaculatory ducts. Those ducts, which also carry sperm and fluid discharged by the seminal vesicles, join the urethra inside the prostate. The prostate contributes 15–30% of the seminal fluid. It reaches its mature size at PUBERTY. Around age 50, it commonly shrinks and decreases its secretions; an increase in size after midlife may be due to INFLAMMATION or malignancy. See also PROSTATIC DISORDER.

prostatic disorder \prä-'sta-tik\ Abnormality or disease of the PROSTATE GLAND. About half of all men over 60 have some nonmalignant enlargement, or benign prostatic hyperplasia (BPH). The gland may eventually compress the urethra, causing problems urinating. Severe cases can lead to infection, bladder stones, obstruction, and kidney failure. Prostate cancer, also found mainly in older men, can be deadly but usually grows so slowly that most patients die of something else before the cancer spreads. Since surgery and radiation therapy often lead to incontinence and impotence, many cases are monitored (through prostate-specific antigen, or PSA, tests) and treated only if necessary. Gonorrhea and other bacterial infections involving the prostate are treated with antibiotics.

prosthesis \präs-'thē-səs\ Artificial substitute for a missing part of the body, usually an arm or leg. Prostheses have evolved from wooden legs and hooks that replaced hands to sophisticated plastic, fibreglass, and metal devices designed to fit limbs amputated at different points. They may have working joints and allow motion either by amplification of electric current generated by muscle contractions or by actual attachment to the muscles. Arm prostheses usually allow some degree of grasping and manipulation. External or implanted breast prostheses are used after mastectomy.

prostitution Practice of engaging in sexual activity, usually with individuals other than a spouse or friend, in exchange for immediate payment in money or other valuables. Prostitutes may be of either sex and may engage in either heterosexual or homosexual activity, but historically most prostitution has been by females with males as clients. Prostitution is a very old and universal phenomenon; also universal is condemnation of the prostitute but relative indifference toward the client. Prostitutes are often set apart in some way. In ancient Rome they were required to wear distinctive dress; under Hebrew law only foreign women could be prostitutes; in prewar Japan they were required to live in special sections of the city. In medieval Europe prostitution was licensed and regulated by law, but by the 16th century an epidemic of venereal disease and post-Reformation morality led to the closure of brothels. International cooperation to end the traffic in women for the purpose of prostitution began in 1899. In 1921 the League of Nations established the Committee on the Traffic in Women and Children, and in 1949 the UN General Assembly adopted a convention for the suppression of prostitution. In the U.S. prostitution was first curtailed by the Mann Act (1910), and by 1915 most states had banned brothels (Nevada being a notable exception). Prostitution is nevertheless tolerated in most U.S. and European cities. In The Netherlands many prostitutes have become members of a professional service union, and in Scandinavia government regulations emphasize hygienic aspects, requiring frequent medical examination and providing free mandatory hospitalization for anyone found to be infected with venereal disease. Prostitutes are very often poor and lack skills to support themselves; in many traditional societies there are few other available money-earning occupations for women without family support. In developing African and Asian countries, prostitution has been largely responsible for the spread of AIDS and the orphaning of hundreds of thousands of children.

Protagoras \prō-'tag-ə-rəs\ (b. 485, Abdera, Greece—d. c. 410 BC) Greek philosopher, first and most famous of the SOPHISTS. He spent most of his life at Athens, where he considerably influenced contemporary thought on moral and political questions. PLATO named one of his dialogues after him. Protagoras claimed to teach men "virtue" in the conduct of their daily lives. He is best known for his dictum, "Man is the measure of all things" (see RELATIVISM; ETHICAL RELATIVISM). Though he adopted conventional moral ideas, his work *Concerning the Gods* advocated AGNOSTICISM regarding religious belief. He was accused of impiety, his books were publicly burned, and he was exiled from Athens c. 415 BC.

protectionism Policy of protecting domestic industries against foreign competition by means of TARIFFS, SUBSIDIES, import QUOTAS, or other handicaps placed on imports. The chief protectionist measures, government-levied tariffs, raise the price of imported articles, making them less attractive to consumers than cheaper domestic products. Import quotas, which limit the quantities of goods that can be imported, are another protectionist device. Wars and economic depressions historically have resulted in increases in protectionism, while peace and prosperity have tended to encourage FREE TRADE. Protectionist policies were common in Europe in the 17th–18th centuries under MERCANTILISM. Britain abandoned many of its protectionist laws in the 19th century, and by World War I tariffs were low throughout the Western world. Economic and political dislocation led to rising customs barriers in Europe in the 1920s, and the GREAT DEPRESSION produced a spate of protectionist measures; world trade shrank drastically as a result. The U.S. had a long history of protectionism, with tariffs reaching high points in the 1820s and the Great Depres-

© 2006 Encyclopædia Britannica, Inc.

sion, but in 1947 it became one of 23 nations to sign the General Agreement on Tariffs and Trade (GATT), which substantially reduced customs tariffs while reducing or eliminating quotas. Despite trade agreements such as GATT and NAFTA, calls for protectionism are still heard in many countries when industries suffer severely from foreign competition. See also trade agreement; World Trade Organization.

protectorate Relationship in which one country exercises some decisive control over another country or region. The degree of control may vary from one in which the protecting state guarantees the safety of the other to one that is a disguised form of annexation. Though the relationship is an ancient one, the use of the term dates only from the 19th century. In modern times most protectorates have been established by treaties requiring the weaker state to surrender management of its international relations, thus losing part of its sovereignty.

protein Any of numerous organic compounds, complex polymers of amino acids that are involved in nearly every aspect of the physiology and biochemistry of living organisms. Twenty different amino acids are common to proteins, linked in chains of hundreds to thousands of units. An active protein molecule has three important levels of structure: primary (the amino acid sequence), determined by the genes; secondary (the geometric shape, often a helix), determined by the angles of the covalent bonds between and within amino acids; and tertiary (the looped and folded overall shape), determined largely by attraction between oppositely charged groups (and repulsion between like charged groups) on amino-acid side chains and especially by hydrogen bonding. The tertiary structure, which can be globular or sheetlike with ridges, crevices, or pockets, often holds the key to a protein's biological activity. Proteins can serve, e.g., as structural material (as in connective tissue and hair; see collagen; keratin), as enzymes and hormones, as transporters of essential substances such as oxygen (see hemoglobin), as antibodies, or as regulators of gene expression. Some proteins are simple (amino acids only), some conjugated (see conjugation) to other groups, often vitamins or metal atoms needed in tiny amounts in the diet (see coenzyme; cofactor). Rhodopsin and hemoglobin are conjugated proteins. Proteins may be covalently linked to other atoms or molecules, as to sugars (glycoproteins), phosphate groups (phosphoproteins), or sulfur (sulfoproteins). Proteins are an essential human nutrient, obtained from both plant and animal foods. Their greatest commercial use is in food products; they are also employed in adhesives, plastics, and fibres.

proteolysis \ˌprō-tē-ˈä-lə-səs\ Process in which a protein is broken down partially, into peptides, or completely, into amino acids, by proteolytic enzymes, present in bacteria and in plants but most abundant in animals. Proteins in food are attacked in the stomach by pepsin and in the small intestine mainly by trypsin and chymotrypsin from the pancreas. Proteolytic enzymes are secreted as zymogens, which are themselves converted by proteolysis to their active forms. Many other zymogens or precursors undergo proteolysis to form active enzymes or proteins (e.g., fibrinogen to fibrin). In cells, proteolytic degradation of old proteins is part of cellular maintenance.

Proterozoic \ˌprä-tə-rə-ˈzō-ik, ˌprō-tə-rə-ˈzō-ik\ **Eon** Younger of the two divisions of Precambrian time, from 2.5 billion to 543 million years ago. Proterozoic rocks have been identified on all the continents and often constitute important sources of metallic ores, notably of iron, gold, copper, uranium, and nickel. The many small protocontinents that had formed during early Precambrian time had coalesced into one or several large landmasses by the beginning of the Proterozoic. Rocks of the Proterozoic contain many traces of primitive life forms, such as the fossil remains of bacteria and blue-green algae (see cyanobacteria).

Protestant ethic Value attached to hard work, thrift, and self-discipline under certain Protestant doctrines, particularly those of Calvinism. Max Weber, in *The Protestant Ethic and the Spirit of Capitalism* (1904–05), held that the Protestant ethic was an important factor in the economic success of Protestant groups in the early stages of European capitalism, in that worldly success came to be interpreted as a sign of the individual's election to eternal salvation. Weber's thesis was variously criticized and expanded throughout the 20th century. See also Protestantism; Richard H. Tawney.

Protestantism One of the three major branches of Christianity, originating in the 16th-century Reformation. The term applies to the beliefs of Christians who do not adhere to Roman Catholicism or Eastern Orthodoxy. A variety of Protestant denominations grew out of the Reformation. The followers of Martin Luther established the evangelical churches of Germany and Scandinavia; John Calvin and more radical reformers such as Huldrych Zwingli founded Reformed churches in Switzerland, and Calvin's disciple John Knox established a church in Scotland (Presbyterianism). Another important branch of Protestantism, represented by the Church of England and Episcopal Church, had its origins in 16th-century England and is now the Protestant denomination closest to Roman Catholicism in theology and worship. The doctrines of the various Protestant denominations vary considerably, but all emphasize the supremacy of the Bible in matters of faith and order, justification by grace through faith and not through works, and the priesthood of all believers. In the early 21st century there were nearly 350 million Protestants in the world. See also Adventist, Baptist, Society of Friends, Mennonite, Methodism.

Proteus \ˈprō-tē-əs\ In Greek mythology, the prophetic old man of the sea and the shepherd of sea animals such as seals. He was subject to Poseidon. He knew all things—past, present, and future—but disliked telling what he knew. Those who wanted information from him had to catch him sleeping and bind him. He would try to escape by changing his form, but if a captor held him fast he gave the wished-for answer and plunged into the sea.

prothrombin \prō-ˈthräm-bin\ Carbohydrate-protein compound in plasma essential to coagulation. In response to bleeding, a complex series of clotting-factor interactions leads to its conversion by thromboplastin to thrombin, which transforms fibrinogen in plasma into fibrin. Fibrin and platelets combine to form a clot. Hemophilia is caused by a hereditary lack of one of the clotting factors. Vitamin K is needed to synthesize prothrombin, so conditions that impair the vitamin's absorption result in prothrombin deficiency and a tendency to prolonged bleeding.

protist \ˈprō-təst\ Any member of a kingdom (Protista) of diverse eukaryotes, including algae, protozoans, and lower fungi (see fungus). Most are single-celled organisms, though the algae tend to be multicellular. Many can move, mainly by using flagella (see flagellum), cilia (see cilium), or footlike extensions (pseudopodia). The kingdom was developed to accommodate intermediate organisms that, even though they possessed some plant or animal characteristics, did not exhibit the specialized features indicative of those groups. Some protists are considered the ancestors of multicellular plants, animals, and fungi. The term was first suggested in 1866 by Ernst Haeckel. With the development of advanced biochemical, genetic, and imaging techniques, previously established relationships have come under scrutiny, and it is now thought that some groups are less closely related to one another than once believed. As a result, the classification of protists, while convenient, is no longer entirely satisfactory.

Proto-Geometric style Visual art style of ancient Greece that signaled the reawakening of technical proficiency and conscious creative spirit after the collapse of the Minoan and Mycenaean civilizations, around the 12th century BC. The vocabulary of the style was limited to circles, arcs, triangles, and wavy lines, all derived from Minoan-Mycenaean representations of aquatic and plant life. On pottery, these design elements were carefully placed in horizontal bands, mainly at a vase's shoulder or belly. Its lower portion was usually either left plain or painted in a solid glossy black pigment inherited from Bronze Age artists.

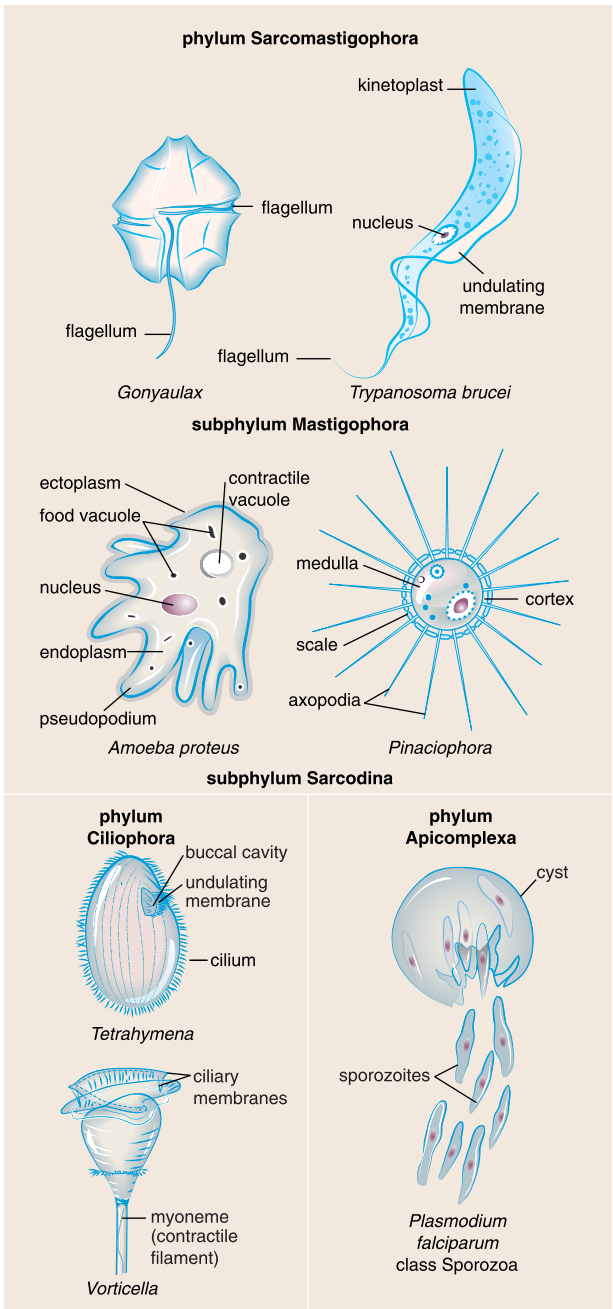
Proto-Geometric amphora from Athens, early 10th century BC; in the Kerameikos Museum, Athens.
HIRMER FOTOARCHIV, MUNICH

protoceratops \ˌprō-tə-ˈser-ə-ˌtäps\ Any member of a genus of quadrupedal dinosaurs found as fossils in Gobi deposits of the Cretaceous period (144–65 million years ago). The hind limbs were more strongly developed than the forelimbs; the back was arched. Adults were about 7 ft (2 m) long and probably weighed about 400 lbs (180 kg). The skull was about one-fifth the body length. Bones in the skull grew backward into a perforated frill. The jaws were beaklike and toothed. There may have been a hornlike structure on top of the snout. Long spines on the well-developed tail suggest that protoceratops was semiaquatic.

© 2006 Encyclopædia Britannica, Inc.

Protococcus \ˌprō-tə-'kä-kəs\ *or* **Pleurococcus** Genus of green ALGAE. Popularly called MOSS though not actually classified as such, it is found as a thin, green covering on the moist, shaded side of trees, rocks, and soil. The spherical cells, either solitary or clumped together forming short false filaments, have heavy cell walls that protect them against excessive water loss. Each cell contains a large dense CHLOROPLAST. The position of *Protococcus* in classification systems is uncertain.

protocol In computer science, a set of rules or procedures for transmitting data between electronic devices, such as computers. In order for computers to exchange information, there must be a preexisting agreement as to how the information will be structured and how each side will send and receive it. Without a protocol, a transmitting computer, for example, could be sending its data in 8-BIT packets while the receiving computer might expect the data in 16-bit packets. Protocols are established by international or industrywide organizations. Perhaps the most important computer protocol is OSI (Open Systems Interconnection), a set of guidelines for implementing networking communications between computers. The most important sets of Internet protocols are TCP/IP, HTTP, and FTP.



proton Stable SUBATOMIC PARTICLE (one of the BARYONS) with a unit of positive ELECTRIC CHARGE and a mass 1,836 times that of the ELECTRON. Protons are found in the atomic nucleus along with NEUTRONS. For every nucleus of a given ELEMENT, the number of protons is always the same; this number is the element's ATOMIC NUMBER. A single proton is the nucleus of an atom of ordinary hydrogen; as such, it is identical to the hydrogen ion (H^+). Protons have ANTIMATTER counterparts (antiprotons), with the same mass but a negative charge. Protons are used as projectiles in PARTICLE ACCELERATORS to produce and study nuclear reactions. They are the chief constituent of primary COSMIC RAYS and are among the products of radioactive decay (see RADIOACTIVITY) and nuclear reactions.

protozoal \ˌprō-tə-'zō-əl\ **diseases** Diseases caused by PROTOZOANS. These organisms may remain in the human host for their entire life cycle, but many carry out part of their reproductive cycle in insects or other hosts. For example, mosquitoes are vectors of PLASMODIUM, the cause of MALARIA. See also ENTAMOEBA; GIARDIA LAMBLIA; SLEEPING SICKNESS.

protozoan \ˌprō-tə-'zō-ən\ Any of a group of small (usually microscopic) single-celled PROTISTS. They are found in most soils, fresh water, and oceans. While most are solitary individuals, various colonial forms exist. The taxonomic relationships of protozoans to one another and to other protists continue to be revised. The smallest known protozoans are tiny blood parasites less than 2 microns long; the largest may be 16 mm long and visible to the naked eye. Protozoan shapes vary, but all share such eukaryotic features as lipid-protein membranes and membrane-enclosed vacuoles and organelles (see EUKARYOTE). They show wide variation in modes of movement, nutrition, and reproduction. Various classification systems exist to group the protozoans. The major phyla include Sarcomastigophora (flagellated forms and forms possessing cytoplasmic extensions called pseudopodia), Ciliophora (ciliated forms), and Apicomplexa, Microspora, and Myxozoa (spore-producing forms). Apicomplexa and Microspora are sometimes included in the single phylum Sporozoa. Commonly known protozoans include DINOFLAGELLATES, AMOEBAS, and paramecia (see PARAMECIUM). See illustration opposite.

protractor Instrument for constructing and measuring plane ANGLES. The simplest protractor is a semicircular disk marked in degrees from 0° to 180°. A more complex protractor, for plotting position on NAVIGATION charts, is called a three-arm protractor, or station pointer, and consists of a circular scale connected to three arms. The centre arm is fixed, while the outer two can be rotated to any desired angle relative to the centre one. A related instrument is the course protractor, which allows navigators to measure the angular distance between north and the course plotted on a navigation chart.

Proudhon \prü-'dōⁿ**, Pierre-Joseph** (b. Jan. 15, 1809, Besançon, France—d. Jan. 19, 1865, Paris) French journalist and socialist. After working as a printer, he moved to Paris in 1838 and joined the socialist movement. His *What Is Property?* (1840) created a sensation with such phrases as "property is theft." While working in Lyon (1843–48), he encountered the Mutualists, a weavers' anarchist society whose name he later adopted for his form of ANARCHISM. His *System of Economic Contradictions* (1846) was attacked by KARL MARX and initiated the split between anarchists and Marxists. In Paris in 1848, Proudhon published radical newspapers; imprisoned (1849–52), he was harassed by the police after

Representative protozoans. The zooflagellate *Trypanosoma brucei* is the causative agent of African sleeping sickness. The phytoflagellate *Gonyaulax* is one of the dinoflagellates responsible for the occurrence of red tides. The amoeba is one of the most common sarcodines. Other members of the subphylum Sarcodina, such as the radiolarians, heliozoans, and foraminiferans, usually possess protective coverings. The heliozoan *Pinaciophora* is shown covered with scales. The subphylum Ciliophora, which includes the ciliated *Tetrahymena* and *Vorticella,* contains the greatest number of protozoan species but is the most homogeneous group. The malaria-causing *Plasmodium* is spread by the bite of a mosquito that injects infective spores (sporozoites) into the bloodstream.

his release and fled to Belgium in 1858. On his return in 1862, he gained influence among the workers, including some of the founders of the First International.

Proulx \'prü**, (Edna) Annie** (b. Aug. 22, 1935, Norwich, Conn., U.S.) U.S. writer. She studied at the University of Vermont. She began professional writing with commissioned nonfiction books on cooking, gardening, and country living. She founded and edited (1984–86) *Behind the Times*, a rural Vermont newspaper, and published stories in men's outdoor magazines. Her first novel, *Postcards* (1992), depicting the decline of the small farm, received the PEN/Faulkner Award. It was followed by *The Shipping News* (1993, Pulitzer Prize, National Book Award) and *Accordion Crimes* (1996). Her story collections *Heart Songs* (1988) and *Close Range* (1999) also won high praise.

Proust \'prüst**, Marcel** (b. July 10, 1871, Auteuil, near Paris, France—d. Nov. 18, 1922, Paris) French novelist. Born to a wealthy family, he studied law and literature. His social connections allowed him to become an observant habitué of the most exclusive drawing rooms of the nobility, and he wrote social pieces for Parisian journals. He published essays and stories, including the story collection *Pleasures and Days* (1896). He had suffered from asthma since childhood, and c. 1897 he began to disengage from social life as his health declined. Half-Jewish himself, he became a major supporter of Alfred Dreyfus in the affair that made French anti-Semitism into a national issue. Deeply affected by his mother's death in 1905, he withdrew further from society. An incident of involuntary revival of childhood memory in 1909 led him to retire almost totally into an eccentric seclusion in his cork-lined bedroom to write *À la recherche du temps perdu* (1913–27; *In Search of Lost Time*, or *Remembrance of Things Past*). The vast seven-part novel is at once a kind of autobiography, a vast social panorama of France in the years just before and during World War I, and an immense meditation on love and jealousy and on art and its relation to reality. One of the supreme achievements in fiction of all time, it brought him world-wide fame and affected the entire climate of the 20th-century novel.

Provençal language See Occitan language

Provence \prō-'vä^{n}s\ Historical, cultural, and governmental region, southeast-coastal France. Provence was part of Roman Gallia Transalpina. With the breakdown of the Roman Empire in the late 5th century, Provence was invaded successively by the Visigoths, Burgundians, and Ostrogoths. It came under the rule of the Franks c. 536. During the 13th century it was involved in the Albigensian Crusade. It was united with the French crown in 1481. The language of Provence, Provençal, was important in medieval literature, and Provence's Romanesque architecture was an outstanding cultural achievement of the Middle Ages. The region suffered in the 16th-century Wars of Religion. In 1790, during the French Revolution, it lost its political institutions and was divided into several *département*s. The historical region of Provence is roughly coextensive with the present-day *région* of Provence-Alpes-Côte d'Azur (pop., 2003 est.: 4,665,051), which has an area of 12,124 sq mi (31,400 sq km); its capital is Marseille.

proverb Succinct and pithy saying that is in general use and expresses commonly held ideas and beliefs. Proverbs are part of every spoken language and folk literature, originating in oral tradition. Often a proverb is found with variations in many different parts of the world. Literate societies dating to the ancient Egyptians have collected proverbs. One of the earliest English proverb collections, *The Proverbs of Alfred*, dates from c. 1150–80. In North America the best-known collection is probably *Poor Richard's*, an almanac published 1732–57 by Benjamin Franklin.

Providence City (pop., 2000: 173,618), capital of Rhode Island, U.S. It is located at the head of Narragansett Bay on the Providence River. Founded in 1636 by Roger Williams as a refuge for religious dissenters, it was partly destroyed in King Philip's War in 1676. It played an important role in the American Revolution and was a major port in trade with the West Indies in the 18th century. Incorporated as a city in 1831, it became the sole capital of the state in 1900. Previously it had shared that honour with Newport since 1854. A seaport and an industrial and commercial centre, it is the focus of a metropolitan area that includes Pawtucket and East Providence. Educational institutions include Brown University and the Rhode Island School of Design.

Provincetown Town (pop., 2000: 3,431), eastern Massachusetts, U.S. At the northern tip of Cape Cod, Provincetown was the first landing place of the Pilgrims in 1620, and the Mayflower Compact was drawn up in its harbour. Incorporated as a town in 1727, it was a whaling and fishing port in the 19th century. Bounded by the Cape Cod National Seashore, it is a popular summer resort and noted artists' colony. The Provincetown Players theatre group originated there.

Provincetown Players U.S. theatrical company. It was founded in 1915 by a group of writers and artists in Provincetown, Mass., to encourage new and experimental works. Among their first productions, which were often staged in members' homes, was the first play by Eugene O'Neill, a founding member whose career was launched by the Players. In 1916 the players moved to New York's Greenwich Village. There they introduced several more of O'Neill's plays as well as works by Edna St. Vincent Millay, Susan Glaspell, Paul Green, and dozens of other playwrights. The company disbanded after the stock-market crash of 1929, though the Provincetown Playhouse has continued to serve intermittently as a theatre into the 21st century.

Provisions of Oxford See Provisions of Oxford

Provisors, Statute of (1351) Law passed by the English Parliament during the reign of Edward III. It set up procedures to increase royal control over the papal practice of making appointments to church benefices in England, and damaged English relations with the church.

Provo City (pop., 2000: 105,166), north-central Utah, U.S. Situated on the Provo River between Utah Lake and the Wasatch Mountains, it was founded in 1849 by Mormon colonists. Construction of railroads in the 1870s spurred the city's development as a centre for the mining of silver, lead, copper, and gold. The founding in 1875 of Brigham Young Academy (now Brigham Young University) also contributed to Provo's growth. The city's industries include steel, canning, electronics, and textiles. Nearby is Timpanogos Cave National Monument.

Proxima Centauri See Alpha Centauri

Prozac First of the class of antidepressant drugs called selective serotonin reuptake inhibitors (SSRIs), generic name fluoxetine hydrochloride. Introduced in 1986 as a treatment for clinical depression, Prozac is also used to treat a variety of other psychiatric disorders, including obsessive-compulsive disorder and bulimia nervosa. The drug, taken as a pill, apparently achieves its therapeutic effect by interfering with the reabsorption of the neurotransmitter serotonin within the brain.

Prudhoe \'prü-dō\ **Bay** Small inlet of the Beaufort Sea, northern Alaska, U.S. It has been the centre of oil-drilling activities since the discovery in 1968 of vast petroleum deposits on Alaska's North Slope. The Trans-Alaska Pipeline links the area to Valdez on Prince William Sound.

Prudhomme, Sully See Sully Prudhomme

Prud'hon \prüē-'dō^{n}**, Pierre-Paul** (b. April 4, 1758, Cluny, France—d. Feb. 16, 1823, Paris) French painter. During his years in Rome (1784–88), the works of Correggio inspired him to introduce a softer effect into French painting, then dominated by the austere style of Jacques-Louis David. He made drawings for engravers before he came to the attention of Napoleon. His portrait of the empress Joséphine (1805) exhibits the seductive and mysterious quality with which he invested his portraits of women. He achieved fame and received the Legion of Honor for his allegorical *Crime Pursued by Divine Vengeance and Justice* (1808). His elegant style served as a bridge from late 18th-century Neoclassicism to 19th-century Romanticism.

Prusiner, Stanley (Ben) (b. May 28, 1942, Des Moines, Iowa, U.S.) U.S. neurologist. He earned his M.D. from the University of Pennsylvania and subsequently taught at UC–San Francisco (1974–84) and UC–Berkeley (from 1984). As a medical resident, he was intrigued by spongiform encephalopathies when a patient died of Creutzfeldt-Jakob dis-

EASE; he later studied the related sheep disorder scrapie and in 1982 reported isolation of its causative agent, which he called a prion. Initially criticized, his prion theory was eventually generally accepted, and his research received world attention when MAD COW DISEASE emerged in Britain. The theory may also shed light on disorders such as ALZHEIMER DISEASE and PARKINSONISM, which share traits with prion-based diseases. His work won him a 1997 Nobel Prize.

Prussia *German* **Preussen** \'prȯis-ᵊn\ In European history, any of three areas of eastern and central Europe. The first was the land of the Prussians on the southeastern coast of the Baltic Sea, which came under Polish and German rule in the Middle Ages. The second was the kingdom ruled from 1701 by the German HOHENZOLLERN DYNASTY, including Prussia and BRANDENBURG, with BERLIN as its capital. It seized much of northern Germany and western Poland in the 18th–19th century and united Germany under its leadership in 1871. The third was the state created after the fall of the Hohenzollerns in 1918, which included most of their former kingdom and which was abolished by the Allies in 1947 as part of the political reorganization of Germany after its defeat in World War II.

Prynne \'prin**, William** (b. 1600, Swainswick, Somerset, Eng.—d. Oct. 24, 1669, London) English Puritan pamphleteer. Trained as a lawyer, he published Puritan tracts from 1627 and assailed Anglican ceremonialism. He attacked popular amusements, especially plays, in his book *Histrio Mastix: The Players Scourge* (1633). Archbishop WILLIAM LAUD had him imprisoned; after he wrote more pamphlets attacking Laud and other Anglicans, his ears were cut off. Released in 1640, Prynne brought about Laud's conviction and execution (1645). Elected to Parliament in 1648, he was expelled for attacks on radical Puritans and later imprisoned for refusing to pay taxes (1650–53). Disaffected with OLIVER CROMWELL's Commonwealth, he became a supporter of CHARLES II.

Pryp'yat River See PRIPET RIVER

Prypyats' River See PRIPET RIVER

Przewalski's horse \pshə-'väl-skēz, ˌpər-zhə-'väl-skēz\ Last wild EQUINE subspecies (*Equus caballus przewalskii*) surviving into the 20th century. It is yellowish or light red (dun) and stands 12–14 hands (48–56 in., 122–142 cm) high. It has a dark mane and tail and usually a stripe on the back. The mane is short and erect with no forelock. It was discovered in western Mongolia in the 1870s. The horse disappeared in the wild in the 1960s, but the descendants of specimens that had earlier been taken to European zoos began to be reintroduced into the Mongolian steppe in the 1990s.

Przewalski's horse (*Equus caballus przewalskii*).
KENNETH W. FINK FROM ROOT RESOURCES

psalm \'säm\ Sacred song or poem. The term is most widely known from the book of Psalms in the Bible. Its 150 psalms, ranging in subject from songs of joyous faith and thanksgiving to songs of bitter protest and lamentation, rank among the immortal poems of all time. They have had a profound influence on the liturgies of Judaism and Christianity. Their dating and authorship are highly problematic, and the tradition of assigning them to King DAVID is no longer accepted. In the original Hebrew text the book had no name. When the Hebrew Bible was translated into Greek (the SEPTUAGINT), it was titled Psalterion, referring to a stringed instrument that would accompany such songs.

Pseudo-Demetrius See False DMITRY

Pseudo-Dionysius the Areopagite (fl. c. 500) Probably a Syrian monk. Under the pseudonym DIONYSIUS THE AREOPAGITE, he wrote a series of treatises that united Neoplatonic philosophy (see NEOPLATONISM), Christian theology, and mystical experience. Their doctrinal content covers the Trinity, the angelic world, and the Incarnation and redemption and provides an explanation of all that is. His treatise "On Divine Names" discusses the nature and effects of contemplative prayer. The Dionysian corpus was absorbed into Greek and Eastern Christian theologies and also influenced mystics in the Western church. THOMAS AQUINAS was among those who wrote commentaries on the works.

pseudomonad \ˌsü-də-'mō-ˌnad\ Any of a large and varied group of rod-shaped, often curved BACTERIA. Many can move, propelled by one or more flagella. Some aquatic species are attached to surfaces by long strands or stalks. Most are found in soil or water; some cause diseases in plants, and a few cause serious diseases in humans and other mammals. One very common and widespread species, *Pseudomonas aeruginosa*, is a serious cause of disease in humans, causing antibiotic-resistant infections in individuals with weakened resistance. Pseudomonads have been implicated in hospital-acquired infections of surgical wounds and severely burned tissue and in fatal infections of cancer patients treated with immunosuppressive drugs.

psilomelane \ˌsī-lō-'me-ˌlān\ Barium and manganese hydrous oxide, $BaMnMn_8O_{16}(OH)_4$, an important ore mineral of MANGANESE. What was formerly called psilomelane is now known to be a mixture of several manganese oxides of which romanechite is a major constituent. Such manganese oxide mixtures may form large deposits and may occur in lake or swamp bedded deposits and clays; it has been found in Germany, France, Belgium, Scotland, Sweden, India, and the U.S. The name *psilomelane* (from the Greek words for "smooth" and "black") refers to its typical black, smooth-surfaced, grape-bunch-shaped or stalactitic masses.

psoriasis \sə-'rī-ə-səs\ Chronic, recurrent skin disorder with reddish, slightly elevated patches or bumps covered with silvery-white scales. Spots may coalesce into large patches around a normal area. If the nails are involved, they may become pitted, thick, and separated from the nail bed. Skin injury, infection, stress, and certain drugs may trigger psoriasis. Skin cells move at an accelerated rate from the dermis into the epidermis, where they slough off, causing inflammation. In some cases, patients also have arthritis. Psoriasis often becomes less severe in the summer and during pregnancy. There is no cure, but treatment with drugs and ultraviolet light may help.

Psyche \'sī-kē\ In Greek and Roman mythology, a beautiful princess who won CUPID's love. Her beauty was such that worshipers began to turn away from VENUS, and the envious goddess commanded her son Cupid to make Psyche fall in love with the most despicable of men. But Cupid himself fell in love with Psyche and hid her in a remote place, where he visited her secretly under cover of darkness. One night she lit a lamp and discovered her lover's identity. He left angrily, and Psyche wandered the earth searching for him and was captured by Venus. After Cupid rescued Psyche, JUPITER made her immortal and gave her in marriage to Cupid.

Psyche, depicted with wings, classical sculpture; in the Louvre, Paris
ALINARI-ART RESOURCE/EB INC.

psychiatry Branch of medicine concerned with mental disorders. Until the 18th century, mental health problems were considered forms of demonic possession; gradually they came to be seen as illnesses requiring treatment. In the 19th century, research into and classification and treatment of mental illnesses advanced. SIGMUND FREUD's psychoanalytic theory dominated the field for many years before it was challenged by behavioral and cognitive therapy and humanistic PSYCHOLOGY in the mid-20th century. Psychiatrists hold medical degrees and can prescribe drugs and other medical treatments in addition to conducting psychotherapy. The psychiatrist often works as a member of a mental health team that includes clinical psychologists and social workers.

psychoanalysis Method of treating MENTAL DISORDERS that emphasizes the probing of unconscious mental processes. It is based on the psychoanalytic theory devised by SIGMUND FREUD in Vienna in the late 19th and early 20th century. It calls for patients to engage in free ASSOCIATION of ideas, speaking to therapists about anything that comes to mind. DREAMS and slips of the tongue are examined as a key to the workings of the unconscious mind, and the "work" of therapy is to uncover the tensions existing between the instinctual drive of the ID, the perceptions and actions

© 2006 Encyclopædia Britannica, Inc.

of the EGO, and the censorship imposed by the morality of the SUPEREGO. Careful attention is paid to early childhood experiences (especially those with a sexual dimension), the memory of which may have been repressed because of guilt or trauma; recalling and analyzing these experiences is thought to help free patients from the ANXIETY and neuroses caused by REPRESSION as well as from more serious illnesses known as psychoses (see NEUROSIS, PSYCHOSIS). Some of Freud's early associates, notably CARL GUSTAV JUNG and ALFRED ADLER, rejected his theories on many points and devised alternative methods of analysis. Other important figures in psychoanalysis, including ERIK ERIKSON, KAREN HORNEY, and ERICH FROMM, accepted the basic Freudian framework but contributed their own additions or modifications.

psycholinguistics Study of the mental processes involved in the comprehension, production, and acquisition of LANGUAGE. Much psycholinguistic work has been devoted to the learning of language by children and on speech processing and comprehension by both children and adults. Traditional areas of research include language production, language comprehension, language acquisition, language disorders, language and thought, and neurocognition. See also LINGUISTICS.

psychological development Development of cognitive, emotional, intellectual, and social capabilities and functioning over the course of one's life. It is the subject matter of the discipline of DEVELOPMENTAL PSYCHOLOGY. In INFANCY, language is acquired, PERCEPTION, EMOTION, and MEMORY take shape, and learning and motor skills develop. In childhood, SPEECH emerges, cognitive abilities advance from concrete to abstract operations, emotional responses become more sophisticated, and EMPATHY and moral reasoning begin to be employed. ADOLESCENCE is a time of rapid emotional and intellectual growth, while ADULTHOOD is characterized by the maturing of all developmental processes.

psychological testing Use of tests to measure skill, knowledge, intelligence, capacities, or aptitudes and to make predictions about performance. Best known is the IQ test; other tests include achievement tests—designed to evaluate a student's grade or performance level—and PERSONALITY tests. The latter include both inventory-type (question-and-response) tests and projective tests such as the Rorschach (inkblot) and thematic apperception (picture-theme) tests, which are used by clinical psychologists and psychiatrists to help diagnose mental disorders and by psychotherapists and counselors to help assess their clients. Experimental psychologists routinely devise tests to obtain data on PERCEPTION, LEARNING, and MOTIVATION. Clinical neuropsychologists often use tests to assess cognitive functioning of people with brain injuries. See also EXPERIMENTAL PSYCHOLOGY; PSYCHOMETRICS.

psychological warfare Use of propaganda against an enemy, supported by whatever military, economic, or political measures are required, and usually intended to demoralize an enemy or to win it over to a different point of view. It has been carried on since ancient times. The conquests of GENGHIS KHAN were aided by expertly planted rumours about large numbers of ferocious MONGOL horsemen in his army. Specialized units were a major part of the German and Allied forces in World War II and the U.S. armed forces in the Korean and Vietnam wars. Strategic psychological warfare is mass communications directed to a very large audience or over a considerable expanse of territory; tactical psychological warfare implies a direct connection with combat operations (e.g., the surrender demand). Consolidation psychological warfare consists of messages distributed to the rear of one's own advancing forces for the sake of protecting the line of communications, establishing military government, and carrying out administrative tasks within such a government.

psychology Scientific discipline that studies mental processes and behaviour in humans and other animals. Literally meaning "the study of the mind," psychology focuses on both individual and group behaviour. CLINICAL PSYCHOLOGY is concerned with the diagnosis and treatment of MENTAL DISORDERS. Other specialized fields of psychology include CHILD PSYCHOLOGY, EDUCATIONAL PSYCHOLOGY, sports psychology, SOCIAL PSYCHOLOGY, and COMPARATIVE PSYCHOLOGY. The issues studied by psychologists cover a wide spectrum, including LEARNING, COGNITION, INTELLIGENCE, motivation, EMOTION, PERCEPTION, PERSONALITY, and the extent to which individual differences are shaped by genetics or environment. The methods used in psychological research include observation, interviews, PSYCHOLOGICAL TESTING, laboratory experimentation, and statistical analysis.

psychometrics Science of psychological measurement. Psychometricians design and administer psychological tests (see PSYCHOLOGICAL TESTING), both to generate empirical data on mental processes and to refine their understanding of measurement techniques and the statistical analysis of results. Major concerns include test reliability and validity and the norming or standardization of results.

psychoneurosis See NEUROSIS

psychopathology See ABNORMAL PSYCHOLOGY

psychopharmacology Study of the effect of drugs on the mind and behaviour, particularly in the context of developing treatments for mental disorders. Major psychopharmacological advances in the 20th century include the development of TRANQUILIZERS, ANTIDEPRESSANTS, lithium carbonate (for BIPOLAR DISORDER), certain stimulants (including AMPHETAMINES), and antipsychotic agents such as chlorpromazine (Thorazine), fluphenazine (Prolixin), and haloperidol (Haldol).

psychophysics Branch of psychology concerned with the effect of physical stimuli (such as sound waves) on mental processes. Psychophysics was established by GUSTAV THEODOR FECHNER in the mid-19th century, and since then its central inquiry has remained the quantitative relation between stimulus and SENSATION. A key tenet has been WEBER'S LAW. Psychophysical methods are used today in vision research and audiology, PSYCHOLOGICAL TESTING, and commercial product comparisons (e.g., tobacco, perfume, and liquor).

psychosis \sī-'kō-səs\ Serious mental derangement characterized by defective or lost contact with reality. The primary psychoses are SCHIZOPHRENIA and the delusional disorders (e.g., megalomania), but extreme cases of DEPRESSION and BIPOLAR DISORDER, substance-induced DELIRIUM, and certain varieties of DEMENTIA are also understood to share important features with the psychoses. The major symptoms, aside from delusions and HALLUCINATIONS, are disorganized speech and behaviour and, often, mood disturbances. Treatment usually consists of medication and counseling in an institutional setting. Compare NEUROSIS.

psychosomatic disorder Bodily ailment or symptom, caused by mental or emotional disturbance, in which psychological stresses adversely affect physiological (somatic) functioning to the point of distress. Psychosomatic disorders may include HYPERTENSION, respiratory ailments, gastrointestinal disturbances, migraine and tension HEADACHES, SEXUAL DYSFUNCTIONS, and DERMATITIS. Many patients with psychosomatic conditions respond to a combination of drug therapy and PSYCHOTHERAPY. See also HYPOCHONDRIASIS.

psychosurgery Treatment of PSYCHOSIS or other MENTAL DISORDERS by means of brain surgery. The first such technique was the prefrontal LOBOTOMY. Fairly common from the 1930s through the 1950s, lobotomy reduced neurotic symptoms such as agitation and aggressiveness but also left patients apathetic and with a limited range of emotions; it has since been largely replaced by the use of tranquilizing and antipsychotic drugs (see PSYCHOPHARMACOLOGY). A form of psychosurgery developed more recently involves the placement of tiny lesions in specific areas of the brain and has little effect on intellectual function or quality of life; it has been used to treat OBSESSIVE-COMPULSIVE DISORDER and occasionally cases of severe psychosis.

psychotherapy Treatment of psychological, emotional, or behaviour disorders through interpersonal communications between the patient and a trained counselor or therapist. The goal of many modern individual and GROUP THERAPIES is to establish a central relationship of trust in which the client or patient can feel free to express personal thoughts and emotions and thus gain insight into his condition and generally share in the healing power of words. Such therapies include PSYCHOANALYSIS and its variants (see ALFRED ADLER; CARL GUSTAV JUNG), client-centred or NONDIRECTIVE PSYCHOTHERAPY, Gestalt therapy (see GESTALT PSYCHOLOGY), play and art therapy, and general COUNSELING. In contrast, BEHAVIOUR THERAPY focuses on modifying behaviour by reinforcement techniques without concerning itself with internal states.

Ptah \'ptä\ In EGYPTIAN RELIGION, the creator god. The patron of craftsmen, especially sculptors, Ptah was identified by the Greeks with HEPHAESTUS, the divine blacksmith. He was represented as a man in mummy form, wearing a skullcap and a short, straight false beard. He was originally the local deity of MEMPHIS, capital of Egypt from the 1st dynasty onward; the political importance of Memphis caused Ptah's cult to spread across Egypt. With Sekhmet and Nefertem, he was one of the Memphite Triad of deities. See photograph on opposite page.

© 2006 Encyclopædia Britannica, Inc.

ptarmigan \'tär-mi-gən\ Any of three or four species of GROUSE (genus *Lagopus*) of cold regions. Ptarmigan plumage changes from white in winter to gray or brown, with barring, in spring and summer. The toes are covered with stiff feathers above and below. The common ptarmigan (*L. mutus*) occurs throughout the British Isles, Europe, and North America, where it is called rock ptarmigan. Ptarmigans survive winter in the Arctic and on mountaintops by browsing shrubs and scratching up lichens and leaves; they burrow in snow to sleep. Males begin group displays in early spring and then separate and display singly in adjoining territories.

Pteranodon \tə-'ra-nə-ˌdän\ Genus of extinct flying REPTILES, descendants of the PTERODACTYL. Fossils are known from Late Cretaceous (99–65 million years ago) deposits of Europe, Asia, and North America. *Pteranodon* had a wingspan of 23 ft (7 m) or more. The largest specimen had a wingspan of 50 ft (15.5 m). The body was about the size of a modern turkey. *Pteranodon* had a crest at the back of the skull and long, pelican-like, toothless jaws. They probably made nests and spent much time gliding over the ocean searching for fish. They probably depended on air currents for liftoff rather than on flapping their wings.

pterodactyl \ˌter-ə-'dak-tᵊl\ Any member of the PTEROSAUR suborder Pterodactyloidea, known from Late Jurassic and Cretaceous fossils (159–65 million years ago) in eastern Africa and Europe. Members of the typical genus, *Pterodactylus*, ranged from the size of a sparrow to that of an albatross. Pterodactyls had slender, delicate teeth that were angled forward (possibly for use as straining devices), long metacarpal bones, and a short tail. They were probably able gliders but not efficient as active fliers, and they apparently lacked feathers. Unlike the ARCHAEOPTERYX, the pterodactyl was not an ancestor of the birds.

pterosaur \'ter-ə-ˌsȯr\ Any of several extinct flying REPTILES (order Pterosauria) that flourished during the Jurassic and Cretaceous periods (206–65 million years ago). Pterosaurs hung by their long, slender hind limbs when at rest. They soared and glided on fragile, membranous wings that were attached to the long fourth finger of each forelimb and extended along the flank. The first three fingers were slender, clawed, clutching structures. Pterosaurs had a long, slender beak and a large brain. *Ramphorhynchus* had strong, sharply pointed teeth, a long tail, and a wingspread of about 3 ft (1 m). It probably obtained food by diving for fish. See also PTERODACTYL.

Ptolemais \ˌtä-lə-'mā-əs\ Ancient coastal city, CYRENAICA. Located in modern Libya, it received its name in the 3rd century BC from Ptolemy III, who united Cyrenaica with Egypt. Its economy was based on trade with the interior, and it flourished in Hellenistic times, in the early period of the Roman Empire, and again from the late 3rd century AD, when DIOCLETIAN made it the metropolis of the Roman province of Upper Libya.

Ptah, holding the emblems of life and power, bronze statuette, Memphis, *c.* 600–100 BC; in the British Museum.
COURTESY OF THE TRUSTEES OF THE BRITISH MUSEUM

Ptolemy \'tä-lə-mē\ *Latin* **Claudius Ptolemaeus** (b. c. AD 100—d. c. AD 170) Greek astronomer and mathematician. He worked principally in Alexandria. It is often difficult to determine which findings in his great astronomical book, the *ALMAGEST*, are Ptolemy's and which are HIPPARCHUS's. The Sun, Moon, planets, and stars, he believed, were attached to crystalline spheres, centred on Earth, which turned to create the cycles of day and night, the lunar month, and so on. In order to explain RETROGRADE MOTION of the planets, he refined a complex geometric model of cycles within cycles that was highly successful at predicting the planets' positions in the sky. The Earth-centred Ptolemaic system became dogmatically asserted in Western Christendom until the Sun-centred COPERNICAN SYSTEM replaced it. His *Geography* contained an estimate of the size of Earth, a description of its surface, and a list of places located by latitude and longitude. Ptolemy also dabbled in mechanics, optics, and music theory.

Ptolemy I Soter \'tä-lə-mē...'sō-tər\ (b. 367/366, Macedonia—d. 283/282 BC, Egypt) Ruler of Egypt (323–285) and founder of the Ptolemaic dynasty. A Macedonian general of ALEXANDER THE GREAT, he and the other generals divided the empire after Alexander's death, Ptolemy becoming SATRAP of Egypt. Alexander's successors were soon at war. Ptolemy was defeated in 306 by ANTIGONUS I MONOPHTHALMUS, though he and the others rebuffed Antigonus's attack on Egypt. He earned the name Soter ("Saviour") after defeating Antigonus on Rhodes (304), but Antigonus was not finally crushed until 301 at the Battle of IPSUS. Ptolemy secured and expanded his empire through alliances and marriages. He and his fellow kings won a final war (288–286) against DEMETRIUS of Macedonia, freeing Athens from Macedonian occupation. He obtained control of the League of Islanders (including most of the Aegean islands), which formed the basis of Egypt's maritime supremacy. As king he respected Egyptian culture, blended Greek and Egyptian peoples and religions, and founded the Library and Museum of ALEXANDRIA. After his death the Egyptians raised him to the level of a god. He was succeeded by his son, PTOLEMY II PHILADELPHUS.

Ptolemy II Philadelphus (b. 308, Cos—d. 246 BC) King of Egypt (285–246 BC), second king of the Ptolemaic dynasty. He reigned as coruler (285–282) with his father, PTOLEMY I SOTER, then purged his family of rivals, including his first wife, and married his sister, ARSINOE II. Wars with the rulers of the SELEUCID and ANTIGONID dynasties weakened his influence in the Aegean and brought near-disaster to his allies Athens and Sparta. He concluded these wars by diplomacy and marriage alliances and managed to regain his influence in the Aegean. He devised a buffer zone of possessions to protect Egypt from attack, and he dealt with reverses through diplomacy. A prudent and enlightened ruler, he promoted economic development and made Alexandria into a centre for poets and scholars.

Ptolemy III–XV (r. 246–30 BC) Macedonian kings of the Ptolemaic dynasty in Egypt. Ptolemy III Euergetes ("Benefactor") (fl. 246–221) defeated the ruler of the SELEUCID DYNASTY in the Third Syrian War (245–241). Ptolemy IV Philopator ("Father-loving") (r. 221–205) allowed Egypt to decline under his debauched rule. Ptolemy IX Soter II ruled with his mother (116–110, 109–107), until she expelled him and installed his brother Ptolemy X Alexander (r. 107–88). Alexander's unpopularity resulted in his expulsion, and he died at sea in 88. Soter II assumed sole rule (88–81), installing his brother's widow, his own daughter, with him. Ptolemy XI Alexander II (r. 80) was the last fully legitimate Ptolemaic king of Egypt. On the orders of SULLA, whose hostage he had been, he took Ptolemy IX Soter II's widow as wife and attempted to rule with her. This being unacceptable to the queen, Ptolemy murdered her and took sole power, for which the people of Alexandria killed him; his rule lasted 19 days. Of the remaining Ptolemies, Ptolemy XIV Theos Philopator II shared power (47–44) with his sister CLEOPATRA; it was probably she who had him assassinated, to make way for her son by Julius CAESAR. Ptolemy XV Caesar, or Caesarion, shared power with his mother from 44; he was killed by Octavian (later AUGUSTUS) after Cleopatra's suicide in 30. His death marked the Roman conquest of Egypt and the dynasty's end.

puberty In human physiology, the period of first becoming capable of reproducing sexually. Occurring at about age 12 in girls and age 14 in boys, puberty is characterized by the maturing of the genital organs, development of secondary sex characteristics, and, in girls, onset of MENSTRUATION. Both sexes experience a swift increase in body size and changes in body shape and composition. Puberty marks the beginning of ADOLESCENCE.

Public Broadcasting Service See PBS

public debt See NATIONAL DEBT

public health Science and art of preventing disease, prolonging life, and promoting health through organized community efforts. These include sanitation, control of contagious infections, hygiene education, early diagnosis and preventive treatment, and adequate living standards. It requires understanding not only of epidemiology, nutrition, and antiseptic practices but also of social science. Historical public health measures included quarantine of leprosy victims in the Middle Ages and efforts to improve sanitation following the 14th-century plague epidemics. Population increases in Europe brought with them increased awareness of infant

© 2006 Encyclopædia Britannica, Inc.

deaths and a proliferation of hospitals. Britain's Public Health Act of 1848 established a special public health ministry. In the U.S., public health is studied and coordinated on a national level by the Centers for Disease Control and Prevention; internationally, the World Health Organization plays an equivalent role.

public house *or* **pub** Establishment that serves alcoholic beverages for consumption on the premises, especially in Britain. Under English common law, inns and taverns were declared public houses responsible for the well-being of travelers. They were expected to receive all travelers in reasonable condition who were willing to pay for food, drink, and lodging. In Tudor England, certain innkeepers were obliged by royal act to maintain stables; others served as unofficial postmasters. The early public houses were identified by simple signs that featured creatures such as lions, dolphins, or swans. In the 18th century, the word Arms was added to many pub names to indicate that the establishment was under the protection of a noble family. Though British public houses were traditionally owned and operated by independent licensed proprietors, by the early 20th century many were owned or associated with brewery companies.

public relations (PR) Aspect of communications that involves promoting a desirable image for a person or group seeking public attention. It originated in the U.S. in the early 20th century with pioneers such as Edward L. Bernays and Ivy Ledbetter Lee. Government agencies in Britain and the U.S. soon began hiring publicists to engineer support for their policies and programs, and the public-relations business boomed after World War II. Clients may include individuals such as politicians, performers, and authors, and groups such as business corporations, government agencies, charities, and religious bodies. The audience addressed may be as narrow as male alternative-music fans between the ages of 21 and 30 or as broad as the world at large. A publicist's functions include generating favourable publicity and knowing what kind of story is likely to be printed or broadcast. The task is complicated by the variety of existing media: besides newspapers, magazines, radio, and television, there are publications of professional associations, direct-mail lists, on-site promotional events, and so on. It consists largely of optimizing good news and forestalling bad news; if disaster strikes, the publicist must assess the situation, organize the client's response so as to minimize damage, and marshal and present information to the media.

Public Safety, Committee of See Committee of Public Safety

public school *or* **independent school** In the United Kingdom, any of a small group of tuition-charging secondary schools that specialize in preparing students for university and for public service. The name *public school* dates from the 18th century, when the schools began attracting students from beyond their immediate environs and thus became "public" as opposed to local. Such schools are thus in fact private schools independent of the state system. Although many schools have become coeducational, only boys attend the historically important schools Winchester (1394), Eton (1440–41), Westminster (1560), and Harrow (1571); well-known girls' schools include Cheltenham (1853), Roedean (1885), and Wycomb Abbey (1896). Public schools cultivated a class-conscious code of behaviour, speech, and appearance that set the standard for British officialdom from the early 19th century. See also secondary education.

public television See PBS

public transportation See mass transit

public utility Enterprise that provides certain classes of services to the public, including common-carrier transportation (buses, airlines, railroads); telephone and telegraph services; power, heat and light; and community facilities for water and sanitation. In most countries such enterprises are state-owned and state-operated; in the U.S. they are mainly privately owned, but they operate under close regulation. Given the technology of production and distribution, they are considered natural monopolies, since the capital costs for such enterprises are large and the existence of competing or parallel systems would be inordinately expensive and wasteful. Government regulation in the U.S., particularly at the state level, aims to ensure safe operation, reasonable rates, and service on equal terms to all customers. Some states have experimented with deregulation of electricity and natural-gas operations to stimulate price reductions and improved service through competition, but the results have not been universally promising.

Public Works Administration U.S. government agency (1933–39). It was established as part of the New Deal to reduce unemployment through the construction of highways and public buildings. Authorized by the National Industrial Recovery Act (1933) and administered by Harold Ickes, it spent about $4 billion to build schools, courthouses, city halls, public-health facilities, and roads, bridges, dams, and subways. It was gradually dismantled as the country moved to a military-industrial economy during World War II.

Public Works of Art Project (PWAP) First of the U.S. federal art programs conceived as part of the New Deal during the Great Depression. Organized in 1933, it provided work to thousands of unemployed artists. PWAP projects (many of which were left unfinished) included some 7,000 easel paintings and watercolours, 1,400 murals and sculptures, 2,500 works of graphic art, and numerous other works designated to embellish nonfederal public buildings and parks. Prominent works include the murals in San Francisco's Coit Memorial Tower, Grant Wood's mural at Iowa State College, and Ben Shahn's mural designs on the theme of Prohibition. Many projects left incomplete when the PWAP ended in 1934 were finished under the WPA Federal Art Project.

publishing Traditionally, the selection, preparation, and distribution of printed matter—including books, newspapers, magazines, and pamphlets. Contemporary publishing includes the production of materials in digital formats such as CD-ROMs, as well as materials created or adapted for electronic distribution. Publishing has evolved from small, ancient, and law- or religion-bound origins into a vast industry that disseminates every kind of information imaginable. In the modern sense of a copying industry supplying a lay readership, publishing began in Hellenistic Greece, in Rome, and in China. After paper reached the West from China in the 11th century, the central innovation in Western publishing was Johannes Gutenberg's invention of movable type. In the 19th and 20th centuries, technological advances, the rise of literacy and leisure, and ever-increasing information needs contributed to an unprecedented expansion of publishing. Contemporary challenges in publishing include attempts at censorship, copyright laws and plagiarism, royalties for authors and commissions for literary agents, competitive marketing techniques, pressures from advertisers affecting editorial independence, acquisition of independent publishing concerns by conglomerates, and the loss of readers to other media such as television and the Internet.

Pucci \'pü-chē**, Emilio, marquess di Barsento** (b. Nov. 20, 1914, Naples, Italy—d. Nov. 29, 1992, Florence) Italian fashion designer and politician. He became a designer when a fashion photographer for *Vogue* noticed his original ski outfit and asked him to design women's ski clothes. He is best known for his tight shantung "Pucci pants" and vividly printed silk dresses and blouses. His colourful, less formal uniforms for Braniff flight attendants were the first of their kind. Later he branched into men's fashions, perfume, and ceramics. He was a member of the Italian Parliament (1963–72).

Puccini \pü-'chē-nē**, Giacomo (Antonio Domenico Michele Secondo Maria)** (b. Dec. 22, 1858, Lucca, Tuscany—d. Nov. 29, 1924, Brussels, Belg.) Italian composer. Born into a family of organists and choirmasters, he was inspired to write operas after hearing Giuseppe Verdi's *Aïda* in 1876. At the Milan Conservatory he studied with Amilcare Ponchielli (1834–86). Puccini entered his first opera, *Le villi* (1883), in a competition; though it lost, a group of his friends subsidized its production, and its premiere took place with immense success. His second, *Edgar* (1889), was a failure, but *Manon Lescaut* (1893) brought him international recognition. His mature operas included *La Bohème* (1896), *Tosca* (1900), *Madam Butterfly* (1904), and *The Girl of the Golden West* (1910). All four are tragic love stories; his use of the orchestra was refined, and he established a dramatic structure that balanced action and conflict with moments of repose, contemplation, and lyricism. They remained exceedingly popular into the 21st century. He was the most popular opera composer in the world at the time of his death; his unfinished *Turandot* was completed by Franco Alfano (1875–1954).

Pucelle \pü̇-'sel**, Jean** (b. 1300?—d. 1355?) French manuscript illuminator. Little is known of his background, but his large workshop dominated Parisian painting in the early 14th century, when he enjoyed court patronage and his work commanded high prices. His most celebrated work, the *Hours of Jeanne d'Evreux* (c. 1325–28), a tiny private prayer book commissioned by the queen, featured numerous drolleries (marginal designs), a style he popularized, and reveals his genius for using sources from Italian and French art to give a playful tone to an essentially religious work.

© 2006 Encyclopædia Britannica, Inc.

puddling process Method of converting PIG IRON into WROUGHT iron by subjecting it to heat and frequent stirring in a furnace in the presence of oxidizing substances (see OXIDATION-REDUCTION). Invented by HENRY CORT in 1784 (superseding the FINERY PROCESS), it was the first method that allowed wrought iron to be produced on a large scale.

Puebla State (pop., 2000: 5,076,686), southeast-central Mexico. It covers an area of 13,090 sq mi (33,902 sq km), and its capital is PUEBLA city. It occupies part of the Anáhuac Plateau and varies in elevation from 5,000 to 8,000 ft (1,500 to 2,400 m), with fertile valleys formed by the SIERRA MADRE Oriental. The region has long been densely populated. Pre-Columbian peoples had a highly developed civilization in the area, and there are many archaeological sites. The Spanish made Puebla an economic and religious centre, and since the 19th century it has been an important agricultural and industrial centre.

Puebla *in full* **Puebla de Zaragoza** City (pop., 2000: 1,271,673), capital of PUEBLA state, southeastern Mexico. Founded in 1532, it lies on a plain about 7,100 ft (2,165 m) above sea level in the SIERRA MADRE Oriental foothills. Located between MEXICO CITY and VERACRUZ, it was occupied by U.S. forces during the MEXICAN WAR. Its Spanish colonial architecture is similar to that of the city of TOLEDO, Spain. The centre of an important agricultural and industrial region, it is also known for its glazed ceramic tiles, glass, and pottery. In 1973 the city was shaken by a severe earthquake.

pueblo (Spanish: "town") Community of the PUEBLO INDIANS of the southwestern U.S., consisting of multistoried apartment houses constructed of large ADOBE blocks beginning c. AD 1000. Freestanding structures up to five stories tall were built around a central court. Each floor is set back from the floor under it; the whole structure resembles a zigzag pyramid, with terraces formed by the rooftops of the level below. Though rooms often have connecting doorways, movement between levels is by means of ladders through holes in the ceilings. Ground-floor rooms, used for storage, have no outside doors. Each pueblo has at least two KIVAS. Many of the pueblos are still occupied; ACOMA pueblo is believed to be the oldest continuously inhabited place in the U.S. Some of the largest pueblos are at Taos, Isleta, Laguna, and Zuni. See also CLIFF DWELLING.

Pueblo Incident (1968) Capture of the USS *Pueblo*, a Navy intelligence ship, by North Korea off its coast on Jan. 23, 1968. The U.S. initiated negotiations with North Korea to secure the release of its 83 crewmen. The resulting agreement allowed the U.S. to publicly disavow the confession the crew had signed while privately admitting its truth; the U.S. also acknowledged the ship's intrusion into North Korean waters and agreed not to undertake similar intelligence gathering activities in the future. An inquiry into the crew's confession and the conduct of the ship's commander produced no apparent disciplinary action.

Pueblo Indian Any of the historic descendants of the prehistoric ANASAZI peoples who have for centuries lived in settled PUEBLOS in what is now northeastern Arizona and northwestern New Mexico. The contemporary pueblos are divided into eastern and western. The eastern group includes settlements along the Rio Grande in New Mexico (most notably TAOS Pueblo), while the western group includes the HOPI villages of northeastern Arizona and the ZUNI, ACOMA, and Laguna villages of northwestern New Mexico. The original Pueblo culture was characterized by both agriculture and the hunting of deer and antelope. Today agriculture predominates. Modern Pueblo social life centres on the village. Pueblo Indians have retained their pre-Spanish way of life to a surprising degree. Even though they have added to their inventory of material goods, the basic fabric of the Pueblo social system, community of organization and native religion, with modifications only of detail, has survived.

Pueblo pottery One of the most highly developed of the Native American arts. Pueblo pots, made only by women of the tribe, are constructed of long "sausages" of clay that are coiled upward and then smoothed out. Designs include geometric, floral, and animal patterns. The method was developed during the Classical Pueblo period (c. 1050–1300) and is still being used today. See photograph above.

Puente \'pwen-tā**, Tito** *orig.* **Ernesto Antonio Puente, Jr.** (b. April 20, 1923, New York, N.Y., U.S.—d. May 31, 2000, New York City) U.S. bandleader, percussionist, and composer. Born to Puerto Rican parents, Puente served in the Navy during World War II and later studied at Juilliard. In the late 1940s he formed his own band and rose to prominence with the SALSA, mambo, MERENGUE, and cha-cha-cha fads of the 1950s.

Pottery made by the Pueblo Indians (Left) Acoma waterjar, 1890, (centre) Santa Clara vase, c. 1880, (right) San Ildefonso waterjar, 1906; in the Denver Art Museum, Colo.
COURTESY OF THE DENVER ART MUSEUM, DENVER, COLO.

Always experimenting, he became a pioneer of Latin-jazz fusion. His compositions include "Pare Cochero" and "Oye Como Va." He performed with many artists, especially CELIA CRUZ, and he recorded more than 100 albums. He also performed in several films, including *Radio Days* (1987) and *The Mambo Kings* (1992).

puerperal \pyü-'ər-pə-rəl\ **fever** *or* **childbed fever** Infection of the female REPRODUCTIVE SYSTEM after childbirth or abortion, with fever over 100 °F (38 °C) in the first 10 days. The inner surface of the uterus is most often infected, but lacerations of any part of the genital tract can give BACTERIA (often *Streptococcus pyogenes*) access to the bloodstream and lymphatic system to cause SEPTICEMIA, cellulitis (cellular inflammation), and pelvic or generalized PERITONITIS. Severity varies. Puerperal fever has become very rare in developed countries but is still seen after abortions performed in unhygienic surroundings.

Puerto Rico *officially* **Commonwealth of Puerto Rico** Self-governing island commonwealth of the WEST INDIES, in the northeastern Caribbean Sea; it is associated with the U.S. Area: 3,515 sq mi (9,104 sq km). Population (2005 est.): 3,912,000. Capital: SAN JUAN. Most of the population is of Spanish descent, with significant minorities of people of African and mixed (African-European) descent. Languages: Spanish, English (both official). Religion: Christianity (predominantly Roman Catholic; also Protestant). Currency: U.S. dollar. The island of Puerto Rico may be divided into three geographic regions: the mountainous interior, the northern plateau, and the coastal plains. It has a developing free-market economy, of which manufacturing, financial services, and trade (mostly with the U.S.) are the main components. Tourism is also an important source of income. Puerto Rico's chief of state is the U.S. president, and its head of government is the commonwealth governor. The island was inhabited by ARAWAK Indians when it was settled by the Spanish in the early 16th century. It remained largely undeveloped economically until the late 18th century. After 1830 it gradually developed a plantation economy based on the export crops of sugarcane, coffee, and tobacco. The independence movement began in the late 19th century, and Spain ceded the island to the U.S. in 1898 after the SPANISH-AMERICAN WAR. In 1917 Puerto Ricans were granted U.S. citizenship, and in 1952 the island became a commonwealth with autonomy in internal affairs. Voters reaffirmed the island's commonwealth status in plebiscites in 1967, 1993, and (tacitly) 1998, but Puerto Rican statehood remained a political issue into the 21st century.

Puerto Vallarta \'pwer-tō-bä-'yär-tä\ City (pop., 2000: 151,432), west-central Mexico. It is situated on Banderas Bay, in the Pacific coastal lowland, south of the mouth of the Ameca River. The major port of JALISCO state, it exports bananas, coconut oil, hides, and fine woods. It is also an international tourist resort, known for aquatic sports, fishing (especially for sharks), and hunting.

Pufendorf \'pü-fən-ˌdȯrf**, Samuel, baron von** (b. Jan. 8, 1632, Dorfchemnitz, near Thalheim, Saxony—d. Oct. 13, 1694, Berlin) German jurist and historian. The son of a pastor, he left the study of theology for jurisprudence, philosophy, and history. He taught at the Universities of Heidelberg (1661–68) and Lund (1670–77). His *Elements of Universal Jurisprudence* (1660) and *Of the Law and Nature of Nations* (1672), which were influenced by HUGO GROTIUS and THOMAS HOBBES, departed from the traditional approach of the medieval theologians to NATURAL LAW in arguing that there is no such creature as a natural slave—that all men have a right to equality and freedom. His views were attacked by conservative Protestant theologians in Sweden and Germany, and GOTTFRIED WILHELM

© 2006 Encyclopædia Britannica, Inc.

Leibniz dismissed him as "a man not a lawyer and scarcely a philosopher at all." Nevertheless, he was protected by the Swedish government, and he became the official historiographer to Charles XI of Sweden (1677–88) and to the elector of Brandenburg (1688–94).

puffball Any of various fungi (see fungus) in the order Lycoperdales of the class Basidiomycetes, found in soil or on decaying wood in grassy areas and woods. Puffballs are named for the fact that puffs of spores are released when the dry and powdery tissues of the mature spherical fruiting body (basidiocarp) are disturbed. Many are edible before maturity.

puffer *or* **blowfish** Any of about 90 species (family Tetraodontidae) of fishes that, when disturbed, inflate themselves into a globular shape with air or water. Most species occur in warm and temperate seas worldwide; some occur in brackish or fresh water. Puffers have tough, usually prickly, skin; their fused teeth form a beaklike structure, split in the center of each jaw. The largest grow to 3 ft (90 cm) long, but most are considerably smaller. Though they contain a lethal toxin, they are sometimes eaten, especially in Japan, where puffers (called fugu) are prepared by a specially trained chef.

Puffer (*Arothron stellatus*).
DOUGLAS FAULKNER

puffin *or* **sea parrot** Any of three species (family Alcidae) of diving birds with a large, brightly coloured, triangular beak. Puffins nest in large colonies on seaside and island cliffs. Both parents carry up to 10 fish crosswise in the bill to the nest (a deep burrow); they feed the single chick for about six weeks. They then leave, and the chick waits alone for its flight feathers to grow, living on stored fat, and then flies out to sea by itself. The common, or Atlantic, puffin (*Fratercula arctica*) is about 12 in. (30 cm) long. The Pacific species are the horned puffin (*F. corniculata*) and the tufted puffin (*Lunda cirrhata*).

Common puffin (*Fratercula arctica*)
BEN GOLDSTEIN—ROOT RESOURCES

pug Breed of toy dog that probably originated in China. Dutch traders brought it to England in the late 17th century. Squarely built and muscular, the pug has a short muzzle, tightly curled tail, large head, prominent eyes, and small, drooping ears. It stands 10–11 in. (26–28 cm) and weighs about 13–18 lbs (6–8 kg). Its short, glossy coat can be black, silver, or apricot fawn; there is a black mask on the face. Loyal and alert, pugs are valued as companions.

Pug.
SALLY ANNE THOMPSON/EB INC.

Pugachov \ˌpü-gə-'chȯf**, Yemelyan (Ivanovich)** (b. c. 1742, Zimoveyskaya-na-Donu, Russia—d. Jan. 21, 1775, Moscow) Russian Cossack leader. He fought in the Russian army (1763–70), then wandered among settlements of the dissident Old Believers. Learning of Cossack discontent after their unsuccessful rebellion in 1772, he claimed to be Tsar Peter III and decreed the abolition of serfdom. Vowing to depose Catherine II, he gathered a large following of Cossacks and peasants in the Ural region. After initial victories against the Russian army, he was defeated, captured, and executed.

Puget \pyü-'zhe**, Pierre** (b. Oct. 16, 1620, at or near Marseille, France—d. Dec. 2, 1694, Marseille) French sculptor, painter, and architect. As a young man he was employed by Pietro da Cortona to work on the ceiling decorations of the Pitti Palace in Florence. Thereafter he worked chiefly in France as a painter and sculptor. While his work is in the tradition of Roman Baroque, such sculptures as *Milo of Crotona* (c. 1671–82), in which the athlete is attacked by a lion while his hand is caught in a tree stump, show a strain and anguish that suggest the works of Michelangelo.

Puget \'pyü-jət\ **Sound** Arm of the Pacific Ocean indenting northwestern Washington, U.S. It was explored by the British navigator George Vancouver in 1792 and named by him for Peter Puget, a second lieutenant in his expedition, who probed the main channel. It has many deep-water harbours, including Seattle, Tacoma, Everett, and Port Townsend, which are shipping ports for the rich farmlands along the river estuaries. It provides a sheltered area for recreational boating and salmon fishing.

Puglia \'pü-lyä\ *or* **Apulia** \ä-'pü-lyä\ Autonomous *regione*, southeastern Italy. It is located between the Adriatic Sea, the Apennines, and the Gulf of Taranto. It was ruled in the early Middle Ages by Goths, Lombards, and Byzantines and achieved its greatest glory under the Hohenstaufen emperors, especially the 13th-century Holy Roman emperor Frederick II. In 1861 it became part of the Italian kingdom. The region is predominantly agricultural. Wheat, barley, and oats are grown on the plain and in the more fertile parts of the plateaus, while olives, grapes, almonds, figs, and vegetables predominate farther south; tobacco is a specialty of the Lecce Plain. The wines of Puglia are the strongest in Italy and are used to fortify other, lighter varieties. There are chemical and petrochemical industries in Bari and iron and steel plants in Taranto. The capital of Puglia (pop., 2001 prelim.: 3,983,487) is Bari; the region has an area of 7,470 sq mi (19,348 sq km).

Pugwash Conferences Series of international meetings of eminent scientists to discuss problems of nuclear weapons and world security. The first meeting was held in 1957 at the estate of Cyrus Eaton in Pugwash, Nova Scotia. The Pugwash organization was established to convene subsequent conferences to discuss arms control and disarmament; these were held in the Soviet Union, Britain, India, and the U.S., among other countries. The organization and its president and founding member, Joseph Rotblat (born 1908), received the 1995 Nobel Prize for Peace.

puja \'pü-jä\ In Hinduism, a form of ceremonial worship. It may range from brief daily rites in the home to an elaborate temple ritual. A typical *puja* offers the image of a deity the honours accorded to a royal guest. The god is gently roused from sleep, ritually bathed and dressed, served three meals during the day, and ceremonially put to bed. Rituals may also include a sacrifice and oblation to the sacred fire. Some *puja*s are performed by the worshiper alone; others require a ritually pure person. A *puja* may be performed for a specific purpose or simply as an act of devotion.

Pukaskwa \pü-'kas-kwə\ **National Park** National park, central Ontario, Canada. Established in 1971, it is Ontario's largest national park, covering 725 sq mi (1,878 sq km). It includes areas of rugged Canadian Shield wilderness as well as 50 mi (80 km) of the shoreline of northeastern Lake Superior, with rocky islets and coves and spectacular cliffs. Excavations of prehistoric Indian remains have been made. Wildlife includes timber wolf, black bear, mink, lynx, white-tailed deer, moose, and woodland caribou. The park has vast forests of white and black spruce, jack pine, poplar, and birch.

Pulcher, Publius Clodius See Publius Clodius Pulcher

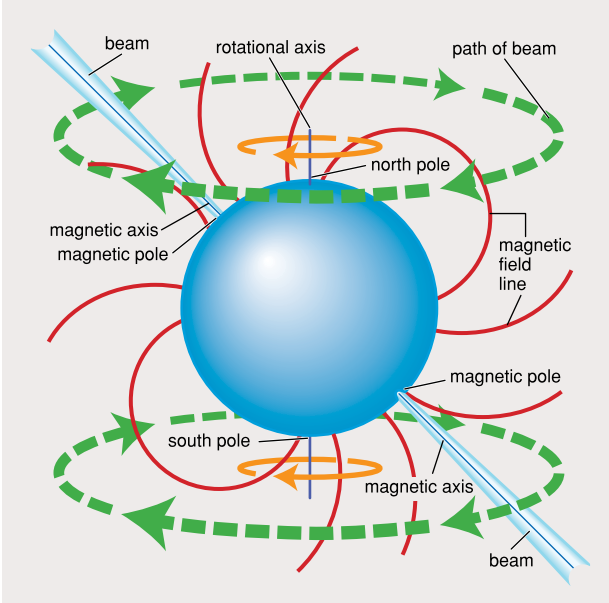
Pulitzer \'pù-lət-sər**, Joseph** (b. April 10, 1847, Makó, Hung.—d. Oct. 29, 1911, Charleston, S.C., U.S.) Hungarian-born U.S. newspaper editor and publisher. He immigrated to the U.S. in 1864 to serve in the American Civil War. After the war he became a reporter and then proprietor at German-language newspapers in St. Louis and entered Missouri politics. In 1878 he merged the *St. Louis Dispatch* (founded 1864) and the *Post* (founded 1875) into the *Post-Dispatch*, which soon became the city's dominant evening newspaper. Shifting his interests to New York City, he purchased the *World* (1883) and founded the *Evening World* (1887). He helped establish the pattern of the modern newspaper by combining exposés of political corruption and crusading investigative reporting with publicity stunts, self-advertising, and sensationalism. In his will he endowed the Columbia University School of Journalism and established the Pulitzer Prizes.

Pulitzer Prize \'pù-lət-sər, 'pyü-lət-sər\ Any of a series of annual prizes awarded by Columbia University for outstanding public service and achievement in American journalism, letters, and music. Fellowships are

© 2006 Encyclopædia Britannica, Inc.

also awarded. The prizes, originally endowed with a gift of $500,000 from Joseph Pulitzer, are highly esteemed and have been awarded each May since 1917 on the recommendation of the Pulitzer Prize Board, composed of judges appointed by the university. The numbers and categories of prizes have varied over the years. Today they include 14 awards in journalism, six in letters, one in music, and four fellowships.

pulley In mechanics, a wheel that carries a flexible rope, cord, cable, chain, or belt on its rim. Pulleys are used singly or in combination to transmit energy and motion. In belt drives, pulleys are attached to shafts at their axes, and power is transmitted between the shafts by means of endless belts running over the pulleys. One or more independently rotating pulleys can be used to gain mechanical advantage, especially for lifting weights. The shafts around which the pulleys turn may attach them to frames or blocks, and a combination of pulleys, blocks, and rope is called a block and tackle. The pulley is considered one of the five simple machines.



Pullman, George M(ortimer) (b. March 3, 1831, Brocton, N.Y., U.S.—d. Oct. 19, 1897, Chicago, Ill.) U.S. industrialist. He moved to Chicago as a young man and worked as a cabinetmaker for his brother. In 1858 he remodeled two day coaches for a local railroad company into sleeping coaches; eventually he set up his own firm, and the first true Pullman sleeping car appeared in 1865. Becoming wealthy from his invention, in 1867 he founded the Pullman Palace Car Company; the next year he created the first dining car. In 1880 he built the town of Pullman (now incorporated into Chicago) for its workers; a much-discussed social experiment, the town was also the scene of the famous Pullman Strike of 1894.

Pullman Strike (May 11–c. July 20, 1894) Massive railroad strike in the U.S. After financial reversals caused the Pullman Palace Car Co. to cut wages by 25%, local union members called a strike. The company's president, George Pullman, refused arbitration, and union president Eugene V. Debs called for a nationwide boycott of Pullman cars. Sympathy strikes followed in 27 states. Violence broke out in Chicago, Ill., but Gov. John Peter Altgeld refused to intervene. The U.S. attorney general, Richard Olney, obtained an injunction against the strikers for impeding the mail service, and federal troops were called in. Debs's conviction for conspiring against interstate commerce established that the Sherman Antitrust Act could be enforced against labour-unions.

pulmonary alveolus \'půl-mə-ˌner-ē-al-'vē-ə-ləs\ Any of the 300 million or so small air spaces in the lungs where carbon dioxide leaves the blood and oxygen enters it. Alveoli form clusters (alveolar sacs) connected by alveolar ducts to the bronchioles. Their thin walls contain numerous capillaries, supported by a mesh of elastic and collagenous fibres; gas exchange between them occurs by diffusion. A film of fatty substances (surfactant) over the walls reduces surface tension, keeping the alveoli from collapsing and making it easier to expand the lungs. Alveolar macrophages (see leukocyte; lymphoid tissue) act as mobile scavengers, engulfing foreign particles in the lungs.

pulmonary heart disease *or* **cor pulmonale** \ˌkȯr-půl-mə-'näl-ē\ Enlargement and eventual failure of the right ventricle of the heart due to disorders of the lungs or their blood vessels or chest wall abnormalities. Chronic disease is most often caused by chronic bronchitis or emphysema. Symptoms include chronic cough, trouble in breathing after exertion, wheezing, weakness, leg edema, right upper abdominal pain, and neck vein distension. Pressure in the pulmonary artery rises and the right ventricle enlarges in response, leading, if uncorrected, to heart failure. Treatment includes a respirator, low-sodium diet, diuretics, digitalis, and antibiotics for respiratory infection. Acute disease due to pulmonary embolism is often treated by removal of the blockage.

pulsar *in full* **pulsating radio star** Any of a class of cosmic objects that appear to emit extremely regular pulses of radio waves. A few give off short rhythmic bursts of visible light, X rays, and gamma radiation as well. Thought to be rapidly spinning neutron stars, they were discovered by Antony Hewish and Jocelyn Bell Burnell in 1967 with a specially designed radio telescope. More than 550 have been detected since. All behave similarly, but the intervals between pulses (and thus their rotation periods) range from one-thousandth of a second to four seconds. Charged particles from the surface enter the star's magnetic field, which accelerates them so that they give off radiation, released as intense beams from the magnetic poles. These do not coincide with the pulsar's own axis of rotation, so as the star spins, the radiation beams swing around like lighthouse beams and are seen as pulses. Pulsars have been shown to be slowing down, typically by a millionth of a second per year. It has been calculated that pulsars "switch off" after about 10 million years, when their magnetic fields weaken enough.

A pulsar emits two beams of electromagnetic radiation along its magnetic axis. If the magnetic axis is offset from the rotational axis, the beams will sweep out circular paths as the star rotates, instead of remaining in one position. An observer in the path of such a beam will thus detect a periodic pulse of radiation as the beam sweeps by.

© MERRIAM-WEBSTER INC.

pulse Pressure wave in the arteries from contraction of the heart. It can be felt where arteries are near the skin's surface; it is usually read at the carotid artery in the neck or at the wrist. Its rate, strength, and rhythm and the contour of the wave provide valuable information but must be viewed in context (e.g., rapid pulse occurs with serious heart disease, simple fever, or vigorous exercise). The average adult pulse rate is 70–80 beats per minute; the rate decreases with age and is generally faster in women.

puma See cougar

pumice \'pə-məs\ Very porous, frothlike volcanic glass that has long been used as an abrasive in cleaning, polishing, and scouring compounds. It is also used in precast masonry units, poured concrete, insulation and acoustic tile, and plaster. Pumice is igneous rock that cooled so rapidly there was no time for it to crystallize. When it solidified, the vapours dissolved in it were suddenly released, and the whole mass swelled up into a froth that immediately consolidated. Any type of lava may become pumiceous under favourable conditions.

pump Machine that uses energy to raise, transport, or compress fluids. Pumps are classified by how they transfer energy to the fluid. The basic methods are volume displacement, addition of kinetic energy, and use of electromagnetic force. Pumps in which displacement is accomplished mechanically are called positive displacement pumps. Kinetic pumps pass kinetic energy to the fluid by means of a rapidly rotating impeller (blade). To use electromagnetic force, the fluid being pumped must be a good electrical conductor. Pumps used to transport or pressurize gases are called compressors, blowers, or fans.

pumpkin Fruit of certain varieties of *Cucurbita pepo* or *C. moschata*, of the gourd family. In the U.S., the thick-growing, small-fruited bush, or nontrailing, varieties of *C. pepo* are called squash, and the long-season, long-trailing, large-fruited varieties are called pumpkin. Pumpkins produce very long vines and large (9–18 lb [4–8 kg]), globe-shaped, orange fruits. Giant and miniature varieties are available. The usually lightly furrowed or ribbed rind is smooth, and the fruit stem is hard and woody. Pumpkins mature in early autumn and can be stored for a few months in

© 2006 Encyclopædia Britannica, Inc.

a dry, warm place. They are commonly grown in North America, Britain, and Europe for human food and livestock feed. In Europe pumpkin is served mainly as a vegetable; in the U.S. and Canada pumpkin pie is a traditional Thanksgiving and Christmas dessert. Pumpkins are used in the U.S. for HALLOWEEN decorations.

Punch Hooknosed, humpbacked character in MARIONETTE and puppet shows (see PUPPETRY). Adapted from a stock character of the COMMEDIA DELL′ARTE, the puppet character was taken to France and England by Italian puppeteers in the 1660s. By 1700 every English puppet show featured Punch (from Punchinello) and his wife, Judy. As marionettes became less popular in the 1790s, smaller glove puppets were used in the popular Punch-and-Judy play. The hooked nose and the brutal, vindictive, and deceitful behaviour of the English Punch were established characteristics by the 19th century. In France his popularity declined during the 19th and 20th centuries, and he disappeared there as a comic figure. Puppeteers in England have carried on the tradition of Punch-and-Judy shows.

Punch English illustrated periodical published 1841–1992 and revived in 1996 with a revised format. Initially a weekly radical paper, it became famous for its satiric humour, caricatures, and cartoons. Among its famous early staff members were WILLIAM THACKERAY and JOHN TENNIEL. A cover drawing by Richard Doyle was used continuously from 1849 to 1956, when each issue's cover was made different, though the traditional figures of Punch and his dog Toby usually appeared somewhere.

punch press MACHINE TOOL that changes the size or shape of a piece of material, usually sheet metal, by applying PRESSURE to a DIE in which the workpiece is held. The form and construction of the die determine the shape produced on the workpiece. A punch press has two components: the punch, which is attached to the reciprocating (back and forth, or up and down) ram (plunger) of the machine; and the die, which is clamped onto a bed or anvil whose flat surface is perpendicular to the path of the ram. The punch pushes against the workpiece, which is held in the die. Punch presses are usually driven by electric motors. See also HYDRAULIC PRESS.

punctuation Standard set of marks used in written and printed texts to clarify meaning and to separate sentences, words, and parts of words. It often marks discourse features such as intonational contours and pauses. It may also convey information about a word (e.g., hyphens in compound words) unrelated to speech patterns. In English, the period (.) marks the end of a sentence or an abbreviation. The comma (,) usually separates clauses, phrases, or items in a series. The colon (:) often introduces an explanation or series of examples. The semicolon (;) usually separates independent clauses. The em-dash (—) marks an abrupt transition. The exclamation point (!) signals surprise. The question mark (?) signals a question. The apostrophe (') marks the possessive case or the omission of letters. Quotation marks (" ") set off either quoted words or words used with special significance. Interpolations in a sentence are marked by brackets ([ ]) or parentheses ( ).

Punctation of Olmütz See OLMÜTZ, PUNCTATION OF

Pune \'pü-nə\ *formerly* **Poona** City (pop., 2001 prelim.: city, 2,540,069; metro. area, 3,755,525), western India. Called "Queen of the DECCAN," it is the cultural capital of the Maratha peoples (see MARATHA CONFEDERACY). It first gained importance as the capital of the Bhonsle Marathas in the 17th century. Temporarily captured by the Mughals, it again became the Maratha capital from 1714 until 1817, when it fell to the British. It served as the seasonal capital of the Bombay presidency, and its mild weather has made it a popular tourist resort. It is a major educational centre and headquarters of the Indian army's southern command; it is ringed by a sprawling complex of industrial suburbs.

Punic Wars \'pyü-nik\ *or* **Carthaginian Wars** Three wars (264–241 BC, 218–201, 149–146) between Rome and CARTHAGE. The first concerned control of Sicily and of the sea lanes in the western Mediterranean; it ended with Rome victorious but with great loss of ships and men on both sides. In 218 HANNIBAL attacked Roman territory, starting from Spain and marching overland into Italy with troops and elephants. After an initial Carthaginian victory, FABIUS MAXIMUS CUNCTATOR harassed him wherever he went without offering battle. Abandoning this tactic resulted in a major Roman loss at the Battle of CANNAE (216); that defeat drew the Romans together and, though worn down, they managed to rally, eventually defeating Hannibal and driving him out of Italy (203). The Third Punic War was essentially the siege of Carthage; it led to the destruction of Carthage, the enslavement of its people, and Roman hegemony in the western Mediterranean. The Carthaginian territory became the Roman province of Africa.

Punjab \ˌpən-'jäb\ State (pop., 2001 prelim.: 24,289,296), northwestern India. Bordered by PAKISTAN and the states of JAMMU AND KASHMIR, HIMACHAL PRADESH, HARYANA, and RAJASTHAN, it occupies an area of 19,445 sq mi (50,362 sq km). The city of CHANDIGARH is the joint administrative capital of Punjab and Haryana. In the 18th century the Sikhs (see SIKHISM) built a powerful kingdom in the Punjab, which came under British rule in 1849. In 1947 the area was split between the new nations of India and Pakistan, the smaller eastern portion going to India. It is the only Indian state with a majority of Sikhs. Hindus make up about one-third of the population, and there are smaller minorities of Christians, Jains, and Muslims. The economy is based on agriculture and small- and medium-scale industry.

Punjabi \ˌpən-jä-bē\ **language** *or* **Panjabi language** Indo-Aryan language of the Punjab in India and Pakistan. Punjabi has about 26 million speakers in India and more than 60 million in Pakistan—nearly half the population of the latter—but linguists have sometimes considered the dialects of southwestern, western, and northern Punjab province in Pakistan a different language. Inhabitants of southern Punjab province have agitated for consideration of their speech, Siraiki (with more than 12 million speakers), as a distinct language, though Siraiki and Punjabi are mutually intelligible.

punk Aggressive form of ROCK MUSIC that coalesced into an international (though predominantly Anglo-American) movement in 1975–80. Originating in the countercultural rock of artists such as the Velvet Underground and Iggy (Pop) and the Stooges, punk rock evolved in New York City in the mid-1970s with artists such as Patti Smith and the Ramones. It soon took root in London—where distinctly "punk" fashions, including spiked hair and ripped clothing, were popularized—with bands such as the Sex Pistols and the Clash, and later in California, with X, Black Flag, and the Dead Kennedys. It is often marked by a fast, aggressive beat, loud guitar with abrupt chord changes, and nihilistic lyrics. Variants include new wave (more pop-oriented and accessible) and hardcore (characterized by brief, harsh songs played at breakneck speed); the latter continued to thrive through the 1990s.

Punnett \'pən-ət\, **Reginald Crundall** (b. June 20, 1875, Tonbridge, Kent, Eng.—d. Jan. 3, 1967, Bilbrook, Somerset) British geneticist. Through contact with WILLIAM BATESON he came to support the theories of GREGOR MENDEL, and in 1905 he published the first textbook on Mendelian genetics. Using poultry and sweet peas, Punnett and Bateson discovered some of the fundamental processes of Mendelian genetics, including linkage, sex determination, sex linkage, and the first example of nonsexual chromosome linkage. Punnett demonstrated the value of using sex-linked plumage-colour factors to distinguish male from female chickens, making possible early identification of the less valuable males, a process now known as autosexing.

Punt \'pünt\ In ancient Egyptian and Greek geography, the southern coast of the RED SEA and adjacent coasts of the Gulf of ADEN, corresponding to modern coastal Ethiopia and Djibouti. Visited by Egyptian expeditions as early as 2200 BC, it was a place of ancient legend and fable and Egypt's source for incense, ivory, and ostrich feathers. During the reign of Queen HATSHEPSUT, an expedition was sent to Punt, and the queen had the details of the journey recorded on the walls of the Deir el-Bahri temple near THEBES. Only in the late 4th century BC were the trade routes to Punt opened to the Greeks.

pupa \'pyü-pə\ Inactive, nonfeeding stage in the life of insects that undergo complete METAMORPHOSIS. In a protective covering (cocoon or chrysalis), the LARVA is transformed into an adult. During pupation, a process controlled by hormones, larval structures break down and adult structures form; wings appear for the first time. The adult emerges either by splitting the pupal skin and chewing its way out or by secreting a fluid that softens the cocoon.

puppetry Art of creating and manipulating puppets in a theatrical show. Puppets are figures that are moved by human rather than mechanical aid. They may be controlled by one or several puppeteers, who are screened from the spectators. Varieties include glove (or hand) puppets, rod puppets, shadow puppets, and MARIONETTES (or string puppets). Puppetry had its beginnings in tribal society and has been part of every civilization. By the 18th century it was so popular in Europe that permanent theatres were

© 2006 Encyclopædia Britannica, Inc.

built for the usually itinerant puppeteers. Companies presented favourite stories of the French Guignol, the Italian Arlecchino, the German Kasperle, and the English Punch and Judy. By the mid 20th century puppetry had reached television with Jim Henson's Muppets. See also bunraku; Sergey Obraztsov.

Puracé \ˌpü-rä-ˈsā\ **National Park** National park, southwestern Colombia. Established in 1961, its main feature is the active Puracé Volcano, which is located just southeast of the city of Popayán and reaches an elevation of 15,603 ft (4,756 m). The park covers 320 sq mi (830 sq km) and is home to the spectacled bear and the pudu, a small deer that is about 12 inches (30 cm) tall.

Purana \pù-ˈrä-nə\ In Hinduism, an encyclopaedic collection of myth, legend, and genealogy. A *Purana* traditionally treats five subjects: primary creation of the universe, secondary creation after periodic annihilation, genealogy of gods and saints, grand epochs, and histories of the royal dynasties. Written in narrative couplets, the *Purana*s date from c. 400 to c. 1000. The 18 principal surviving *Purana*s are grouped according to whether they exalt Vishnu, Shiva, or Brahma. Most popular is the *Bhagavata Purana*, which treats the early life of Krishna.

Purari River River, eastern central New Guinea. Rising in the central highlands of Papua New Guinea, it flows about 290 mi (470 km) to the Gulf of Papua of the Coral Sea. Its lower course divides into five main channels that lace through a well-settled swampy delta. It is navigable for about 120 mi (190 km). Although found and partially charted in 1887, the river system was not fully traced until the 1930s.

Purcell \ˈpər-səl**, Henry** (b. c. 1659, London, Eng.—d. Nov. 21, 1695, London) British composer. Little is known of his origins, but he was in the Chapel Royal choir from boyhood, and he probably studied with Pelham Humfrey (1647–74) and John Blow (1649–1708). His first known composition was written at age eight. When his voice changed, he assisted in keeping the royal instruments in repair and tuning the Westminster Abbey organ. He became organist there in 1679 and at the Chapel Royal in 1682. He wrote music in a number of genres. His opera *Dido and Aeneas* (1689) is notable for achieving a high degree of dramatic intensity within a narrow framework. This he followed with the "semi-operas" *King Arthur* (1691), *The Fairy Queen* (1692), and *The Indian Queen* (1695). He also wrote much incidental music, some 250 songs, 12 fantasias for viol consort, and many anthems and services. He is regarded as the greatest English composer after William Byrd and before the 20th century.

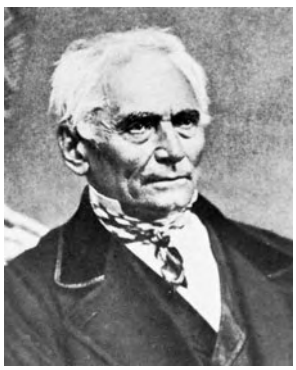
purdah Seclusion of women from public observation by means of concealing clothing (including the veil) and walled enclosures as well as screens and curtains within the home. The custom seems to have originated in Persia and was adopted by Muslims during the Arab conquest of what is now Iraq in the 7th century. The Muslim domination of northern India led to its adoption by the Hindu upper classes, but it was discarded by Hindus after the end of British rule in India. The custom of purdah still continues in many Islamic countries.

pure culture In microbiology, laboratory culture containing a single species of organism. A pure culture is usually derived from a mixed culture (containing many species) by methods that separate the individual cells so that, when they multiply, each will form an individually distinct colony, which may then be used to establish new cultures with the assurance that only one type of organism will be present. Pure cultures may be more easily isolated if the growth medium of the original mixed culture favours the growth of one organism to the exclusion of others.

Pure Land Buddhism Devotional cult of the buddha Amitabha. It is one of the most popular forms of Mahayana Buddhism in East Asia today. Pure Land schools believe that rebirth in the Western Paradise (the Pure Land) is given to all those who invoke Amitabha's name with sincere devotion. In China the Pure Land cult can be traced back to the 4th century, when the scholar Huiyuan (333–416) formed a society of monks and laymen who meditated on the name of Amitabha. His successors systematized and spread the doctrine in the 6th–7th century. The Pure Land teaching was transmitted to Japan by monks of the Tiantai school.

purgatory In Roman Catholic doctrine, the condition of those who have died in a state of grace but have not been purged of sin. These remaining sins include unforgiven venial sins or forgiven mortal sins. Souls burdened by such sins must be purified before entering heaven. The church also teaches that souls in purgatory may be aided by efforts of the living faithful through prayers, almsgiving, indulgences, and other works. The existence of purgatory has been denied as unbiblical by Protestant churches and most Eastern Orthodox churches.

purge trials Soviet trials of critics of Joseph Stalin. After the assassination of Sergey Kirov, prominent Bolsheviks were accused of conspiracy to remove Stalin from power. In three widely publicized show trials (1936–38), which presented confessions obtained under torture or fabricated by the secret police, the accused were found guilty and executed or sent to prison. Numerous closed, unpublicized trials of Soviet military leaders were also held and resulted in a massive purge throughout the armed forces. The trials eliminated such potential rivals and critics of Stalin as Nikolay Bukharin, Lev Kamenev, Aleksey Rykov, Mikhayl Tukhachevsky, Genrikh Yagoda, and Grigory Zinovyev but earned worldwide condemnation.



Purim \ˈpůr-im, pů-ˈrēm\ Jewish festival celebrating the survival of the Jews marked for death in Persia in the 5th cent BC. According to the Book of Esther, Haman, chief minister of King Ahasuerus, planned a general massacre of the Jews and set the date by casting lots. Ahasuerus' wife Esther interceded for the Jews, and they were allowed to attack their enemies. The ritual observance begins with a day of fasting on the 13th of Adar (in February or March), the day before the actual holiday. The Book of Esther is read in the synagogue, and Jews are enjoined to exchange gifts and make donations to the poor. Purim is a day of merrymaking and feasting.

purine \ˈpyůr-ˌēn\ Any of a class of heterocyclic compounds with a two-ring structure composed of carbon and nitrogen atoms. The simplest member, purine itself ($C_5H_4N_4$), is not common, but its derivatives with the structure are. Examples are uric acid, caffeine, and two of the nucleotides in nucleic acids, guanine and adenine.

Puritan Revolution See English Civil Wars

Puritanism Movement in the late 16th and 17th century that sought to "purify" the Church of England, leading to civil war in England and to the founding of colonies in North America. Many Puritans joined the Parliamentary party during the English Civil War and gained considerable power, but after the Restoration they were once again a dissenting minority. Believing themselves chosen by God to revolutionize history, some Puritans founded settlements in America (see Pilgrims), notably the Massachusetts Bay Colony. The Puritans of Massachusetts emphasized the conversion experience, by which the elect experienced the descent of grace. In their theocracy only the elect were allowed to vote and rule, though the privileges of church membership were extended to all baptized and orthodox persons.

Purkinje \pər-ˈkin-jē**, Jan Evangelista** (b. Dec. 17, 1787, Libochovice, Bohemia—d. July 28, 1869, Prague, Czech.) Czech experimental physiologist. He discovered the Purkinje effect (as light decreases, red objects appear to fade faster than blue ones), Purkinje cells (large branching neurons in the cerebellum), and Purkinje fibres (which conduct impulses from the natural pacemaker throughout the heart). At Breslau he created the world's first independent physiology department and first official physiology laboratory. He introduced the term *protoplasm*, devised new methods for preparing microscope samples, discovered the skin's sweat glands and the nucleus of the unripe ovum, recognized the uniqueness of fingerprints, and noted that pancreatic extracts digest protein.

Purkinje

purpura \ˈpər-pə-rə\ Presence of hemorrhages in the skin, often associated with bleeding from natural cavities and in tissues. Major causes include damage to small artery walls (as in vitamin deficiency or allergic reaction) and platelet deficiency (in association with such disorders as lupus erythematosus and as a complication of leukemia or chemotherapy).

Purus \pü-ˈrüs\ **River** River, northwest-central South America. It rises in Peru and flows generally northeast through the rainforests of Peru and Brazil in one of the world's most meandering courses. In Brazil it joins

© 2006 Encyclopædia Britannica, Inc.

the stretch of the Amazon River upstream from Manaus known as the Solimões River. At its mouth it divides into numerous branches. Most of its 1,995-mi (3,211-km) course is navigable, as are the many lakes formed near its shores. Rubber is gathered from forests along its course.

purusha See prakriti and purusha

Pusan \'pü-ˌsän\ *or* **Busan** City (pop., 2003 est.: 3,747,369) and port, South Korea, at the southeastern tip of the Korean peninsula. Pusan was opened to Japanese trade in 1876 and to general foreign trade in 1883. It developed into a major port under Japanese rule (1910–45). It served as the country's temporary capital during the Korean War. Pusan is South Korea's largest port and second largest city. Administratively, it has the status of a metropolitan city equal to that of a province. Industries include shipbuilding and manufacturing. Hot springs are located in the northeastern suburbs.

Pushkin, Aleksandr (Sergeyevich) (b. June 6, 1799, Moscow, Russia—d. Feb. 10, 1837, St. Petersburg) Russian writer. Born into an aristocratic family, Pushkin began his literary career while still a student at the Imperial Lyceum at Tsarskoye Selo (later renamed Pushkin). His first major work was the romantic poem *Ruslan and Ludmila* (1820). With his political verses and epigrams, he became associated with a revolutionary movement that culminated in the unsuccessful Decembrist revolt of 1825. Banished to several provincial locations, he produced a cycle of romantic narrative poems that confirmed him as the leading Russian poet of the day and the leader of the Romantic generation of the 1820s. He also worked on his important historical tragedy, *Boris Godunov* (1831), and his central masterpiece, the novel in verse *Eugene Onegin* (1833). After Nicholas I allowed him to return to Moscow in 1826, Pushkin abandoned his revolutionary sentiments, turning to the figure of Peter the Great in poems such as *The Bronze Horseman* (1837). Other works from this period include the classic short story "The Queen of Spades" (1834) and the drama *The Stone Guest* (1839). In his late works the motif of peasant rebellion is prominent. The object of suspicion in court circles, he died at age 37 after being forced into a duel. He is often considered his country's greatest poet and the founder of modern Russian literature.

Putin \'pü-tyin**, Vladimir (Vladimirovich)** (b. Oct. 7, 1952, Leningrad, U.S.S.R.) Russian president (from 1999). Putin served 15 years with the KGB, including six years in Dresden, East Ger. In 1990 he retired from active KGB service and returned to Russia to become prorector of Leningrad State University, and by 1994 he had risen to the post of first deputy mayor of the city. In 1996 he moved to Moscow, where he joined the presidential staff as deputy to Pavel Borodin, the Kremlin's chief administrator. In July 1998 President Boris Yeltsin made Putin director of the Federal Security Service (the KGB's domestic successor). In 1999 Yeltsin appointed Putin prime minister, and on December 31 of that year Yeltsin stepped down as president in Putin's favour. Three months later Putin won a resounding electoral victory, partly the result of his success in the battle to keep Chechnya from seceding. In his first term he asserted central control over Russia's 89 regions and republics and moved to reduce the power of Russia's unpopular financiers and media tycoons. The period was also marked by frequent terrorist attacks by Chechen separatists. Putin easily won reelection in 2004.

Putnam, Hilary (b. July 31, 1926, Chicago, Ill., U.S.) U.S. philosopher. After receiving his Ph.D. in 1951 he taught at Northwestern University, Princeton University, the Massachusetts Institute of Technology, and Harvard. Early in his career he was a defender of scientific realism. In the 1960s he extended the causal theory of reference to natural-kind and other scientific terms. He is known as the originator of functionalism in the philosophy of mind, though he later rejected that approach (see philosophy of language). Beginning in the mid-1970s he gradually abandoned his earlier scientific realism in favour of a pragmatically oriented view he called "internal realism." According to this view, scientific theories are not true absolutely but only relative to large-scale conceptual schemes. Among his many works are *Philosophical Papers* (3 vol., 1975–83), *Reason, Truth, and History* (1981), and *Pragmatism* (1995).

Putnam, Israel (b. Jan. 7, 1718, Salem Village, Mass.—d. May 29, 1790, Pomfret, Conn., U.S.) American Revolutionary army officer. He was a prosperous farmer in Connecticut from 1740. He served throughout the French and Indian War and rose to the rank of lieutenant colonel in 1759. Appointed a major general in the Continental Army in 1775, he fought with distinction at Bunker Hill, but his troops were defeated at the Battle of Long Island. He was charged with the defense of the Hudson highlands but abandoned Fort Montgomery and Fort Clinton to the British. He served in lesser commands until suffering a stroke in 1779.

Putnam, Rufus (b. April 9, 1738, Sutton, Mass.—d. May 4, 1824, Marietta, Ohio, U.S.) American Revolutionary army officer. A cousin of Israel Putnam, he fought in the French and Indian War. Entering the Continental Army in 1775, he organized fortifications in Boston and New York (1776–77) and at West Point (1778), and he fought at the Battle of Saratoga. In 1783 he was promoted to brigadier general. After the war he helped found the Ohio Company of Associates to obtain a land grant for settlement by war veterans; he led the group that founded Marietta, Ohio (1788). From 1796 to 1803 he was U.S. surveyor general.

putting-out system See domestic system

Putumayo \ˌpü-tü-'mä-yō\ **River** River, northwestern South America. Rising in southwestern Colombia, it is about 980 mi (1,575 km) long and flows southeast through tropical rainforests, where it forms a large section of the border between Peru and Colombia. It crosses the border into Brazil, where it is known as the Içá and empties into the Amazon River. It is navigable for almost its entire length and is a major transport route, especially for the rubber produced in the region.

Puvis de Chavannes \püē-'vē-də-shå-'vän**, Pierre (-Cécile)** (b. Dec. 14, 1824, Lyon, France—d. Oct. 24, 1898, Paris) French painter. He studied briefly with Eugène Delacroix in Paris and exhibited regularly at the Paris Salons. He is best known for his large canvas paintings for the walls of public buildings in Paris, including the Pantheon (1874–78, 1893–98), the Sorbonne (1889–91), and the Hôtel de Ville (1891–94), as well as the museum in Amiens (1880–82). He also decorated the staircase of the Boston Public Library (1895–96). His works are usually idealized depictions of antiquity or allegorical representations of abstract themes, in simplified forms and pale, flat, frescolike colours. The leading French mural painter of the later 19th century, he exerted a strong influence on the Post-Impressionists.

The Poor Fisherman, oil on canvas by Pierre Puvis de Chavannes, 1881; in the Louvre, Paris.

PVC *in full* **polyvinyl chloride** Synthetic resin, an organic polymer made by treating vinyl chloride monomers with a peroxide. It may be blended with more rubbery polymers or copolymerized with other vinyls to obtain products with desired properties. PVC resin mixed with plasticizers (see Waldo Semon), stabilizers, and pigments is made into flexible articles (e.g., raincoats, toys, containers). Nonplasticized resin has been used for rigid products (e.g., water pipes, plumbing fittings, phonograph records). Concern over leaching of vinyl chloride into foods has resulted in restrictions on its use in food containers; its decomposition into hydrogen chloride when burned has also raised concerns. Today it is produced in larger quantities than any other plastic except polyethylene.

Pydna \'pid-nə**, Battle of** (June 22, 168 BC) Decisive confrontation in the Roman victory over Perseus and Macedonia in the Third Macedonian

© 2006 Encyclopædia Britannica, Inc.

War. It took place on a plain near Pydna (present-day Kítros, Greece). The Roman general Lucius Paullus (b. c. 229–d. 160 BC) adroitly outmaneuvered the Macedonians; their phalanx was penetrated by the Roman legions, whose short swords were more effective than the Macedonian pikes. When defeat was imminent, Perseus fled. The Romans ended the Macedonian monarchy and divided the country into four republics.

pyelonephritis \ˌpī-ə-lō-ni-ˈfrī-təs\ Infection (usually bacterial) and inflammation of kidney tissue and the renal pelvis. Acute pyelonephritis is usually localized and may have no apparent cause. Symptoms include fever, chills, lower-back pain, and bacteria and white blood cells in the urine. Treatment with antibiotics requires one to three weeks. Scar tissue forms, but kidney function is usually not impaired. Chronic pyelonephritis results from repeated bacterial infections, which may have no symptoms but destroy more and more tissue over years. If it is diagnosed before too much function is lost, surgery may help, but uremia, severe infections, and heart and blood-vessel disorders can lead to death. Dialysis or kidney transplant sometimes prolongs life.

Pygmalion In Greek mythology, a king of Cyprus who fell in love with a statue of Aphrodite. The goddess took pity on him and brought the statue to life, and he married her. In some versions of the myth Pygmalion was a sculptor who carved the statue himself because he was disgusted with the faults of ordinary women, and when it was brought to life he gave it the name Galatea.

Pygmy Member of any human group whose adult males grow to less than 59 in. (150 cm) in average height. The name is also sometimes loosely applied to the San of southern Africa and the so-called Negrito peoples of Asia (such as the Philippine Ilongot). Besides their short stature, Pygmies are notable in having the highest basal-metabolism rate in the world and a high incidence of sickle-cell anemia. The Bambuti of the Ituri Forest are a well-studied example. See also race.

Pyle \ˈpīl**, Ernie** *orig.* **Ernest Taylor Pyle** (b. Aug. 3, 1900, near Dana, Ind., U.S.—d. April 18, 1945, le Shima, Ryukyu Islands) U.S. journalist. Pyle left Indiana University to become a reporter for a small-town newspaper. Later he acquired a roving assignment for the Scripps-Howard newspaper chain; his experiences provided material for a column that appeared in as many as 200 newspapers before World War II. His reporting of the campaigns in North Africa, Sicily, Italy, and France won a Pulitzer Prize in 1944. He was killed by Japanese machine-gun fire during the Okinawa campaign. Compilations of his columns include *Ernie Pyle in England* (1941), *Brave Men* (1944), and *Last Chapter* (1946).

pylon \ˈpī-ˌlän\ (Greek: "gateway") In modern construction, a tower that gives support, such as the steel towers between which electrical wires are strung or the piers of a bridge. Originally, pylons were monumental gateways to ancient Egyptian temples, either a pair of tall truncated pyramids with a doorway between them or a masonry mass pierced by a doorway.

Pym \ˈpim**, John** (b. 1583/84, Brymore, Somerset, Eng.—d. Dec. 8, 1643, London) English politician. As a member of Parliament (1621–43), he soon became an expert on finances and colonial affairs. He was an architect of Parliament's victory over Charles I in the first phase of the English Civil Wars. He helped form the system of taxation that survived in England until the 19th century. His skill as a parliamentary tactician preserved the unity of Parliament and led to close relations between the government and the city of London.

Pynchon \ˈpin-chən**, Thomas** (b. May 8, 1937, Glen Cove, Long Island, N.Y., U.S.) U.S. writer. He studied physics at Cornell University and worked briefly as a technical writer before devoting himself to fiction. Beginning with his first novel, *V* (1963), a complex, cynically absurd tale that juxtaposes scenes of 1950s hipster life with symbolic images of the entire century, his works have combined black humour and fantasy to depict human alienation in the chaos of modern society. The idea of conspiracy is central to *The Crying of Lot 49* (1966) and to his masterpiece, *Gravity's Rainbow* (1973), an extraordinary novel about the end of World War II, full of paranoid fantasy, grotesque imagery, and esoteric scientific and anthropological material. Later works include the novels *Vineland* (1990) and *Mason & Dixon* (1997) and the story collection *Slow Learner* (1984). He has lived in hiding or incognito for decades, refusing to grant interviews or be photographed.

P'yŏngyang \ˌpyəŋ-ˈyaŋ\ City (pop., 2003 est.: 3,164,000), capital of North Korea, on the Taedong River. Founded in 1122 BC according to legend, it is said to be the oldest city in Korea. In 108 BC the Chinese established a trading colony there. It was the capital of the Koguryŏ kingdom (AD 427–668), then was captured by Chinese invaders. It fell to the Japanese in 1592 and was devastated by the Manchus in the early 17th century. Much of it was destroyed during the Sino-Japanese War (1894–95). During the Japanese occupation of Korea (1910–45), it was built up as an industrial city. Captured by UN forces during the Korean War in 1950, it was retaken by Chinese communist troops. After 1953 it was rebuilt with Soviet and Chinese aid. It is a centre of heavy industry and transportation.

pyramid Ancient monumental structure constructed of or faced with stone or brick and having a rectangular base and four sloping triangular sides meeting at an apex. Pyramids have been built at various times and places; the best-known are those of Egypt and of Central and South America. The pyramids of ancient Egypt were royal tombs. Each contained an inner sepulchral chamber that housed the deceased (usually mummified) ruler, members of his entourage, and artifacts. The rest of the pyramid complex consisted of a large enclosure, an adjacent mortuary temple, and a causeway leading down to a pavilion. About 80 royal pyramids survive in Egypt, the greatest being those at Giza. American pyramids include the pyramids of the Sun and Moon at Teotihuacán, the Castillo at Chichén Itzá, and various Inca and Chimú structures in Andean settlements. These pyramids were generally built of earth and faced with stone; they are typically stepped pyramids and are topped by a platform or temple structure used for rituals, including human sacrifice.

Pyramus and Thisbe \ˈpir-ə-məs...ˈthiz-bē\ Hero and heroine of a Babylonian love story related in Ovid's *Metamorphoses*. Their parents forbade them to meet, so they communicated through a hole in the wall between their two houses before at last deciding to run away together. They agreed to meet at a mulberry tree. Arriving first, Thisbe was scared away by a lion, which shredded the veil she dropped when she fled. Pyramus, finding the veil, believed her dead and stabbed himself; she returned and, finding Pyramus dying, killed herself. The fruit of the mulberry tree, white until then, was stained dark purple by the lovers' blood.

Pyrenees \ˈpir-ə-ˌnēz\ Mountain range, southwestern Europe. It extends 270 mi (430 km) from the Mediterranean Sea to the Bay of Biscay on the Atlantic Ocean. The Pyrenees form a high wall between France and Spain; generally, the crest of the range marks the boundary between the two countries. The tiny, autonomous principality of Andorra lies among the range's peaks. The highest point is Aneto Peak, elevation 11,169 ft (3,404 m). There are few passes through the mountains. The pass at Roncesvalles was made famous in the 12th-century *La* Chanson de Roland, based on the 778 Battle of Roncesvalles (Roncevaux).

Pyrenees, Treaty of the (November 7, 1659) Peace treaty between France and Spain. From the end of the Thirty Years' War (1648) until 1659, Spain and France fought almost continuously. When Philip IV of Spain did not receive the expected Habsburg support against France, he concluded a peace settlement that ceded border regions to France. The treaty also involved a marriage compact between Louis XIV and the Spanish infanta Maria Teresa, which established Louis as the most powerful monarch in Europe.

pyrethrum \pī-ˈrē-thrəm\ Any of certain plant species of the genus *Chrysanthemum* (see chrysanthemum) native to South Asia, whose aromatic flower heads, when powdered, constitute the active ingredient in the insecticide pyrethrin (or pyrethrum). The concentrations of pyrethrum powder used in insecticides are nontoxic to plants and higher animals; these insecticides therefore find wide use in household and livestock sprays as well as in dusts for edible plants. The typical species, the perennial *C. coccineum*, also is the florists' pyrethrum, or painted lady. Large petals of a deep rose colour surrounding the yellow centre, or disk, are borne on long simple stems above the crown of finely cut leaves.

pyridine \ˈpir-ə-ˌdēn\ Any of a class of aromatic compounds with a six-member aromatic ring composed of five carbon atoms and one nitrogen atom, making it a heterocyclic compound. The simplest one is pyridine itself (C_5H_5N). Natural compounds with pyridine rings include niacin and pyridoxine (see vitamin B complex), the tuberculosis drug isoniazid, and several plant products (e.g., nicotine). Pyridine is used as a raw material for various drugs, vitamins, and fungicides and as a solvent. Because it has a nauseating odour and a burning taste, it is added to ethanol and antifreezes to make them undrinkable (see denaturation).

pyrimidine \pə-ˈrim-ə-ˌdēn\ Any of a class of heterocyclic compounds with a ring structure of four carbon and two nitrogen atoms. The simplest

© 2006 Encyclopædia Britannica, Inc.

member, pyrimidine itself ($C_4H_4N_2$), is not common, but derivatives with the structure are. Examples include THIAMINE (vitamin B_1), several SULFA DRUGS, BARBITURATES, and three of the bases in NUCLEIC ACIDS (CYTOSINE, THYMINE, and URACIL).

pyrite \'pī-ˌrīt\ *or* **iron pyrite** *or* **fool's gold** Naturally occurring, gold-coloured iron disulfide mineral. Pyrite has frequently fooled prospectors into thinking they had discovered gold. Pure pyrite (FeS_2) contains 47% iron and 53% sulfur, by weight. Pyrite is used commercially as a source of SULFUR, particularly for the production of sulfuric acid. Because there are much better sources of iron, it is not generally used as an iron ore. For many years Spain was the largest producer; other countries include Japan, the U.S., Canada, Italy, Norway, Portugal, and Slovakia.

pyrometer \pī-'rä-mə-tər\ Instrument for measuring relatively high TEMPERATURES, as in furnaces. Most pyrometers work by measuring RADIATION from the body whose temperature is to be measured (radiation devices have the advantage of not having to touch the material being measured). Optical pyrometers measure the temperature of glowing bodies by comparing them visually with an incandescent filament of known temperature whose temperature can be adjusted. In resistance pyrometers, a fine wire is put in contact with the object; the instrument converts the change in electrical resistance caused by heat to a reading of the temperature of the object.

pyroxene \pī-'räk-ˌsēn\ A group of important rock-forming SILICATE MINERALS of variable composition, among which calcium-, magnesium-, and iron-rich varieties predominate. Common pyroxenes belong to either the low-calcium enstatite-(ortho)ferrosilite series, $(Mg,Fe)SiO_3$, or the high-calcium diopside-hedenbergite series, $Ca(Mg,Fe)Si_2O_6$. Rare pyroxenes include JADEITE, AEGIRINE, and johannsenite. See also ENSTATITE.

pyroxenite \pī-'räk-sə-ˌnīt\ Dark medium- to coarse-grained igneous rock that consists chiefly of PYROXENE. Accessory minerals include HORNBLENDE, BIOTITE, or OLIVINE. Pyroxenites are not abundant.

pyrrhotite \'pir-ə-ˌtīt\ Iron SULFIDE MINERAL in which the ratio of iron to sulfur atoms is somewhat variable but is always slightly less than 1. It commonly is found in association with other sulfides. The variety troilite, with a composition near that of iron sulfide (FeS), is an important constituent of some meteorites.

Pyrrhus \'pir-əs\ (b. 319—d. 272 BC, Argos, Argolis) King of Hellenistic EPIRUS. After being allied to DEMETRIUS and taken hostage, he was befriended by PTOLEMY I SOTER and restored to his kingdom. In 281 he was asked for help against Rome by the Greek enclave of Tarentum (TARANTO) and won costly victories at Heraclea and Ausculum. Crossing to Sicily, he conquered most of the Punic territory, but the Greek Sicilians revolted against his despotism. He suffered serious losses on his return to Italy (275) but defeated ANTIGONUS II GONATAS in Macedonia (274) and became king there. He died in a skirmish in Argos trying to help Sparta. His costly victories gave rise to the term "Pyrrhic victory."

Pythagoras \pə-'tha-gə-rəs\ (b. c. 580 BC, Samos, Ionia—d. c. 500, Metapontum, Lucania) Greek philosopher and mathematician. He established a community of followers in Croton who adhered to a way of life he prescribed. His school of philosophy reduced all meaning to numerical relationships and proposed that all existing objects are fundamentally composed of form and not material substance. The principles of PYTHAGOREANISM, including belief in the immortality and reincarnation of the soul and in the liberating power of abstinence and asceticism, influenced the thought of PLATO and ARISTOTLE and contributed to the development of mathematics and Western rational philosophy. The proportions of musical intervals and SCALES were first studied by Pythagoras, and he was the first influential Western practitioner of VEGETARIANISM. None of his writings survive, and it is difficult to distinguish the ideas he originated from those of his disciples. His memory is kept alive partly by the PYTHAGOREAN THEOREM, probably developed by his school after he died.

Pythagorean \pə-ˌtha-gə-'rē-ən\ **theorem** Rule relating the lengths of the sides of a right triangle. It says that the sum of the squares of the lengths of the legs is equal to the square of the length of the hypotenuse (the side opposite the right angle). That is, $a^2 + b^2 = c^2$, where c is the length of the hypotenuse. Triads of whole numbers that satisfy it (e.g., 3, 4, and 5) are called Pythagorean triples. See also LAW OF COSINES; LAW OF SINES.

Pythagoreanism \pə-ˌtha-gə-'rē-ə-ˌni-zəm\ Philosophical school, probably founded by PYTHAGORAS c. 525 BC. It originated as a religious brotherhood or an association for the moral reformation of society; brothers were sworn to strict loyalty and secrecy. The brotherhood had much in common with the Orphic communities (see ORPHISM), which sought by rites and abstinence to purify the believer's soul and enable it to escape from the "wheel of birth." Pythagoreanism held that reality, at its deepest level, is mathematical, that philosophy can be used for spiritual purification, that the soul can rise to union with the divine, and that certain symbols have mystical significance. It was the first important Western system of thought to advocate vegetarianism. The school became extinct in the mid-4th century.

Pythian \'pi-thē-ən\ **Games** In ancient Greece, various athletic and musical competitions held in honour of APOLLO, chiefly those at DELPHI. The games were held from before the 5th century BC to the 4th century AD. They took place in August of the third year of each Olympiad (the four-year period between OLYMPIC GAMES). Events were similar to those of the ancient Olympics.

python \'pī-ˌthän\ Any of 28 species (family Pythonidae, sometimes a subfamily of Boidae) of sluggish, docile, nonvenomous SNAKES found in tropical and temperate regions. Except for one Central American species (*Loxocemus bicolor*), pythons are found from western Africa to China, Australia, and the Pacific islands. Pythons feed on birds and mammals, killing them by constriction. Most are found near water; some are arboreal. Unlike BOAS, pythons lay eggs (15–100, depending on body size). The Asian reticulated python (*Python reticulatus*) may be the world's longest snake (the ANACONDA is heavier); specimens over 30 ft (9 m) long have been recorded.

© 2006 Encyclopædia Britannica, Inc.

Qadariya \ˌkä-də-'rē-ə\ In Islam, adherents of the doctrine of free will. The name was also applied to the Mutazila. The issue of free will was a major point of controversy in Islamic theology, and the Qadariya took the most extreme stand in its defense. They based their argument on the necessity of divine justice, maintaining that without responsibility and freedom one cannot fairly be held accountable for one's actions. See free will problem.

Qaddafi \kə-'dä-fē**, Muammar al-** *or* **Muʿammar al-Qadhdhāfī** (b. 1942, Surt, Libya) Ruler of Libya from 1969. Son of a Bedouin farmer, he was born in a tent in the desert. He graduated from the University of Libya and Libya's military academy and was a devout Muslim and ardent nationalist. As a captain in the army, he led the 1969 coup that deposed King Idrīs I. He espoused his own form of Islamic socialism, and his foreign policy was anti-Western and anti-Israel. In 1970 he closed U.S. and British military bases and expelled Italians and Jews. He banned alcoholic beverages and gambling and in 1973 nationalized the oil industry. He made unsuccessful attempts to unify Libya with other countries. His government was repeatedly linked with terrorist incidents in Europe and elsewhere, and he supported groups trying to overthrow neighbouring governments. He narrowly escaped death in 1986 when U.S. planes bombed sites in Libya, including his own residence.

qāḍī \'kä-ˌdē\ Muslim judge who renders decisions according to the Sharīʿah, the canon law of Islam. The *qāḍī* hears only religious cases, such as those involving inheritance, pious bequests, marriage, and divorce, though theoretically his jurisdiction extends to civil and criminal matters. The second caliph, ʿUmar ibn al-Khaṭṭāb, was the first to appoint a *qāḍī* to eliminate the necessity of his personally judging every dispute that arose in the community.

Qādisiyyah \ˌkä-di-'sē-ə**, Battle of** (636?) Battle fought near Al-Ḥīrah (in present-day Iraq) between forces of the Sāsānian dynasty and an invading Arab army. The Arab victory over the army of Yazdegerd (r. 632–651) marked the end of his dynasty and the beginning of Arab and Islamic rule in Persia.

Qaeda, al- *also* **al-Qāʿidah** *Arabic* **"the Base"** Broad-based Islamic militant organization founded in Afghanistan by Osama bin Laden. Its members supported Muslim fighters during the Afghan war of 1979–89; afterward the organization dispersed but continued to oppose secularized Muslim regimes and foreign (notably U.S.) presence in Islamic lands. It staged numerous terrorist attacks, including the bombing of the World Trade Center in 1993, the destruction of two U.S. embassies in Africa in 1998, and a suicide bomb attack against the U.S. warship *Cole* in 2000. During that time it merged with other Islamic extremist organizations and eventually reestablished its headquarters in Taliban-controlled Afghanistan, where it trained thousands of Muslim militants. In 2001, 19 such militants staged the September 11 attacks. The U.S. and allied forces responded by attacking Taliban and al-Qaeda forces in Afghanistan, killing and capturing thousands and driving the remainder into hiding.

Qājār \kä-'jär\ **dynasty** (1794–1925) Ruling dynasty of Iran. It was founded by Āghā Muḥammad Khan, who brutally reunified Iran and reasserted Iranian rule over territories in Georgia and the Caucasus by defeating his rivals, including the last ruler of the Zand dynasty. His successor, Fatḥ ʿAlī Shah (r. 1797–1834), lost land to Russia and increased contacts with the West. Nāṣir al-Dīn Shah's (r. 1848–96) successful manipulation of Russia and Britain preserved Persia's independence, but his successors could not cope with subsequent European meddling, and the dynasty was overthrown by Reza Shah Pahlavi in 1925.

Qantas Airways Limited Australian airline, the oldest in the English-speaking world, founded in 1920 as Queensland and Northern Territory Aerial Services Ltd. (later abbreviated as Qantas). By 2002 it had more than 140 destinations in over 30 countries.

Qara Qoyunlu See Kara Koyunlu

Qaraghandy *or* **Karaganda** \ˌkä-rə-'gän-də\ City (pop., 1999.: 436,900), central Kazakhstan. The first settlement appeared in 1856, and small-scale coal mining began the next year. Mining expanded rapidly in the early 1930s, and the town was made a city in 1934. Kazakhstan's second largest city, it consists of the old town, which grew up haphazardly around more than 20 mining settlements, and the new town, the region's cultural and administrative centre, which includes a university and medical and polytechnic institutes.

Qaraism See Karaism

Qarqar See Karkar

Qāsimī \kä-'sē-mē**, Sheikh Sulṭān ibn Muḥammad al-** (b. July 1, 1939) Ruler of the emirate of Al-Shariqah (Sharjah) in the United Arab Emirates (UAE) from 1972. He succeeded his brother, who was assassinated. A political moderate, he favoured strengthening the federal government of the UAE. In the wake of a failed coup attempt by another brother, he agreed to implement financial and administrative reforms and to make his brother crown prince, with the right to succeed him, but he changed his mind and exiled his brother in 1990.

Qatar \'kä-tər\ *officially* **State of Qatar** Country, Middle East, southwestern Asia. It juts out from the east coast of the Arabian Peninsula into the Persian Gulf. Area: 4,412 sq mi (11,427 sq km). Population (2005 est.): 773,000. Capital: Doha. Most of the population is Arab, with South Asian and Iranian minorities who are often migrant workers. Languages: Arabic (official), English. Religions: Islam (official; predominantly Sunni); also Christianity, Hinduism. Currency: Qatar rial. Qatar is mostly stony, sandy, and barren and consists of salt flats, dune desert, and arid plains. Largely because of petroleum and natural gas exports, its gross national product per capita is one of the highest in the world. The government owns all of the agricultural land and generates most of the economic activity; the private sector participates in trade and contracting on a limited scale. Qatar is a constitutional emirate, and its basis of legislation is Islamic law. The head of state and government is the emir, assisted by the prime minister. It was partly controlled

by Bahrain from the mid-18th to the mid-19th century and then was nominally part of the Ottoman Empire until World War I (1914–18). In 1916 it became a British protectorate. Oil was discovered in 1939, and Qatar rapidly modernized. It declared independence in 1971, when the British protectorate ended. In 1991 Qatar served as a base for air strikes against Iraq in the First Persian Gulf War.

Qayrawān, Al- See KAIROUAN

Qazvīn *or* **Kazvīn** \kaz-'vēn\ City (pop., 1996: 291,117), northwestern Iran. Founded as Shad Shāhpūr in AD 250, it flourished under Muslim rule in the 7th century. GENGHIS KHAN laid waste to the city, but it later revived and was made the capital of Persia (1548–98) under the ṢAFAVID DYNASTY. In the late 18th century it became a base for foreign trade with areas of the Caspian Sea, Persian Gulf, and Anatolia. A coup was launched from Qazvīn in 1921 that led to Iran's consolidation under Reza Shah PAHLAVI. It is a regional communications centre, with some manufacturing.

qedesha \'kä-de-shä\ One of a class of sacred prostitutes found throughout the ancient Middle East and associated especially with the worship of the fertility goddess ASTARTE. Prostitutes, who often played an important part in official temple worship, could be either male or female. The early Israelites adopted Canaanite rites of sacred prostitution, and despite the denunciations of Israelite PROPHETS, the practice continued until the reforms of JOSIAH in the 7th century BC.

Qi *or* **Ch'i** One of the largest and most powerful of the many states into which early China was divided (771?–221 BC). During the Eastern ZHOU DYNASTY, Qi was the first state to fully institute a uniform tax system, a central army, and a centralized bureaucracy based on talent rather than hereditary rank. It formed a league of states in 651 BC to stave off invasions from the north and south, but its hegemony was short-lived. In 221 BC it was absorbed into the QIN DYNASTY.

qi *or* **ch'i** \'chē\ In Chinese philosophy, the ethereal substance of which everything is composed. Early Daoist philosophers and alchemists regarded it as a vital force associated with breath and bodily fluids and sought to control its movement within the body in order to achieve longevity and spiritual power. Manipulation of *qi* is central to Chinese meditation, medicine, and MARTIAL ARTS. In the 10th–13th centuries NEO-CONFUCIANISM regarded *qi* as emanating from the Great Ultimate by way of *li*, the ordering principle of the universe, transformed into the elements through yin and yang (see YIN-YANG).

Qianlong emperor *or* **Ch'ien-lung** \chē-'en-'lůŋ\ **emperor** *orig.* **Hongli** (b. Sept. 25, 1711, China—d. Feb. 7, 1799, Beijing) Fourth emperor of the QING DYNASTY in China. His reign (1735–96) was one of the longest in Chinese history. China's boundaries reached their greatest extent, encompassing Mongolia, Tibet, Nepal, Taiwan, and portions of Central Asia. Qianlong sponsored a compilation of the Confucian Classics (see FIVE CLASSICS); the compilation's descriptive catalog is still used today. At the same time, he ordered that all books containing anti-Manchu sentiments be expurgated or destroyed; some 2,600 titles were lost. He enjoyed excellent personal relationships with JESUIT missionaries in Beijing, though Roman Catholic preaching remained officially forbidden. In the first half of his reign, agriculture made great strides and was superior to that in much of Europe. Taxes were light and education was widespread, even among the peasantry. Subsequently, military expeditions and increasing governmental corruption permanently harmed the dynasty, sowing the seeds for its decline in the 19th century. See also HESHEN; KANGXI EMPEROR; MANCHU.

qilin *or* **ch'i-lin** \chē-'lin\ In Chinese mythology, a kind of UNICORN whose rare appearance often coincides with the imminent birth or death of a sage or illustrious ruler. Appearances could also indicate the benevolence of living emperors. A *qilin* has a single horn on its forehead, a yellow belly, a multicoloured back, a horse's hooves, a deer's body, and an ox's tail. Legend has it that a *qilin* appeared to the pregnant mother of CONFUCIUS.

Qin dynasty *or* **Ch'in** \'chin\ **dynasty** (221–207 BC) Dynasty that established the first great Chinese empire. The Qin (from which the name China is derived) established the approximate boundaries and basic administrative system that all subsequent dynasties were to follow. Qin accomplishments include standardizing the CHINESE WRITING SYSTEM and building the GREAT WALL; the dynasty is also notorious for the "Qin bibliocaust," in which all nonutilitarian books were ordered burned. Due to its harshness, the dynasty outlasted its first emperor, SHIHUANGDI, by only three years; it was beset by rebellion and succeeded by the HAN DYNASTY.

Qin Hui *or* **Ch'in Kuei** \'chin-kü-'ā\ (b. 1090, Jiangning, Jiangsu province, China—d. 1155, Hangzhou, Zhejiang province) Chief counselor to the Southern SONG emperor Gaozong. He maintained external security by signing a peace treaty with the Juchen in the north and internal security by undermining the power of leading generals, notably YUE FEI, who had argued for war with the Juchen and whom Qin Hui executed. For relinquishing northern China to the Juchen, Qin Hui is remembered as a traitor.

Qin Jiushao (b. c. 1202, Puzhou, China—d. c. 1261, Meizhou) Chinese mathematician who developed a method of solving simultaneous linear congruences. In 1219 he joined the army as captain of a territorial volunteer unit and helped quash a local rebellion. In 1233 he began his official government service. In his only mathematical book, now known as *Shushu jiuzhang* (1247; "Mathematical Writings in Nine Sections"), he introduced a method of solving systems of linear equations that was rediscovered in Europe about 1802, where it became known as the Ruffini-Horner method. He later became provincial governor of Qiongzhou, but charges of corruption and bribery brought his dismissal in 1258.

Qin tomb *or* **Ch'in** \'chin\ **tomb** Major Chinese archaeological site near the ancient capital city of Chang'an (now Xi'an), a 20-sq-mi (50-sq-km) funerary compound built by the first sovereign emperor, Qin SHIHUANGDI. In 1974 workers drilling a well discovered a subterranean chamber that contained an army of some 6,000 life-size terra-cotta soldiers with individually detailed faces, as well as horses, weapons, and other objects. Three nearby chambers containing more than 1,400 figures have also been unearthed; the tomb itself has not yet been excavated. Archaeologists anticipate that it will take many years to unearth the rest of the complex. The mausoleum is a UNESCO World Heritage site.

Qing dynasty *or* **Ch'ing** \'chiŋ\ **dynasty** *or* **Manchu dynasty** (1644–1911/12) Last of the imperial dynasties in China. The name Qing was first applied to the dynasty established by the MANCHU in 1636 in Manchuria and then applied by extension to their rule in China. During the Qing dynasty, China's territory and population expanded tremendously. Cultural attitudes were strongly conservative and NEO-CONFUCIANISM was the dominant philosophy. The arts flourished: LITERATI painting was popular, novels in the vernacular developed substantially, and *JINGXI* (Peking opera) developed. Qing porcelain, textiles, tea, paper, sugar, and steel were exported to all parts of the world. Military campaigns in the latter part of the 18th century depleted government finances, and corruption grew. These conditions, combined with population pressures and natural disasters, led to the OPIUM WARS and the TAIPING and NIAN rebellions, which in turn so weakened the dynasty that it was unable to rebuff the demands of foreign powers. The dynasty ended with the republican revolution of 1911 and the abdication of the last emperor in 1912.

Qinghai *or* **Ch'ing-hai** *conventional* **Tsinghai** Province (pop., 2000 est.: 5,180,000), west-central China. It is bordered by GANSU and SICHUAN provinces and the TIBET and XINJIANG autonomous regions.With an area of 278,400 sq mi (721,000 sq km), it is the largest Chinese province. The capital is XINING. Located in a remote region west of the historic provinces of China proper, it forms the northeastern part of the Plateau of Tibet, mostly above 10,000 ft (3,048 m) in elevation. The source of the HUANG HE (Yellow River) is in one of its mountain ranges. Parts of Qinghai came under Chinese control in the 3rd century BC. For centuries it was sparsely occupied by nomadic herdsmen, chiefly Tibetans and Mongols, and a few Chinese farmers. The Chinese population increased over the years. Qinghai was made a Chinese province in 1928. Economic activities today include farming, herding, mining, lumbering, and manufacturing. It possesses some of China's best pasturelands and is noted for its horse breeding.

Qinghai Hu See KOKO NOR

Qishon River *or* **Kishon** \'kī-ˌshän\ **River** River, northern Israel. It rises near Mount Gilboa and flows northwest for about 25 mi (40 km) through the Plain of Esdraelon to the Mediterranean Sea just north of HAIFA. It was the scene of biblical events, including the Israelite victory of DEBORAH over the Canaanite general Sisera and of ELIJAH's slaying of the prophets of BAAL. In modern times, the river's mouth has been developed as part of Haifa's port complex. It is the main base of Israel's fishing fleet.

Qiu Chuji *or* **Ch'iu Ch'u-chi** \'jyü-'jü-'jē\ *orig.* **Changchun** \'chäŋ-'chůn\ (b. 1148, Qixia, Dengzhou, China—d. 1227, Beijing) Daoist monk and alchemist. His disciple Li Zhichang chronicled Qiu's journey to meet GENGHIS KHAN (who wished to learn from Qiu) in *The Travels of an Alchemist*, which describes the land and people between the GREAT WALL and Kabul and between the Yellow and Aral seas. Qiu Chuji was a member of a sect known for its extreme asceticism and for the doctrine of *xingming*, which held that humanity's lost natural state could be recovered through prescribed practices.

Qizilqum See KYZYLKUM

Qo‘qon \kə-'kȯn\ *or* **Qŭqon** *or* **Kokand** \kə-'känt\ Region, eastern UZBEKISTAN. A powerful khanate by the 18th century, it was conquered by Russia in 1876 and was made a province of Turkistan under its ancient name, Fergana. It became part of the new Uzbek S.S.R. in 1924 and of independent Uzbekistan in 1991. Its chief city, also called Qo‘qon (pop., 1999 est.: 192,500), was founded in 1732, though its settlement dates to the 10th century.

Qu Yuan *or* **Ch‘ü Yüan** \'chü-'ywen\ (b. c. 339, Quyi, China—d. 278 BC, Hunan) Chinese poet. Born into the ruling house of Chu, in youth Qu Yuan was a favourite of the region’s ruler. Later he was banished and wandered in despair, writing and observing folk customs, which would influence his works. He eventually drowned himself. His most famous poem is the melancholy *Lisao* (“On Encountering Sorrow”). One of the greatest poets of ancient China, he exerted enormous influence on later poets with his highly original verse.

quack grass See COUCH GRASS

quadrangle Rectangular open space completely or partially enclosed by buildings of an academic or civic character. The grounds of a quadrangle are often grassy or landscaped. Such an area, intended as an environment for contemplation, study, or relaxation, was a feature of monastic establishments and the colleges that evolved from them. The quadrangular layout at New College in Oxford University (completed 1386), with its partially connected buildings, was enormously influential in subsequent collegiate building.

quadratic equation Algebraic equation of particular importance in OPTIMIZATION. A more descriptive name is second-degree POLYNOMIAL equation. Its standard form is $ax^2 + bx + c = 0$, and its solution is given by the quadratic formula

$$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{(2a)}$$

which guarantees two REAL-NUMBER solutions, one real-number solution, or two COMPLEX-NUMBER solutions, depending on whether the discriminate, $b^2 - 4ac$, is greater than, equal to, or less than 0.

quadrille \kwä-'dril\ Dance for four couples in square formation, fashionable from the late 18th through the 19th century. Imported to England from Parisian ballrooms in 1815, it consisted of four or five contredanses (see COUNTRY DANCE), each danced with prescribed combinations of intertwining figures rather than depending on intricate individual steps. It was often danced to opera melodies. See also American SQUARE DANCE.

Quadros, Jânio da Silva (b. Jan. 25, 1917, Campo Grande, Mato Grosso, Braz.—d. Feb. 16, 1992, São Paulo) President of Brazil (1961). A colourful and eccentric populist, he campaigned with a broom to dramatize his pledge to “sweep out corruption.” In his seven months as president, he banned bikini swimsuits and cockfights, reestablished relations with the Soviet Union, decorated CHE GUEVARA, and refused to support the U.S. in the BAY OF PIGS INVASION of Cuba. He attributed his sudden resignation to “terrible forces” conspiring against him. Stripped of political rights and exiled in 1968, he was granted amnesty in 1980 and returned to serve two terms as mayor of São Paulo.

Quadruple Alliance (1718) Alliance between Austria, Britain, the Dutch Republic, and France, formed to prevent Spain from altering the terms of the Peace of UTRECHT (1713). When PHILIP V of Spain seized Sardinia and Sicily, the British fleet brought Austrian troops to Sicily and the French occupied northern Spain, and Philip was forced to renounce his claims in Italy.

Quadruple Alliance (1815) Alliance between Britain, Russia, Austria, and Prussia first formed in 1813 to oppose France in the final phase of the NAPOLEONIC WARS. It was officially renewed in 1815 to enforce the peace settlement concluded at the Congress of VIENNA. The allies agreed to meet occasionally to keep European political development within terms of the 1815 settlement. This program was partially carried out by the Congresses of AIX-LA-CHAPELLE (1818), TROPPAU (1820), LAIBACH (1821), and VERONA (1822).

quaestor \'kwe-stər, 'kwē-stər\ *Latin* **“investigator”** In ancient Rome, the lowest ranking regular magistrate, whose traditional responsibility was the treasury. Quaestors functioned as deputies to consuls. Like CONSULS, PRAETORS, and PREFECTS they were of the magistrate class, high-level government administrators. Quaestors were the lowest level of this class and were elected by the people. Initially they were appointed by the consuls, but later they were elected. After 421 BC there were four quaestors, two public treasurers and two who assisted the consuls, serving as quartermasters. From the time of AUGUSTUS, the number of quaestors increased to 20, many of whom acted as financial officers and assistants to provincial governors.

quahog \'kō-ˌhȯg, 'kwȯ-ˌhȯg\ Thick-shelled edible CLAM of the U.S. The northern quahog (*Mercenaria mercenaria*), also known as the cherrystone, littleneck, or hard-shell clam, is 3–5 in. (8–13 cm) long. The dingy white shell is thick and rounded and has prominent concentric lines. It is found in the intertidal zone from the Gulf of St. Lawrence to the Gulf of Mexico. It is the most important food clam of the Atlantic coast. The southern quahog (*M. campechiensis*), found in the intertidal zone from Chesapeake Bay to the West Indies, is about 3–6 in. (8–15 cm) long and has a heavy, white, plump shell.

quail Any of several species of short-tailed game birds (family Phasianidae), some with a head plume that is straight or curled forward. Species range from 5 to 13 in. (13–33 cm) long. Some of the 95 Old World species have leg spurs, but the 36 New World species never do. Quails prefer open country and brushy borders. The male may help incubate the 12 eggs. Quails mainly eat seeds and berries but also leaves, roots, and insects. The common quail (*Coturnix coturnix*) of Eurasia and Africa is the only migratory bird in the order Galliformes. Quails are generally smaller than PARTRIDGES. See also BOBWHITE.

California quail (*Callipepla californica*).

Quaker Oats Co. International manufacturer of grocery products. It was formed in 1901 by the merging of three milling companies from Ohio and Iowa, including the country’s largest cereal mill. The company initially produced oat and wheat cereals, cornmeal, and baby food. By the late 20th century, hundreds of food products had been added. In the 1960s and ’70s, the company diversified into chemical products, restaurants, and toys. Quaker purchased Gatorade in 1983 and sold most of its nonfood assets in the 1990s. The company merged with PEPSICO, INC., in 2001.

Quakers See Society of FRIENDS

quality In philosophy, a property that applies to things taken singly, in contrast to a RELATION, which applies to things taken in pairs, triples, etc. The distinction drawn by GALILEO and JOHN LOCKE between primary and secondary qualities is motivated by the fact that modern science seems to reveal that unaided sensory perception gives false or incomplete information about the intrinsic qualities of physical objects. In this view, primary qualities, such as shape, quantity, and motion, are genuine properties of things that are describable by mathematics, whereas secondary qualities, such as odour, taste, sound, and colour, exist only in human consciousness.

Quant, Mary (b. Feb. 11, 1934, London, Eng.) English fashion designer. Specializing in youth-oriented fashions, she was responsible in the 1960s for the “Chelsea look” of England and the widespread popularity of the miniskirt and “hot pants.” After opening a successful boutique called Bazaar in 1957, she went on to mass-produce her designs on a multimillion-dollar annual scale.

Quantrill \'kwän-trəl**, William C(larke)** (b. July 31, 1837, Canal Dover, Ohio, U.S.—d. June 6, 1865, Louisville, Ky.) U.S. outlaw and Confederate guerrilla. After working as an itinerant schoolteacher, he moved to Kansas, where he failed at farming. By 1860 he was a horse thief and murderer. In the AMERICAN CIVIL WAR he joined the Confederate army and later gathered a gang of guerrillas to raid and rob Union towns

© 2006 Encyclopædia Britannica, Inc.

and farms. Quantrill's Raiders were made an official troop by the Confederates in 1862. In 1863 Quantrill and his group of about 450 men sacked the free-state town of Lawrence, Kan., killing 150 people. They later defeated a Union detachment, killing 90 soldiers. Quantrill was mortally wounded in a raid into Kentucky.

quantum In physics, a discrete natural unit, or packet, of energy, charge, angular momentum, or other physical property. Light, for example, which appears in some respects as a continuous electromagnetic wave, on the submicroscopic level is emitted and absorbed in discrete amounts, or quanta; for light of a given wavelength, the magnitude of all the quanta emitted or absorbed is the same in both energy and momentum. These particlelike packets of light are called PHOTONS, a term also applicable to quanta of other forms of electromagnetic energy such as X RAYS and GAMMA RAYS. Submicroscopic mechanical vibrations in the layers of atoms comprising CRYSTALS also give up or take on energy and momentum in quanta called PHONONS. See also QUANTUM MECHANICS.

quantum chromodynamics (QCD) Theory that describes the action of the STRONG FORCE. The strong force acts only on certain particles, principally QUARKS that are bound together in the PROTONS and NEUTRONS of the atomic NUCLEUS, as well as in less stable, more exotic forms of matter. Quantum chromodynamics has been built on the concept that QUARKS interact via the strong force because they carry a form of "strong charge," which has been given the name "colour." The three types of charge are called red, green, and blue, in analogy to the primary colours of light, though there is no connection with the usual sense of colour.

quantum computing Experimental method of computing that makes use of quantum-mechanical phenomena. It incorporates quantum theory and the UNCERTAINTY PRINCIPLE. Quantum computers would allow a BIT to store a value of 0 and 1 simultaneously. They could pursue multiple lines of inquiry simultaneously, with the final output dependent on the interference pattern generated by the various calculations. See also DNA COMPUTING, QUANTUM MECHANICS.

quantum electrodynamics (QED) Quantum theory of the interactions of charged particles with the ELECTROMAGNETIC FIELD. It describes the interactions of light with matter as well as those of charged particles with each other. Its foundations were laid by P. A. M. DIRAC when he discovered an equation describing the motion and spin of electrons that incorporated both QUANTUM MECHANICS and the theory of special RELATIVITY. The theory, as refined and developed in the late 1940s, rests on the idea that charged particles interact by emitting and absorbing PHOTONS. It has become a model for other QUANTUM FIELD THEORIES.

quantum field theory Theory that brings QUANTUM MECHANICS and special RELATIVITY together to account for subatomic phenomena. In particular, the interactions of SUBATOMIC PARTICLES are described in terms of their interactions with fields, such as the ELECTROMAGNETIC FIELD. However, the fields are quantized and represented by particles, such as PHOTONS for the electromagnetic field. QUANTUM ELECTRODYNAMICS is the quantum field theory that describes the interaction of electrically charged particles via electromagnetic fields. QUANTUM CHROMODYNAMICS describes the action of the STRONG FORCE. The ELECTROWEAK THEORY, a unified theory of electromagnetic and WEAK FORCES, has considerable experimental support, and can likely be extended to include the strong force. Theories that include the gravitational force (see GRAVITATION) are more speculative. See also GRAND UNIFIED THEORY, UNIFIED FIELD THEORY.

quantum mechanics Branch of mathematical physics that deals with atomic and subatomic systems. It is concerned with phenomena that are so small-scale that they cannot be described in classical terms, and it is formulated entirely in terms of statistical probabilities. Considered one of the great ideas of the 20th century, quantum mechanics was developed mainly by NIELS BOHR, ERWIN SCHRÖDINGER, WERNER HEISENBERG, and MAX BORN and led to a drastic reappraisal of the concept of objective reality. It explained the structure of ATOMS, atomic nuclei (see NUCLEUS), and MOLECULES; the behaviour of SUBATOMIC PARTICLES; the nature of chemical bonds (see BONDING); the properties of crystalline solids (see CRYSTAL); NUCLEAR ENERGY; and the forces that stabilize collapsed STARS. It also led directly to the development of the LASER, the ELECTRON MICROSCOPE, and the TRANSISTOR.

Qu'Appelle \kwä-'pel\ **River** River, southern Saskatchewan, Canada. It is about 270 mi (435 km) long and flows east through several lakes and Indian reservations and across the Manitoba border into the ASSINIBOINE RIVER. Its French name, meaning "who calls," derived from its CREE Indian name Kah-tep-was ("River That Calls"), referring to the cries of a legendary spirit supposedly haunting its waters. Once a fur-trapping region, its basin is now farmed for wheat.

quarantine Detention of humans or animals suspected to have communicable disease until they are proved free of infection. The term is often used interchangeably with *isolation* (separation of a known infected individual from healthy ones until the danger of transmission passes). It derives from the 40-day (*quarantina*) isolation period instituted in an attempt to prevent spread of plague in the Middle Ages. Though appropriate in some cases (e.g., DIPHTHERIA), it is ineffective for diseases that are spread by other means (e.g., PLAGUE) or are contagious before symptoms appear. In some cases, contacts (e.g., the family of a hepatitis patient) are notified, educated on precautions, and monitored for development of illness. Quarantine is more often applied to animals (e.g., for RABIES).

quark Any of a group of SUBATOMIC PARTICLES thought to be among the fundamental constituents of matter—more specifically, of PROTONS and NEUTRONS. The concept of the quark was first proposed by MURRAY GELL-MANN and George Zweig (b. 1937); its name was taken from JAMES JOYCE's novel *Finnegans Wake*. Quarks include all particles that interact by means of the STRONG FORCE. They have MASS and SPIN, and they obey the PAULI EXCLUSION PRINCIPLE. They have never been resolved into smaller components, and they never occur alone. Their behaviour is explained by the theory of QUANTUM CHROMODYNAMICS, which provides a means of calculating their basic properties. There are six types of quarks, called up, down, strange, charm, bottom, and top. Only the up and down quarks are needed to make protons and neutrons; the others occur in heavier, unstable particles.

Quarles, Francis (baptized May 8, 1592, Romford, Essex, Eng.—d. Sept. 8, 1644, London) English religious poet. Quarles is remembered for his *Emblemes* (1635), the most notable of English-language emblem books (collections of symbolic pictures, usually with verse and prose). Its success led him to produce another, *Hieroglyphikes of the Life of Man* (1638). Printed together in 1639, they formed perhaps the most popular volume of verse of the 17th century. He also wrote *Enchiridion* (1640), a highly popular book of aphorisms.

quarter horse Breed of light HORSE developed in the U.S. from THOROUGHBRED, MORGAN, AMERICAN SADDLEBRED, and other stock as a quarter-mile racer. Though overshadowed by the Thoroughbred, it found a place in the western and southwestern U.S. as a stock horse (see CUTTING HORSE). Modern quarter horses are short and stocky, with a muscular build and a deep, broad chest. They are noted for fast starting, turning, and stopping ability, short-distance speed, and intelligence. They stand 14.3–16 hands (57–64 in., 145–163 cm) high, weigh 950–1,200 lbs (431–544 kg), and have a calm, cooperative temperament.

quarter-horse racing Racing of QUARTER HORSES. It originated among British settlers in Virginia shortly after Jamestown was established in 1607. The course was traditionally a quarter-mile (400 m); today there are 11 officially sanctioned races, ranging from 220 to 870 yd (201 to 796 m). Timing is to the nearest .01 second.

quartermaster Officer who oversees arrangements for the quartering and movement of troops. The office dates at least to the 15th century in Europe. The French minister of war under LOUIS XIV created a quartermaster general's department that dotted the countryside with strategically located stockpiles of food, forage, ammunition, and equipment. By the 18th century his duties in some European countries included coordinating marches and deployments and drafting operational orders; in the U.S. he remained a specialized administrative and logistical functionary until 1962, when the Quartermaster Corps was absorbed by other agencies.

quartz Second most abundant mineral (after FELDSPAR) in the Earth's crust, present in many rocks. Quartz, which consists of silica, or silicon dioxide (SiO_2), has great economic importance. Many varieties are gemstones, including AMETHYST, CITRINE, SMOKY QUARTZ, and rose quartz. SANDSTONE, composed mainly of quartz, is an important building stone. Large amounts of quartz sand (or silica sand) are used in the manufacture of glass and ceramics and for molds in metal casting. Crushed quartz is used as an abrasive in sandpaper; silica sand is employed in sandblasting; and sandstone is used whole to make whetstones, millstones, and grindstones. Silica glass (or fused quartz) is used in optics to transmit ultraviolet light. Tubing and various vessels of fused quartz have important laboratory applications, and quartz fibres are employed in extremely sensitive weighing devices.

© 2006 Encyclopædia Britannica, Inc.

quartzite SANDSTONE that has been converted into a solid QUARTZ rock. Quartzites are usually white; they fracture smoothly and break up into rubble under frost action. Sandstone may be converted to quartzite by precipitation of silica from waters below the Earth's surface; such rocks are called orthoquartzites, whereas those produced by recrystallization (METAMORPHISM) are metaquartzites. Because they weather slowly, they tend to project as hills or mountain masses. Many prominent ridges in the Appalachian Mountains are composed of quartzite. Pure quartzites are a source of silica for metallurgical purposes and for the manufacture of silica brick. Quartzite is also quarried for paving and roofing materials.

quasar \'kwā-ˌzär\ *in full* **quasi-stellar radio source** Any of a class of enigmatic cosmic objects of high luminosity and strong radio emission observed at extremely great distances; also, a closely related object that has the same optical appearance but does not emit radio waves, i.e., a so-called quasi-stellar object (QSO). Most quasars exhibit very large REDSHIFTS, suggesting that they are moving away from Earth at tremendous speeds (approaching the speed of light); they thus are some of the most distant known objects in the universe. Quasars are no more than a light-year or two across but as much as 1,000 times more luminous than a giant galaxy having a diameter of 100,000 light-years; their extreme brightness allows them to be observed at distances of more than 10 billion light-years. Many investigators attribute such energy generation to matter spiraling at high velocity into a supermassive BLACK HOLE (millions or billions of times as much mass as the Sun) at the centre of a distant GALAXY. See also ACTIVE GALACTIC NUCLEUS.

Quasimodo \ˌkwä-zē-'mō-dō**, Salvatore** (b. Aug. 20, 1901, Modica, Italy—d. June 14, 1968, Naples) Italian poet, critic, and translator. He spent 10 years as an engineer for the Italian government while writing poetry in his spare time. He gradually became a leader of HERMETICISM after the publication of his first poetry collection, *Waters and Land* (1930). After World War II his social convictions shaped his work, beginning with *Day After Day* (1947). He published an astonishing range of translations, edited anthologies, and wrote essays, including those in *The Poet and the Politician* (1960). He received the Nobel Prize for Literature in 1959.

Quaternary \'kwä-tər-ˌner-ē, kwə-'tər-nə-rē\ **Period** Interval of geologic time, 1.8 million years ago to the present. The Quaternary follows the TERTIARY PERIOD and is the more recent of the two periods of the CENOZOIC ERA. The Quaternary is subdivided into the PLEISTOCENE EPOCH and the HOLOCENE EPOCH and is characterized by major cyclical changes of climate on a global scale. These led to repeated invasions of vast areas by ice sheets. Its major biologic feature is the evolution and dispersion of humans. The dramatic changes of climate and environment in the Quaternary led to high rates of evolution and extinction, particularly among the mammals. The extinction of many large mammals toward the end of the last ice age may also be related to the rapid territorial expansion of humans.

Quayle, (James) Dan(forth) (b. Feb. 4, 1947, Indianapolis, Ind., U.S.) U.S. politician. After earning a law degree, he served as associate publisher of his family's *Huntington Herald-Press* (1974–76). He served two terms in the U.S. House of Representatives (1977–81) and two in the Senate (1981–89). Chosen as the Republican Party candidate for vice president in 1988, he was elected with GEORGE H.W. BUSH. During his term, Quayle traveled abroad on goodwill missions but was criticized for various verbal gaffes. He and Bush ran for reelection in 1992 but were defeated. He briefly campaigned for the Republican nomination for president in 2000.

Quds, Al- See JERUSALEM

Quebec Province (pop., 2001: 7,410,500), eastern Canada. It is bounded on the north by HUDSON STRAIT and UNGAVA BAY, on the east by LABRADOR, on the southeast by the GULF OF ST. LAWRENCE and NEW BRUNSWICK, on the south by the U.S. (MAINE, NEW HAMPSHIRE, VERMONT, and NEW YORK), and on the west by ONTARIO and by HUDSON BAY. Its capital is QUEBEC city. The original inhabitants were Inuit (see ESKIMO) and members of Algonquin, Cree, and other Indian tribes. Settled by the French in the early 17th century, the area was lost to the British in the FRENCH AND INDIAN WAR, but the struggle for authority between the French and British groups led to a rebellion by French Canadians in 1837. The rebellion was quelled and in 1867 Quebec (formerly CANADA EAST) united with New Brunswick and Nova Scotia to form the Dominion of Canada. Most of the population of Quebec is of French descent. Various movements calling for Quebec's independence from the rest of Canada continued throughout the 20th century; the PARTI QUÉBÉCOIS won provincial elections in 1976, but its independence referendum was defeated in 1980. A second independence referendum was defeated in 1995 by a close margin. Principal industries include mining, hydroelectric power, and forestry.

Quebec *or* **Quebec City** City (pop., 2001: metro. area, 682,757), port and capital of QUEBEC province, Canada. It lies at the confluence of the ST. LAWRENCE and St. Charles rivers, about 150 mi (240 km) northeast of MONTREAL, on a rocky promontory above the rivers. Canada's oldest city, it was settled by the French in 1608 as a trading post. It was the capital of NEW FRANCE from 1663 to 1763, when it was lost to the British. It was the capital of Lower Canada 1791–1841 and CANADA EAST 1841–67. It became the provincial capital in 1867. Most of the population is French speaking and Roman Catholic. It is the site of LAVAL UNIVERSITY and other colleges and cultural institutions. Manufactures include newsprint, milled grain, cigarettes, and clothing. Shipbuilding and tourism are important industries.

Quebec, Battle of (Sept. 13, 1759) Decisive battle of the FRENCH AND INDIAN WAR. In June 1759, JAMES WOLFE led a British force of 250 ships with 8,500 soldiers to take up positions in the St. Lawrence River around Quebec. French forces under the marquis de MONTCALM withstood a two-month siege of the city. In September the British secretly landed 4,000 men near the city and forced a confrontation with French troops on the Plains of ABRAHAM. The defending French were routed in the battle, in which both Wolfe and Montcalm were mortally wounded.

Quebec Act (1774) British statute establishing Quebec's government and extending its borders. It provided for a governor and appointed council, religious freedom for Roman Catholics, and use of the French civil code. The act attempted to resolve the problem of making the colony a province of British North America and tried to build French-Canadian loyalty to the British. It also extended the borders of Quebec to include the land between the Ohio and Mississippi rivers, a region claimed by American colonists. It was considered one of the INTOLERABLE ACTS, which led to the AMERICAN REVOLUTION.

Québécois, Parti See PARTI QUÉBÉCOIS

Quechua \'ke-chə-wə\ South American Indian population of the ANDES MOUNTAINS from Ecuador to Bolivia. In the early 15th century the Quechua were conquered by the Chanca, who in turn were subdued by the INCA. Much of the traditional Quechua way of life endured under the Inca, but it was drastically altered by the 16th-century Spanish conquest. Traditional Quechua now lead isolated lives as marginal farmers in the high Andes. Their religion combines Roman Catholicism with folk beliefs. See also QUECHUAN LANGUAGES.

Quechuan \'ke-chə-wən\ **languages** Family of closely related South American Indian languages still spoken by some 12 million people in southern Colombia and Ecuador, Bolivia, and northern Argentina. Southern Peruvian Quechua, one language of the family, was a KOINE and administrative language within the INCA empire and was spread by Inca colonization.

Queen, Ellery *pseudonym of* **Frederic Dannay** *orig.* **Daniel Nathan** *and* **Manfred Bennington Lee** *orig.* **Manford Lepofsky** (respectively b. Oct. 20, 1905, Brooklyn, N.Y., U.S.—d. Sept. 3, 1982, White Plains, N.Y.; b. Jan. 11, 1905, Brooklyn, N.Y., U.S.—d. April 3, 1971, near Waterbury, Conn.) U.S. writers. The two cousins collaborated on more than 35 best-selling DETECTIVE NOVELS featuring the detective Ellery Queen. They took turns writing stories about Queen after winning a detective-story contest with *The Roman Hat Mystery* (1929). The pair used the pseudonym Barnaby Ross to write about a second detective, Drury Lane. They also cofounded *Ellery Queen's Mystery Magazine* (1941), edited numerous anthologies, and cofounded Mystery Writers of America.

Queen Anne style Style of English decorative arts that reached its apex during the reign (1702–14) of Queen ANNE. The most distinctive feature of Queen Anne furniture is the cabriole leg, shaped in a double curve (the upper part convex, the lower concave) and ending in either a claw-and-ball or paw foot. The Queen Anne chair is identifiable by a splat back curved to fit the hollow of the spine. The wood used was almost exclusively walnut, often embellished with marquetry, inlay, veneering, and lacquerwork. Ornamentation motifs include scallop shells, scrolls, Asian figures, and animals.

Queen Anne's lace *or* **wild carrot** Bristly biennial (*Daucus carota*) of the PARSLEY family, native to Eurasia but now found almost worldwide.

© 2006 Encyclopædia Britannica, Inc.

An ancestor of the cultivated CARROT, it grows 5 ft (1.5 m) tall and has divided, long, feathery leaves. Flat-topped clusters (umbels) of white or pink flowers have a single dark-purple flower in the center and resemble lace. The enlarged root is edible but very bitter, and the ribbed fruits have sharp spines.

Queen Anne's War (1702–13) Second in a series of wars between Britain and France for control of North America. It was the American phase of the War of the SPANISH SUCCESSION. American colonial settlements along the New York and New England borders with Canada were raided by French forces and their Indian allies. The British capture of Port Royal (1710) resulted in French-held Acadia's becoming the British province of Nova Scotia. Under the Treaty of Utrecht (1713), Britain also acquired Newfoundland and the Hudson Bay region from France.

Queen Charlotte Islands Group of about 150 islands (pop., 2001: 4,935) off western British Columbia, Canada. They have an area of 3,705 sq mi (9,596 sq km). The two largest islands, Graham and Moresby, are irregular in shape and rise to nearly 4,000 ft (1,200 m). The inhabitants, including HAIDA Indians, engage in fishing and ranching.

Queen Charlotte Sound Broad, deep inlet of the Pacific Ocean indenting western British Columbia, Canada. Bounded on the north by the QUEEN CHARLOTTE ISLANDS and on the south by VANCOUVER ISLAND, the sound feeds into a series of straits that once were the paths followed by the continental GLACIERS as they pushed out to sea. Its eastern border is a complex of islands, inlets, and fjords.

Queen Elizabeth Islands Island group, northern Canada. Part of the Canadian Arctic archipelago, it comprises all the islands north of latitude 74°30' N, including the Parry and Sverdrup island groups. The islands, the largest of which are ELLESMERE, MELVILLE, Devon, and Axel Heiberg, have a total land area of over 150,000 sq mi (390,000 sq km). Probably first visited by the Vikings c. AD 1000, they were partially explored (1615–16) by English navigators William Baffin and Robert Bylot. The islands, which are administratively split between the NORTHWEST TERRITORIES and NUNAVUT, were named in 1953 to honour Queen ELIZABETH II.

Queen Elizabeth National Park *or* **Ruwenzori National Park** National park, southwestern Uganda. Established in 1952, it has an area of 764 sq mi (1,978 sq km) and lies east of Lake EDWARD. One of the largest parks in Uganda, it has areas of rainforest and savanna grassland. It is within the western branch of the GREAT RIFT VALLEY and is dotted with PLEISTOCENE volcanic craters. Wildlife includes chimpanzees, leopards, lions, and elephants.

Queens Borough (pop., 2000: 2,229,379) of NEW YORK CITY, coextensive with Queens county, southeastern New York, U.S. The largest of the five boroughs, it lies on western LONG ISLAND and extends across the width of the island from the junction of the EAST RIVER and LONG ISLAND SOUND to the Atlantic Ocean. The first settlements, made by the Dutch 1636–56, came under English control in 1664. It became a county in 1683 and a borough in 1898. Queens was primarily rural during the 19th century, but some of its shore communities began attracting summer vacationers. Development was spurred by the construction of the Queensboro Bridge and the Long Island Railroad tunnel. It is mostly residential, though it has extensive manufacturing around Long Island City and storage and shipping facilities lining the East River. It is the site of New York City's major airports, Kennedy and La Guardia.

Queen's University at Kingston Privately endowed university in Kingston, Ontario, Canada. It was founded in 1841 and modeled after the University of EDINBURGH. It is a comprehensive research institution, offering undergraduate, graduate, and professional degrees in most major fields. Research facilities include centres for the study of international relations, industrial relations, and natural resources.

Queensberry rules Code of BOXING rules. It was written by John Graham Chambers (1843–1883) and published in 1867 under the sponsorship of John Sholto Douglas, marquess of Queensberry (1844–1900), who was known also for precipitating the downfall of OSCAR WILDE. Besides calling for the wearing of gloves, the rules forbade wrestling holds, required a fallen man to be given a free count of 10 to recover, established the three-minute round with a one-minute rest period, and disallowed seconds from entering the ring during the round.

Queensland State (pop., 2001: 3,635,121), northeastern Australia. Bounded on the north by the Pacific Ocean and the GREAT BARRIER REEF, it has an area of 668,210 sq mi (1,730,650 sq km); the capital is BRISBANE. Its coastal region, the most tropical part of Australia, attracts many tourists. Inland from the GREAT DIVIDING RANGE, which runs the entire length of the state, mining and cattle ranching are important. Capt. JAMES COOK charted the coast in 1770. In the 19th century the state housed several penal colonies and drew settlers to mine its gold. It became a constituent state in 1901 when the Commonwealth of Australia was proclaimed.

quenching Rapid cooling, as by immersion in oil or water, of a METAL object from the high temperature at which it is shaped. Quenching is usually done to maintain mechanical properties that would be lost with slow cooling. It is commonly applied to STEEL objects, to which it gives HARDNESS. The quenching media and the type of agitation during quenching are selected to obtain specified physical properties with minimum internal stresses and distortions. Oil is the mildest medium, and salt brine has the strongest quenching effect. In special cases, steel is cooled and held for some time in a molten salt bath, which is kept at a temperature either just above or just below the temperature where martensite begins to form. These two heat treatments, called martempering and austempering, both result in even less distortion of the metal. Copper objects hardened by hammering or other deformation at ordinary temperatures can be restored to malleability by heating and quenching. See also TEMPERING.

Queneau \kə-'nō**, Raymond** (b. Feb. 21, 1903, Le Havre, France—d. Oct. 25, 1976, Paris) French author. After working as a reporter, he became a reader for the prestigious *Encyclopédie de la Pléiade*, a scholarly edition of past and present classical authors; by 1955 he was its director. Verbal play, black humour, pessimism, and a derisive posture toward authority appear often in his more than 30 works of prose and poetry, which include the novels *Zazie dans le métro* (1959; film, 1960), perhaps his best-known work, and *The Blue Flowers* (1965).

Quercia, Jacopo della See JACOPO DELLA QUERCIA

Quercy \ker-'sē\ Historical and cultural region, southwestern France. The district was organized in Gallo-Roman times and was occupied by the FRANKS in the 6th century. It was contested by England and France throughout the Middle Ages. United with the French crown in 1472, it suffered severely during the Wars of RELIGION of the 16th century. It is well forested with oaks of the genus *Quercus* that give the region its name. There are vineyards around Cahors that produce rich red wines.

Querétaro City (pop., 2000: 536,463), capital of QUERÉTARO state, Mexico. Situated on the Mexican Plateau about 6,100 ft (1,860 m) above sea level, it is an excellent example of a Spanish colonial city. Founded by the OTOMI Indians, it was incorporated into the AZTEC empire in 1446. Brought under Spanish control in 1531, it became an important supply centre for the rich mining districts of GUANAJUATO and ZACATECAS. Emperor MAXIMILIAN was executed there in 1867 after his defeat by the forces of BENITO JUÁREZ. The Mexican Constitution of 1917 was written in Querétaro. It is the site of one of Mexico's oldest and largest cotton factories; textiles and pottery are also produced there.

Querétaro \kā-'rā-tä-,rō\ State (pop., 2000: 1,404,306), central Mexico. It has an area of 4,420 sq mi (11,449 sq km), and its capital is QUERÉTARO city. Situated on the central plateau, it is almost evenly divided between mountainous areas in the north and plains and valleys in the south that form part of Mexico's Bajío region. In 1531 the area was conquered by Spain, which began colonization in the 1550s. It was administered with Guanajuato before it became a state in 1824. Chief mineral products are opals and mercury. Medicinal plants, sweet potatoes, fruits, and grains are among the many crops cultivated.

Quesada, Gonzalo Jiménez de See Gonzalo JIMÉNEZ DE QUESADA

Quesnay \kā-'nā**, François** (b. June 4, 1694, near Paris, France—d. Dec. 16, 1774, Versailles) French physician and economist. He served as consulting physician to LOUIS XV at Versailles, where he developed an interest in economics. In his *Tableau économique* (1758), he described the relationship between the different economic classes of society and the flow of payments among them, and he developed the concept of economic equilibrium used by many later economic analysts. An advocate of LAISSEZ-FAIRE economic policy, he became the intellectual leader of the PHYSIOCRAT, the first systematic school of POLITICAL ECONOMY.

Quetelet \ket-'le**, (Lambert) Adolphe (Jacques)** (b. Feb. 22, 1796, Ghent, Belg.—d. Feb. 17, 1874, Brussels) Belgian statistician, sociologist, and astronomer. He is known for his application of STATISTICS and

© 2006 Encyclopædia Britannica, Inc.

the theory of probability to social phenomena. He collected and analyzed government statistics on crime, mortality, and other subjects and devised improvements in census taking. In *Sur l'homme* (1835) and *L'Anthropométrie* (1871) he developed the notion of the *homme moyen*, the statistically "average man." A founder of quantitative social science, he was nonetheless widely criticized for the crudeness of his methodology.

quetzal \ket-'säl\ Any of several tropical arboreal, short-billed, fruit-eating birds (genus *Pharomachrus*) in the trogon family (Trogonidae), whose weak feet have, uniquely, the second toe directed backward. It was the sacred bird of the ancient MAYAS and AZTECS. Today the quetzal, found in remote parts of cloud forests from southern Mexico to Bolivia, is the national emblem of Guatemala (whose monetary unit is the quetzal). The resplendent, or Guatemalan, quetzal is about 50 in. (125 cm) long. Long blue-green plumes cover the tail; the breast and head, with a rounded hairlike crest, are gold-green; the blue back has a curly gold-tinged mantle; and the belly is red. The quetzal is now listed as endangered.

Quetzalcóatl \ˌkāt-säl-'kō-ä-təl, ˌkāt-säl-kō-'ä-təl\ Feathered Serpent, a major deity of ancient Mexico. Quetzalcóatl began as a god of vegetation in the TEOTIHUACÁN civilization. For the TOLTECS he was the god of the morning and evening star. The AZTECS revered him as the patron of priests, the inventor of the calendar and of books, and the protector of goldsmiths and other craftsmen. He was also identified with the planet Venus and was a symbol of death and resurrection. One myth held that he was a white priest-king who sailed away on a raft made of snakes. The belief that he would someday return from the east led MONTEZUMA II to regard HERNAN CORTES as the fulfillment of the prophecy.

Quetzalcóatl, limestone figure of the Huastec culture, Mexico, AD 900–1250; in The Brooklyn Museum, New York.
COURTESY OF THE BROOKLYN MUSEUM, NEW YORK, HENRY L. BATTERMAN AND FRANK S. BENSON FUNDS

queuing \'kyü-iŋ\ **theory** Study of the behaviour of queues (waiting lines) and their elements. Queuing theory is a tool for studying several performance parameters of computer systems and is particularly useful in locating the reasons for "bottlenecks," compromised computer performance caused by too much data waiting to be acted on at a particular phase. Queue size and waiting time can be looked at, or items within queues can be studied and manipulated according to factors such as priority, size, or time of arrival.

Quezon \'kā-sȯn\ **(y Molina), Manuel (Luis)** (b. Aug. 19, 1878, Baler, Phil.—d. Aug. 1, 1944, Saranac Lake, N.Y., U.S.) Filipino statesman. Quezon fought in the PHILIPPINE-AMERICAN WAR but became convinced after the Philippines' defeat that the only way to independence was through cooperation with the U.S. He served in the Philippine Assembly (1907–09). As the Philippines' representative in the U.S. House of Representatives (1909–16), he played a major role in obtaining Congress's pledge of independence for the Philippines (1916) and fought for passage of the Tydings-McDuffie Act (1934), which laid out a timetable for independence. He became president of the Commonwealth (a precursor to the independent republic) in 1935 and was reelected in 1941; when Japan occupied the Philippines in 1942, he formed a government-in-exile in the U.S. He did not live to see full independence for the Philippines. Quezon City is named in his honour.

Quezon \'kā-ˌsȯn\ **City** City (pop., 2000: 2,173,831), Luzon Island, Philippines, northeast of MANILA. Named for Pres. MANUEL QUEZON, who selected the site in 1939, it replaced Manila as the capital in 1948. Considered part of metropolitan Manila, it began to grow after World War II with the construction of many government buildings. The seat of government moved back to Manila in 1976. The city is home to two major universities.

Quiché *or* **K'iche** *or* **Kiche** \kē-'chā\ Indian group of the Guatemalan highlands, largest of all ethnic groups speaking a MAYA LANGUAGE. The Quiché Maya had an advanced civilization in pre-Columbian times. Records of their history and mythology are preserved in the *POPOL VUH*. Traditional Quiché are agricultural. Their homes are thatched huts, and they practice weaving and pottery. Nominally Roman Catholic, they conduct traditional rituals as well. Many were killed or displaced during the Guatemalan military's counterinsurgency campaign of the early 1980s.

quicklime See LIME

quicksand State in which water-saturated sand loses its supporting capacity and acquires the characteristics of a liquid. Quicksand is usually found in a hollow at the mouth of a large river or along a flat stretch of stream or beach where pools of water become partly filled with sand and an underlying layer of stiff clay or other dense material prevents drainage. Mixtures of sand, mud, and vegetation in bogs often act like true quicksands. Any sand may become "quick" if its effective weight is being carried by water between the grains. In that case, even a footstep may collapse the loose structure. The sand-water suspension is denser than an animal or human body, so the body cannot sink below the surface, but struggling may lead to loss of balance and drowning.

quicksilver See MERCURY

Quiller-Couch, Sir Arthur (Thomas) (b. Nov. 21, 1863, Bodmin, Cornwall, Eng.—d. May 12, 1944, Fowey, Cornwall) English poet, novelist, and anthologist. Educated at Oxford, he worked as a journalist and editor in London before settling in his native Cornwall. He taught at Cambridge from 1912. He is noted for compiling *The Oxford Book of English Verse 1250–1900* (1900; revised 1939) and *The Oxford Book of Ballads* (1910). His works, written in a clear and apparently effortless style, include many novels and short stories, verse, and criticism, including *On the Art of Writing* (1916) and *On the Art of Reading* (1920).

quilombo \kē-'lȯm-bō\ *ormocambo* In colonial Brazil, a community organized by fugitive slaves. *Quilombos* were located in inaccessible areas and usually consisted of fewer than 100 people who survived by farming and raiding. The largest and most famous was Palmares, which grew into an autonomous republic and by the 1690s had 20,000 inhabitants. It owed its prosperity to abundant irrigated land and the abduction of slaves from Portuguese plantations. The abducted slaves were kept in bondage by the runaways. Several Portuguese and Dutch slave-hunting expeditions (*BANDEIRA*) attempted to destroy Palmares; one of these finally succeeded in 1694.

quilting Process of stitching together two layers of fabric, usually with a soft, thick substance placed between them. The layer of wool, cotton, or other stuffing provides insulation; the stitching keeps the stuffing evenly distributed and also provides opportunity for artistic expression. Quilting has long been used for clothing in many parts of the world, especially in the Far and Middle East and the Muslim regions of Africa. It reached its fullest development in the U.S., where it was at first popularly used for petticoats and comforters. By the end of the 18th century the U.S. quilt had distinctive features, such as coloured fabric sewn on the outer layers (appliqué) and stitching that echoed the appliqué pattern. Patchwork patterns proliferated in the 19th and 20th centuries.

quince Any of the fruit shrubs and small trees that make up the genus *Cydonia*, in the ROSE family. Common quince (*C. oblonga*) is native to Iran, Turkey, and perhaps Greece and the Crimea. The raw golden-yellow fruit has a strong fragrant aroma and astringent taste; it takes on a pink colour when cooked and makes an excellent preserve. The Japanese quince (*Chaenomeles* species) is an ornamental shrub widely used for its flowers, which appear on the tightly branched stems before the leaves open fully in late winter and early spring.

Quince (*Cydonia oblonga*).
WALTER CHANDOHA

Quincey, Thomas De See THOMAS DE QUINCEY

Quine, W(illard) V(an) O(rman) (b. June 25, 1908, Akron, Ohio, U.S.—d. Dec. 25, 2000, Boston, Mass.) U.S. logician and philosopher. He completed his Ph.D. at Harvard University in 1932 and joined the faculty there in 1936. From 1942 to 1945 he served as a naval intelligence

© 2006 Encyclopædia Britannica, Inc.

officer in Washington, D.C. Promoted to full professor at Harvard in 1948, he remained there until 1978, when he retired. He produced highly original and important work in several areas of philosophy, including epistemology, logic, ontology, and the philosophy of language. He was known for rejecting epistemological foundationalism in favour of what he called "naturalized epistemology," whose modest task is merely to give a psychological account of how scientific knowledge is obtained. Though influenced by the LOGICAL POSITIVISM of RUDOLF CARNAP and other members of the VIENNA CIRCLE, he famously rejected one of their cardinal doctrines, the ANALYTIC-SYNTHETIC DISTINCTION. In ontology he rejected the existence of properties, propositions, and meanings as ill-defined or scientifically useless. He was also known for his behaviourist account of language learning and for his thesis of the "indeterminacy of translation," according to which there can be no "fact of the matter" about which of indefinitely many possible translations of one language into another is correct. His many books include *Word and Object* (1960), *The Roots of Reference* (1974), and an autobiography, *The Time of My Life* (1985).

quinine \'kwī-ˌnīn\ ALKALOID found in the bark of CINCHONA trees and shrubs. The chemical structure of this HETEROCYCLIC COMPOUND is large and complex, with several rings. For the 300 years preceding the 1940s, when newer antimalarials were developed, quinine was the only drug known to Western medicine for the prevention and treatment of MALARIA. The first chemical compound ever used successfully against an infectious disease, it has benefited more people than any other such drug in history and is still used to treat malaria, often in combination with other drugs. Quinine is also a flavouring agent in some carbonated beverages, including tonic water.

Quinn, Anthony (Rudolph Oaxaca) (b. April 21, 1915, Chihuahua, Mex.—d. June 3, 2001, Boston, Mass., U.S.) Mexican-born U.S. film actor. He began appearing in movies in 1936, initially playing bit parts as American Indians or ethnic characters. After appearing on Broadway in *A Streetcar Named Desire*, he returned to Hollywood, where he won Academy Awards for his supporting roles in *Viva Zapata!* (1952) and *Lust for Life* (1956). He was noted for his earthy masculinity and acted in over 100 other films, notably FEDERICO FELLINI's *La strada* (1954), *Requiem for a Heavyweight* (1962), and *Zorba the Greek* (1964). Quinn was also a successful artist and sculptor.

quinone \kwi-'nōn\ Any member of a class of cyclic organic compounds comprising a six-membered unsaturated ring (see SATURATION) to which two oxygen atoms are bonded as carbonyl groups (—C═O; see FUNCTIONAL GROUP). This structure plays an important role in theories of chemical structure and colour, since quinones occur as PIGMENTS in bacteria, fungi, and certain higher plants; animals containing quinones obtain them from plants they eat. The K vitamins (see VITAMIN K) are naphthoquinones. The term *quinone* often specifically denotes *para*-benzoquinone ($C_6H_4O_2$), a bright yellow solid with a sharp odour used in manufacturing dyes and fungicides and in photography.

Quintana Roo \kē-'tä-nä-'rō\ State (pop., 2000: 874,963), eastern YUCATÁN PENINSULA, southeastern Mexico. It has an area of 19,397 sq mi (50,212 sq km), and its capital is CHETUMAL. The region was used as a place of exile for political prisoners for many years. Originally created as a territory from parts of YUCATÁN and CAMPECHE states, it became a state in 1974. It is the site of many MAYA ruins. Its main products are chicle (for chewing gum) and a small amount of copra (for producing coconut oil); the latter is produced on the coast near the island of Cozumel (where HERNÁN CORTÉS landed in 1519), which is now a popular tourist destination.

Quinte \'kwin-tē**, Bay of** Arm of Lake ONTARIO, southeastern Ontario, Canada. It extends for 75 mi (121 km) from its entrance near Amherst Island to Murray Canal at the western end. A resort area, it is a scenic, narrow bay with many small inlets. Among the major settlements around the bay are Trenton, Belleville, Deseronto, and Picton. The bay's name was derived from Kenté, an Indian village on the bay's western shore.

Quintero \kēn-'ter-ō**, José (Benjamín)** (b. Oct. 15, 1924, Panama City, Pan.—d. Feb. 26, 1999, New York, N.Y., U.S.) Panamanian-born U.S. theatrical director. After studying theatre at theUniversity of Southern California, he directed his first play in 1949. He was a founder of the Off-Broadway theatre Circle in the Square, where he directed regularly from 1950, establishing the house as a major centre for serious theatre. His direction of TENNESSEE WILLIAMS's *Summer and Smoke* (1952) confirmed his reputation and made a star of GERALDINE PAGE. He was best known for his productions of 20th-century plays, especially those of Williams and EUGENE O'NEILL, including *The Iceman Cometh* (1956), *Long Day's Journey into Night* (1956), and *A Moon for the Misbegotten* (1973, Tony Award).

Quintilian *Latin* **Marcus Fabius Quintilianus** (b. AD 35, Calagurris Nassica, Hispania Tarraconensis—d. after 96, Rome) Latin teacher and writer. Quintilian was probably educated and trained in oratory in Rome. From about 68 to 88 he taught rhetoric, becoming Rome's leading teacher, and was an eminent advocate in the law courts. His *Institutio oratoria* is a practical survey of rhetoric in 12 books and a major contribution to educational theory and literary criticism. His dual emphasis on intellectual and moral training appealed to humanists of the 15th–16th centuries and through them influenced the modern view of education as all-around character training to equip a student for life.

Quirino \kē-'rē-nō**, Elpidio** (b. Nov. 16, 1890, Vigan, Phil.—d. Feb. 28, 1956, Novaliches) Second president of the independent Republic of the Philippines. Quirino served in numerous elected and appointed posts in the Philippines prior to independence. In 1934 he accompanied MANUEL QUEZON to the U.S. to secure passage of the Tydings-McDuffie Act, which set a date for Philippine independence. He became vice president to MANUEL ROXAS after independence, succeeding to the presidency on Roxas's death in 1948. Quirino's presidency (1948–53) was one of notable postwar reconstruction and economic gains, but social problems remained unsolved (leading to the HUKBALAHAP REBELLION), and government corruption was widespread.

Quirinus \kwə-'rī-nəs\ Major Roman deity ranking close to JUPITER and MARS. The *flamines* (see FLAMEN) of these three gods were the three major priests of Rome. Despite his importance, little is known about Quirinus, who was originally a god of the SABINES. He may have been another form of Mars. By the late republic he was identified with ROMULUS. His festival, the Quirinalia, was celebrated on February 17, and his temple was one of the oldest in Rome.

Quisling, Vidkun (Abraham Lauritz Jonsson) (b. July 18, 1887, Fyresdal, Nor.—d. Oct. 24, 1945, Akershus Fortress, Oslo) Norwegian politician and collaborator with the Germans in World War II. After serving as military attaché in Petrograd and Helsinki, he became Norway's minister of defense in 1931. He resigned in 1933 to form the fascist National Union party. He actively collaborated in the German conquest of Norway (1940) and served in the occupation government. His attempts to convert Norwegians to NATIONAL SOCIALISM aroused strong opposition. After Norway's liberation, he was found guilty of treason and executed. His name became a synonym for "traitor."

Quito \'kē-tō\ City (pop., 2001: 1,399,378), capital of Ecuador. The city lies at an elevation of 9,350 ft (2,850 m) on the lower slopes of Pichincha, an active volcano, in a narrow valley of the Andes Mountains. A pre-Columbian town, it was captured by the INCA in 1487 and taken by the Spanish in 1534. It is the oldest of all South American capitals, and its old town preserves much of its colonial atmosphere. In 1552 the Franciscans established an art school there, the first of its kind in South America. One of Ecuador's two major industrial centres, it produces textiles and light consumer goods. It is the site of several institutions of higher learning. The old town was designated a UNESCO WORLD HERITAGE SITE in 1978.

quiz show See GAME SHOW

Qumrān \kům-'rän\ Site on the northwestern shore of the DEAD SEA where the DEAD SEA SCROLLS were discovered in 1947. Excavations less than a mile from the sea have revealed the ruins of buildings believed by some scholars to have been occupied by ESSENES, the probable authors of the scrolls. The buildings include a scriptorium, a potter's workshop, and a flour mill; water was supplied through an aqueduct. The Essenes are thought to have founded a monastic community at Qumrān in the mid-2nd century BC. They temporarily abandoned the settlement after an earthquake and fire in 31 BC but later returned and lived there until Roman legions destroyed the community in AD 68.

quoin \'kȯin, 'kwȯin\ In architecture, both the external corner of a building and, more often, one of the stones used to form that corner. These stones are both structural and decorative in that they often differ in jointing, colour, texture, or size from the masonry of the adjoining walls. Usually quoins are toothed (i.e., set in short courses in a regular pattern of alternating lengths). Such construction dates back to ancient Rome.

quoits \'kȯits, 'kwȯits\ Game in which flattened rings of iron or circles of rope (both called quoits) are thrown at an upright pin (hob) in an

© 2006 Encyclopædia Britannica, Inc.

attempt to ring it or come as near to it as possible. Quoits may have been played in Roman-occupied Britain (1st–5th century AD), and it may have given rise to HORSESHOE PITCHING.

quota In international trade, a government-imposed limit on the quantity of goods and services that may be exported or imported over a specified period of time. Quotas are more effective than TARIFFS in restricting trade, since they limit the availability of goods rather than simply increasing their price. By limiting foreign goods, a quota aims to allow domestic goods to compete more successfully, though the PRICE of the goods may also rise. Quotas restricting trade were first imposed on a large scale during World War I. In the 1920s, quotas were progressively abolished and replaced by tariffs, but their use was revived in the wave of PROTECTIONISM set off by the GREAT DEPRESSION. After World War II, the western European countries began a gradual dismantling of quantitative import restrictions, but the U.S. was slower to discard them. See also FREE TRADE; GATT.

quotient rule Rule for finding the DERIVATIVE of a quotient of two functions. If both f and g are differentiable, then so is the quotient $f(x)/g(x)$. In abbreviated notation, it says $(f/g)' = (gf' - fg')/g^2$.

Qŭqon See QO'QON

Qur'ān \kù-'rän\ *or* **Koran** \kə-'ran, kə'rän\ Sacred SCRIPTURE of ISLAM, regarded by Muslims as the infallible word of God, revealed to the Prophet MUHAMMAD. The book, first compiled in its authoritative form in the 7th century, consists of 114 chapters (SŪRAHS) of varying length, written in Arabic. The earliest *sūrahs* call for moral and religious obedience in light of the coming Day of Judgment; the ones written later provide directives for the creation of a social structure that will support the moral life called for by God. The Qur'ān also provides detailed accounts of the joys of paradise and the terrors of hell. Muslims believe that the God who spoke to Muhammad is the God worshiped by Jews and Christians but that the revelations received by those religions are incomplete. Emphasis on the stern justice of God is tempered by frequent references to his mercy and compassion. The Qur'ān demands absolute submission (*islam*) to God and his word, and it serves as the primary source of Islamic law. It is regarded as immutable in both form and content; traditionally translation was forbidden. The translations available today are regarded as paraphrases to facilitate understanding of the actual scripture.

qurra \kù-'rä\ Professional class of reciters of the QUR'ĀN. MUHAMMAD's early disciples often memorized his divine revelations, and even after the Qur'ān was assembled in written form, it was common for pious Muslims to memorize it in its entirety. Such reciters were often called on by scholars to elucidate points of pronunciation and meaning, and by the 9th century they formed an established class. Religious men employed in mosques still memorize the Qur'ān to aid them in interpreting its revelations to the faithful. In some Arab countries the professional duties of reciting the Qur'ān are usually reserved for blind men.

Quṭb \'kù-tùb**, Sayyid** *in full* **Ibrāhīm Ḥusayn Shādhilī Sayyid Quṭb** (b. Oct. 9, 1906, near Asyūṭ, Egypt—d. Aug. 29, 1966, Cairo) Egyptian writer who was one of the foremost figures in modern Sunnite Islamic revivalism. He was from a family of impoverished rural notables. For most of his early life he was a schoolteacher. Originally an ardent secularist, he came, over time, to adopt many Islamist views. Following a brief period studying in the U.S. (1948–50), he became convinced of the corruption of Western secularism and on his return to Egypt joined the MUSLIM BROTHERHOOD. He was at first on good terms with the revolutionary regime of GAMAL ABDEL NASSER but was imprisoned (1954–64) along with other Brotherhood leaders on charges of sedition. His prison years were his most productive. The brutal treatment he received convinced him that Egypt, like the West, was corrupt, and, drawing (often freely) on the work of early Muslim scholars such as IBN TAYMIYYAH, he argued that much of modern Muslim society had fallen in apostasy and was, therefore, a legitimate target of JIHAD. He penned these ideas in several books, including *Signposts in the Road* (1964), which became a template for modern Sunnite militancy. Released from prison in 1964, he was soon rearrested, tried for treason, and executed.

Qwaqwa \'kwä-ˌkwä\ Former black enclave, South Africa. It bordered Lesotho and the province of NATAL. With an area of 253 sq mi (655 sq km), it was the smallest of South Africa's black states. Established in 1974, it had industries that included brickworks, gravel quarries, and furniture making. In 1994 it was incorporated into ORANGE FREE STATE province, which was called Free State province after 1995.

Rabanus Maurus *or* **Hrabanus Maurus** \rä-'bä-nůs-'maů-růs\ (b. c. 780, Mainz, Franconia—d. Feb. 4, 856, Winkel) Frankish abbot, archbishop, and theologian whose encyclopaedic knowledge and numerous writings brought him the title Praeceptor Germaniae ("Teacher of Germany"). A Benedictine monk, he became director of the school at the Fulda monastery near Frankfurt am Main in 803, and he built Fulda into a leading European centre of learning. He was elected abbot in 822 and used the monastery as a base for Christian missions throughout Europe. He was named archbishop of Mainz in 847. His many writings include *On the Nature of Things* (842–847), an encyclopaedia synthesizing intellectual history until the 9th century. He also wrote treatises on education and grammar and commentaries on the Bible. As abbot and archbishop, he was involved in the disciplinary and theological controversies associated with Gottschalk of Orbais.

Rabat \rə-'bät\ *Arabic* **Ribāṭ** \ri-'bät\ City (pop., 1994: city, 623,457; Rabat-Salé metro. area, 1,385,872), capital of Morocco. It is situated on the Atlantic coast at the mouth of the Bou Regreg River, opposite Salé. One of Morocco's four imperial cities, it was founded in the 12th century by a ruler of the Almohad dynasty, ʿAbd al-Muʾmin, as a *ribāṭ* (camp) quartering troops for his holy war against Spain. After 1609 the unified community of Rabat-Salé became the home of large numbers of Andalusian Moors who had been driven from Spain and, later, of the Sallee Corsairs, the most dreaded of Barbary Coast pirates. Under the French, it was made the administrative capital of a French protectorate after 1912. Now a centre of the textile industry, it is noted for its carpets, blankets, and leather handicrafts.

Rabban Gamaliel See Gamaliel I

rabbi \'ra-ˌbī\ *or* **rebbe** \'re-bə\ In Judaism, a person qualified by study of the Hebrew scriptures and the Talmud to serve as spiritual leader of a Jewish community or congregation. Ordination can be conferred by any rabbi, but it usually depends on a written statement issued by the candidate's teacher. Though rabbis are considered teachers rather than priests, they conduct religious services, assist at Bar Mitzvahs, perform marriages, and are present at funerals. In questions of divorce, a rabbi's role depends on an appointment to a special court of Jewish law. The rabbi also counsels and consoles members of his congregation and oversees the religious education of the young.

rabbinic Judaism \rə-'bi-nik\ Principal form of Judaism that developed after the fall of the Second Temple of Jerusalem (AD 70). It originated in the teachings of the Pharisees, who emphasized the need for critical interpretation of the Torah. Rabbinic Judaism is centered on study of the Talmud and debate about the legal and theological issues it raises. Its mode of worship and life discipline continue to be practiced by Jews worldwide.

rabbit Any small, bounding, gnawing mammal of the family Leporidae. Rabbits have long ears, a short tail, long hind legs, and continuously growing incisors. Most species are gray or brown and range in size from 10 to 18 in. (25 to 45 cm) long and 1 to 4 lb (0.5 to 2 kg). They feed primarily on grasses. Their reproductive rate is very high; unlike hares, rabbits are born blind, hairless, and helpless. Most species are nocturnal and live alone in burrows. However, the European, or Old World, rabbit (*Oryctolagus cuniculus*; of Europe and Asia) lives in warrens consisting of many burrows; this species is the ancestor to all domestic breeds. The 13 North American species called cottontails (genus *Sylvilagus*) have white on the underside of the tail.

Eastern cottontail rabbit (*Sylvilagus floridanus*).
STEVE AND DAVE MASLOWSKI

Rabéarivelo \rä-bā-ä-rē-'vā-lō**, Jean-Joseph** (b. March 4, 1901, Tananarive, Madag.—d. June 22, 1937, Tananarive) Malagasy writer. Largely self-educated, he earned his living as a proofreader for a publishing concern. He wrote seven volumes of poetry in French, of which *Near-Dreams* (1934) and *Translation of the Night* (1935) are considered the most important. The mythical and surrealistic world created in his poems is intensely personal and dominated by visions of death, catastrophe, and alienation. Harassed by French authorities and addicted to drugs, he committed suicide. He is regarded as the father of modern literature in his native land.

Rabelais \rà-'ble,\ *English* \'ra-bə-ˌlā**, François** (b. c. 1494, Poitou, France—d. probably April 9, 1553, Paris) French writer and priest. After apparently studying law, he took holy orders as a Franciscan but later, because of a dispute, removed to a Benedictine house. In 1530 he left the Benedictines to study medicine, a profession he would follow the rest of his life. He became a significant humanist scholar, publishing translations of Hippocrates and Galen. His fame rests on the five comic novels (one of doubtful authenticity) known collectively as *Gargantua and Pantagruel*, including the masterpieces *Pantagruel* (1532) and *Gargantua* (1534) as well as *Le Tiers Livre* (1546; "The Third Book"), his most profound work. These works display a delight in words, a mastery of storytelling, and deep humanist learning in a mosaic of scholarly, literary, and scientific parody that is unlike any previous work in French. The books were banned by civil and church authorities for their satirical content and earthy humour, but they were nevertheless read throughout Europe. Throughout his career, Rabelais owed his freedom to the protection of powerful patrons.

Rabi \'rä-bē**, I(sidor) I(saac)** (b. July 29, 1898, Rymanów, Austria-Hungary—d. Jan. 11, 1988, New York, N.Y., U.S.) Polish-born U.S. physicist. He earned his Ph.D. at Columbia University, where he later taught physics (from 1929). In 1940–45 at the Massachusetts Institute of Technology he led a group of scientists who helped develop radar, and he succeeded J. Robert Oppenheimer as chairman of the Atomic Energy Commission's General Advisory Committee (1952–56). He was the first to propose the joint European laboratory CERN, and he helped found New York's Brookhaven National Laboratory. His method for measuring the magnetic properties of atoms, atomic nuclei, and molecules (1937) led to the atomic clock, the maser, the laser, magnetic resonance imaging, and the central technique for molecular and atomic beam experimentation; it also won him a 1944 Nobel Prize.

rabies \'rā-ˌbēz\ Acute, usually fatal infectious disease of warm-blooded animals that attacks the central nervous system. It is spread by contact with an infected animal's saliva, usually from a bite. The rhabdovirus that causes it spreads along nerve tissue from the wound to the brain. Symptoms usually appear four to six weeks later, often beginning with irritability and aggressiveness. Wild animals lose their fear of humans and are easily provoked to bite, as are pets. Depression and paralysis soon follow. Death usually comes three to five days after symptoms begin. In humans, death can result from a seizure in the early phase even before symptoms of central nervous system depression develop. One name for rabies, hydrophobia ("fear of water"), comes from painful throat contraction on trying to swallow. If not treated in time (within a day or two) with a serum containing antibodies and then a series of vaccinations, rabies in humans is almost always fatal. Immediate cleansing of animal bites with soap and water can remove much of the virus.

Rabin \rə-'bēn**, Yitzhak** (b. March 1, 1922, Jerusalem—d. Nov. 4, 1995, Tel Aviv–Yafo, Israel) First native-born prime minister of Israel. He fought in the first Arab-Israeli War and became chief of staff in 1964. His strategies helped win the Six-Day War in 1967. After retiring from the army (1968), he served as ambassador to the U.S. (1968–73). As head of the Israel Labour Party, he twice served as prime minister (1974–77, 1992–95). During his first tenure, he secured a cease-fire with Syria in the Golan Heights and ordered the raid at Entebbe, Ugan. (see Entebbe raid). As defense minister (1984–90) he responded forcefully to the Palestinian first *intifādah*. In 1993 secret negotiations with the Palestinians yielded a political settlement that called for limited Palestinian self-rule in the Gaza Strip and the West Bank, for which he shared the 1994 Nobel Prize for Peace with Shimon Peres and Yāsir ʿArafāt. He was assassinated by a right-wing Jewish extremist.

raccoon *or* **ringtail** Any of seven species of omnivorous, nocturnal carnivores (genus *Procyon*, family Procyonidae) characterized by a bushy,

© 2006 Encyclopædia Britannica, Inc.

ringed tail and a black mask on the face. The North American raccoon (*P. lotor*) has a stout body, short legs, pointed muzzle, and small erect ears. It is 30–36 in. (75–90 cm) long, including the 10-in. (25-cm) tail, and weighs over 22 lb (10 kg). The shaggy, coarse fur is iron-gray to blackish. The feet resemble slender human hands. Raccoons eat arthropods, rodents, frogs, berries, fruit, and plants; in towns and cities they thrive on garbage. They prefer woods near water and usually live in hollow trees. The crab-eating raccoon (*P. cancrivorus*) of South America is similar but has coarser fur.

North American raccoon (*Procyon lotor*).
LEONARD LEE RUE III

race Term once commonly used in PHYSICAL ANTHROPOLOGY to denote a division of humankind possessing traits that are transmissible by descent and sufficient to characterize it as a distinct human type (e.g., Caucasoid, Mongoloid, Negroid). Today the term has little scientific standing, as older methods of differentiation, including hair form and body measurement, have given way to the comparative analysis of DNA and gene frequencies relating to such factors as BLOOD TYPING, the excretion of AMINO ACIDS, and inherited ENZYME deficiencies. Because all human populations today are extremely similar genetically, most researchers have abandoned the concept of race for the concept of the cline, a graded series of differences occurring along a line of environmental or geographical transition. This reflects the recognition that human populations have always been in a state of flux, with genes constantly flowing from one gene pool to another, impeded only by physical or ecological boundaries. While relative isolation does preserve genetic differences and allow populations to maximally adapt to climatic and disease factors over long periods of time, all groups currently existing are thoroughly "mixed" genetically, and such differences as still exist do not lend themselves to simple typologizing. "Race" is today primarily a sociological designation, identifying a class sharing some outward physical characteristics and some commonalities of culture and history. See also CLIMATIC ADAPTATION, ETHNIC GROUP, RACISM.

racemate \rā-'sē-ˌmāt\ Mixture of equal quantities of two enantiomers, substances whose molecular structures are mirror images of one another (see ISOMER). The two enantiomers rotate polarized light through opposite angles, canceling each other out so that the racemic mixture has no OPTICAL ACTIVITY. Racemization is the conversion of an optically active form of a compound into a racemic mixture; reversing this process is called resolution.

racer Any of several slender, swift SNAKES (subspecies of *Coluber constrictor*, family Colubridae) of North and Central America and Asia. Racers have a long tail, big eyes, and smooth scales. Colour and pattern vary among subspecies, some of which grow to 6 ft (1.8 m) long. Among the fastest of snakes, racers can move at 3.5 mph (5.6 km/hr). They hold down their prey, usually a small warm-blooded animal, by the weight of their coils and then swallow it. If cornered, they vibrate the tail and strike repeatedly with a sideways motion that tears a victim's skin. See also BLACK SNAKE.

Racer (*Coluber constrictor*)
© 1971 Z. LESZCZYNSKI—ANIMALS ANIMALS

Rachel In the book of GENESIS, one of JACOB's two wives. Jacob was forced to serve her father, Laban, for seven years to win her, but at the end of that time he was tricked into marrying her sister, Leah. He was then allowed to marry Rachel as well, in return for seven more years of labour. At first childless, Rachel eventually gave birth to JOSEPH, and she died giving birth to Benjamin.

Rachmaninoff \räk-'mä-nə-ˌnȯf**, Sergey (Vassilyevich)** (b. April 1, 1873, Oneg, near Semyonovo, Russia—d. March 28, 1943, Beverly Hills, Calif., U.S.) Russian-born U.S. composer and pianist. He studied at the St. Petersburg and Moscow conservatories. After playing his first concerto for his graduation as a piano student (1891), he stayed on to earn a composition degree, writing his first opera, *Aleko* (1892). His first symphony (1897) was such a disaster that he could not compose for three years. Known for his titanic virtuosity as a pianist, he toured widely while returning to composing prolifically. He moved to the U.S. after the 1917 revolution. His works, most of them in a lush late-Romantic style, include three symphonies, four piano concertos, the tone poem *From the Isle of the Dead* (1909), and *Symphonic Dances* (1940).

Racine \rà-'sēn**, Jean (-Baptiste)** (baptized Dec. 22, 1639, La Ferté-Milon, France—d. April 21, 1699, Paris) French playwright. Orphaned at an early age, he was educated in a Jansenist convent, and he chose drama in defiance of his upbringing. His first play was produced by MOLIÈRE in 1664. Their friendship ended when Racine took his next play, *Alexander the Great* (1665), to a competing theatre and seduced Molière's mistress and leading actress, Thérèse du Parc. She starred in Racine's successful *Andromaque* (1667), which explored his theme of the tragic folly of passionate love. His only comedy, *The Litigants* (1668), was followed by his great tragedies *Britannicus* (1669), *Bérénice* (1670), and *Bajazet* (1672). After writing his masterpiece, *Phèdre* (1677), a tragedy drawn from Greek mythology, he retired to become official historian to LOUIS XIV. His final plays, *Esther* (1689) and *Athalie* (1691), were commissioned by the king's wife, Mme. de MAINTENON.

racism Any action, practice, or belief that reflects the racial worldview—the ideology that humans are divided into separate and exclusive biological entities called "races," that there is a causal link between inherited physical traits and traits of personality, intellect, morality, and other cultural behavioral features, and that some "races" are innately superior to others. Racism was at the heart of North American SLAVERY and the overseas colonization and empire-building activities of some western Europeans, especially in the 18th century. The idea of RACE was invented to magnify the differences between people of European origin in the U.S. and those of African descent whose ancestors had been brought against their will to function as slaves in the American South. By viewing Africans and their descendants as lesser human beings, the proponents of slavery attempted to justify and maintain this system of exploitation while at the same time portraying the U.S. as a bastion and champion of human freedom, with human rights, democratic institutions, unlimited opportunities, and equality. The contradiction between slavery and the ideology of human equality, accompanying a philosophy of human freedom and dignity, seemed to demand the dehumanization of those enslaved. By the 19th century racism had matured and the idea spread around the world. Racism differs from ethnocentrism in that it is linked to physical and therefore immutable differences among people. Ethnic identity is acquired, and ethnic features are learned forms of behaviour. Race, on the other hand, is a form of identity that is perceived as innate and unalterable. In the last half of the 20th century several conflicts around the world were interpreted in racial terms even though their origins were in the ethnic hostilities that have long characterized many human societies (e.g., Arabs and Jews, English and Irish). Racism reflects an acceptance of the deepest forms and degrees of divisiveness and carries the implication that differences among groups are so great that they cannot be transcended. See also ETHNIC GROUP; SOCIOCULTURAL EVOLUTION.

rack and pinion Mechanical device consisting of a bar of rectangular cross section (the rack), having teeth on one side that mesh with teeth on a small GEAR (the pinion). If the pinion rotates about a fixed axis, the rack will move in a straight path. Some AUTOMOBILE steering mechanisms have rack-and-pinion drives that use this principle. If the rack is fixed and the pinion is carried in bearings on a table guided on tracks parallel to the rack, rotation of the pinion shaft will move the table parallel to the rack. On MACHINE TOOLS, this principle is used to obtain rapid movements of worktables.

racketeering See ORGANIZED CRIME

rackets Game for two or four players with ball and racket on a four-walled court. Rackets is played with a hard ball in a relatively large court (approximately 9 × 18 m), unlike the related games of SQUASH and RACQUETBALL. As in these other games, the object of rackets is to bounce, or rebound, the ball off the front and other walls in such a way as to defeat an opponent's attempt to reach and return it. It appears to have developed in England in the early 19th century.

Rackham, Arthur (b. Sept. 19, 1867, London, Eng.—d. Sept. 6, 1939, Limpsfield, Surrey) British artist and illustrator. While a staff artist for a

© 2006 Encyclopædia Britannica, Inc.

London newspaper, he also began illustrating books. He became skillful using the new halftone process, and his highly detailed drawings revealed a unique imagination. He achieved renown with a 1900 edition of *Grimm's Fairy Tales*, and his illustrations for *Rip Van Winkle* (1905) brought him recognition in America as well. Altogether he illustrated more than 60 books, including classics of children's literature as well as works by William Shakespeare, Charles Dickens, John Milton, Richard Wagner, and Edgar Allan Poe.

racquetball Game similar to handball but played with racquets. The game is played on a four-walled court with a short-handled racket and a ball larger than that used in handball. It was invented in 1950 by Joseph G. Sobek (1918–98), who was unhappy with the indoor racquet sports then available. By the late 1990s there were 8.5 million racquetball players in 91 countries.

radar System that uses electromagnetic echoes to detect and locate objects. It can also measure precisely the distance (range) to an object and the speed at which the object is moving toward or away from the observing unit. Radar (the name is derived from *ra*dio *d*etecting *a*nd *r*anging) originated in the experimental work of Heinrich Hertz in the late 1880s. During World War II British and U.S. researchers developed a high-powered microwave radar system for military use. Radar is used today in identification and monitoring of artificial satellites in Earth orbit, as a navigational aid for airplanes and marine vessels, for air traffic control around major airports, for monitoring local weather systems, and for spotting "speeders."

radar astronomy See radio and radar astronomy

Radcliffe, Ann *orig.* **Ann Ward** (b. July 9, 1764, London, Eng.—d. Feb. 7, 1823, London) English gothic novelist. Brought up in a well-to-do family, in 1787 she married a journalist who encouraged her literary pursuits. Her first two novels were published anonymously. She achieved fame with her third novel, *The Romance of the Forest* (1791). With her fourth, *The Mysteries of Udolpho* (1794), she became the most popular novelist in England. *The Italian* (1797), which displays rare psychological insight, reveals her full powers. In her tales, scenes of terror and suspense are infused with an aura of romantic sensibility. See also gothic novel.

Radcliffe-Brown, A(lfred) R(eginald) (b. Jan. 17, 1881, Birmingham, Warwick, Eng.—d. Oct. 24, 1955, London) British social anthropologist. He taught at the universities of Cape Town, Sydney, Chicago, and Oxford. In his version of functionalism, he viewed the component parts of society (e.g., the kinship system, the legal system) as having an indispensable function for one another, the continued existence of one component being dependent on that of the other, and he developed a systematic framework of concepts relating to the social structures of small-scale societies. He had a profound impact on British and American social anthropology. Among his major works are *The Andaman Islanders* (1922) and *Structure and Function in Primitive Society* (1952).

Radek \'rä-dyik**, Karl (Bernhardovich)** *orig.* **Karl Sobelsohn** (b. 1885, Lemberg, Galicia, Austria-Hungary—d. 1939?) Russian communist politician. He took part in the Russian Revolution of 1905, then wrote for leftist newspapers in Poland and Germany (1906–14). After meeting Vladimir Lenin in 1915, he helped reorganize the German Communist Party in 1918. He returned to Russia in 1919 and rose to leadership in the Comintern but was ousted in 1924 for his support of Leon Trotsky. After recanting in 1929, he became a fervent Stalinist and editorial board member of *Izvestiya* (1931–36). Despite his conversion, he was arrested and tried in the purge trials and sentenced to 10 years in prison, where he died.

Radetzky \rä-'det-skē**, Joseph, Count** (b. Nov. 2, 1766, Trebnice, Bohemia—d. Jan. 5, 1858, Milan) Austrian army officer. He fought with distinction against the French in the Napoleonic Wars. As army chief of staff, he attempted to modernize the Austrian army. As commander in chief of the Austrian army in northern Italy (1831–57), he suppressed the revolt in the Austrian-ruled provinces of Lombardy and Venetia in 1848. He served as governor-general of these provinces (1849–57). His status among conservatives as a national hero inspired Johann Strauss the Elder to compose the *Radetzky March*.

Radha \'rä-dä\ In Hindu mythology, mistress of the god Krishna when he lived among the cowherds of Vrndavana. Though Radha was the wife of another cowherd, she was the most beloved of Krishna's consorts and his constant companion. In the bhakti movement of Vaishnavism, Radha symbolizes the human soul and Krishna the divine. The allegorical love of Radha and Krishna has been celebrated in the poetry of many Indian languages, and Radha is often worshiped along with Krishna, especially in northern and eastern India.

radial engine Type of internal-combustion engine used mainly in small airplanes, in which the cylinders (ranging from five to as many as 28, depending on engine size) are mounted in a circle around the crankshaft, sometimes in banks of two or more. Once the dominant piston-engine type, radials are now in only limited production; most new requirements are met by remanufacturing existing stock.

radiant heating Heating system in which heat is transmitted by radiation from a heated surface. Radiant heating systems usually employ either electric-resistance wiring or hot-water heating pipes, which may embedded in the floor, ceiling, or walls. Panel heating is a form of radiant heating characterized by very large surfaces (typically an entire ceiling or floor) containing electrical conductors, hot-water pipes, or hot-air ducts. With many such systems there is no visible heating equipment in the room.

radiation Process by which energy is emitted from a source and propagated through the surrounding medium, or the energy involved in this process. Radiation consists of a flow of atomic or subatomic particles or of waves. Familiar examples are light (a form of electromagnetic radiation) and sound (a form of acoustic radiation). Both electromagnetic and acoustic radiation can be described as waves with a range of frequencies and intensities. Electromagnetic radiation is also often treated as discrete packets of energy, called photons. All matter is constantly bombarded by radiation from cosmic and terrestrial sources, and radioactive elements emit several types of radiation (see radioactivity). See also Cherenkov radiation, Hawking radiation, infrared radiation, synchrotron radiation, thermal radiation, ultraviolet radiation.

radiation injury Tissue damage caused by exposure to ionizing radiation. Structures with rapid cell turnover (e.g., skin, stomach or intestinal lining, and bone marrow) are most susceptible. High-dose irradiation of the last two causes radiation sickness. Nausea and vomiting subside in a few hours. They are followed in intestinal cases by abdominal pain, fever, and diarrhea leading to dehydration and a fatal shocklike state, and in bone-marrow cases (two to three weeks later) by fever, weakness, hair loss, infection, and hemorrhage. In severe cases, death occurs from infection and uncontrollable bleeding. Lower radiation doses can cause cancer (notably leukemia and breast cancer), sometimes years later. Radiation exposure in early pregnancy can produce abnormalities in the embryo, whose cells are multiplying rapidly.

radiation pressure Pressure on a surface resulting from electromagnetic radiation that impinges on it. The pressure is a result of the momentum carried by the radiation. When radiation is reflected rather than absorbed, the radiation pressure is doubled. Radiation pressure can sometimes be great enough to produce a force that is useful.

radiation therapy *or* **radiotherapy** *or* **therapeutic radiology** Use of radiation sources to treat or relieve diseases, usually cancer (including leukemia). The ionizing radiation primarily used to destroy diseased cells works best on fast-growing cancers. However, radiation can also cause cancer (see radiation injury) and is no longer used for benign conditions. Other complications include nausea, hair loss, weight loss, and weakness. Radioactive substances may be implanted in tumours (see nuclear medicine). External radiation involves 10–20 sessions over several months, either after surgical removal of the growth or when surgery is impossible; it can deliver higher doses to deep tumours than implantation. Infrared radiation and ultraviolet radiation is applied with lamps to relieve inflammation.

radical Term used in chemistry with one predominant and two subsidiary, looser meanings. It most often refers to a free radical. It can also mean an ion or a functional group.

radical In politics, one who desires extreme change of part or all of the social order. The term (which derives from the Latin word for "root," and thus implies change beginning at a system's roots) was given this sense by Charles James Fox in 1797 when he demanded "radical reform" consisting of universal manhood suffrage. In France before 1848, republicans and advocates of universal male suffrage were called radicals. The term was later applied to Marxists (see Marxism) who called for fundamental

© 2006 Encyclopædia Britannica, Inc.

social change to eradicate divisions among social classes. In popular usage, it is applied to political extremism, not necessarily violent, of both the left and the right.

Radical Republican Member of the Republican Party in the 1860s committed to the emancipation of slaves and the equal treatment and enfranchisment of blacks. Zealous antislavery advocates in the Congress pressed Pres. Abraham Lincoln to include emancipation as a war aim. They later opposed his policy of lenient Reconstruction of the South under presidential control and passed harsher measures in the Wade-Davis Bill. After Lincoln's death the Radicals supported Pres. Andrew Johnson but soon demanded congressional control of Reconstruction. Johnson's attempt to break the Radicals' power led them to pass the Tenure of Office Act; his challenge of the act led to his impeachment. Radical Republican leaders included Henry Winter Davis (1817–65), Thaddeus Stevens, Charles Sumner, and Benjamin Butler. Their influence waned as white control over Southern governments gradually returned in the 1870s.

Radical-Socialist Party French political party. The oldest of France's political parties, it was founded in 1901 but originated in the 1870s in the reformist wing of the French Republican Party, known as the Radicals, led by Georges Clemenceau. Traditionally a centrist party, it was most prominent in the Third Republic and Fourth Republic. In the 1920s and '30s it joined coalition governments with the French Socialist Party. After 1945 it led other centrist groups to form politically important coalitions. By the late 20th century, however, it was only a minor party. In 1998 it renamed itself the Radical Party of the Left.

radio Electromagnetic radiation of lower frequency (hence longer wavelength) than visible light or infrared radiation, and consisting of the range of frequencies used for navigation signals, AM and FM broadcasting, television transmissions, cell-phone communications, and various forms of radar. For radio transmission, information is imparted to a carrier wave by varying (modulating) its amplitude, frequency, or duration. The technology of radio arose from the work of Michael Faraday, James Clerk Maxwell, Heinrich Hertz, Guglielmo Marconi, and others, and improvement followed the development of the vacuum tube, the electronic-tube oscillator, the tuned circuit, and other components. Later innovations have included the replacement of tubes by transistors and of wires by printed circuits. See also radio and radar astronomy.

radio and radar astronomy Study of celestial bodies by measuring the energy they emit or reflect at radio wavelengths. It began in 1931 with Karl Jansky's discovery of radio waves from an extraterrestrial source. After 1945, huge dish antennas, improved receivers and data-processing methods, and radio interferometers let astronomers study fainter sources and obtain greater detail. Radio waves penetrate much of the gas and dust in space, giving a much clearer picture of the centre and structure of the Milky Way Galaxy than optical observation can. This has allowed detailed studies of the interstellar medium in the Galaxy and the discovery of previously unknown cosmic objects (e.g., pulsars, quasars). In radar astronomy, radio signals are sent to near-Earth bodies or phenomena (e.g., meteor trails, the Moon, asteroids, nearby planets) and the reflections detected, providing precise measurement of the objects' distances and surface structure. Because radar waves can penetrate even dense clouds, they have provided astronomers' only maps of the surface of Venus. Radio and radar studies of the Moon revealed its sandlike surface before landings were made. Radio observations have also contributed greatly to knowledge about the Sun. See also radio telescope.

radio broadcasting See broadcasting

radio telescope Combination of radio receiver and antenna, used for observation in radio and radar astronomy. Radio telescopes vary widely, but all have two basic components: a large radio antenna or an antenna array and a radiometer or radio receiver. Because some astronomical radio sources are extremely weak, radio telescopes are usually very large, and only the most sensitive radio receivers are used. The first large fully steerable radio telescope was completed in 1957 at Jodrell Bank, Eng. The world's largest fully steerable radio telescope is the 360 × 330-ft (110 × 100-m) off-axis antenna operated by the National Radio Astronomy Observatory in Green Bank, W.Va. The largest single radio telescope is the 1,000-ft (305-m) fixed spherical reflector at the Arecibo Observatory in Puerto Rico. The world's most powerful radio telescope is the Very Large Array in New Mexico, made up of 27 separate mobile parabolic antennas that together provide the angular resolution of a single antenna 22 mi (35 km) in diameter. See photograph above.

Lovell Telescope, a fully steerable radio telescope at Jodrell Bank, Macclesfield, Cheshire, Eng.
JODRELL BANK SCIENCE CENTRE

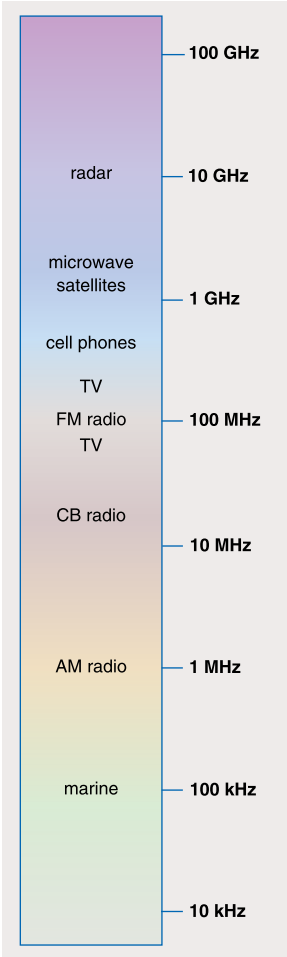
radio wave Wave from the portion of the electromagnetic spectrum at lower frequencies than microwaves. The wavelengths of radio waves range from thousands of metres to around 30 cm. These correspond to frequencies as low as 3 Hz and as high as 1 gigahertz (10^9 Hz). Radio-wave communications signals travel through the air in a straight line, reflect off of clouds or layers of the ionosphere, or are relayed by satellites in space. They are used in standard broadcast radio and television, short-wave radio, navigation and air-traffic control, cellular telephony, and even remote-controlled toys. See illustration on following page.

radioactive series Any of four sets of unstable heavy atomic nuclei that undergo a series of alpha decay and beta decay until a stable nucleus is achieved. The natural series are the thorium series, the uranium series, and the actinium series. These are headed by naturally occurring species of unstable nuclei that have half-lives comparable to the age of the earth. The fourth set, the neptunium series, is headed by neptunium-237, which has a half-life of 2 million years. Its members do not occur naturally but are artificially produced by nuclear reactions and have short half-lives.

radioactivity Property exhibited by certain types of matter of emitting radiation spontaneously. The phenomenon was first reported in 1896 by Henri Becquerel for a uranium salt, and it was soon found that all uranium compounds are radioactive due to the uranium's radioactivity. In 1898 Marie Curie and her husband discovered two other naturally occurring, strongly radioactive elements, radium and polonium. The radiation is emitted by unstable atomic nuclei (see nucleus) as they attempt to become more stable. The main processes of radioactivity are alpha decay, beta decay, and gamma decay. In 1934 it was discovered that radioactivity could be induced in ordinary matter by artificial transmutation.

radiocarbon dating See carbon-14 dating

radiology Branch of medicine that uses radiation for diagnosis (diagnostic imaging) and treatment (radiation therapy) of disease. Originally, it involved X rays for diagnosis and X rays, gamma rays, and other ionizing radiation for treatment. Diagnostic methods now include isotope scanning (see nuclear medicine), use of nonionizing radiation, as in ultrasound and magnetic resonance imaging, and radioimmunoassay (in which radioactive isotopes in antibodies against hormones detect minute amounts of hormones for diagnosis of endocrine disorders). Radiotherapy now includes, in cancer treatment, radioactive hormones and chemotherapeutic drugs.



radiotherapy See radiation therapy

radish Annual or biennial plant (*Raphanus sativus*) of the mustard family, probably of Oriental origin,

Radish (*Raphanus sativus* variety *radicula*)

Radio waves lie at the low-frequency end of the electromagnetic spectrum. They are primarily used in various types of communications signals. Also of importance is the detection of natural radio sources in radio and radar astronomy. A few applications are shown at their approximate positions in the spectrum (on a logarithmic scale). Microwaves are a subset of the radio spectrum, ranging from about 1 to 1000 mm in wavelength, or a frequency between about 1 and 100 GHz. The microwave region is used especially in various forms of radar, in communications with spacecraft and satellites (as in the Global Positioning System), and in microwave ovens. Amateur communications, such as CB (citizens' band) and short-wave radio, occur around 10 MHz. Marine navigation and communications systems operate especially below 1 MHz. Other devices or systems using radio waves include metal detectors, loran, and magnetic resonance imaging.

© MERRIAM-WEBSTER INC.

grown for its large, succulent root. Low in calories and high in bulk, radishes have a sharp taste and are usually eaten raw. The shape of the edible portion of the root varies greatly, as does the color (from white through pink to red, purple, and black). Radishes may weigh only a few ounces (U.S. and European varieties) or, in the case of the Japanese daikon, more than 2 lbs (1 kg).

Radishchev \rə-'dyēsh-chif**, Aleksandr (Nikolayevich)** (b. Aug. 31, 1749, Moscow, Russia—d. Sept. 24, 1802, St. Petersburg) Russian political writer. Although from the nobility, he pursued a career as a civil servant, in which he met people from all social classes. Influenced by such writers as Jean-Jacques Rousseau, he wrote *A Journey from St. Petersburg to Moscow* (1790), in which he described examples of social injustice, hoping that his criticism of serfdom, autocracy, and censorship would enlighten Catherine II. Instead, he was arrested and exiled to Siberia. He was pardoned by Alexander I in 1801 but committed suicide a year later. He inspired later revolutionaries, including those who instigated the Decembrist revolt.

radium Chemical element, heaviest alkaline earth metal, chemical symbol Ra, atomic number 88. It was discovered by Marie Curie and her husband, Pierre Curie, in 1898 and isolated by 1910. All its isotopes are radioactive (see radioactivity). Radium does not occur free in nature but occurs in natural ores such as pitchblende as a disintegration product of radioactive decay of heavier elements, including uranium. Chemically it is highly reactive and has valence 2 in all of its compounds. Its use in medicine (see radiation therapy; radiology; nuclear medicine) has declined because of its cost, and its use in consumer goods (to illuminate watch and clock hands and numbers, as well as instrument dials) was halted because it can cause radiation injury. It is still used for some radiography and as a source of neutrons.

radon \'rā-ˌdän\ Chemical element, chemical symbol Rn, atomic number 86. The heaviest noble gas, it is colourless, odourless, tasteless, radioactive (see radioactivity), and almost completely unreactive (forming compounds only with fluorine). It is rare in nature because all its isotopes are short-lived and because radium, its source, is scarce. Radon seeps from certain soils and rocks (such as granite) into the atmosphere and can accumulate in poorly ventilated spaces near ground level, including house basements; in some regions of the world the use of such spaces is believed to increase the risk of lung cancer more than any other common factor except smoking. Radon is used in radiotherapy, radiography, and research.

Raeburn, Sir Henry (b. March 4, 1756, Stockbridge, Scot.—d. July 8, 1823, Edinburgh) Scottish portrait painter. Though apprenticed early to a goldsmith, he lacked formal training as a painter. He worked principally as a miniaturist and evolved a distinctive style of oil portraiture, painting directly on the canvas without preliminary drawings. His portraits are characterized by a vigorous handling of paint and vivid and experimental lighting effects, usually from behind the sitters' heads. He was elected president of the Edinburgh Society of Artists (1812) and Royal Academician (1815), knighted in 1822, and appointed His Majesty's Limner for Scotland (1822).

Raeder \'rā-dər**, Erich** (b. April 24, 1876, Wandsbek, Ger.—d. Nov. 6, 1960, Kiel, W.Ger.) German naval officer. After serving as chief of staff to an admiral in World War I, he himself rose to the rank of admiral. As naval commander in chief from 1928, he urged the construction of submarines (forbidden by the Treaty of Versailles) and fast cruisers. Appointed grand admiral in 1939, he supervised the invasion of Denmark and Norway in 1940. Differences with Adolf Hitler led to his dismissal from supreme command in 1943. He was sentenced to life in prison at the Nürnberg trials, but he was released because of ill health in 1955.

Raetia *or* **Rhaetia** \'rē-shē-ə\ Ancient Roman province south of the Danube River. It comprised parts of present-day Austria, Switzerland, and Germany. Its native inhabitants were probably of mixed Illyrian and Celtic descent. Conquered by Rome in 15 BC, it became an important part of the empire for its position on the highways between Italy and the Danube and between Gaul and the Balkans. Because it was a frontier province, its boundaries shifted when German tribes encroached; in the 1st century AD, the northern boundary extended to the Neckar River, but in the 3rd century the western and northern boundaries were pulled back. By 450, Rome controlled only the alpine regions.

RAF See Royal Air Force

Raffles, Sir (Thomas) Stamford (b. July 6, 1781, at sea off Port Morant, Jam.—d. July 5, 1826, London, Eng.) Administrator in the British East India Company and founder of Singapore. He joined the British East India Company at age 14, and his hard work won him an appointment as assistant secretary to the government of Penang (in present-day Malaysia). There he undertook an intensive study of the Malayan peoples, and his knowledge allowed him to play a key role in 1811, when the British defeated Dutch-French forces in Java. He subsequently became lieutenant governor there and inaugurated a mass of reforms aimed at transforming the Dutch colonial system and improving the condition of the native population. He was recalled by the company, which deemed his reforms too costly; though he was popular in London (he was knighted in 1816), his authority when he resumed his service in Southeast Asia was severely restricted. Undeterred, he founded the port city of Singapore in 1819 in order to to ensure British access to the China seas; in 1824 the Dutch relinquished all claims to Singapore. Raffles is credited with creating Britain's Far Eastern empire.

raga In the classical music of India and Pakistan, a melodic framework for improvisation based on a given set of notes (usually five to seven) and characteristic rhythmic patterns. A raga can be regarded as a vocabulary of melodic figures that tend, as a group, to emphasize certain tones of a scale, giving the raga a specific emotional character and implying the kind of music to be improvised. The emphasis on certain pitches effectively divides the scale into primary and secondary tones; the secondary tones serve to ornament the primary tones, thus reinforcing the emphasis. Each scale can have several different ragas, depending on which tones of the scale are made primary. Two additional factors contribute to the artistic potential of the raga: the division of tones between primary and secondary is not always hard and fast; moreover, a tertiary level (ornaments of the ornaments) is often made available to the performer. The concept of raga, introduced sometime before the 9th century, became influential throughout South and East Asia. See also South Asian arts.

Ragae See Rhagae

Raglan (of Raglan), FitzRoy James Henry Somerset, 1st Baron (b. Sept. 30, 1788, Badminton, Gloucestershire, Eng.—d. June 28, 1855, near Sevastopol, Crimea, Russia) English army officer. He served as aide and, later, military secretary to the duke of Wellington. Appointed commander in chief of British forces in the Crimean War

© 2006 Encyclopædia Britannica, Inc.

(1854), he gave an ambiguous order in the Battle of Balaklava that led to the disastrous charge of the Light Cavalry Brigade under the earl of Cardigan. Raglan became the scapegoat for the campaign's lack of progress and the inadequate supplies to the troops in the winter of 1854–55. His name was applied to the raglan sleeve, probably designed to adapt his coat to the arm he had amputated after the Battle of Waterloo.

Ragnarök \'räg-nə-ˌrœk, 'räg-nə-ˌräk\ In Scandinavian mythology, the end of the divine and human worlds. As described in the 10th-century Icelandic poem *Völuspá* and other sources, Ragnarök will be preceded by cruel winters and moral chaos. Giants and demons will attack the gods, who will face death like heroes. The sun will be darkened, the stars will vanish, and the earth will sink into the sea. Afterward the earth will rise again, the innocent Balder will return from the dead, and the hosts of the just will live in a hall roofed with gold. The title of Richard Wagner's opera *Götterdämmerung* (*The Twilight of the Gods*) is a German equivalent of Ragnarök.

ragtime U.S. popular music of the late 19th and early 20th centuries distinguished by its heavily syncopated rhythm. Ragtime found its characteristic expression in formally structured piano compositions, the accented left-hand beat opposed in the right hand by a fast, bouncing melody that gave the music its powerful forward impetus. (The term probably derives from "ragged time," a description of syncopation.) Ragtime compositions typically featured three or four discrete 16-bar strains performed at a moderate tempo. The most celebrated ragtime composer was Scott Joplin. The rhythm and structure of ragtime were important influences on the development of jazz.

ragweed Any of about 15 species of weedy plants (see weed) that make up the genus *Ambrosia* in the composite family, most of which are native to North America. They have rough hairy stems, mostly lobed or divided leaves, and inconspicuous greenish flowers borne in small heads. Common ragweed (*A. artemisiifolia*) is found across North America. Pollen shed by ragweeds in great abundance in late summer is the principal cause of hay fever in eastern and middle North America. Since ragweeds are annuals, mowing before pollination season eradicates them.

rail Any of about 100 species (family Rallidae) of slender marsh birds found almost worldwide. Rails have short rounded wings, a short tail, large feet, and long toes. Their loud call, especially at night, reveals their presence in dense vegetation. They are mostly dull grays and browns, often with barred patterns. Species vary from 4 to 18 in. (11–45 cm) long. Short-billed species are often called crakes. The king (*Rallus elegans*), clapper (*R. longirostris*), and Virginia (*R. limicola*) rails and the sora, or Carolina rail (*Porzana carolina*), have been hunted in the U.S.; several of the rails are now endangered, and some species have been exterminated.

Virginia rail (*Rallus limicola*)
JOHN H. GERARD FROM THE NATIONAL AUDUBON SOCIETY COLLECTION/PHOTO RESEARCHERS

railroad Mode of land transportation in which flange-wheeled vehicles move over two parallel steel rails or tracks, drawn by a locomotive or propelled by self-contained motors. The earliest railroads were built in European mines in the 16th century, using cars pulled on tracks by men or horses. With the advent of the steam locomotive and construction of the first railway in 1825, the modern railroad developed quickly. The first U.S. railroad, the Baltimore and Ohio, began operation in 1827. Specialized railroad cars were built to transport freight and passengers, including the sleeping cars developed by George Pullman in 1859. In the 19th century the railroad had an important influence on every country's economic and social development. In the U.S. the transcontinental railroad, completed in 1869, began an era of railroad expansion and consolidation that involved such financial empire builders as Cornelius Vanderbilt, Jay Gould, Edward H. Harriman, James J. Hill, and Leland Stanford. The railroad's importance in the U.S. began to diminish from the early 20th century, but in Europe, Asia, and Africa it continues to provide vital transportation links within and between countries. See also Orient Express, Trans-Siberian Railroad.

Railway Express Agency U.S. company that once operated the nation's largest ground and air express services. It was founded by the U.S. government as the American Railway Express Co. in 1918, when the nation's major express carriers—Adams & Co., American Express Co., Wells, Fargo & Co., and Southern Express Co.—were merged into a public corporation. An association of railroads bought out the business in 1929 and began to operate it as the Railway Express Agency. Its name was changed to REA Express in 1970. Poor management, strikes, and competition led to heavy losses, and REA filed for bankruptcy in 1975.

Raimondi \rī-'män-dē, rī-'mōn-dē**, Marcantonio** (b. c. 1480, near Bologna—d. c. 1534, Bologna) Italian engraver. He trained in Bologna under Francesco Francia, but his energetic lines and use of cross-hatching in modeling were influenced by Albrecht Dürer. After he moved to Rome c. 1510, he specialized in reproducing works by other artists, particularly Raphael. He retained Raphael's idealized figures but provided his own background and landscapes. His engravings sold in large numbers and did much to spread High Renaissance style throughout Europe during his lifetime.

rain Precipitation of liquid water drops with diameters greater than 0.02 in. (0.5 mm). When the drops are smaller, the precipitation is usually called drizzle. Raindrops may form by the coalescence of colliding small water droplets or from the melting of snowflakes and other ice particles as they fall into warm air near the ground. Hawaii's Mount Waialeale, with a 20-year annual average of 460 in. (11,700 mm), is the Earth's wettest known point; the driest areas are in parts of deserts where no appreciable rain has ever been observed. Less than 10 in. (250 mm) and more than 60 in. (1,500 mm) per year represent approximate extremes of rainfall for all the continents.

rain dance Ceremonial dance performed to bring rain needed to water crops. Rain dances have been customary in many cultures, from the ancient Egyptians to the civilization of the Mayas and the people of the 20th-century Balkans. Rain dances often include dancing in a circle, the participation of young girls, decoration with green vegetation, nudity, the pouring of water, and whirling, meant to act as a wind charm. They may also include phallic and fertility rites.

rainbow Series of concentric, coloured arcs that may be seen when light from a distant source—usually the Sun—falls on a collection of water drops such as in rain, spray, or fog. The coloured rays of the rainbow are caused by the refraction and internal reflection of light rays that enter the drop, each colour being bent through a slightly different angle. Hence, the combined colours are separated upon emerging from the drop. The most brilliant and most common rainbow is the so-called primary bow, which results from light that emerges from the drop after one internal reflection. The colours of the arc (from outside to inside) are red, orange, yellow, green, blue, indigo, and violet. Occasionally a less-intense secondary bow may be observed; it has its colour sequence reversed.

Rainbow Bridge National Monument Natural area, southern Utah, U.S. Located on the Navajo Indian Reservation near the Utah-Arizona border, the monument was established in 1910 and occupies 160 acres (65 hectares). It centres on a rainbow-shaped bridge of pink sandstone 290 ft (88 m) above a creek that winds toward the Colorado River. The bridge is 275 ft (84 m) long and is one of the world's largest natural bridges. Embedded among canyons, the area is accessible only on foot, by horseback, or by boat on Lake Powell.

rainbow trout Species (*Oncorhynchus mykiss*) of fish in the salmon family (Salmonidae) noted for spectacular leaps and hard fighting when hooked. It has been introduced from western North America to many other countries. A brightly coloured fish of lakes and swift streams, it is covered with small black spots and has a reddish band along either side. The steelhead, a large, bluish, oceangoing form, is also a prized game fish. Rainbow trout may weigh 6 lb (2.8 kg); steelheads (and rainbows in large lakes) may weigh 10–20 lb (4.5–9 kg) or more. Another form of rainbow, the Kamloops, or Kootenay, trout of Idaho, may exceed 30 lb (14 kg).

Rainer \'rī-nər**, Luise** (b. Jan. 12, 1910, Vienna, Austria) Austrian film actress. She grew up in Munich, in Switzerland, and in Vienna and was a distinguished stage actress with Max Reinhardt's company (from 1927) before making films in Europe. Moving to Hollywood, she starred in *The Great Ziegfeld* (1936) and *The Good Earth* (1936), winning Academy Awards for both pictures. After a brief career and a stormy marriage to Clifford Odets, she retired to Europe, returning to the screen many years later in *Dancer* (1988) and *The Gambler* (1997).

© 2006 Encyclopædia Britannica, Inc.

Rainey, Ma *orig.* **Gertrude Malissa Nix Pridgett** (b. April 26, 1886, Columbus, Ga., U.S.—d. Dec. 22, 1939, Rome, Ga.) U.S. singer. Rainey began touring Southern tent shows, levee camps, and cabarets at age 17 in a song-and-dance team with her husband, the minstrel comic William ("Pa") Rainey. She performed through the 1920s, leading her own troupes, including at times Bessie Smith and Thomas A. Dorsey. An earthy stage presence, known for her flamboyant dress and her deep, powerful contralto voice, Rainey recorded more than 90 songs (including "See See Rider" and "Ma Rainey's Black Bottom") from 1923 to 1928 with country blues musicians and black jazz players. She retired in 1933. The first great professional blues vocalist, she earned the sobriquet "mother of the blues."

rainforest Lush forest, generally composed of tall, broad-leaved trees and usually found in wet tropical regions around the Equator. Despite increased awareness of the rainforests' importance during the late 20th century, they continue to be cleared. Rainforests grow mainly in South and Central America, West and Central Africa, Indonesia, parts of Southeast Asia, and tropical Australia, where the climate is relatively humid with no marked seasonal variation. Depending on the amount of annual rainfall, the trees may be evergreen or mainly deciduous. The former require more water. Temperatures are high, usually about 86 °F (30 °C) during the day and 68 °F (20 °C) at night. Soil conditions vary with location and climate, though most rainforest soils tend to be permanently moist and not very fertile, because the hot, humid weather causes organic matter to decompose rapidly and to be absorbed quickly by tree roots and fungi. Rainforests have several layers. The highest continuous layer, called the canopy, extends across the treetops at a height of 100–165 ft (30–50 m). Most animals live among the leaves and branches. Below the canopy is a thick understory filled with small trees, lianas, and epiphytes. The space directly above the ground can be occupied by tree branches, twigs, and foliage, but, contrary to popular belief, the rainforest floor is not impassable. Rather, it is bare except for a thin layer of humus and fallen leaves. Animals inhabiting this layer (e.g., gorillas, elephants, jaguars, and bears) are adapted to walking or climbing for only short distances. Burrowing animals, such as armadillos and caecilians, are found in the soil, as are microorganisms that help decompose and recycle the organic litter accumulated by other plants and animals from all layers. The climate of the ground layer is unusually stable because the upper stories of tree canopies and the lower branches filter out sunlight, retain heat, and reduce wind speeds, keeping the temperature fairly even.

Rainier \ren-'yā,\ *English* \rā-'nir\ **III** *orig.* **Rainier-Louis-Henri-Maxence-Bertrand de Grimaldi** (b. May 31, 1923, Monaco—d. April 6, 2005, Monaco) Prince of Monaco (1949–2005), 31st in a line of hereditary rulers. He intensified, expanded, and diversified Monaco's enterprises, including its industry. Through land reclamation from the sea, he expanded the principality's territory by one-fifth. His most significant political reform was the promulgation of a new constitution, based on modern principles without repudiating tradition. His wedding to Grace Kelly in 1956 attracted worldwide attention.

Rainier \rə-'nir**, Mount** Mountain, west-central Washington state, U.S. At 14,410 ft (4,392 m), Mount Rainier is the highest point in the Cascade Range and in the state. The mountain is actually a dormant volcano that last erupted some 150–175 years ago; it covers 100 sq mi (260 sq km) and is surrounded by the largest single-mountain glacier system in the continental U.S., with 41 glaciers radiating from the broad summit. It forms the centre of Mount Rainier National Park, which was established in 1899 and comprises 368 sq mi (953 sq km). It is a popular tourist and recreation area.

Rainy Lake Narrow lake astride the Canadian-U.S. border, between Minnesota and southwestern Ontario. Rainy Lake is about 50 mi (80 km) long and has an area of 360 sq mi (932 sq km). Its shores are irregular and deeply indented, and it contains more than 500 islands. The region is the site of several Indian reservations and is popular for hunting, fishing, and canoeing.

Rajang \'rä-,jäŋ\ **River** *or* **Rejang** \'rā-,jäŋ\ **River** Chief river, central Sarawak, Malaysia, on the island of Borneo. It flows southwest and west into the South China Sea and is about 350 mi (565 km) long. It is navigable for about 80 mi (130 km) to Sibu by oceangoing vessels and has a wide, swampy delta. Several market towns are along its banks.

Rajasthan \'rä-jə-,stän\ State (pop., 2001 prelim.: 56,473,122), northwestern India. Bordered by Pakistan and the states of Punjab, Haryana, Uttar Pradesh, Madhya Pradesh, and Gujarat, it covers an area of 132,139 sq mi (342,239 sq km); its capital is Jaipur. Archaeological evidence shows continuous human habitation for about 100,000 years. In the 7th–11th centuries AD, several Rajput dynasties arose, reaching their height in the 16th century. The emperor Akbar brought the Rajput states into the Mughal Empire. In the 19th century, the British came into control of the region. After Indian independence (1947), the area was organized as the Union of Rajasthan, then reorganized in 1956. It is dominated by the Aravalli Range and the Thar Desert. Predominantly an agricultural and pastoral state, it is the largest producer of wool in India.

Rajneesh \'rəj-,nēsh, räj-'nēsh**, Bhagwan Shree** *orig.* **Chandra Mohan Jain** (b. Dec. 11, 1931, central India—d. Jan. 19, 1990, Pune) Indian spiritual leader. A teacher of philosophy, he lectured throughout India and established an ashram in Pune (Poona). He preached an eclectic doctrine of Eastern mysticism, individual devotion, and sexual freedom while amassing vast personal wealth. By the early 1970s he had attracted 200,000 devotees, many from Europe and the U.S. He lived with a community of followers in Oregon from 1981 to 1985, when he was deported from the U.S. for immigration fraud. He spent his last years in Pune, where he reestablished his ashram.

Rajput \'räj-,půt\ Any member of a caste of landowners located mainly in central and northern India. The Rajputs are organized in patrilineal clans and number about 12 million. They regard themselves as descendants or members of the Kshattriya (warrior ruling) class, though in fact they vary greatly in status. After the fall of the Gupta dynasty, invaders and indigenous peoples in northwestern India were probably integrated, the leaders in both groups becoming Kshattriyas. The Rajputs became important politically in the 9th–10th centuries, and for centuries they prevented complete Muslim domination of Hindu India. They eventually accepted Mughal overlordship and, in 1818, British suzerainty.

Rajputana \,räj-pə-'tä-nə\ Region of northwestern India that now comprises Rajasthan state and small sections of Madhya Pradesh and Gujarat. The Aravalli Range crosses the southern part of the region from northeast to southwest. The northwestern part is largely the Thar desert, but to the southeast the country is very fertile. The Rajput states came under British protection by treaties in 1818; most of the area was formed into Rajasthan state in 1948.

Rakaia River \rə-'kī-ə\ River, eastern central South Island, New Zealand. Rising in the glaciers of the Southern Alps, it flows east and southeast for 90 mi (145 km) before entering Canterbury Bight of the Pacific Ocean through a delta west of Banks Peninsula.

Rákóczi family \'rä-kōt-sē\ Noble Magyar family prominent in 17th-century Hungary. Its members included György I (1593–1648), who as prince of Transylvania (1630–48) allied himself with Sweden against the Habsburgs and won religious freedom for Protestants in Hungary. His son György II (1621–1660), prince of Transylvania (1648–60), joined Sweden in attacking Poland (1656) but was forced to retreat; he was killed in battle by the invading Turks, who restored Turkish control over Transylvania. György's son Ferenc I (1645–1676) became a Catholic and joined Croatia in an unsuccessful revolt against Habsburg rule in Hungary. His son Ferenc II (1676–1735), prince of Transylvania (1704–11), led a Hungarian uprising for independence from the Habsburg empire (1703) that was initially successful, but his forces were defeated by the Austrians in 1711.

Raleigh \'rò-lē, 'rä-lē\ City (pop., 2000: 276,093), capital of North Carolina, U.S. It was selected as the state capital in 1788 and was laid out in 1792. It is a major retail shipping point for eastern North Carolina and a wholesale distributing point for food stores. Manufactures include textiles, electronic equipment and computers, and processed foods. Along with Durham and Chapel Hill, Raleigh is part of North Carolina's Research Triangle—an area of cultural, scientific, and educational institutions that includes Duke University and the University of North Carolina.

Raleigh, Sir Walter (b. 1554?, Hayes Barton, near Budleigh Salterton, Devon, Eng.—d. Oct. 29, 1618, London) English adventurer and favourite of Elizabeth I. He joined his half brother Humphrey Gilbert on a piratical expedition against the Spanish (1578) then fought against the Irish rebels in Munster (1580). His outspoken views on English policy in Ireland caught the attention of Elizabeth I, who made him her favourite at court. In 1584 he sent an expedition to explore the coast north of Florida, which he named Virginia, and to establish an unsuccessful colony at Roanoke Island. He was knighted by Elizabeth in 1585. Out of favour

© 2006 Encyclopædia Britannica, Inc.

at court from c. 1592, he led an unsuccessful expedition up the Orinoco River in search of gold, which he described in *The Discoverie of Guiana* (1596). When Elizabeth died (1603), he was accused of plotting to depose James I and was imprisoned in the Tower of London. Released in 1616, he led another unsuccessful expedition to search for gold in Guyana. When his men burned a Spanish settlement, he was rearrested by James and executed, at the demand of the Spanish ambassador, under Raleigh's original sentence for treason.

rally *or* **rallye** Automobile competition using public roads and ordinary traffic rules. The object is to maintain a specified average speed between checkpoints; the route is unknown to the driver and navigator until the start of the event. Such competition began in 1907 with a Beijing-to-Paris event (12,000 km [7,500 mi]). The Monte-Carlo rally began in 1911. The Paris-Dakar (Senegal) Rally (15,000 km (9,300 mi]) is considered one of the most grueling rally events.

Rally for the Republic (RPR) *or* **Gaullists** Former French political party. It was founded by Jacques Chirac in 1976 as the successor to the various Gaullist coalitions that dominated the political life of the Fifth Republic under Charles de Gaulle and Georges Pompidou. The party had its antecedents in the group Rally of the French People, organized by de Gaulle in 1947. It evolved into the Union for the New Republic (1958–62) and then the Union of Democrats for the New Republic (1968–76) before assuming the name Rally for the Republic. In 2002 the party merged with the Liberal Democratic party and much of the Union for the French Democracy to form the Union for a Popular Movement.

ram Projection fixed to the front end of a fighting vessel and designed to damage enemy ships struck by it. It may have been developed by the Egyptians as early as 1200 BC, but it was most commonly used on Phoenician, Greek, and Roman galleys. It was briefly revived in the mid-19th century, notably in the American Civil War, when rams mounted on armored, steam-driven warships were used effectively against wooden sailing ships. Improvements in naval weaponry and the spread of metal-hulled ships soon made it obsolete again. See also battering ram.

RAM \'ram\ *in full* **random-access memory** Computer main memory in which specific contents can be accessed (read or written) directly by the CPU in a very short time regardless of the sequence (and hence location) in which they were recorded. Two types of memory are possible with random-access circuits, static RAM (SRAM) and dynamic RAM (DRAM). A single memory chip is made up of several million memory cells. In a SRAM chip, each memory cell stores a binary digit (1 or 0) for as long as power is supplied. In a DRAM chip, the charge on individual memory cells must be refreshed periodically in order to retain data. Because it has fewer components, DRAM requires less chip area than SRAM; hence a DRAM chip can hold more memory, though its access time is slower.

Rama Major Hindu deity. The name became associated with Ramacandra, the seventh incarnation of Vishnu, whose story is told in the Ramayana. Conceived as a model of reason, virtue, and right action, Rama was one of the chief objects of the bhakti cults. He is often depicted as a standing figure, holding an arrow in his right hand and a bow in his left. In temples his image is attended by the figures of his wife, Sita, his half brother, Laksmana, and the monkey general, Hanuman.

Ramadan \rä-mä-'dän\ In Islam, a holy month of fasting, the ninth month of the Muslim year, commemorating the revelation of the Qur'ān to Muhammad. As an act of atonement, Muslims are required to fast and abstain from sexual activity during the daylight hours of Ramadan. Determined according to the lunar calendar, Ramadan can fall in any season of the year. The Ramadan fast is considered one of the Five Pillars of Islam, and the end of the fast is celebrated as one of the important religious holidays of Islam.

Ramakrishna (Paramahamsa) *orig.* **Gadadhar Chattopadhyaya** (b. Feb. 18, 1836, Hooghly, Bengal state, India—d. Aug. 16, 1886, Calcutta) Indian mystic. Born into a poor Brahman family, he worked as a priest in a temple of Kali in Calcutta (now Kolkata), where he had a vision and commenced spiritual practices in a number of different religious traditions. He denounced sexual desire and money as the twin evils that put spiritual enlightenment beyond reach, rejected the caste system, and held that all religions are in essence the same and that all are true. His teachings were spread by his disciples, notably Vivekananda. A religious order bearing his name, with headquarters in Kolkata, sends missionaries throughout the world.

Raman \'rä-mən**, Sir Chandrasekhara Venkata** (b. Nov. 7, 1888, Trichinopoly, India—d. Nov. 21, 1970, Bangalore) Indian physicist influential in the growth of science in India. He received a Nobel Prize in 1930 for discovering that when light passes through a transparent material, some of the light that emerges at a right angle to the original beam is of other frequencies (Raman frequencies) characteristic of the material. He contributed to the building up of nearly every Indian research institution in his time, founded a scholarly physics journal and an academy of sciences, and trained hundreds of students.

Ramana Maharshi \'rə-mə-nə-mə-'hər-shē\ *orig.* **Venkataraman Aiyer** (b. Dec. 30, 1879, Madurai, Madras state, India—d. April 14, 1950, Tiruvannamalai) Hindu spiritual leader. Born into a Brahman family, he left his village at age 17 to become a hermit on Mount Arunachala, where Shiva was said to have entered the world at creation. One of India's youngest gurus, he held that evil and death were an illusion, which could be dissipated through his technique of *vicara* (self-pondering inquiry), and that to achieve liberation from rebirth it was necessary to practice bhakti (devotional surrender) either to Shiva or to Ramana Maharshi himself.

Ramananda \ˌrä-mə-'nən-də\ (b. c. 1400—d. c. 1470) Indian spiritual leader. He lived as an ascetic before settling in Varanasi (Benares) to study Vedic texts and the philosophy of Ramanuja. He was fifth in succession in the lineage of Ramanuja, but his determination to ignore caste distinctions led to a break with the philosopher's other followers. With 12 disciples he founded his own sect, the Ramanandis, who practiced devotion to Rama. His teachings were similar to Ramanuja's, but he dropped the ban on intercaste dining and the strict rule that all teaching and all texts must be in Sanskrit, himself teaching in the vernacular Hindi in order to reach the masses who did not know Sanskrit.

Ramanuja \rä-'mä-nù-jə\ (b. c. 1017, Shriperumbudur, India—d. 1137, Shrirangam) Indian theologian and philosopher, the most influential thinker of devotional Hinduism. After a long pilgrimage through India, he founded centres to spread devotion to Vishnu and Lakshmi. He provided an intellectual basis for the practice of bhakti in major commentaries on the Vedas, the *Brahma-sutra*s, and the *Bhagavadgita*. He was a major figure in the school of Visistadvaita, which emphasized the need for the soul to be united with a personal god. His chief philosophical contributions follow from his conviction that the phenomenal world is real and provides real knowledge and that the exigencies of daily life are not contrary to the life of the spirit.

Ramanujan \rä-'män-ù-jə^{n}**, Srinivasa (Aaiyangar)** (b. Dec. 22, 1887, Erode, India—d. April 26, 1920, Kumbakonam) Indian mathematician. Extremely poor, he was largely self-taught from age 15. In 1913 he began a correspondence with Godfrey H. Hardy (1877–1947) that took him to England, where he made advances, especially in the theory of numbers, the partition of numbers, and the theory of continued fractions. He published papers in English and European journals, and in 1918 he became the first Indian elected to the Royal Society of London. He died of tuberculosis at age 32, generally unknown but recognized by mathematicians as a phenomenal genius.

Ramatirtha \ˌrä-mə-'tir-tə\ *orig.* **Tirath Rama** (b. 1873, Miraliwala, Punjab province, India—d. Oct. 17, 1906, Tehri, United Provinces of Agra and Oudh) Hindu religious leader. He was a professor of mathematics before a meeting with Vivekananda strengthened his desire to pursue a

© 2006 Encyclopædia Britannica, Inc.

religious life. In 1901 he left his wife and children and went into seclusion in the Himalayas, and he later traveled to Japan and the U.S. He became known for his poetic manner of interpreting VEDANTA and for his joyful approach to religious learning as a means to the liberation of the individual. He died by drowning in the Ganges.

Ramayana \rä-'mä-yə-nə\ Indian epic poem, composed in Sanskrit c. 300 BCE. With the MAHABHARATA, it is one of the two great epic poems of India. Consisting of 24,000 couplets in seven books, it describes the royal birth of RAMA and the loss of his throne. Banished to the forest with his wife, SITA, and his half brother, Laksmana, he spends 14 years in exile. When a demon king carries off Sita, Rama enters into an alliance with Sugriva, king of the monkeys, and HANUMAN, the monkey general, who help him rescue her. Rama regains his kingdom, but Sita is banished when her chastity is questioned, and she is swallowed by the earth after proving her innocence.

Rambert \räm-'ber**, Dame Marie** *orig.* **Cyvia Rambam** (b. Feb. 20, 1888, Warsaw, Pol., Russian Empire—d. June 12, 1982, London, Eng.) Polish-born English ballet producer and director. She studied with the musician ÉMILE JAQUES-DALCROZE and taught his technique, eurythmics, to the Paris-based BALLETS RUSSES, influencing VASLAV NIJINSKY's avant-garde choreography. At the outbreak of World War I, she moved to London, where she studied ballet with Enrico Cecchetti (1850–1928); in 1920 she founded a ballet school that used his methods. In 1930 she helped found the Camargo Society and established the Ballet Club (later Ballet Rambert). As director of Ballet Rambert, she favoured experimentation, encouraging young choreographers such as FREDERICK ASHTON and supporting new dancers and stage designers. Her troupe, renamed the Rambert Dance Company in 1987, has continued to perform.

Rameau \rä-'mō**, Jean-Philippe** (baptized Sept. 25, 1683, Dijon, France—d. Sept. 12, 1764, Paris) French composer and music theorist. Son of an organist, he held organist posts until he was 49. His *Treatise on Harmony* (1722) established him as a major music theorist. In it he asserted that HARMONY is the basis of music, and that chords, which had been understood principally as collections of intervals above a bass, should instead be seen as representing inversions of more fundamental harmonic entities. From 1733 he wrote a series of highly successful operas, including *Hippolyte et Aricie* (1733) and *The Gallant Indies* (1735), assuring his place as the most important French opera composer since JEAN-BAPTISTE LULLY. In the *querelles des bouffons* ("war of the buffoons," 1752–53), a famous artistic controversy about the relative merits of French and Italian opera, Rameau's music exemplified the French style. He also won renown for his many keyboard pieces, mostly composed for harpsichord.

ramjet Air-breathing JET ENGINE that operates with no major moving parts. It relies on the craft's forward motion to draw in air and on a specially shaped intake passage to compress the air for combustion. After fuel sprayed into the engine has been ignited, combustion is self-sustaining. As in other jet engines, forward thrust is obtained as a reaction to the rearward rush of hot exhaust gases. Ramjets work best at speeds of Mach 2 (twice the speed of sound) and higher. See also TURBOJET.

Ramkhamhaeng \ˌräm-ˌkäm-'haŋ\ (b. 1239?—d. 1298) Third king of Sukhothai (in modern north-central Thailand) who created the first major TAI state in Southeast Asia. He united a region that shared a common religion (THERAVADA Buddhism). Under him, the arts developed distinctively Tai expressions, and accomplished bronze sculptures were created. He is also credited with inventing the Thai alphabet, a modification of Khmer script. He was remembered only in legend until 1834 when King MONGKUT of Siam (then a Buddhist monk) rediscovered an inscription Ramkhamhaeng had made in 1292. As a result, he came to be regarded as a national hero, a just and liberal ruler who imparted a sense of cultural unity to the region.

rammed earth *or* **pisé de terre** \ˌpē-ˌzā-də-'ter\ Building material made by compacting and drying a stiff mixture of clay, sand or other aggregate, and water. It has been used by many civilizations. The most durable of the earth-building forms, it is formed into building blocks (see ADOBE) or rammed within removable wooden forms in layers or lifts to construct walls. China's Erligang (c. 1600 BC) is an example of a rammed-earth fortification; it covers an area of 1.2 sq mi (3.2 sq km) and may have taken 10,000 people more than 12 years to build.

Rampal \räm-'päl**, Jean-Pierre (-Louis)** (b. Jan. 7, 1922, Marseille, France—d. May 20, 2000, Paris) French flutist. From 1947 he appeared widely in chamber music and solo recitals. In the 1950s he founded his own chamber groups, while also playing in the pit at the Paris Opéra (1956–62). Works were written for him by FRANCIS POULENC and others. His sweetness of tone and virtuosity in a largely Baroque repertoire, as evidenced on many admired recordings, made him the first flutist to attain international stardom.

Ramses \'ram-ˌsēz\ **II** *known as* **Ramses the Great** (fl. 13th century BC) King of ancient Egypt, 1279–13 BC. His family came to power some decades after the reign of AKHENATON. Ramses set about restoring Egypt's power by quelling rebellions in southern Syria and fighting the HITTITES inconclusively at the Battle of KADESH. He captured towns in Galilee and Amor, but, unable to defeat the Hittites, he assented to a peace treaty in 1258 BC. He married one and perhaps two of the Hittite king's daughters, and the later part of his reign was free from war. Its prosperity may be measured by the amount of construction he undertook. Early on he built himself a residence city in the Nile delta as a base for military campaigns and resumed construction of the temple of Osiris, begun by his father. He added to the temple at KARNAK and completed a funerary temple for his father at LUXOR. In Nubia he built six temples, most famously those at ABU SIMBEL.

Ramses III (d. 1156 BC) King of ancient Egypt, 1187–56 BC. Son of Setnakht, the founder of Egypt's 20th dynasty, he fought off Libyan invaders in the fifth year of his reign and the SEA PEOPLES (a conglomeration of migrating peoples from Anatolia and the Mediterranean Sea region) two years later. After another conflict with the Libyans, he achieved a lasting peace. He then reorganized society into classes grouped by occupation and resumed temple building. He encouraged trade and industry, and the country prospered. A delay in sending monthly rations to temple builders in Thebes c. 1158 BC resulted in the world's first recorded labour dispute.

Ramu River \'rä-mü\ River, Papua New Guinea. One of the country's longest rivers, it is about 400 mi (645 km) long. It rises in the southeast and flows northwest through the great Central Depression, where it receives numerous streams draining the mountainous region. During World War II its valley was taken from the Japanese by Allied forces (1943). It was the scene of an earthquake in 1993.

Rana era (1846–1951) In Nepal, the period during which control of the government lay in the hands of the Rana family. Jung Bahadur (1817–77) seized power in 1846 and made himself permanent prime minister. He was given the hereditary title of Rana. Under the Ranas, Nepal maintained relations with the British, who provided it with support. When the British withdrew from India in 1947, the Rana family was exposed to new dangers. They faced a revolution in 1950, and in 1951, under pressure from India, Nepal's King Tribhuvan took the throne with restored sovereignty.

ranch Large farm for breeding and raising cattle, sheep, or horses. Ranching originated in South America and Mexico in early colonial times, when Spanish settlers introduced cattle and horses and tended them on the pampas. It was an itinerant form of LIVESTOCK farming: herds were tended on open range, and biannual roundups were held for branding calves and driving mature animals to market. Itinerant ranching reached

© 2006 Encyclopædia Britannica, Inc.

its peak in the 1880s. By the early 20th century, overstocking, quarantine laws, railroad competition, and barbed-wire fences had put an end to cattle drives and open-range farming. Ranching today is nearly all sedentary, but huge ranches still exist.

Rand, Ayn *orig.* **Alice Rosenbaum** *or* **Alissa Rosenbaum** (b. Feb. 2, 1905, St. Petersburg, Russia—d. March 6, 1982, New York, N.Y., U.S.) Russian-born U.S. writer. She immigrated to the U.S. in 1926 after graduating from the University of Petrograd and worked as a screenwriter in Hollywood. She won a cult following with two best-selling novels presenting her belief that all real achievement comes from individual ability and effort, that laissez-faire capitalism is most congenial to the exercise of talent, and that selfishness is a virtue, altruism a vice. In *The Fountainhead* (1943), a superior individual transcends traditionalism and conformism. The allegorical *Atlas Shrugged* (1957) combines SCIENCE FICTION with her political message. She expounded her philosophy, which she called objectivism, in nonfiction works and as editor of two journals and became an icon of radical LIBERTARIANISM.

RAND Corp. Nonpartisan think tank whose original focus was national security. It grew out of a research-and-development project (its name is a contraction of "research and development") by Douglas Aircraft Co. for the Army Air Force in 1945. In 1948 it became a private nonprofit corporation. In the 1960s it expanded its focus to address domestic public-policy issues. Its mission today is to improve policy and decision making through research and analysis. It employs several hundred scholars in many disciplines. Its funding comes from government contracts, charitable foundations, private corporations, and earnings on its endowment. Its headquarters are in Santa Monica, Cal., and it has offices in Washington, D.C., New York, and overseas.

Randolph, A(sa) Philip (b. April 15, 1889, Crescent City, Fla., U.S.—d. May 16, 1979, New York, N.Y.) U.S. civil-rights leader. He was the son of a Methodist minister. In 1911 he moved to New York, where he cofounded the journal *The Messenger* (later *Black Worker*), in which he called for more positions for African Americans in the war industry and the armed forces. In 1925 he founded the Brotherhood of Sleeping Car Porters, the first successful African American trade union, and he served as its president until 1968. In 1941 he lobbied Pres. FRANKLIN D. ROOSEVELT to ban racial discrimination in defense industries and federal bureaus. In 1948 he influenced Pres. HARRY TRUMAN to bar racial segregation in the armed forces. In 1955 he was made a vice president of the newly combined AFL-CIO. In order to combat discrimination in that union, he formed the Negro American Labor Council in 1960.

Randolph, Edmund Jennings (b. Aug. 10, 1753, Willliamsburg, Va.—d. Sept. 12, 1813, Clark county, Va., U.S.) U.S. politician. He helped draft Virginia's constitution (1776) and served in the Continental Congress (1779–82). He was a delegate to the ANNAPOLIS CONVENTION and the CONSTITUTIONAL CONVENTION, where he presented the Virginia (or large-state) Plan, which influenced the final draft of the CONSTITUTION OF THE UNITED STATES. As governor of Virginia (1786–88), he effected the state's ratification of the Constitution. He served as U.S. attorney general (1789–94) and secretary of state (1794–95) but resigned after he was falsely accused of accepting a bribe from the French to influence the U.S. government against Britain. He returned to his law practice and served as chief counsel for AARON BURR in his 1807 trial.

Randolph, John (b. June 2, 1773, Prince George county, Va.—d. May 24, 1833, Philadelphia, Pa., U.S.) U.S. politician. In 1799 he was elected to the U.S. House of Representatives, where he served almost continuously until 1829. A noted orator, he was a staunch advocate of STATES' RIGHTS and opposed a national bank and federal protective tariffs. A supporter of slavery, he led the resistance to the MISSOURI COMPROMISE. His denunciation of HENRY CLAY for his support of the presidential candidacy of JOHN QUINCY ADAMS led to a harmless duel with Clay (1826).

random-access memory See RAM

Random House U.S. publishing company. It was founded by BENNETT CERF and Donald S. Klopfer in 1925. As it grew it published many successful and prestigious writers and gathered under its corporate roof many other firms, including Alfred A. Knopf, Inc. (acquired 1960), Pantheon Books (1961), Ballantine Books (1973), Fawcett Books (1982), and the Crown Publishing Group (1988). It was itself bought several times before becoming in 1998 a part of one of the world's largest media companies, Bertelsmann AG.

random variable In statistics, a FUNCTION that can take on either a finite number of values, each with an associated probability, or an infinite number of values, whose probabilities are summarized by a DENSITY FUNCTION. Used in studying chance events, it is defined so as to account for all possible outcomes of the event. When these are finite (e.g., the number of heads in a three-coin toss), the random variable is called discrete and the probabilities of the outcomes sum to 1. If the possible outcomes are infinite (e.g., the life expectancy of a light bulb), the random variable is called continuous and corresponds to a density function whose INTEGRAL over the entire range of outcomes equals 1. Probabilities for specific outcomes are determined by summing probabilities (in the discrete case) or by integrating the density function over an interval corresponding to that outcome (in the continuous case).

range finder Instrument used to measure the distance from the instrument to a selected point or object. The optical range finder, used chiefly in CAMERAS, consists of an arrangement of LENSES and PRISMS set at each end of a tube. The object's range is determined by measuring the ANGLES formed by a line of sight at each end of the tube; the smaller the angles, the greater the distance, and vice versa. Since the mid-1940s, radar has replaced optical range finders for most military targeting, and the laser range finder, developed in 1965, has largely replaced optical range finders for SURVEYING and radar in certain military applications.

Rangeley \'rānj-lē\ **Lakes** Chain of lakes, western Maine, U.S. It includes Rangeley, Mooselookmeguntic, Richardson, and Umbagog lakes. The lakes extend more than 50 mi (80 km) and cover an area of 80 sq mi (207 sq km), with elevations between 1,200 and 1,500 ft (365 and 460 m).

Ranger Any of a series of unmanned probes launched from 1961 to 1965 by NASA. The project was NASA's earliest attempt to explore the MOON's surface. Ranger 4 (1962) became the first U.S. spacecraft to hit the Moon, crash-landing on its surface as planned. The last three probes in the series (1964–65) sent more than 17,000 high-resolution photographs of the Moon before crashing. See also LUNA; PIONEER; SURVEYOR.

Rangoon See YANGÔN

Ranjit Singh \'rən-jit-'si^{n}-hə\ (b. Nov. 13, 1780, Budrukhan or Gujranwala, India—d. June 27, 1839, Lahore) Founder and maharaja (1801–39) of the Sikh kingdom of the Punjab. He became chief of the Shukerchakias (a Sikh group located in what is now Pakistan) on the death of his father in 1792. In 1799 he seized Lahore, the capital of the Punjab (and now in Pakistan), and in 1801 he proclaimed himself maharaja of the Punjab. In 1802 he captured Amritsar, a city sacred to the Sikhs, and by 1820 he had consolidated his rule over the whole of Punjab between the Sutlej and the Indus rivers. The Sikh state he created, which had included Sikhs, Muslims, and Hindus in both the army and the cabinet, collapsed soon after his death.

Rank, J(oseph) Arthur, Baron Rank (of Sutton Scotney) (b. Dec. 22/23, 1888, Hull, Yorkshire, Eng.—d. March 29, 1972, Winchester, Hampshire) British motion-picture distributor and producer. His British National Film Co. made its first commercial picture in 1935. That year he and Charles Woolf established General Film Distributors to distribute UNIVERSAL PICTURES films in Britain. By 1941 Rank controlled two of the three largest movie theatre chains in Britain. The J. Arthur Rank Organisation (incorporated 1946) dominated British film production in the late 1940s and '50s. Rank served as chairman (1946–62) and president (1962–72) of the Rank Organisation, which shifted from filmmaking to hotel ownership and other more profitable enterprises in the late 1960s.

Rank \'räŋk**, Otto** *orig.* **Otto Rosenfeld** (b. April 22, 1884, Vienna, Austria—d. Oct. 31, 1939, New York, N.Y., U.S.) Austrian psychologist. A protégé of SIGMUND FREUD, Rank's early books, including *The Artist* (1907) and *The Myth of the Birth of the Hero* (1909), extended psychoanalytic theory to explain the significance of myths. He edited the *International Journal of Psychoanalysis* (1912–24). The publication of *The Trauma of Birth* (1924), which was seen to undermine the principles of psychoanalysis by arguing that the basis of anxiety neurosis is psychological trauma occurring during birth, led to his expulsion from the Vienna Psychoanalytic Society. Rank settled in New York City in 1936, and his later work focused on the will as the guiding force in personality development.

Ranke \'räŋ-kə**, Leopold von** *orig.* **Leopold Ranke** (b. Dec. 21, 1795, Wiehe, Thuringia, Saxony—d. May 23, 1886, Berlin) German his-

© 2006 Encyclopædia Britannica, Inc.

torian. Ranke taught at the University of Berlin (1825–71). Inspired by the scientific method of historical study used by Barthold Georg Niebuhr, he championed objective writing based on philological and textual criticism of source materials. His scholarly technique and way of teaching (he was the first to establish a historical seminar) had great influence on Western historiography. His many works covering a wide variety of topics typically are subtle accounts of particular limited periods in European state and political history that, like his source materials, take comparatively little notice of social and economic forces.

Rankin, Jeannette (b. June 11, 1880, near Missoula, Mont., U.S.—d. May 18, 1973, Carmel, Calif.) U.S. reformer, first woman member of the U.S. Congress (1917–19, 1941–43). She was a social worker and an active member of the woman suffrage movement. Elected to the U.S. House of Representatives in 1916, she introduced the first bill to give women the vote. A pacifist, she voted against declaring war on Germany (1917). After losing her bid for a U.S. Senate seat (1918), she returned to social work. In 1940 she was again elected to the House, where she became the only legislator to vote against the declaration of war on Japan. Declining to seek reelection, she continued to lecture on social reform. In 1968, at age 87, she led 5,000 women, the "Jeannette Rankin Brigade," in protest of the Vietnam War.

Jeannette Rankin, 1918.
LIBRARY OF CONGRESS, WASHINGTON, D.C.

Rankine \'raŋ-kən**, William J(ohn) M(acquorn)** (b. July 5, 1820, Edinburgh, Scot.—d. Dec. 24, 1872, Glasgow) Scottish engineer and physicist, one of the founders of thermodynamics. His classic *Manual of the Steam Engine and Other Prime Movers* (1859) was the first attempt at a systematic treatment of the theory of steam engines. He worked out a thermodynamic cycle of events (the Rankine cycle) that was used as a standard for the performance of steam-power installations in which a condensable vapour provides the working fluid.

Rankine cycle Ideal cyclical sequence of changes of pressure and temperature of a fluid, such as water, used in an engine, such as a steam engine. Described in 1859 by William Rankine, it is used as a standard for rating the performance of steam power plants. In the Rankine cycle, the working substance of the engine undergoes four successive changes: (1) heating at constant volume (as in a boiler), (2) evaporation and superheating (if any) at constant pressure, (3) isentropic expansion in the engine, and (4) condensation at constant pressure with return of the fluid to the boiler. See also Carnot cycle.

Ransom, John Crowe (b. April 30, 1888, Pulaski, Tenn., U.S.—d. July 4, 1974, Gambier, Ohio) U.S. poet and critic. Ransom attended and later taught at Vanderbilt University, where he became the leader of the Fugitives, a group of poets who shared a belief in the South and its agrarian traditions and published the influential journal *The Fugitive* (1922–25); he was among those Fugitives called Agrarian who contributed to *I'll Take My Stand* (1930). At Kenyon College, he founded and edited (1939–59) the *Kenyon Review*. His literary studies include *The New Criticism* (1941), which gave its name to an important critical movement (see New Criticism), and he became recognized as a leading theorist of the post-World War I Southern literary renaissance. His *Selected Poems* (1945; rev. ed., 1969) won the National Book Award.

rap Musical style in which rhythmic and/or rhyming speech is chanted ("rapped") to musical accompaniment. This backing music, which can include digital sampling (music and sounds extracted from other recordings), is also called hip-hop, the name used to refer to a broader cultural movement that includes rap, deejaying (turntable manipulation), graffiti painting, and breakdancing. Rap, which originated in African American communities in New York City, came to national prominence with the Sugar Hill Gang's "Rapper's Delight" (1979). Rap's early stars included Grandmaster Flash and the Furious Five, Run-D.M.C., LL Cool J, Public Enemy (who espoused a radical political message), and the Beastie Boys. The late 1980s saw the advent of "gangsta rap," with lyrics that were often misogynistic or that glamorized violence and drug dealing. More recent stars have included Sean "Puffy" Combs, Jay-Z, OutKast, and Eminem.

Rapa Nui See Easter Island

Rapallo \rä-'pä-lō**, Treaty of** (April 16, 1922) Treaty between Germany and the Soviet Union, signed at Rapallo, Italy. Negotiated by Germany's Walther Rathenau and the Soviet Union's Georgy V. Chicherin, it reestablished normal relations between the two nations. The nations agreed to cancel all financial claims against each other, and the treaty strengthened their economic and military ties. As the first agreement concluded by Germany as an independent agent since World War I, it angered the Western Allies.

rape Annual plant (*Brassica napus*) of the mustard family, native to Europe. This 1-ft-tall (30-cm) plant has a long, thin taproot; smooth, bluish-green, deeply scalloped leaves; and clusters of yellow flowers. Each round, elongated seedpod has a short beak and contains many seeds. The seeds yield an oil (rapeseed oil, or canola) that is the lowest in saturated fat of any edible oil, making it popular for use in cooking. It is also used as an ingredient in soap and margarine and as a lamp fuel.

Rape (*Brassica napus*)
INGMAR HOLMASEN

rape Unlawful sexual activity, usually sexual intercourse, carried out forcibly or under threat of injury and against the will of the victim. Though traditionally limited to attacks on women by men, the definition of rape has been broadened to cover same-sex attacks and attacks against those who, because of mental illness, intoxication, or other reasons, are incapable of valid consent. Statutory rape, or intercourse with a person younger than a certain age (generally from 12 to 18 years), has long been a serious crime in most jurisdictions. Rape is widely considered an expression of anger or aggression and a pathological assertion of power by the rapist. The psychological responses of victims vary but usually include feelings of shame, humiliation, confusion, fear, and rage. Many rape victims fail to report the crime, deterred by the prospect of a distressing cross-examination in court and the difficulty of proving a crime for which there usually are no witnesses. In the late 20th century there was a notable increase in the use of rape as a weapon of war, and in the 1990s the tribunal investigating crimes stemming from genocide in Rwanda ruled that rape and sexual violence constituted a form of genocide. See also assault and battery.

Raphael \'ra-fē-əl, 'rā-fē-əl\ *orig.* **Raffaello Sanzio** (b. April 6, 1483, Urbino, Duchy of Urbino—d. April 6, 1520, Rome, Papal States) Italian painter and architect. As a member of Perugino's workshop, he established his mastery by 17 and began receiving important commissions. In 1504 he moved to Florence, where he executed many of his famous Madonnas; his unity of composition and suppression of inessentials is evident in *The Madonna of the Goldfinch* (c. 1506). Though influenced by Leonardo da Vinci's chiaroscuro and sfumato, his figure types were his own creation, with round, gentle faces that reveal human sentiments raised to a sublime serenity. In 1508 he was summoned to Rome to decorate a suite of papal chambers in the Vatican. The frescoes in the Stanza della Segnatura are probably his greatest work; the most famous, *The School of Athens* (1510–11), is a complex and magnificently ordered allegory of secular knowledge showing Greek philosophers in an architectural setting. The Madonnas he painted in Rome show him turning away from his earlier work's serenity to emphasize movement and grandeur, partly under Michelangelo's High Renaissance influence. The *Sistine Madonna* (1513) shows the richness of colour and new boldness of compositional invention typical of his Roman period. He became the most important portraitist in Rome, designed 10 large tapestries to hang in the Sistine Chapel, designed a church and a chapel, assumed the direction of work on St. Peter's Basilica at the death of Donato Bramante, and took charge of virtually all the papacy's projects in architecture, painting, and the preservation of antiquities. When he died on his 37th birthday, his last masterpiece, the *Transfiguration* altarpiece, was placed at the head of his bier.

© 2006 Encyclopædia Britannica, Inc.

Raphael In the BIBLE and the QUR'ĀN, one of the archangels. In the apocryphal book of Tobit he appears in human disguise and conquers the demon Asmodeus. His name in Hebrew means "God has healed," and in Tobit his business is to heal the earth. Raphael is reckoned among the saints in both Eastern and Western churches, and his feast day is October 24.

Rapier \'rāp-yər**, James T(homas)** (b. Nov. 13, 1837, Florence, Ala., U.S.—d. May 31, 1883, Montgomery, Ala.) U.S. politician. The son of a slave and a wealthy planter, he was educated in Canada and Scotland. After the AMERICAN CIVIL WAR he returned to Alabama, where he became a successful cotton planter and a delegate to the state's first Republican convention. Serving in the U.S. House of Representatives (1873–75) during RECONSTRUCTION, he worked for passage of the Civil Rights Act of 1875. He was later collector of internal revenue in Alabama's second district, and he remained active as a labour organizer and publisher of the *Montgomery Sentinel*.

raptor \'rap-tər\ In general, any BIRD OF PREY, including OWLS. The raptors are sometimes restricted to EAGLES, FALCONS, HAWKS, and VULTURES (birds of the order Falconiformes), all diurnal predators that "seize and carry off" (Latin *raptare*) their prey.

rare earth metal Any of a large class of chemical ELEMENTS including scandium (atomic number 21), yttrium (39), and the 15 elements from 57 (lanthanum) to 71 (see LANTHANIDES). The rare earths themselves are pure or mixed OXIDES of these METALS, originally thought to be quite scarce; however, CERIUM, the most plentiful, is three times as abundant as lead in the Earth's crust. The metals never occur free, and the pure oxides never occur in minerals. These metals are similar chemically because their atomic structures are generally similar; all form compounds in which they have VALENCE 3, including stable oxides, CARBIDES, and borides.

Ra's Naṣrānī See Cape NAṢRĀNĪ

Rashi \'rä-shē\ *in full* **Rabbi Shlomo Yitzhaqi** (b. 1040, Troyes, Champagne—d. July 13, 1105, Troyes) Medieval French commentator on the Bible and the Talmud. He studied in the schools of Worms and Mainz and became a local Jewish leader in the valley of the Seine c. 1065. His influential writings on the Bible examined the literal meaning of the text and used allegory, parable, and symbolism to analyze its nonliteral meaning. His landmark commentary on the Talmud is a classic introduction to biblical and postbiblical Judaism.

Rashīd Riḍā \rä-'shēd-rē-'dä**, Muḥammad** (b. 1865, Syria—d. 1935, Syria) Syrian Islamic scholar. As founder (1898) and publisher of the newspaper *Al-Manār*, he helped Muslims formulate an intellectual response to the problem of reconciling their religious heritage with the modern world. He was concerned with the backwardness of the Muslim countries, which he proposed to remedy by reviving the original principles of Islam. He advocated that rulers consult with religious leaders in formulating government policies. He also urged Arabs and Muslims to emulate the scientific and technological progress of the West.

Rashīdūn \ˌrä-shi-'dün\ *Arabic* **"Rightly Guided"** First four CALIPHS of the Islamic community: ABŪ BAKR, ʿUMAR IBN AL-KHAṬṬĀB, ʿUTHMĀN IBN ʿAFFĀN, and ʿALĪ. As ISLAM's first rulers after MUHAMMAD, they assumed all his duties except prophecy: they led the congregation in prayer, delivered the Friday sermons, and commanded the army. The caliphate of the Rashīdūn expanded the Islamic state beyond Arabia into Iraq, Syria, Palestine, Egypt, Iran, and Armenia. They were also responsible for the adoption of the Islamic calendar and the establishment of an authoritative reading of the QUR'ĀN.

Rashnu \'räsh-nü\ In ZOROASTRIANISM, the god of justice, who determines the fates of the dead. Assisted by MITHRA and SRAOSHA, Rashnu stands at the Bridge of the Requiter and weighs on his golden scales the deeds of the souls that wish to pass. The divine triad sometimes attempts to intercede for souls and obtain forgiveness for their sins. The 18th day of the month is sacred to Rashnu.

Rasht City (pop., 1996: 417,748), north-central Iran. It is situated on a branch of the Safīd River south of the Caspian Sea. Its importance as the main city of the Gīlān region dates from Russia's expansion southward in the 17th century. In the 20th century, it was severely damaged by Russian occupation during both world wars. Surrounded by rice fields and areas of half-cleared forests, it is a market and processing centre for rice, tea, peanuts, and silk.

Rask \'räsk**, Rasmus (Kristian)** (b. Nov. 22, 1787, Braendekilde, Den.—d. Nov. 14, 1832, Copenhagen) Danish linguist. A scholar of INDO-EUROPEAN LANGUAGES, he was a principal founder of the science of comparative linguistics. His observation that sound shifts between corresponding words in GERMANIC and other Indo-European languages followed predictable patterns was the basis of a fundamental law of linguistics later enunciated by JACOB GRIMM (Grimm's law). Rask also carried out extensive research on OLD NORSE, publishing his *Investigation of the Origin of the Old Norse or Icelandic Language* in 1818. By the end of his life he had mastered 25 languages and dialects.

Raskob \'ras-kəb**, John Jakob** (b. March 19, 1879, Lockport, N.Y., U.S.—d. Oct. 15, 1950, Centreville, Md.) U.S. financier. He went to work for E.I. du Pont de Nemours & Co. in 1902 and played a major role in DU PONT's expansion in the early 20th century. He joined the board of GENERAL MOTORS in 1915; as chairman of its finance committee from 1918, he greatly increased sales and earnings, establishing the General Motors Acceptance Corp. (GMAC) to allow dealers to finance their inventory and offer credit and long-term financing to their customers. He left in 1928 to head the Democratic National Committee and run ALFRED E. SMITH's unsuccessful presidential campaign; later he and Smith helped direct the construction of the EMPIRE STATE BUILDING.

raspberry Any of many species of fruit-bearing bushes of the genus *Rubus* in the ROSE family. When picked, the juicy red, purple, or black BERRY separates from a core, whereas in the related BLACKBERRY the core is part of the fruit. Both so-called berries are actually aggregate fruits. Red raspberries are propagated by suckers (see SUCKERING) from the roots of the parent plant or from root CUTTINGS. Black and purple varieties have arched canes and are propagated by LAYERING of the shoot tips. Raspberries contain iron and vitamin C. They are eaten fresh and are also very popular in jams, as a pastry filling, and as a flavouring for liqueurs.

Black raspberry (*Rubus occidentalis*). GRANT HEILMAN

Rasputin \ra-'spyü-tᵊn**, Grigory (Yefimovich)** *orig.* **Grigory (Yefimovich) Novykh** (b. 1872?, Pokrovskoye, near Tyumen, Siberia, Russian Empire—d. Dec. 30, 1916, Petrograd) Russian mystic influential at the court of Tsar NICHOLAS II and ALEXANDRA. An illiterate peasant, he earned the name *rasputin* ("debauched one") for his early licentious behaviour. After undergoing a religious experience, he gained a reputation among the peasants as a holy man, able to heal the sick. He became known to Nicholas and the susceptible Alexandra, and he proved capable of stopping the bleeding of their hemophiliac son, probably by means of hypnotism. He became a favourite at court, despite reports of his continuing and flagrant debauchery. When Nicholas left Alexandra in charge of Russia's internal affairs in 1915, Rasputin influenced her appointment of church officials and incompetent cabinet ministers. After several attempts to remove his harmful influence, a group of noblemen including Prince Felix Yusupov assassinated him by successively poisoning him, shooting him, and finally throwing him into the ice-filled Neva River. The RUSSIAN REVOLUTION OF 1917 followed weeks later.

Rastafarian \ˌras-tə-'fer-ē-ən\ Member of a political and religious movement among blacks in Jamaica and several other countries. Rastafarians worship HAILE SELASSIE, considering him the MESSIAH. They believe that blacks are the Israelites reincarnated, who have been subjected to the evil and inferior white race in divine punishment for their sins; they will eventually be redeemed by repatriation to Africa and will compel the whites to serve them. These beliefs, first enunciated in 1953, can be traced to several independent prophets, particularly MARCUS GARVEY. As the movement grew, ideas of repatriation tended to give way to either black militancy or mysticism. The Rastafarian life usually includes vegetarianism, the wearing of dreadlocks, and the smoking of marijuana.

Rastatt and Baden \'rä-ˌshtät...'bäd-ᵊn**, treaties of** (March 6 and Sept. 7, 1714) Two peace treaties between CHARLES VI, the Holy Roman emperor, and France that ended Charles's attempt to continue the War of the SPANISH SUCCESSION. In these treaties, Charles renounced his claims to the Spanish throne but did not actually make peace with Spain.

Rastenburg Assassination Plot See JULY PLOT

© 2006 Encyclopædia Britannica, Inc.

rat Any of more than 500 forms of Asian RODENT (genus *Rattus*, family Muridae) that have been introduced worldwide. The black rat (*Rattus rattus*) and the Norway rat (*R. norvegicus*) are the aggressive, omnivorous animals commonly associated with the name. They prefer areas of human habitation, where they can easily find food. They have keen senses and can climb, jump, burrow, or gnaw their way into seemingly inaccessible places. They reproduce extremely rapidly (up to 150 offspring a year) and have few natural predators. Rats transmit numerous human diseases and have often destroyed grain supplies. The black rat is about 8 in. (20 cm) long, excluding the slightly longer tail. The Norway rat (also called the brown, barn, sewer, or wharf rat) has proportionately smaller ears and a shorter tail. Laboratory rats are strains of the Norway rat. The name rat is applied, without scientific basis, to other rodents (e.g., KANGAROO RAT, WOOD RAT).

Norway rat (*Rattus norvegicus*).
JOHN H. GERARD

rat snake Any of 40–55 SNAKE species in the genus *Elaphe* (family Colubridae) and similar forms, found in woodlands and barnyards in North America, Europe, and Asia. Nonvenomous, they kill rats and mice by constriction, and also eat eggs and poultry. Some hunt birds in trees. These egg-laying snakes are normally slow and docile, but in self-defense they vibrate the tail, discharge a foul liquid, and strike from an upreared position. The black rat, or pilot black, snake (*E. obsoleta obsoleta*) of the eastern U.S. may exceed 8 ft (2.5 m).

Aesculapian snake (*Elaphe longissima*).
ANTON THAU-BAVARIA VERLAG

ratchet Mechanical device that transmits intermittent MOTION or permits a shaft to rotate in one direction but not in the opposite one. Reversible ratchets are used on socket WRENCH handles and are convenient for tightening or loosening bolts in positions where a complete revolution of a wrench handle is impossible. They are used in mechanical jacks to lock the jack rod after each successive lift.

Rathbone, (Philip St. John) Basil (b. June 13, 1892, Johannesburg, S.Af.—d. July 21, 1967, New York, N.Y., U.S.) British actor. He made his stage debut in 1911 and later played classical roles in London and New York City. From 1924 he appeared in Hollywood movies, often in romantic roles. With his distinctive voice and gaunt appearance, he was cast as a villain in several swashbuckling movies starring TYRONE POWER and ERROL FLYNN. He won praise for his roles in *Romeo and Juliet* (1936) and *If I Were King* (1938), but he became best known for portraying Sherlock Holmes in a series of films that began with *The Hound of the Baskervilles* (1939).

Rathenau \'rä-tᵊn-ˌaů,\ *English* \'ra-thən-ˌaů**, Walther** (b. Sept. 29, 1867, Berlin, Prussia—d. June 24, 1922, Berlin, Ger.) German industrialist and statesman. From 1915 he headed the AEG conglomerate developed by his father, Emil Rathenau (1838–1915). In World War I he organized the conservation and distribution of raw materials for the War Ministry. In 1918 he cofounded the liberal German Democratic Party and supported cooperation with the Social Democratic Party. After serving as minister of reconstruction (1921–22), he was appointed foreign minister and negotiated the Treaty of RAPALLO with the Soviet Union. Reviled by extreme nationalists as a Jew and a promoter of "creeping Communism," he was assassinated.

Rathke \'rät-kə**, Martin H(einrich)** (b. Aug. 25, 1793, Danzig, Prussia—d. Sept. 3, 1860, Königsberg) German anatomist and embryologist. He was the first to describe gill slits and gill arches in mammal and bird embryos. He thought they were vestigial gills but recognized their significance in development of the associated blood vessels. He first described the Rathke pouch (1839), an embryonic structure that develops into the pituitary gland's anterior lobe. He also did pioneering marine zoology research.

ratio Quotient of two values. The ratio of *a* to *b* can be written *a*:*b* or as the fraction *a*/*b*. In either case, *a* is the antecedent and *b* the consequent. Ratios arise whenever comparisons are made. They are usually reduced to lowest terms for simplicity. Thus, a school with 1,000 students and 50 teachers has a student/teacher ratio of 20 to 1. The ratio of the width to the height of a rectangle is called an aspect ratio, an example of which is the GOLDEN RATIO of classical architecture. When two ratios are set equal to each other, the resulting equation is called a PROPORTION.

rational number Any number that can be represented as the quotient of two INTEGERS (i.e., the denominator cannot equal zero). The set of rational numbers includes all integers as well as all FRACTIONS. In decimal form, rational numbers are either terminating or repeating decimals.

rational psychology Metaphysical discipline that attempted to determine the nature of the human soul by A PRIORI reasoning. In CHRISTIAN WOLFF's division of metaphysics, rational psychology was one of three disciplines included under the heading of "special metaphysics" (the others being rational cosmology and rational theology). IMMANUEL KANT, in his *Critique of Pure Reason*, criticized the pretensions of rational psychology.

rationalism Philosophical view that regards reason as the chief source and test of knowledge. Rationalism has long been the rival of EMPIRICISM, the doctrine that all knowledge of matters of fact ultimately derives from, and must be tested by, sense experience. As against this doctrine, rationalism holds reason to be a faculty that can lay hold of truths beyond the reach of sense perception, both in certainty and in generality. In stressing the existence of a "natural light," rationalism also has been the rival of systems claiming esoteric knowledge, whether from mystical experience, revelation, or intuition, and has been opposed to various irrationalisms that tend to stress the biological, the emotional or volitional, the unconscious, or the existential at the expense of the rational.

rationing Government allocation of scarce resources and consumer goods, usually adopted during wars, famines, or other national emergencies. Rationing according to use prohibits the less important uses of a commodity (e.g., the use of gasoline for pleasure trips as opposed to work-related travel). Rationing by quantity limits the amounts of a commodity available to each claimant (e.g., a pound of butter per month). Rationing by value limits the amount of money consumers can spend on commodities that are difficult to standardize (e.g., clothing). Point rationing assigns a point value to each commodity and allocates a certain number of points to each consumer. These can be tracked through coupons, which are issued to consumers and must be exchanged for the approved amounts of rationed goods. Consumers in a rationed economy are usually encouraged to save their money or invest in government BONDS so that unspent money will not be used for unrationed items or purchases on the BLACK MARKET.

ratite \'ra-ˌtīt\ Any bird species that cannot fly because its smooth, or raftlike, sternum (breastbone) lacks a keel to which flight muscles can be anchored. The group includes some of the largest birds of all time. Two extinct types, the slow-moving, heavy-bodied elephant bird of Madagascar and the MOAS of New Zealand, grew to 10 ft (3 m) tall. Extant ratites include the CASSOWARY, EMU, KIWI, OSTRICH, and RHEA.

Rattigan, Sir Terence (Mervyn) (b. June 10, 1911, London, Eng.—d. Nov. 30, 1977, Hamilton, Bermuda) British playwright. After writing two comedies, he won acclaim for the drama *The Winslow Boy* (1946; film, 1948). His best-known work, *Separate Tables* (1955; film, 1958), explores the isolation created by rigidly imposed social conventions. His other plays include *The Browning Version* (1948), *Ross* (1960), and *A Bequest to the Nation* (1970). He wrote screenplays for the film adaptations of his plays and for *The Yellow Rolls-Royce* (1965) and *Goodbye Mr. Chips* (1969).

rattlesnake Any of about 30 species in two genera of New World PIT VIPERS having a tail rattle that produces a buzzing sound when vibrated. The rattle is composed of horny, loosely connected segments added one at a time with each molt. *Sistrurus* species have large scales on the top of the head. *Crotalus* species have mostly small scales on the head. Species range from 1 to 8 ft (30 to 250 cm) long. Most eat small animals, primarily rodents, birds, and lizards. All bear live young. In hot

Timber rattlesnake (*Crotalus horridus*).

areas rattlesnakes become nocturnal; in cold areas they hibernate in groups. Heat-sensitive organs on the sides of the head help them locate and strike their prey. A rattlesnake bite is painful and can be fatal if not treated. See also SIDEWINDER.

Ratzenhofer, Gustav (b. July 4, 1842, Vienna—d. Oct. 8, 1904, at sea) Austrian general, philosopher, and sociologist. After a successful military career in which he attained the rank of field marshal, he developed an interest in the social sciences, particularly SOCIAL DARWINISM. He believed human interaction was characterized by "absolute hostility" between ethnic groups but that the species could evolve higher forms of association through sociology. His works included *The Essence and Objective of Politics*, 3 vol. (1893), and *Sociological Perception* (1898).

Rauschenberg \'raù-shən-ˌberg**, Robert** *orig.* **Milton Rauschenberg** (b. Oct. 22, 1925, Port Arthur, Texas, U.S.) U.S. painter and graphic artist. He studied under JOSEF ALBERS. His "combine" paintings of the 1950s, incorporating objects such as soda bottles, traffic barricades, and stuffed birds, anticipated the POP ART movement. In later work, he used silkscreen and other techniques to transfer images from commercial print media and his own photographs to canvas, reinforcing the images and unifying them compositionally with bold strokes of paint. His work has roots in DADA and the ready-mades of MARCEL DUCHAMP.

Ravana \'rä-və-nə\ In Hinduism, king of the demons. Ravana is depicted with 10 heads and 20 hands and flying a magic chariot. He ruled in the kingdom of Lanka, from which he had expelled his brother Kubera. His abduction of SITA and defeat by her husband, RAMA, are the central events of the epic *RAMAYANA*. The demon king is also remembered for shaking Mount Kailasa until SHIVA intervened and imprisoned him beneath it for 1,000 years. The popular annual Ram Lila festival climaxes with the defeat of Ravana and the burning of huge effigies of demons.

Ravana, the 10-headed demon-king, detail from a Guler painting of the *Ramayana*, c. 1720; in the Cleveland Museum of Art.
COURTESY OF THE CLEVELAND MUSEUM OF ART, OHIO, GIFT OF GEORGE P. BICKFORD

Ravel \rà-'vel**, (Joseph-) Maurice** (b. March 7, 1875, Ciboure, France—d. Dec. 28, 1937, Paris) French composer. At age 14 he was admitted to the Paris Conservatoire. Completing his piano studies, he returned to study composition with GABRIEL FAURÉ, writing the important piano piece *Jeux d'eau* (completed 1901) and a string quartet. In the next decade he produced some of his best-known music, including *Pavane pour une infante défunte* (1899), the *String Quartet* (1903), and the *Sonatine* for piano (1905). His great ballet *Daphnis et Chloé* (1912) was commissioned by the impresario SERGEY DIAGHILEV. Other works include the opera *L'Enfant et les sortileges* (1925), the suite *Le Tombeau de Couperin* (1917), and the orchestral works *La Valse* (1920) and *Boléro* (1928). Careful and precise, Ravel possessed great gifts as an orchestrator, and his works are universally admired for their superb craftsmanship; he has remained the most widely popular of all French composers.

raven Any of several species (genus *Corvus*, CROW family Corvidae) of heavy-billed, usually solitary, songbirds, once abundant throughout the Northern Hemisphere but now restricted to undisturbed areas. The common raven (*C. corax*), the biggest PASSERINE, grows to 26 in. (66 cm) long and has a wingspan of more than 4 ft (1.3 m). The dark, iridescent plumage is shaggy, especially around the throat. Ravens eat rodents, insects, grain, birds' eggs, and, in winter, carrion and refuse. Captive nestlings may learn to mimic a few words. The large nest, a crude structure of sticks, is built high on a cliff or treetop.

Ravenna \rə-'ve-nə\ City (pop., 2001 prelim.: 138,204), northeastern Italy. It is located inland from the Adriatic Sea, with which it is connected by a canal. It was the capital of the Western Roman Empire in the 5th century AD and of the Ostrogothic kingdom and Byzantine Italy in the 6th–8th centuries. Ravenna's art and architecture reflect a fusion of Roman forms with Byzantine mosaics and other decoration; sites include the 6th-century basilica of Sant'Apollinare Nuovo and the octagonal church of San Vitale. It became part of the Kingdom of Italy in 1861 and today is an agricultural and industrial city, with industries that include petroleum and natural-gas refining.

Ravi \'rä-vē\ **River** River, northwestern India and northeastern Pakistan, one of the five main rivers of the PUNJAB. It rises in the HIMALAYAS in HIMACHAL PRADESH state, India, and flows past Chamba, turning southwest at the boundary of JAMMU AND KASHMIR state. It then flows to the Pakistani border and along it before entering Pakistani Punjab. In Pakistan it runs past LAHORE and turns west near Kamalia, emptying into the CHENAB RIVER after a course of about 450 mi (725 km).

Rawalpindi \ˌrä-wəl-'pin-dē\ City (pop., 1998: 1,406,214), PUNJAB province, northern Pakistan, southwest of ISLAMABAD. In ancient times, the locality was included in the Achaemenian Persian Empire. The ancient city of TAXILA has been identified with nearby ruins. Strategically located, it controls the routes to the Kashmir region and was the site of an important British military station. The former capital of Pakistan (1959–69), Rawalpindi is the headquarters of Pakistan's army and an administrative, commercial, and industrial centre. Wheat, barley, corn, and millet are the chief crops grown in the area. Mankial, south of the city, is the site of a Buddhist STUPA dating to the 3rd century BC.

Rawlings, Jerry J(ohn) (b. June 22, 1947, Accra, Ghana) Ruler of Ghana (1981–2001). Of Scottish and Ghanaian descent, Rawlings, then a junior air force officer, first overthrew the government in 1979, but he yielded power to a freely elected civilian president, Hilla Limann. Two years later he ousted Limann. As Ghana's ruler, he created workers' councils and established production and price controls but later abandoned these measures. His policies afforded GHANA relative political and economic stability. He was returned to office by election in 1996 and stepped down from the presidency in 2001.

Rawlings, Marjorie Kinnan *orig.* **Marjorie Kinnan** (b. Aug. 8, 1896, Washington, D.C., U.S.—d. Dec. 14, 1953, St. Augustine, Fla.) U.S. short-story writer and novelist. Rawlings worked as a journalist before moving to backwoods Florida and devoting herself to fiction. Taking her material from the people and land around her, she wrote richly atmospheric works that resemble vivid factual reporting and are noted for their magical descriptions of landscape. Her best-known novel is *The Yearling* (1938, Pulitzer Prize), about a boy from a hardscrabble family and the fawn he adopts. Her later works include *Cross Creek* (1942) and *The Sojourner* (1953).

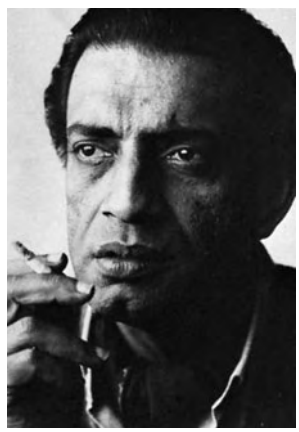
Rawls, John (b. Feb. 21, 1921, Baltimore, Md., U.S.—d. Nov. 24, 2002, Lexington, Mass.) U.S. political philosopher. He taught at Cornell University (1962–79) and later at Harvard University. He wrote primarily on political philosophy and ethics. His *Theory of Justice* (1971) is widely recognized as the major work in 20th-century political philosophy. In that work and others Rawls sought to develop a conception of justice appropriate to a democratic society. He believes that UTILITARIANISM, which enjoins maximizing overall happiness, inadequately protects freedom and equality, the core liberal and democratic values. Following JEAN-JACQUES ROUSSEAU and IMMANUEL KANT, he appealed to the idea of a SOCIAL CONTRACT: he depicted justice as the result of a hypothetical agreement among free persons acting from a position of equal right. To insure a fair, impartial agreement, Rawls situated parties to it equally by imposing a "veil of ignorance": parties do not know any particular facts about themselves and others (e.g., their talents, social class, wealth, or religious and other values) or even facts about history or their society. From this "original position" Rawls contends that free persons would agree to a liberal egalitarian conception of justice, or "justice as fairness." This conception comprises two principles: (1) certain basic liberties, such as freedom of thought and association, are so important that they take precedence over other social values, such as economic efficiency and improving the welfare of the poor; (2) offices and positions of authority are to be open to all under conditions of equality of opportunity.

Cow-nosed ray (*Rhinoptera bonasus*), a stingray
PAINTING BY RICHARD ELLIS

ray Any of 300–350 mostly marine species of cartilaginous fish (order Batoidei) found worldwide and classified as ELECTRIC RAYS, SAWFISHES, SKATES, and STINGRAYS. Many species

© 2006 Encyclopædia Britannica, Inc.

are slow-moving bottom-dwellers. The gill openings and mouth are on the underside of the flattened body. Winglike pectoral fins extend along the sides of the head. All but electric rays have a long, slender tail, often with saw-edged, venomous spines, and rough, often spiny, skin. See also MANTA RAY.



Ray, James Earl (b. March 10, 1928, Alton, Ill., U.S.—d. April 23, 1998, Nashville, Tenn.) Assassin of MARTIN LUTHER KING, JR. Ray was a petty criminal who had been sentenced several times to prison; he escaped from the Missouri state prison in 1967. In Memphis, Tenn., on April 4, 1968, he shot King from the window of a rooming house as King emerged from his motel room across the street. Ray fled to Toronto, London, Lisbon, and back to London, where he was arrested on June 8. In Memphis he pleaded guilty and was sentenced to 99 years in prison. Months later, he recanted his confession, without effect. Later in life, his unsuccessful pleas to have his case reopened were supported by some civil rights leaders, notably the King family.

Ray, John (b. Nov. 29, 1627, Black Notley, Essex, Eng.—d. Jan. 17, 1705, Black Notley) British naturalist and botanist. He attended Cambridge University and spent many years there as a fellow. With Francis Willughby (1635–1672) he undertook a complete catalog of living things, of which he published numerous volumes. His enduring legacy to botany was the establishment of species as the ultimate unit of taxonomy. He attempted to base his systems of classification on all the structural characteristics of organisms, including internal anatomy, rather than on a single feature. By insisting on the importance of lungs and heart structure, he effectively established the class of mammals, and he divided insects according to the presence or absence of multiple metamorphoses. Coming closer to a truly natural system of taxonomy than had any of his contemporaries, Ray helped make possible CAROLUS LINNAEUS's later contributions.

Ray, Man See MAN RAY

Ray, Nicholas *orig.* **Raymond Nicholas Kienzle** (b. Aug. 7, 1911, Galesville, Wis., U.S.—d. June 16, 1979, New York, N.Y.) U.S. film director. He studied architecture and drama and began directing plays in the mid-1930s. After working in New York with JOHN HOUSEMAN and ELIA KAZAN, he followed them to Hollywood, where he directed *They Live by Night* (1948). Ray was praised for demonstrating a personal style in movies such as *In a Lonely Place* (1950), *The Lusty Men* (1952), *Johnny Guitar* (1954), and the landmark film of youthful rebellion, *Rebel Without a Cause* (1955). He also directed *Bigger Than Life* (1956), *Bitter Victory* (1958), and *55 Days at Peking* (1963). He later tried directing in Yugoslavia and taught at the State University of New York.

Ray, Satyajit (b. May 2, 1921, Calcutta, India—d. April 23, 1992, Calcutta) Bengali-Indian film director. After studying with RABINDRANATH TAGORE, he became art director of an ad agency and a book illustrator. He sold all his possessions to make his first film, *Pather Panchali* (1955), a story of village life. With *Aparajito* (1956) and *The World of Apu* (1959), he completed the brilliant Apu Trilogy and brought Indian cinema to world attention. He later won acclaim for *Devi* (1960), *Two Daughters* (1961), *The Big City* (1964), *The Lonely Wife* (1964), *The Chess Players* (1977), *The Home and the World* (1984), and *The Visitor* (1990). He wrote all his own screenplays, noted for their humanism and poetry, and often composed the music for his films, though his short stories and novellas became his main source of income.

Rayburn, Sam(uel) (Taliaferro) (b. Jan. 6, 1882, Roane county, Tenn., U.S.—d. Nov. 16, 1961, Bonham, Texas) U.S. politician. He taught school in Texas before becoming a lawyer. He served in the state legislature from 1907 to 1913. In 1912 he was elected as a Democrat to the U.S. House of Representatives, where he served for the next 48 years, including 17 years as speaker (1940–46, 1949–53, 1955–61). A skillful tactician, he influenced the passage of much NEW DEAL legislation and cowrote the bill enacting rural electrification. He was the long-time political mentor of LYNDON B. JOHNSON and a trusted adviser to presidents from FRANKLIN D. ROOSEVELT to JOHN F. KENNEDY.

Rayleigh \'rā-lē\ **(of Terling Place), John William Strutt, 3rd Baron** (b. Nov. 12, 1842, Langford Grove, Essex, Eng.—d. June 30, 1919, Terling Place, Witham, Essex) English physicist. In 1873 he succeeded to his father's title and built a research laboratory on his estate. He taught physics at Cambridge University (1879–84) and was secretary of the Royal Society (1884–95). His research included work on electromagnetism, colour, acoustics, and diffraction gratings, and his theory explaining the blue colour of the sky evolved into the RAYLEIGH SCATTERING law. In 1904 he was awarded the Nobel Prize for Physics for his isolation of ARGON. In 1908 he became chancellor of Cambridge University. His influential *Theory of Sound* (1877, 1878) examines questions of vibrations and resonance of media.

Rayleigh scattering Dispersion of ELECTROMAGNETIC RADIATION by particles with radii less than ⅒ the WAVELENGTH of the radiation. It is named for Baron RAYLEIGH, who described it in 1871. Since blue light is at the short wavelength end of the visible SPECTRUM, it is scattered in the atmosphere much more than the longer-wavelength red light. This causes the blue colour of the sky, since the observer sees only the scattered light. The Rayleigh laws predict the variation of the intensity and the POLARIZATION of scattered light.

Raymond IV *French* **Raimond** *known as* **Raymond of Saint-Gilles** \sa^{n}-'zhēl\ (b. 1041 or 1042, Toulouse, county of Toulouse—d. Feb. 28, 1105, near Tripoli) Count of Toulouse (1093–1105) and marquis of Provence (1066–1105). The first western European ruler to join the First CRUSADE, he helped capture Antioch (1098) and Jerusalem (1099) but refused the Crusaders' crown of Jerusalem. He also conquered and ruled Tripoli (1102–05).

Raymond VI *French* **Raimond** (b. Oct. 27, 1156—d. Aug. 1222, Toulouse, France) Count of TOULOUSE (1194–1222). He at first tolerated the heretical CATHARI but later joined the ALBIGENSIAN CRUSADE against them. Raymond fought the Crusaders to save his own dominions. Though he lost his title by decree of the fourth LATERAN COUNCIL (1215), despite the effort of Pope INNOCENT III to arrange a compromise, he regained most of his lands by conquest. Twice excommunicated, he was refused Christian burial.

Raymond VII *French* **Raimond** (b. July 1197, Beaucaire, France—d. Sept. 27, 1249, Millau) Count of Toulouse (1222–49). He helped recover lands taken from his father, RAYMOND VI, and negotiated a truce (1223) with land-hungry Crusaders from northern France. For failing to suppress the heretical CATHARI, he was excommunicated (1226) and subjected to a French invasion. He ceded territory to France by treaty and agreed to permit the ALBIGENSIAN CRUSADE to continue in Languedoc (1229). Allied with HENRY III of England, he rebelled unsuccessfully against Louis VIII of France (1242) and was forced to accept greater French authority over Toulouse.

Raymond, Antonin (b. May 10, 1888, Kladno, Bohemia—d. Nov. 21, 1976, Langhorne, Pa., U.S.) Czech-born U.S. architect. He immigrated to the U.S. in 1910. He assisted FRANK LLOYD WRIGHT in building the Imperial Hotel, Tokyo (1916). Remaining in Japan, he and his partner, Ladislav Rado, built numerous structures, mostly for Americans. One of the few Modernist architects working in Japan at the time, he influenced such Japanese architects as Yoshimura Junzo and MAEKAWA KUNIO. Among his works were the Reader's Digest Building, Tokyo (1951; since destroyed), and the Nagoya International School (opened 1967), a circular structure serving a flexible, progressive educational program.

Raymond of Peñafort \ˌpān-yə-'fȯrt**, Saint** *Spanish* **Raimundo** (b. c. 1185, Peñafort, near Barcelona—d. Jan. 6, 1275, Barcelona; canonized 1601; feast day January 7) Catalan Dominican friar influential in defining church law. He studied and taught CANON LAW at Bologna, then returned to Barcelona, where he joined the Dominicans and wrote a manual for confessors widely used in the late Middle Ages. Appointed papal chaplain by Pope GREGORY IX (1230), he was commissioned to codify the papal statues and rulings on canon law; these *Decretals* (1234) remained part of church law until 1917. He later organized schools of Arabic and Hebrew studies in Tunis and Murcia.

Rayonism \'rā-ə-ˌni-zəm\ (from Russian, *Luchizm*: "ray-ism") Russian art movement founded 1912–13 by Mikhail Larionov (1881–1964) and his wife, Natalia Goncharova (1881–1962), which represented one of the first steps toward the development of abstract art in Russia. A synthesis of CUBISM, FUTURISM, and ORPHISM, Rayonism was described by Larionov as "concerned with spatial forms that are obtained through the crossing of reflected rays from various objects." It apparently ended after 1914, when its founders departed for Paris.

Rayonnant style \re-yən-'äⁿ\ French style (13th century) that represents the height of GOTHIC ARCHITECTURE. During this period architects became less interested in achieving great size than in decoration, which took such forms as pinnacles, moldings, and especially window TRACERY. The style's name reflects the radiating character of the ROSE WINDOW. Other features include the thinning of vertical supporting members, the enlargement of windows, and the combination of the triforium gallery and CLERESTORY into one large glazed area, until walls became largely undifferentiated screens of tracery, mullions, and glass. Amiens Cathedral (1220–70) is cited as its earliest manifestation. Especially fine achievements include NOTRE-DAME DE PARIS, the church of Saint-Urbain in Troyes (founded 1262), and the extraordinary Sainte-Chapelle, Paris (consecrated 1248), Louis IX's palace chapel. See also CATHEDRAL.

Rāzī \'rä-zē**, al-** *in full* **Abū Bakr Muḥammad ibn Zakariyyā' al-Rāzī** *Latin* **Rhazes** (b. c. 865, Rayy, Persia—d. 925 or 935, Rayy) Persian alchemist and philosopher. He saw himself as the Islamic heir of SOCRATES in philosophy and of HIPPOCRATES in medicine. In *The Comprehensive Book*, he surveyed Greek, Syrian, early Arabic, and some Indian medical knowledge, adding his own comments. A number of his works were translated into Latin and other languages. One such, *The Spiritual Physick of Rhazes*, is a popular ethical treatise and major alchemical study. He called himself a follower of PLATO but disagreed with Arabic interpreters of Plato. His theory of the composition of matter is similar to that of DEMOCRITUS. He was considered one of the greatest physicians of the early Islamic world.

Razin \'rä-zyin**, Stenka** *orig.* **Stepan Timofeyevich Razin** (b. c. 1630, Zimoveyskaya-na-Donu, Russia—d. June 16, 1671, Moscow) Russian COSSACK rebel. Born in the prosperous Don Cossack area, he supported the runaway serfs from Poland and Russia who escaped into the region to find land. In 1667 he led a band of newcomers to establish an outpost on the upper Don River. They raided Russian and Persian settlements on the Caspian Sea (1667–70), acquiring great fame and wealth. He then led his Cossack anarchists on a campaign into the Volga River region, where he was joined by disaffected peasants. After seizing Tsaritsyn (now Volgograd), Astrakhan, and Saratov, his force of 20,000 undisciplined rebels was defeated by the Russian army at Simbirsk. Razin was captured, tortured, and executed. He became a popular Russian folk hero and was immortalized in songs and legends.

razor clam Any of several species of marine CLAMS (family Solenidae) common in intertidal sands and muds, particularly of temperate seas. Razor clams have narrow and elongated shells (shaped like straight razors) up to 8 in. (20 cm) long. A large active foot enables them to move rapidly up and down within their burrow and retreat quickly when disturbed. With their short siphons (tubes) they feed on particulate material in seawater. Some species can swim short distances by jetting water through their siphons.

razorback whale See FIN WHALE

RCA Corp. Major U.S. electronics and broadcasting conglomerate that was purchased by the GENERAL ELECTRIC CO. (GE) in 1986. RCA's subsidiaries at the time of the acquisition included NBC, which is managed as a separate division within GE. RCA was founded as the Radio Corp. of America by General Electric in 1919 to acquire Marconi Wireless Telegraph Co. of America, at that time the only company capable of handling commercial transatlantic radio communications. RCA founded NBC in 1926 to manage radio broadcasting operations for GE, AT&T, and WESTINGHOUSE. An ANTITRUST suit against the three latter companies in 1932 caused RCA and its NBC unit to become independent. In 1939 RCA developed the first experimental TELEVISION set, and its black-and-white sets went on the market seven years later. After consolidating most of RCA's operations into GE's businesses, in 1987 General Electric sold RCA's consumer-electronics division to the French corporation Thomson-Brandt, SA (later Thomson SA). Within GE, RCA's core products are in military and space electronics and satellite communications.

Re \'rā\ *or* **Ra** \'rä\ In ancient EGYPTIAN RELIGION, the creator god and god of the sun. He was believed to sail across the sky in his solar bark and at night to travel in another bark through the underworld, where he had to vanquish a serpent before he could be born again. As the creator, he rose from the ocean of chaos, creating himself and then engendering eight other gods. From the 4th dynasty, kings held the title Son of Re, and Re later became part of the throne name they adopted at accession and was appended to the names of such gods as AMON and SEBEK.

reactance Measure of the opposition that an electrical CIRCUIT or a part of a circuit presents to ELECTRIC CURRENT (see ELECTRICAL IMPEDANCE) insofar as the current is varying or alternating. Steady electric currents flowing along conductors in one direction undergo opposition called electrical RESISTANCE, but no reactance. Reactance is present in addition to resistance when conductors carry ALTERNATING CURRENT. Reactance also occurs for short intervals when DIRECT CURRENT is changing as it approaches or departs from steady flow (e.g., when switches are closed or opened). Reactance is of two types, inductive and capacitive. Inductive reactance is associated with the varying magnetic field that surrounds a wire or a coil carrying a current. Capacitive reactance is associated with the changing electric field between two conducting surfaces (plates) separated from each other by an insulating medium. The ohm is the unit of reactance.

reaction, heat of Amount of HEAT that must be added or removed during a CHEMICAL REACTION to keep all substances involved at the same temperature. If it is positive (heat must be added), the reaction is endothermic; if it is negative (heat is given off), the reaction is exothermic. Accurate heat of reaction values are needed for proper design of equipment used in chemical processes; they are usually estimated from compiled tables of THERMODYNAMICS data (heats of formation and heats of combustion of many known materials). The ACTIVATION ENERGY is unrelated to the heat of reaction.

reaction rate Speed at which a CHEMICAL REACTION proceeds, in terms of amount of product formed or amount of reactant consumed per unit of time. The reaction rate depends on the nature of the reacting substances and the type of chemical change, as well as temperature and pressure, especially if GASES are involved. In general, the reactions of IONS occur very rapidly, but those in which COVALENT BONDS are formed or broken are slower. CATALYSTS usually accelerate reaction rates. The prediction, measurement, and interpretation of reaction rates are subjects of the branch of chemistry known as chemical kinetics. See also MASS ACTION, LAW OF.

read-only memory See ROM

Reade, Charles (b. June 8, 1814, near Ipsden, Oxfordshire, Eng.—d. April 11, 1884, London) English novelist and dramatist. Though trained in law and an administrator at Oxford University, he put much of his time and resources into writing and staging his melodramatic plays. His novels expose, with passionate indignation, the social injustices of his times. He is best remembered for the historical romance *The Cloister and the Hearth* (1861). His other novels include *It Is Never Too Late to Mend* (1856), attacking prison conditions; *Hard Cash* (1863), on the abuse of mental patients; and *Put Yourself in His Place* (1870), about terrorism by trade unionists.

Reader's Digest U.S.-based monthly magazine. Founded by DEWITT AND LILA WALLACE, it was first published in 1922 as a digest of articles of topical interest and entertainment value condensed from other periodicals. From 1934 it published condensed versions of current books; later it began publishing books containing original material. Though initially conceived as an impartial journal, the *Digest* has tended to reflect its publishers' generally conservative outlook. It probably has the largest circulation of any periodical in the world, appearing in dozens of editions and a wide variety of languages worldwide.

Reading \'re-diŋ\ Town and unitary authority (pop., 2001: 143,124), county seat of BERKSHIRE, England, west of LONDON. Reading was a Danish encampment as early as AD 871. It was given a town charter by King HENRY III in 1253; that charter was confirmed by succeeding sovereigns. Between the 12th and 16th centuries Reading was dominated by a struggle for privileges between the Benedictine abbey founded in 1121 and the emergent merchants' guild. By the 17th century the town's trade, notably in clothing, had begun to decline. In the 18th century the chief trade was in malt. In the city's public gardens are the ruins of the abbey, which was dissolved by Henry VIII. The structure was destroyed during the English Civil Wars, during which time the town in general also suffered severely.

© 2006 Encyclopædia Britannica, Inc.

In Reading Gaol, adjoining the ruins, Oscar Wilde was imprisoned, and it was there that he wrote *The Ballad of Reading Gaol*. The city is now an agricultural centre noted for the bulbs produced in its nurseries. It is the site of a university, and its industries include computer production and malting and brewing.

ready-made Everyday object selected and designated as art. The name was coined by Marcel Duchamp, whose first ready-mades included a snow shovel that he picked up on a snowy day in New York, and a wheel mounted on a stool (1913). They represented a protest against the excessive importance attached to works of art. Duchamp's anti-aesthetic gestures made him one of the leading Dadaists of his day, and his ready-made concept, though widely regarded for decades as an insult to art, was adapted by such later artists as Robert Rauschenberg, Andy Warhol, and Jasper Johns.

Reagan \'rā-gən**, Ronald W(ilson)** (b. Feb. 6, 1911, Tampico, Ill., U.S.—d. June 5, 2004, Los Angeles, Calif.) 40th president of the U.S. (1981–89). He attended Eureka College and worked as a radio sports announcer before going to Hollywood in 1937. In his career as a movie actor, he appeared in more than 50 films and was twice president of the Screen Actors Guild (1947–52, 1959–60). In the mid-1950s he became a spokesman for the General Electric Co.; he hosted its television theatre program from 1954 to 1962. Having gradually changed his political affiliation from liberal Democrat to conservative Republican, he was elected governor of California in 1966 and served two terms. In 1980 he defeated incumbent Pres. Jimmy Carter to become president. Shortly after taking office, he was wounded in an assassination attempt. His administration adopted policies based on supply-side economics in an effort to promote rapid economic growth and reduce the federal deficit. Congress approved many of his proposals (1981), which succeeded in lowering inflation but doubled the national debt by 1986. He began the largest peacetime military buildup in U.S. history; in 1983 he proposed construction of the Strategic Defense Initiative. His administration concluded a treaty with the Soviet Union to restrict intermediate-range nuclear weapons, conducted a proxy war against Nicaragua through its support of the Contras, and invaded Grenada ostensibly to prevent the island nation from becoming a Soviet outpost. He was reelected by a large margin in 1984. Beginning in 1986, the Iran-Contra Affair temporarily weakened his presidency. Though his intellectual capacity for governing was often disparaged by his critics, his affability and artful communication skills enabled him to pursue numerous conservative policies with conspicuous success, and his tough stance toward the Soviet Union is often credited with contributing to the demise of Soviet communism. In 1994 he revealed that he had Alzheimer disease.

real and personal property Basic types of property in English common law, roughly corresponding to the division between immovables and movables in civil law. Real property consists of land, buildings, crops, and other resources, improvements, or fixtures still attached to the land. Personal property is essentially all property other than real property, including goods, animals, money, and vehicles.

real number In mathematics, a quantity that can be expressed as a finite or infinite decimal expansion. The counting numbers, integers, rational numbers, and irrational numbers are all real numbers. Real numbers are used in measuring continuously varying quantities (e.g., size, time), in contrast to measurements that result from counting. The word *real* distinguishes them from the imaginary numbers.

realism In the visual arts, an aesthetic that promotes accurate, detailed, unembellished depiction of nature or of contemporary life. Realism rejects imaginative idealization in favour of close observation of outward appearances. It was a dominant current in French art between 1850 and 1880. In the early 1830s the painters of the Barbizon school espoused realism in their faithful reproduction of the landscape near their village. Gustave Courbet was the first artist to proclaim and practice the realist aesthetic; his *Burial at Ornans* and *The Stone Breakers* (1849) shocked the public and critics with their frank depiction of peasants and labourers. In his satirical caricatures, Honoré Daumier used an energetic linear style and bold detail to criticize the immorality he saw in French society. Realism emerged in the U.S. in the work of Winslow Homer and Thomas Eakins. In the 20th century German artists associated with the Neue Sachlichkeit worked in a realist style to express their disillusionment after World War I. The Depression-era movement known as Social Realism adopted a similarly harsh realism to depict the injustices of U.S. society. See also naturalism.

realism In literature, the theory or practice of fidelity to nature or to real life and to accurate representation without idealization of everyday life. The 18th-century works of Daniel Defoe, Henry Fielding, and Tobias Smollett are among the earliest examples of realism in English literature. It was consciously adopted as an aesthetic program in France in the mid-19th century, when interest arose in recording previously ignored aspects of contemporary life and society; Gustave Flaubert's *Madame Bovary* (1857) established the movement in European literature. The realist emphasis on detachment and objectivity, along with lucid but restrained social criticism, became integral to the novel in the late 19th century. The word has also been used critically to denote excessive minuteness of detail or preoccupation with trivial, sordid, or squalid subjects. See also naturalism.

realism In philosophy, any viewpoint that accords to the objects of human knowledge an existence that is independent of whether they are being perceived or thought about. In the metaphysical debate concerning universals, realism is opposed to nominalism, which denies that universals have any reality at all (except as words), and to conceptualism, which grants universals reality but only as concepts in the mind. Against idealism and phenomenalism, realism asserts the independent existence of material objects and their qualities. Similarly, moral realism holds that the moral qualities of things and actions (such as being good or bad, right or wrong) belong to the things or actions themselves and are not to be explained in terms of the subject's feelings of approval or disapproval. In opposition to conventionalism, realism holds that scientific theories are objectively true (or false) based on their correspondence (or lack of it) to an independently existing reality.

realpolitik Politics based on practical objectives rather than on ideals. The word does not mean "real" in the English sense but rather connotes "things"—hence a politics of adaptation to things as they are. Realpolitik thus suggests a pragmatic, no-nonsense view and a disregard for ethical considerations. In diplomacy it is often associated with relentless, though realistic, pursuit of the national interest.

reamer Rotary cutting tool of cylindrical or conical shape, used for enlarging and finishing to accurate dimensions holes that have been drilled, bored, or cored. A reamer cannot be used to start a hole. All reamers have lengthwise flutes or grooves; either the sides of the tool or the tip may be used for cutting. Reamers are made from high-carbon steel, high-speed steel, or cemented carbides.

reaper Any farm machine that cuts grain (cereal). Early reapers simply cut the crop and dropped it unbound. Modern machines include harvesters, combines (see combine harvester), and binders, which also perform other harvesting operations. See also Cyrus H. McCormick.

reason, practical See practical reason

Réaumur \rā-ō-'mūr,\ *English* \ˌrā-ō-'myůr**, René-Antoine Ferchault de** (b. Feb. 28, 1683, La Rochelle, France—d. Oct. 17, 1757, Saint-Julien-du-Terroux) French physicist and entomologist. He invented the thermometric scale that bears his name (see thermometry); on the Réaumur scale, 0° marks the freezing point of water and 80° marks the boiling point. He invented the opaque white glass known as Réaumur porcelain, improved techniques for making iron and steel, discovered that crayfish can regenerate lost appendages, and isolated gastric juice. His *Memoirs Serving as a Natural History of Insects* (1734–42), though unfinished, was a milestone in entomological history.

rebate Retroactive refund or credit given to a buyer who has purchased a product or service. Fair and equitable rebates are used simply as incentives available to all customers. So-called deferred (or exclusive-patronage) rebates are used by large vendors of perishables and consumer durable goods. To receive such a rebate, the purchaser must agree to buy certain goods or services exclusively from a particular vendor for a fixed period of time. Rebating was a common pricing tactic in the 19th century, often used by large companies to undercut competition from smaller firms. The U.S. railroad industry practiced price discrimination by granting secret rebates to important customers; the rebates granted to Standard Oil Co. helped it acquire a monopoly over the oil industry. Governments occasionally sponsor rebates on previously paid taxes such as property, income, or sales taxes. Tax rebates can be used to stimulate the economy, to return excess revenue to taxpayers, or to encourage specific actions such as energy conservation.

Récamier \rā-kȧm-'yā**, Madame de** *orig.* **Jeanne-Françoise-Julie-Adélaïde Bernard** *in full* **Jeanne-Françoise-Julie-Adélaïde, dame de Récamier** (b. Dec. 4, 1777, Lyon, France—d. May 11, 1849, Paris) French hostess. Daughter of a prosperous banker, she married a wealthy banker and began to entertain widely. Her great charm and wit attracted to her salon most of the important political and literary figures of early 19th-century Paris, including many opponents of NAPOLEON, who exiled her in 1805. After Napoleon's defeat in 1815 she returned to Paris, where in her later years RENÉ, VISCOUNT DE CHATEAUBRIAND became her companion and the central figure in her salon. Her friend GERMAINE DE STAËL created her literary portrait in the novel *Corinne*.

receivership In law, state of being in the hands of a receiver, a person appointed by the court to administer, conserve, rehabilitate, or liquidate the assets of an insolvent corporation for the protection or relief of creditors. It is a legal solution to a financial difficulty; it does not necessarily entail the termination of the corporate charter. See also BANKRUPTCY, INSOLVENCY.

Recent epoch See HOLOCENE EPOCH

recession Downward trend in the BUSINESS CYCLE characterized by a decline in production and employment, which in turn lowers household income and spending. Even though not all households and businesses experience actual declines in income, they become less certain about the future and consequently delay making large purchases or investments. Consumers buy fewer durable household goods, and businesses are less likely to purchase machinery and equipment and more likely to use up existing inventory instead of adding goods to their stock. This drop in demand leads to a corresponding fall in output and thus worsens the economic situation. Whether a recession develops into a severe and prolonged DEPRESSION depends on a number of circumstances. Among them are the extent and quality of CREDIT extended during the previous period of prosperity, the amount of speculation permitted, the ability of government MONETARY and FISCAL policies to reverse (or minimize) the downward trend, and the amount of excess productive capacity. Compare DEPRESSION.

recessiveness Failure of one of a pair of genes (ALLELES) present in an individual to express itself in an observable manner because of the greater influence, or DOMINANCE, of its opposite-acting partner. Both alleles affect the same inherited characteristic, but the presence of the recessive gene cannot be determined by observation of the organism; that is, though present in the organism's GENOTYPE (gene makeup), the recessive trait is not evident in its PHENOTYPE (observable characteristics). The term *recessive* is applied both to the trait in the organism having the alleles of a gene pair in the recessive condition and to the allele whose effect can be masked by another allele of the same gene.

Recife \ri-'sē-fē\ Port and city (pop., 2003: city, 1,461,300; metro. area, 3,466,214), northeastern Brazil. Founded by the Portuguese in the first half of the 16th century, it was raided and sacked by British privateers in 1595. It was later occupied by the Dutch (1630–54). It has been called the Venice of Brazil because it is crossed by waterways, and areas of the city are linked by numerous bridges. Situated at the confluence of the Capibaribe and Beberibe rivers, it is one of the leading ports of Brazil, with extensive modern port facilities. It is an educational and cultural centre, with several universities and theatres.

reciprocity \ˌre-sə-'prä-sə-tē\ In international trade, the granting of mutual concessions on TARIFFS, QUOTAS, or other commercial restrictions. Reciprocity implies that these concessions are neither intended nor expected to be generalized to other countries with which the contracting parties have commercial treaties. Reciprocity agreements may be made between individual countries or groups of countries. Membership in the WORLD TRADE ORGANIZATION to some extent precludes the signing of reciprocity treaties because WTO nations are obliged to grant MOST-FAVORED-NATION TREATMENT to all other members.

recitative \ˌre-sə-tə-'tēv\ Style of accompanied solo singing that imitates the rhythms and tones of speech. Representing an attempt at an ideally expressive musical text setting, which the ancient Greeks were thought to have mastered, it came into existence in tandem with OPERA c. 1600, the first operas being largely written in recitative. Recitative style gradually began to separate from lyrical ARIA style. Regular alternation of recitative with aria became the rule for both opera and CANTATA, and recitative became essential to the dramatic ORATORIO as well. It remains basic to operatic composition; the presence of recitative (as opposed to spoken dialogue) most clearly distinguishes opera from the MUSICAL and related genres.

recognizance \ri-'käg-nə-zənts\ In law, obligation entered into before a court or magistrate requiring the performance of an act (e.g., appearance in court), usually under penalty of a money forfeiture. The most common use of recognizance is in connection with BAIL in criminal cases. The accused may also be released on his "own recognizance" when no bail is required.

recombination In genetics, regrouping of the maternal and paternal GENES during the formation of sex cells (gametes). Recombination occurs randomly in nature as a normal event of MEIOSIS. It is enhanced by crossing-over (see LINKAGE GROUP). Recombination acts to ensure that no two daughter cells are identical, nor are any identical in genetic content to the parent cell. Laboratory study of recombination has contributed significantly to the understanding of genetic mechanisms, allowing scientists to map CHROMOSOMES, identify linkage groups, isolate the causes of certain genetic mistakes, and manipulate recombination itself by transplanting genes from one chromosome to another. See also GENETIC ENGINEERING, MOLECULAR BIOLOGY.

recompression chamber See HYPERBARIC CHAMBER

Reconstruction (1865–77) Period after the AMERICAN CIVIL WAR in which attempts were made to solve the political, social, and economic problems arising from the readmission to the Union of the 11 Confederate states that had seceded at or before the outbreak of war. Pres. ABRAHAM LINCOLN planned to readmit states in which at least 10% of the voters had pledged loyalty to the Union. This lenient approach was opposed by the RADICAL REPUBLICANS, who favoured the harsher measures passed in the WADE-DAVIS BILL. Pres. ANDREW JOHNSON continued Lincoln's moderate policies, but enactment in the South of the BLACK CODES and demand in the North for stricter legislation resulted in victories for Radical Republicans in the congressional elections of 1866. Congress then passed the Reconstruction Acts of 1867, which established military districts in the South and required the Southern states to accept the 14th and 15th Amendments to the Constitution. Southern resentment of the imposed state governments, which included Republicans, CARPETBAGGERS, and SCALAWAGS, and of the activities of the FREEDMEN'S BUREAU led to the formation of terrorist groups such as the KU KLUX KLAN and the Knights of the White Camelia. By the 1870s conservative Democrats again controlled most state governments in the South. Though Reconstruction has been seen as a period of corruption, many constructive legal and educational reforms were introduced. The Reconstruction era led to an increase in sectional bitterness, dissension regarding the rights of blacks, and the development of one-party politics in the South.

Reconstruction Finance Corporation (RFC) U.S. government agency established (1932) to provide loans to railroads, banks, and businesses. The RFC was an attempt by Pres. HERBERT HOOVER to counter the early effects of the GREAT DEPRESSION by rescuing institutions from default. It was widely used by Pres. FRANKLIN ROOSEVELT in the NEW DEAL and to finance defense plants in World War II. After the war, the RFC's powers and functions were gradually transferred to other agencies.

Reconstructionism Movement that originated in U.S. Judaism in the 1920s. It regards Judaism only as a specific human culture, rejects the tradition of a transcendent deity who made a COVENANT with his chosen people, and does not accept the BIBLE as the inspired word of God. Its principles, as enunciated by MORDECAI MENAHEM KAPLAN, are based on the belief that Jews can live a distinctively Jewish cultural life without being religiously observant. Reconstructionists today number about 60,000.

record player See PHONOGRAPH

recorder In music, a cylindrical, usually wooden, wind instrument with fingerholes. As a fipple (duct) flute, its rather soft tones are produced by air blown against the sharp edge of an opening in the tube. The large recorder family includes instruments ranging from the sopranino to the contrabass. The recorder emerged in the 14th century and was widely used in ensembles and orchestras in the late Renaissance and throughout the Baroque era. Displaced by the transverse FLUTE after the mid-18th century, it was revived in the 20th century.

rectum End segment of the LARGE INTESTINE (see DIGESTION) in which FECES accumulate just prior to discharge. It is 5–6 in. (13–15 cm) long and lined with mucous membrane. One set of muscles separates it from the ANAL CANAL; another shortens it to expel feces. The rectal walls distend as feces enter, which stimulates the urge for DEFECATION.

© 2006 Encyclopædia Britannica, Inc.

recycling *or* **materials salvage** Recovery and reuse of materials from consumed products. The main motives for recycling have been the increasing scarcity and cost of natural resources (including oil, gas, coal, mineral ores, and trees) and the pollution of air (see AIR POLLUTION), water (see WATER POLLUTION), and land by waste materials. There are two types of recycling, internal and external. Internal recycling is the reuse in a manufacturing process of materials that are a waste product of that process, and is common in the metals industry (see SCRAP METAL). External recycling is the reclaiming of materials from a product that is worn out or no longer useful; an example is the collection of old newspapers and magazines for the manufacture of newsprint or other paper products.

Red Army Army of the Soviet Union. Formed in the aftermath of the RUSSIAN REVOLUTION OF 1917, its first civilian leader was LEON TROTSKY, who proved a brilliant strategist and administrator. Formed of workers and peasants, it initially lacked an officers' corps, and Trotsky was forced to mobilize officers of the former imperial army until a new, politically reliable corps could be trained. The COMMUNIST PARTY placed commissars in all army units to ensure political orthodoxy. JOSEPH STALIN purged the military leadership in 1937, leaving the army demoralized and unprepared for the German surprise attack in 1941. It recovered sufficiently by 1945 to have forces numbering more than 11 million, surpassed in strength only by the U.S. Army. In 1946 it was renamed the Soviet Army. In 1960 the commissars' duties were transferred to army officers. See also UNION OF SOVIET SOCIALIST REPUBLICS.

Red Army Faction See BAADER-MEINHOF GANG

red blood cell See ERYTHROCYTE

Red Brigades *Italian* **Brigate Rosse** Extreme left-wing terrorist organization in Italy. Its self-proclaimed aim was to undermine the Italian state and pave the way for a Marxist upheaval led by a "revolutionary proletariat." Reputedly founded by Renato Curcio (b. 1945), it began carrying out violent acts with firebombings (1970), escalating to kidnappings (1971) and murders (1974), most notably that of ALDO MORO (1978). At its height, it probably had 400 to 500 full-time members, perhaps 1,000 sporadic members, and a few thousand supporters. Arrest and imprisonment of many leaders and ordinary members greatly weakened the organization in the 1980s. However, a group calling itself the Red Brigades claimed responsibility for several violent attacks in the 1990s and into the 21st century.

Red Cloud *orig.* **Mahpiua Luta** (b. 1822, on the Platte River, Nebraska Territory, U.S.—d. Dec. 10, 1909, Pine Ridge Agency, S.D.) American Indian leader. The principal chief of the Oglala Teton Dakota (SIOUX), he led the opposition of both the Sioux and the Cheyenne to the U.S. government's development of the Bozeman Trail to goldfields in the Montana Territory (1865–67). Relentlessly attacking workers along the route from Fort Laramie (in modern Wyoming) to Montana, he refused offers to negotiate until the U.S. agreed to halt the project, whereupon he laid down his arms and allowed himself to be settled on the Red Cloud Agency in Nebraska.

Red Cross *officially* **International Movement of the Red Cross and Red Crescent** *formerly* **International Red Cross** Humanitarian agency with national affiliates worldwide. Established for the care of victims of battle, it now aids in the general prevention and relief of human suffering. It arose out of the work of JEAN-HENRI DUNANT, who proposed the formation of voluntary relief societies in all countries, the first of which came into being in 1864. The name Red Crescent, adopted in 1906 at the insistence of the Ottoman Empire, is used in Muslim countries. In peacetime, the Red Cross aids victims of natural disasters, maintains blood banks, and provides supplementary health care services. In wartime, it serves as an intermediary between belligerents and visits prisoner-of-war camps to provide relief supplies, deliver mail, and transmit information between prisoners and their relatives. Its operating principles are humanity, impartiality, and neutrality. Its headquarters are in Geneva. Individual national organizations run community programs and coordinate natural-disaster relief efforts. The American Red Cross was founded by CLARA BARTON in 1881 and first chartered by Congress in 1900; it runs the world's largest blood-donor service. In 1901 Dunant received the first Nobel Prize for Peace; the Red Cross itself received the prize in 1917, 1944, and 1963.

red deer Species of DEER (*Cervus elaphus*), sometimes called ELK, native to Europe, Asia, and North Africa. It is found in woodlands and hunted for sport and food. Red deer live in sexually segregated herds except in the breeding season, when males (harts) fight for harems of females (hinds). Red deer stand about 4 ft (1.2 m) high at the shoulder. The coat is reddish brown, with lighter underparts and a light rump. The hart has long, regularly branched antlers bearing 10 or more tines. There are several endangered subspecies. See also WAPITI.

red elm See SLIPPERY ELM

Red Eyebrows Chinese peasant band that formed in response to the unrest and civil war following the floods and famines that accompanied disastrous changes in the course of the HUANG HE (Yellow River) between AD 2 and 11. They painted their faces to look like demons, and their leader spoke through mediums. In AD 23 their forces were involved in the overthrow of WANG MANG, the usurper whose reign had interrupted the HAN DYNASTY.

red-figure pottery Type of Greek POTTERY that flourished from the late 6th to the late 4th century BC. Developed in Athens c. 530 BC, the red-figure pottery quickly overtook the older BLACK-FIGURE POTTERY as the preferred style of vase painting. In red-figure technique, the background was painted black, and the outline details on the figures were also painted (rather than incised) in black, but the rest of each figure was unpainted and so retained the orange-red colour of the natural vase. By comparison with incising, the painting of the details allowed more flexibility in rendering human form, movements, expressions, and perspective. Since most of the ornamentation was narrative, such technical advantages were of utmost importance.

Athenian red-figure cup, detail of a bearded reveler by the Brygos Painter, c. 490 BC; in the Louvre, Paris
J.E. BULLOZ

red fox *or* **common fox** Either of two FOX species: *Vulpes vulpes*, found throughout Europe, temperate Asia, and northern Africa, and *V. fulva* of North America. It has a reddish brown coat; the tail is white-tipped, and the ears and legs are black. Red foxes are 36–42 in. (90–105 cm) long, including the 15-in. (38-cm) tail; they stand about 16 in. (40 cm) tall and weigh about 15 lb (7 kg). They eat small mammals, eggs, fruit, and birds. They are hunted for sport and for their fur and are raised commercially for pelts. North American red foxes exhibit black and silver colour phases.

Red Guards Paramilitary units of radical university and high-school students formed during the Chinese CULTURAL REVOLUTION. Responding in 1966 to MAO ZEDONG's call to revitalize the revolutionary spirit of the CHINESE COMMUNIST PARTY, they went so far as to attempt to purge the country of its pre-Communist culture. With a membership in the millions, they attacked and persecuted local party leaders, schoolteachers, and other intellectuals. By early 1967 they had overthrown party authorities in many localities. Internal strife ensued as different units argued over which among them best represented MAOISM. In 1968 their disruption of industrial production and urban life led the government to redirect them to the countryside, where the movement gradually subsided.

Red River *Chinese* **Yuan Chiang** \'ywän-'jyäŋ\ *Vietnamese* **Song Hong** \'sȯŋ-'hȯŋ\ River, Southeast Asia. It rises in central YUNNAN province, southern China, and flows southeast across northern Vietnam, past HANOI, into the Gulf of TONKIN. The principal river of northern Vietnam, it is about 500 mi (805 km) long and has a wide, fertile delta east of Hanoi.

Red River River, south-central U.S. It rises in the high plains of eastern New Mexico and flows southeast across Texas and Louisiana to a point northwest of Baton Rouge, where it enters the ATCHAFALAYA RIVER. It is 1,290 mi (2,080 km) long and forms a part of Texas's borders with Oklahoma and Arkansas. In Texas it was the site of the RED RIVER INDIAN WAR (1874).

Red River Indian War (1874–75) Uprising of Indian warriors from reservation tribes (ARAPAHO, CHEYENNE, COMANCHE, KIOWA, and Kataka). After settlement of southwestern tribes on reservations in Oklahoma and

Texas (1867), discontented braves broke out repeatedly to raid white travelers and settlers. An attack in 1874 killed 60 Texans. Federal troops under William T. Sherman converged on Indians concentrated in the Red River valley of Texas. Indian resistance forced 14 pitched battles with U.S. troops before the Indians' eventual surrender and return to the reservations.

Red River of the North River, northern U.S. and southern Canada. It flows north, forming the Minnesota–North Dakota boundary, before entering Manitoba and emptying into Lake Winnipeg after a course of 545 mi (877 km). It was explored in 1732–33 by the French voyageur Pierre Gaultier de Varennes et de La Vérendrye. The river, named after the reddish brown silt it carries, was a transportation link between Lake Winnipeg and the Mississippi River system. The Red River Settlement, an agricultural colony, was founded in 1811 near Winnipeg. Its fertile valley produces cereals, potatoes, and sugar beets and supports cattle raising.

red salmon See sockeye salmon

Red Sea Narrow inland sea between the Arabian Peninsula and Africa. It extends southeast from Suez, Egypt, for about 1,200 mi (1,930 km) to the Strait of Mandeb, which connects with the Gulf of Aden and then with the Arabian Sea. It separates the coasts of Egypt, The Sudan, and Eritrea from those of Saudi Arabia and Yemen. It contains some of the world's warmest and saltiest seawater. With its connection to the Mediterranean Sea via the Suez Canal, it is one of the most heavily traveled waterways in the world, carrying traffic between Europe and Asia. Its name is derived from the colour changes observed in its waters.

red soil Any of a group of soils that develop in a warm, temperate, moist climate under deciduous or mixed forests and that have thin organic and organic-mineral layers overlying a yellowish-brown leached layer resting on an illuvial (see illuviation) red layer. Red soils generally form from iron-rich sedimentary rock. They are usually poor growing soils, low in nutrients and humus and difficult to cultivate.

red spider See spider mite

Red Square Large public square, central Moscow. It lies north of the Moskva River, adjacent to the Kremlin, and covers some 18 acres (7.3 hectares). Dating from the late 15th century, it has long been a busy market area as well as a focal point in Russian history as the scene of executions, demonstrations, riots, and parades. Located around it are the State Historical Museum (1875–81), the nine-towered Cathedral of St. Basil the Blessed (1554–60), the former state department store GUM, and the tomb of Vladimir Ilich Lenin. The square and Kremlin were designated a UNESCO World Heritage site in 1990.

red tide Discoloration of seawater caused by dinoflagellates during periodic blooms (population increases). Toxic substances released by these organisms into the water may be lethal to fish and other marine life, and they irritate the human respiratory system. Coastal resorts sometimes close when breaking waves release the toxic substances into the air. The causes of red tide are uncertain; it may require the confluence of several natural phenomena, in which human influence may or may not play a part.

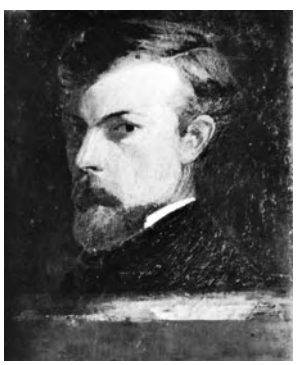
Red Turbans Peasant rebel movement of the mid-14th century that flourished in northern China at the end of the Yuan dynasty (1206–1368). The Red Turbans, whose leader was regarded as an incarnation of the bodhisattva Maitreya, were opposed to alien Mongol rule; their movement gained momentum from the famine that resulted from crop failures and floods in the 1330s. Their marauding, which began in the 1350s, took them as far as Korea, where their incursions contributed to the downfall of the Koryŏ dynasty. Though their rebellion was put down, rival rebel forces under Zhu Yuanzhang (1328–98) toppled the Yuan dynasty and founded the Ming. See also Hongwu emperor.

Eastern redbud (*Cercis canadensis*)
KENNETH AND BRENDA FORMANEK/EB INC.

redbird See cardinal

redbud Any of the shrubs or small trees that make up the genus *Cercis* (family Leguminosae), native to North America, southern Europe, and Asia, and widely planted for their showy early-spring flowers and interesting branch patterns. Clusters of small, purplish-pink flowers appear on old stems and branches before the leaves unfurl. The heart-shaped to roundish leaves quickly turn from bronzy to bright green, then to yellow in fall. The eastern redbud (*C. canadensis*) is the hardiest species.

redfish *or* **rosefish** *or* **ocean perch** Commercially important food fish (*Sebastes marinus*) of the scorpion fish family (Scorpaenidae), found in the Atlantic along European and North American coasts. It has a large mouth, large eyes, and spines on its head and cheeks. It grows to about 40 in. (1 m) long. Related species include *S. owstoni*, a food fish of the Orient, and the Norway haddock (*S. viviparus*) of Europe. Both are red and grow to about 10 in. (25 cm) long.



Redford (Jr.), (Charles) Robert (b. Aug. 18, 1937, Santa Monica, Calif., U.S.) U.S. film actor and director. He made his Broadway debut in 1959 and won acclaim in *Barefoot in the Park* (1963; film, 1967). The blond, appealing Redford began acting in films in the mid-1960s. He appeared with Paul Newman in the hits *Butch Cassidy and the Sundance Kid* (1969) and *The Sting* (1973) and also starred in *The Candidate* (1972), *Jeremiah Johnson* (1972), *All the President's Men* (1976), *The Natural* (1984), *Out of Africa* (1985), and *Indecent Proposal* (1993). His directorial debut, *Ordinary People* (1980, Academy Award), was followed by *The Milagro Beanfield War* (1988), *A River Runs Through It* (1992), *Quiz Show* (1994), *The Horse Whisperer* (1998), and *The Legend of Bagger Vance* (2000). He received an honorary Academy Award in 2001. In 1980 he founded the Sundance Institute to sponsor young filmmakers' works, and by the 1990s its film festival was the major showcase for U.S. independent films.

Redgrave, Sir Michael (Scudamore) (b. March 20, 1908, Bristol, Gloucestershire, Eng.—d. March 21, 1985, Denham, Buckinghamshire) British actor. He made his stage debut in 1934 and acted with the Old Vic and the National Theatre in classic roles from William Shakespeare, Henrik Ibsen, and Anton Chekhov and in modern works such as *Family Reunion* (1939) and *Tiger at the Gate* (1955). Noted for his refined good looks and expressive voice, he began his film career in *The Lady Vanishes* (1938) and continued with roles in *Dead of Night* (1945), *Mourning Becomes Electra* (1947), and *The Browning Version* (1951).

Redgrave, Vanessa (b. Jan. 30, 1937, London, Eng.) British actress. The daughter of actor Michael Redgrave, she made her London stage debut in 1958 and won praise as Rosalind in *As You Like It* (1961). Her performances in such movies as *Blow-Up* (1966), *Camelot* (1967), *Mary, Queen of Scots* (1971), and *Julia* (1977, Academy Award) won her critical adulation. Though criticized by some for her left-wing political activism, especially on behalf of Palestinians, she continued to win acclaim for her work on stage and screen. Her later films included *The Bostonians* (1984), *Howards End* (1992), and *Mrs. Dalloway* (1998).

Redi \'re-dē**, Francesco** (b. Feb. 19, 1626, Arezzo, Italy—d. March 1, 1697, Pisa) Italian physician and poet. While working as physician to the dukes of Tuscany, he demonstrated in 1668, in one of the first biological experiments with proper controls, that the presence of maggots in rotting meat does not result from spontaneous generation. Redi set up a series of flasks containing different meats; half were sealed, half open. He repeated the experiment, replacing the sealed flasks with gauze-covered flasks. Though the meat in all the flasks rotted, Redi found that only in the uncovered flasks, which flies had entered freely, did the meat contain maggots. As a poet, he is known chiefly for his "Bacco in Toscana" (1685).

Redon \rə-'dōⁿ**, Odilon** (b. April 20, 1840, Bordeaux, Fr.—d. July 6, 1916, Paris) French painter, lithographer, and etcher. He studied under Jean-Léon Gérome and learned lithography under Henri Fantin-Latour. He came to be associated with the Symbolist painters. His oils and pastels, chiefly still lifes with flowers, won him admiration as a colourist from

Odilon Redon, self-portrait, 1904; in a private collection.
ARCHIVES PHOTOGRAPHIQUES, PARIS

© 2006 Encyclopædia Britannica, Inc.

Henri Matisse and other painters. His prints (nearly 200 in all), which explore fantastic, often macabre themes, foreshadowed Surrealism and Dada.

Redouté \rə-dü-'tā**, Pierre Joseph** (b. July 10, 1759, Saint-Hubert, Luxembourg—d. June 20, 1840, Paris, France) French botanical painter. He became a favoured artist at the court of France, patronized by kings from Louis XVI to Louis-Philippe. His delicate botanical prints were not only framed as pictures but also used for china patterns. His *Les Liliacées* (1802–15) contained 500 plates of lilies. However, roses became his specialty; *Les Roses* (1817–21) is considered his finest series, and its classic images are still widely reproduced.

redox See oxidation-reduction

redshift Displacement of the spectrum of an astronomical object toward longer wavelengths (visible light shifts toward the red end of the spectrum). In 1929 Edwin Hubble reported that distant galaxies had redshifts proportionate to their distances (see Hubble's constant). Since redshifts can be caused by motion of an object away from the observer (the Doppler effect), Hubble concluded that all galaxies are receding from each other. This became the cornerstone of theories of an expanding universe.

redstart Any of about 11 species of Old World chat-thrushes (see chat) in the genus *Phoenicurus* (family Turdidae) or about 12 New World species of wood warblers (family Parulidae) of similar appearance and behaviour. Old World redstarts have a red tail, which they constantly flit or shiver. They are about 6 in. (14 cm) long. The male common redstart (*P. phoenicurus*) is gray, with a black face and throat and reddish breast. New World redstarts (genera *Setophaga* and *Myioborus*) are usually strikingly marked with black, white, and red.

Common, or American, redstart (*Setophaga ruticilla*)
HAL H. HARRISON FROM GRANT HEILMAN

reduction Any of a class of chemical reactions in which the number of electrons associated with an atom or group of atoms is increased. The electrons taken up by the substance reduced are supplied by another substance, often hydrogen (H_2), which is thereby oxidized. See also oxidation-reduction.

redwood *or* **sequoia** Coniferous evergreen timber tree (*Sequoia sempervirens*) of the family Taxodiaceae, found in the fog belt of west-coastal North America. It grows in the coastal range from southwestern Oregon to central California at elevations up to 3,300 ft (1,000 m). The genus name commemorates the Cherokee Indian Sequoyah. The redwood is sometimes called coast redwood to distinguish it from the Sierra redwood (or big tree) and the Japanese redwood (or Japanese cedar). Redwoods are the tallest living trees, often exceeding 300 ft (90 m) in height; one has reached 368 ft (112 m). Typical trunk diameters are 10–20 ft (3–6 m) or more. The redwood tree takes 400–500 years to reach maturity; some are known to be more than 1,500 years old. As the tree ages, the lower limbs fall away, leaving a columnar trunk. Redwood timber has been used for furniture, shingles, fence posts, paneling, and fine wood objects. Today many of the remaining redwood stands are protected (see Redwood National Park; Sequoia National Park). See also dawn redwood.

Redwood National Park National park, northwestern corner of California, U.S. It was established in 1968, expanded in 1978, and designated a World Heritage site in 1980. It preserves virgin groves of ancient redwood trees, including the world's tallest, 367.8 ft (112.1 m) high. It also includes 40 mi (65 km) of scenic Pacific coastline. It covers an area of 172 sq mi (445 sq km), including land in three state parks.

reed In botany, any of several species of large aquatic grasses, especially the four species in the genus *Phragmites* (family Poaceae, or Gramineae). The common, or water, reed (*P. australis*) occurs along the margins of lakes, fens, marshes, and streams from the Arctic to the tropics. It is a broad-leaved grass, about 5–15 ft (1.5–5 m) tall, with feathery flower clusters and stiff, smooth stems. Bur reed (genus *Sparganium*) and reed mace (genus *Typha*) are plants of other families. Dried reed stems have been used for millennia as thatching and construction material, in basketry, for arrows and pens, and in musical instruments (see reed instruments).

Reed, Sir Carol (b. Dec. 30, 1906, London, Eng.—d. April 25, 1976, London) British film director. He made his stage debut as an actor in 1924 and as a director in 1927, staging Edgar Wallace's detective thrillers. He began directing films in 1935, winning praise for *The Stars Look Down* (1939), *Night Train* (1940), and the wartime semidocumentary *The True Glory* (1945). Noted for his technical mastery of the suspense-thriller genre, he had great success with *Odd Man Out* (1947), *The Fallen Idol* (1948), and the classic *The Third Man* (1949). His later films include *The Key* (1958), *Our Man in Havana* (1959), and *Oliver!* (1968, Academy Award). He was the first British film director to be knighted.

Reed, John (b. Oct. 22, 1887, Portland, Ore., U.S.—d. Oct. 19, 1920, Moscow, Russia) U.S. journalist. He attended Harvard University and began writing for the radical socialist journal *The Masses* in 1913. He covered the revolutionary fighting in Mexico (1914) and was frequently arrested for leading labour strikes. A war correspondent during World War I, he became a close friend of Vladimir Lenin and witnessed the Russian Revolution of 1917, described in his book *Ten Days That Shook the World* (1919). He became head of the U.S. Communist Labor Party; indicted for sedition, he escaped to the Soviet Union, where he died of typhus and was buried beside the Kremlin wall.

Reed, Thomas B(rackett) (b. Oct. 18, 1839, Portland, Maine, U.S.—d. Dec. 7, 1902, Washington, D.C.) U.S. politician. He served in the Maine legislature and was elected to the U.S. House of Representatives (1877–99). As speaker of the House (1889–91, 1895–99) he introduced procedural changes that strengthened legislative control by the majority party and increased the power of the speaker and the Rules Committee. The Reed Rules were attacked by opponents, who called Reed "Czar Reed" for his vigorous promotion of their passage. Ten years later the speaker's powers were reduced.

Reed, Walter (b. Sept. 13, 1851, Belroi, Va., U.S.—d. Nov. 22, 1902, Washington, D.C.) U.S. pathologist and bacteriologist. He received a medical degree at age 18 from the University of Virginia and entered the Army Medical Corps in 1875. He investigated the spread of typhoid fever in military camps during the Spanish-American War and was later curator of the Army Medical Museum in Washington, D.C. Yellow fever was believed to be spread by bedding and other articles, but Carlos Finlay had theorized in 1886 that it was carried by insects, and Reed's team ruled out a bacterium suspected as the cause and found patterns of spread that supported the insect theory. Controlled experiments proved transmission by mosquito bite, and in 1901 efforts to combat an outbreak in Havana succeeded within 90 days.

BETTMANN ARCHIVE

Reed, Willis (b. June 25, 1942, Hico, La., U.S.) U.S. basketball player. Drafted by the New York Knicks in 1964, he averaged 19.5 points in his first season and was named Rookie of the Year. He led the Knicks to the NBA title in 1970 and that year became the only player ever to win the Most Valuable Player award for the regular season, the championships, and the All-Star game. After retiring in 1974 he coached the Knicks (1977–79) and other teams.

reed instrument Any musical wind instrument that sounds when the player's breath or air from a wind chamber causes a reed (a thin blade of cane or metal) to vibrate, thereby setting up a sound wave in an enclosed air column or in the open air. Reed pipes have single or double reeds. A double reed, as in the oboe or bassoon, consists of two cane blades tied together that beat against each other. A single reed may hit against a frame (beating reeds), as in the clarinet or saxophone, or it may vibrate freely through a closely fitting frame (free reeds), as in a harmonica or accordion. Beating reeds in woodwind instruments depend on the pipe's sounding length (as determined by the fingering) to determine the pitch. Free reeds have their own single pitch, determined by their thickness and length. See also English horn; shawm.

Reeds, Plain of *Vietnamese* **Dong Thap Muoi** \'dȯŋ-'täp-'mwȯi\ Low, swampy region, a northwestern extension of the MEKONG RIVER delta, southern Vietnam and eastern Cambodia. It has been partially reclaimed by a levee and drainage system.

reef, coral See CORAL REEF

Refah \re-'fä\ **Party** *or* **Welfare Party** Turkish political party noted for its Islamic orientation. It was founded in 1983 by NECMETTIN ERBAKAN. After doing well in local elections in the early 1990s, it won nearly one-third of the seats (the largest single bloc) in the 1995 national legislative elections, becoming the first religious party in Turkey to win a general election. It took office in 1996 at the head of a new coalition after a centre-right coalition formed to oppose it collapsed after a few months. The party's pro-Islamist policies brought it into conflict with the army and other secular elements in the country, and it left power in 1997. It was subsequently banned.

reference frame *or* **frame of reference** Coordinate system that allows description of time and position of points relative to a body. The axes, or lines, emanate from a position called the origin. As a point moves, its VELOCITY can be described in terms of changes in displacement and direction. Reference frames are chosen arbitrarily. For example, if a person is sitting in a moving train, the description of the person's motion depends on the chosen frame of reference. If the frame of reference is the train, the person is considered to be not moving relative to the train; if the frame of reference is the Earth, the person is moving relative to the Earth.

referendum and initiative Electoral devices by which voters express their wishes regarding government policy or proposed legislation. Obligatory referenda are those required by law. Optional referenda are put on the ballot when a sufficient number of voters sign a PETITION demanding that a law passed by the legislature be ratified by the people. Obligatory and optional referenda should be distinguished from the voluntary referenda that legislatures submit to voters to decide an issue or to test public opinion. Initiatives are used to invoke a popular vote on a proposed law or constitutional amendment. Direct initiatives are submitted directly to the public after approval by a required number of voters; indirect initiatives are submitted to the legislature. Switzerland has held about half the world's national referenda. Referenda also are common at the local and state level in the U.S. In the late 20th century, referenda were employed more frequently, particularly in Europe, to decide public policy on voting systems, treaties and peace agreements (e.g., the MAASTRICHT TREATY), and social issues. See also PLEBISCITE.

referential opacity See INTENTIONALITY

reflection Change in the direction of propagation of a WAVE that strikes a boundary between different media through which it cannot pass. When a wave strikes such a boundary it bounces back, or is reflected, just as a ball bounces off the floor. The angle of incidence is the angle between the path of the wave and a line perpendicular to the boundary. The angle of reflection is the angle between the same line and the path of the reflected wave. All reflected waves obey the law of reflection, which states that the angle of reflection is equal to the angle of incidence. The reflectivity of a material is the fraction of energy of the oncoming wave that is reflected by it.

reflex In biology, an automatic and inborn response to a stimulus that involves a nerve impulse passing from a sensory nerve cell to a muscle or gland without reaching the level of consciousness. Simple reflexes include sucking, swallowing, blinking, scratching, and the knee jerk. Most reflexes consist of complex patterns of many unconsciously coordinated muscular actions that form the basis of much instinctive behavior in animals. Examples include walking, standing, the cat's righting reflex, and basic sexual acts.

Reform Bill of 1832 British parliamentary act that expanded the electorate. It transferred voting privileges from the small rural boroughs controlled by the nobility and gentry to the heavily populated but underrepresented industrial towns. Conceived by Prime Minister EARL GREY and introduced by EARL RUSSELL, it passed in the House of Commons three times but was opposed by the House of Lords until Grey's threat to create 50 new liberal peers (enough to carry the bill) finally brought their agreement. The act redistributed seats in the Commons and lowered the electoral qualifications to allow voting by small property owners (much of the middle class).

Reform Bill of 1867 British parliamentary act that extended the vote to many workingmen in the towns and cities, creating a major working-class constituency for the first time. It was largely conceived by BENJAMIN DISRAELI, who hoped to expand his base of potential supporters.

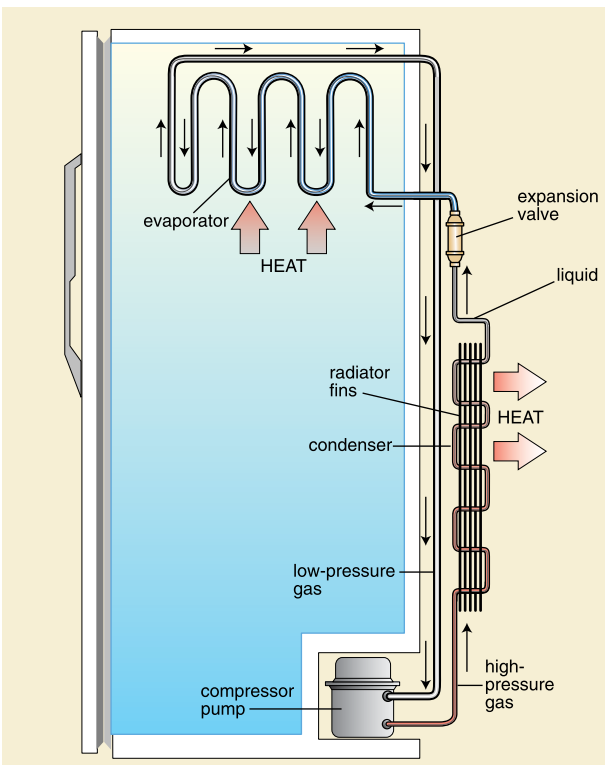
Reform Bill of 1884–85 British parliamentary act that gave the vote to agricultural workers. In 1885 the Redistribution Act equalized representation on the basis of 50,000 voters for each member of parliament. Together the two acts tripled the electorate and prepared the way for universal male suffrage.

Reform Judaism Religious movement that has modified or abandoned many traditional Jewish beliefs and practices in an effort to adapt Judaism to the modern world. It originated in Germany in 1809 and spread to the U.S. in the 1840s under the leadership of Rabbi ISAAC MAYER WISE. Reform Judaism permits men and women to sit together in the synagogue, incorporates choir and organ music in the service, holds a confirmation ceremony for girls parallel to the boys' BAR MITZVAH, and does not observe daily public worship, strict dietary laws, or the restriction of normal activities on the SABBATH. Its principles, initially enunciated in the PITTSBURGH PLATFORM (1885), were revised in the COLUMBUS PLATFORM (1937) to support traditional customs and ceremonies and the liturgical use of Hebrew. The Reform movement continues to move toward ORTHODOX JUDAISM without embracing all its strictures.

Reform Party Political movement in Canada in the 1830s and '40s. Reformers in Upper Canada (later Ontario) led by ROBERT BALDWIN urged that provincial governments be made accountable to elected legislative assemblies ("responsible government"). An extremist group led by WILLIAM L. MACKENZIE opposed the government in the rebellion of 1837. Reformers in Lower Canada (later Quebec) joined LOUIS PAPINEAU and his Patriote Party. Reform Party candidates were elected premier (1842–43, 1848–54) in the province of Canada (union of Upper and Lower Canada). In the 1850s the party split between a moderate group, which allied with JOHN MACDONALD'S PROGRESSIVE CONSERVATIVE PARTY, and a radical faction, the CLEAR GRITS, from which the LIBERAL PARTY emerged.

Reforma, La (1854–76) Liberal political and social revolution in Mexico under the principal leadership of BENITO JUÁREZ. It began with the removal of the dictator ANTONIO SANTA ANNA and went on to abolish special privileges of the church and the military, confiscate church lands, suppress monasteries, institute civil marriage, establish a liberal federalist constitution, and place the army under civilian control. Confiscated church property was to be allocated to the landless, but this policy proved to be La Reforma's outstanding failure; in fact, the number and wealth of large landholders increased. La Reforma came to a close when PORFIRIO DÍAZ seized power in 1876.

Reformation *or* **Protestant Reformation** Break with ROMAN CATHOLICISM and the establishment of Protestant churches in the 16th century. Though reformers such as JAN HUS and JOHN WYCLIFFE attacked abuses in the Roman Catholic church in the late medieval period, the Reformation is usually dated from 1517, when, according to tradition, MARTIN LUTHER posted his NINETY-FIVE THESES on the church door in Wittenberg. Various Protestant denominations were soon founded by more radical reformers, such as HULDRYCH ZWINGLI and the ANABAPTISTS. JOHN CALVIN established a theocracy in Geneva after his conversion to the Protestant cause. The Reformation spread to other European countries and soon dominated northern Europe. Spain and Italy remained resistant to Protestantism and became centres of the COUNTER-REFORMATION. In England, where HENRY VIII founded the Church of ENGLAND in 1534, the Reformation's roots were primarily political rather than religious, motivated by the pope's refusal to grant Henry a divorce. In Scotland the Calvinist JOHN KNOX led in the establishment of the Presbyterian church (see PRESBYTERIANISM).



Reformed church Any of several Protestant groups strongly influenced by CALVINISM. They are often called by national names (Swiss Reformed, Dutch Reformed, etc.). The name was originally used by all the Protestant churches that arose out of the 16th-century REFORMATION but was later confined to the Calvinistic churches of continental Europe, most of which use a Presbyterian form of church government. The Calvinistic churches of the British Isles became known as Presbyterian churches (see PRESBYTERIANISM).

refraction Change in direction of a WAVE as it leaves one medium and enters another. Waves, such as sound and light waves, travel at different speeds in different media. When a wave enters a new medium at an angle of less than 90°, the change in speed occurs sooner on one side of the wave than on the other, causing the wave to bend, or refract. When water waves approach shallower water at an angle, they bend and become parallel to the shore. Refraction explains the apparent bending of a pencil when it is partly immersed in water and viewed from above the surface. It also causes the optical illusion of the MIRAGE.

refractory Material that is not deformed or damaged by high temperatures, used to make CRUCIBLES, incinerators, insulation, and furnaces, particularly metallurgical furnaces. Refractories are produced in several forms: molded bricks of various shapes, bulk granular materials, plastic mixtures consisting of moistened aggregates that are rammed into place, castables composed of dry aggregates and a binder that can be mixed with water and poured like concrete, and mortars and cements for laying brickwork.

refrigeration Process of removing HEAT from an enclosed space or from a substance in order to lower the temperature. In industrialized nations and prosperous regions in the developing world, refrigeration is used chiefly to store foodstuffs at low temperatures, thus inhibiting the destructive action of bacteria, yeasts, and molds. Many perishable products can be frozen, permitting them to be kept for months and even years with little loss in nutrition or flavour or change in appearance. See also AIR-CONDITIONING; COOLING SYSTEM; HEAT EXCHANGER.

Components of a refrigerator. A compressor pressurizes the refrigerant gas, heating it and forcing it through the system. The gas cools and liquefies in the condenser, giving up its heat to the outside air. The liquid's pressure is lowered when it passes through an expansion valve, and there is an associated further drop in temperature. The cold liquid then passes into the evaporator coils, where heat drawn from the warmer refrigerator compartment causes it to vaporize. The gas is then returned to the compressor to repeat the cycle.

refugee Person involuntarily displaced from his or her homeland. Until the late 19th century and the emergence of fixed and closed national boundaries, refugees were always absorbed by neighbouring countries. Later, immigration restrictions and increasing numbers of refugees necessitated special action to aid them. In 1921 FRIDTJOF NANSEN created a League of Nations Passport to allow refugees to move freely across national boundaries. Refugee status at that time was accorded only if the migrant's departure was involuntary and asylum was sought in another country. In 1938 the definition of refugee was expanded to include persons with a well-founded fear of persecution because of ethnicity, religion, nationality, group membership, or political opinion. Later the definition was expanded again to include persons who have fled from their homes to other places in their own countries. Refugee status ceases to apply when the migrant either is resettled or returns home. At the beginning of the 21st century there were some 16 million refugees, including nearly 4 million Palestinians; much of the rest of the world's refugees were in Asia (particularly Afghanistan) and Africa, though conflict in the former Yugoslavia and elsewhere in post-Cold War Europe significantly increased the number of refugees in those regions. See also INTERNATIONAL REFUGEE ORGANIZATION; Office of the UNITED NATIONS HIGH COMMISSIONER FOR REFUGEES; UNITED NATIONS RELIEF AND REHABILITATION ADMINISTRATION.

Refusés, Salon des See SALON DES REFUSÉS

Régence style \rā-'zhäⁿs\ French style in the decorative arts that developed c. 1710–1730, when Philippe II, duc d'Orléans, was regent of France. It marks the transition from the massive rectilinear forms of furniture in the LOUIS XIV STYLE to the ROCOCO forms of LOUIS XV STYLE. In reaction against the pomposity of Louis XIV's court, smaller, more intimate rooms replaced formal state apartments and called for a more graceful style. The delicately styled Régence furniture replaced heavy, carved ornamentation with flat, curving motifs, often foliage and bouquets framed by flowing ribbons and bows. Walnut, rosewood, and mahogany supplied rich but tasteful contrasts in veneering. Intricate tracery in brass and tortoiseshell marquetry on ebony was adapted to the new taste. The commode and writing table were introduced during this period.

Regency style Style in the decorative arts and architecture produced in England during the regency (1811–20) and reign (1820–30) of GEORGE IV. Designers borrowed both structural and ornamental elements from Greek and Roman antiquity. Egyptian motifs, inspired by Napoleon's Egyptian campaign of 1798, became part of the Regency fashion. A resurgence of a taste for CHINOISERIE is seen in imitation bamboo and in "japanned" lacquerwork. The prince's taste for French furniture popularized pieces ornamented with brass marquetry in the French style. Ornamentation relied on rich contrasts of exotic wood veneers and application of metal or painting rather than extensive carving.

Reger \'rā-gər**, (Johann Baptist Joseph) Max(imilian)** (b. March 19, 1873, Brand, Bavaria, Ger.—d. May 11, 1916, Leipzig) German composer and organist. From 1890 to 1893 he studied at Sondershausen and Wiesbaden and taught piano, organ, and theory. By 1901, despite opposition to his traditional methods, he had established himself in Munich as a composer, pianist, and teacher. He became a prolific composer of songs, piano pieces, and especially organ music. His music, combining progressive and conservative elements and often highly chromatic, has always been more popular in Germany than elsewhere.

reggae \'re-gā\ Jamaican popular music and dance style. It originated in the mid-1960s as a music of the Jamaican poor, reflecting social discontent and the RASTAFARIAN movement. Its instrumentation features an electric bass played at high volume as a lead instrument, around which an ensemble of organ, piano, drums, and lead and rhythm electric guitars plays short ostinato phrases with regular accents on the offbeats. Reggae was popularized in the U.S. by the film *The Harder They Come* (1973), starring the singer Jimmy Cliff, and through tours by BOB MARLEY and the Wailers and by Toots (Hibbert) and the Maytals, whose influence was felt among white rock musicians.

Reggio di Calabria \'red-jō-dē-kä-'lä-brē-ə\ *ancient* **Rhegium** City (pop., 2001 prelim.: 179,384), capital of Reggio di Calabria province and former capital (until 1971) of Calabria region, southern Italy. A Greek colony founded on the Strait of MESSINA at the end of the 8th century BC, it was allied with Athens in the 5th century BC and with Rome c. 280 BC. From the 5th century AD it was ruled successively by the Visigoths, Ostrogoths, Byzantines, and Arabs. It was conquered by the Normans under ROBERT GUISCARD c. 1060 and became part of the Kingdom of the TWO SICILIES. Destroyed many times by Muslim invaders and by earthquakes, it has repeatedly been rebuilt. It is a tourist resort and seaport that exports dried herbs and essential oils for the perfume and pharmaceutical industries.

© 2006 Encyclopædia Britannica, Inc.

regiment In most armies, a body of troops headed by a colonel and divided into companies, BATTALIONS, or squadrons. French CAVALRY units were called regiments as early as 1558. In early U.S. service, as in European armies up to that time, the usual number of companies in a regiment was 10. Early in the 19th century, NAPOLEON divided the regiments of the French army into three battalions each, and in 1901 the U.S. Army adopted the three-battalion INFANTRY regimental system.

Regina \ri-ˈjī-nə\ City (pop., 2001: 178,225), capital of Saskatchewan, Canada. It is located on the Wascana Creek in the south-central part of the province. Regina originated as a hunting camp and was known as Pile O'Bones for the heaps of bones left there after skinning and cutting buffalo. It was the administrative headquarters of the Northwest Territories 1882–1905, then it became the provincial capital. It was the headquarters of the ROYAL CANADIAN MOUNTED POLICE until 1920. After World War II the city expanded rapidly to become an important transportation, manufacturing, and distributing centre for a vast agricultural area. Local mineral resources and fertile prairies support an economy based largely on oil, natural gas, potash refining, and food processing.

regional development program Any government program designed to encourage the industrial and economic development of regions beset by joblessness or other economic hardship. Most industrialized countries have adopted some type of regional development program since World War II. The most common method of encouraging development is to offer grants, loans, and loan guarantees to companies relocating or expanding in the region. France, for example, has offered SUBSIDIES related to the amount of investment and the number of new jobs created, as well as loans, interest subsidies, and free land sites. Tax incentives are also used to encourage companies to invest in depressed areas. In other programs, the government may offer low-cost housing for workers and assistance in developing power, light, transportation, and sanitation facilities. See also DEVELOPMENT BANK.

regression In statistics, a process for determining a line or curve that best represents the general trend of a data set. Linear regression results in a line of best fit, for which the sum of the squares of the vertical distances between the proposed line and the points of the data set are minimized (see LEAST SQUARES METHOD). Other types of regression may be based on higher-degree POLYNOMIAL functions or EXPONENTIAL FUNCTIONS. A quadratic regression, for example, uses a quadratic function (second-degree polynomial function) to produce a PARABOLA of best fit.

regressive tax Tax levied at a rate that decreases as its base increases. Regressivity is considered undesirable because poorer people pay a greater percentage of their income in tax than wealthier people. CONSUMPTION TAXES and SALES TAXES are usually considered regressive because of their set rate structures. Tobacco, gasoline, and liquor sales taxes, all major sources of tax revenue, are the most regressive taxes. In an effort to limit regressivity, a number of U.S. states have exempted medicine and grocery items from sales tax. Although the PROPERTY TAX is sometimes judged regressive because poorer people spend a larger percentage of their income on housing than wealthier people, property taxes are nonetheless effective in redistributing wealth from higher to lower income groups. See also PROGRESSIVE TAX.

Regulators of North Carolina (1764–71) Vigilance group formed in the western frontier counties of North Carolina. Opposed to the high taxes and corruption of the colonial government, the group sought vainly to obtain reforms; it then refused to pay taxes, agitated against public officials, and committed acts of violence. Gov. William Tryon sent troops to crush the insurrection at the Battle of Alamance (1771). The leaders were hanged for treason, and many followers fled to Tennessee, where they sided with the LOYALISTS in the AMERICAN REVOLUTION.

regulatory agency Independent government commission charged by the legislature with setting and enforcing standards for specific industries in the private sector. The concept was invented by the U.S. government in 1887, and regulatory agencies exist almost exclusively in the U.S. The theory is that a commission of experts on the industry being regulated is better equipped to regulate it than the legislature or executive departments. Designed to operate with a minimum of executive or legislative supervision, agencies have executive, legislative, and judicial functions, and their regulations have the force of law. Important regulatory agencies include the FOOD AND DRUG ADMINISTRATION, OSHA, the Federal Communications Commission, and the SECURITIES AND EXCHANGE COMMISSION.

Rehnquist \ˈren-ˌkwist**, William H(ubbs)** (b. Oct. 1, 1924, Milwaukee, Wis., U.S.—d. Sept. 3, 2005, Arlington, Va.) U.S. jurist who served as chief justice of the United States (1986–2005). He received his law degree from Stanford University and served as clerk to Supreme Court justice ROBERT JACKSON. He later practiced law in Phoenix, Ariz. (1953–69), where he became active in the conservative wing of the Republican Party. At the U.S. Justice Department (1969–71), he opposed civil rights legislation and advocated greatly enlarged police powers. He was nominated for the Supreme Court by Pres. RICHARD NIXON in 1972. During the 1970s and into the '80s, Rehnquist formed the anchor of the court's conservative minority bloc. His polished legal opinions and consistently conservative stance on almost all legal issues led Pres. RONALD REAGAN to appoint him chief justice in 1986. Rehnquist dramatically reduced the court's caseload and improved its efficiency. With the support of other conservatives, he led the court in curbing the ability of Congress to expand federal authority and in curtailing AFFIRMATIVE ACTION programs. He presided over the U.S. Senate during the impeachment trial of Pres. BILL CLINTON (1999).

Reich \ˈrīk**, Steve** *orig.* **Stephen Michael Reich** (b. Oct. 3, 1936, New York, N.Y., U.S.) U.S. composer. He majored in philosophy at Cornell University. After musical study with DARIUS MILHAUD and LUCIANO BERIO, he pursued interests in Balinese and African music, learning drumming in Ghana. His early music explored the process of simultaneous repeated patterns gradually slipping out of phase ("process music"). With Terry Riley (b. 1935) and PHILIP GLASS, he was among the most prominent of the early "minimalists" of the 1970s. His early works include *Drumming* (1971) and *Music for 18 Musicians* (1976); later works such as *The Desert Music* (1983) and *Different Trains* (1988) show a considerably expanded compositional vocabulary.

Reich \ˈrīk**, Wilhelm** (b. March 24, 1897, Dobrzcynica, Galicia, Austria-Hungary—d. Nov. 3, 1957, Lewisburg, Pa., U.S.) Austrian-U.S. psychologist. Trained at the Berlin Psychoanalytic Institute, he joined the faculty of the Vienna Psychoanalytic Institute in 1924. In *The Function of the Orgasm* (1927), he argued that the failure to achieve orgasm could produce neurosis. An advocate of sexual education and freedom as well as of radical left-wing politics, he left Germany in 1933 and settled in the U.S. in 1939. After breaking with the psychoanalytic movement in 1934, he developed a pseudoscientific system called orgonomy. He conceived of mental illness and some physical illnesses as deficiency of cosmic energy (measured in units called "orgones"), which he treated by placing the patient in a cabinet with reflective inner surfaces known as the orgone box. Reich's views brought him into conflict with U.S. authorities in the early 1950s; he was convicted of contempt of court and died in prison.

Reichstag \ˈrīks-ˌtäk\ **fire** (Feb. 27, 1933) Burning of the German parliament building (Reichstag) in Berlin. Allegedly set by a Dutch communist, the fire was used by ADOLF HITLER to turn public opinion against his opponents, especially the communists. He enacted a decree suspending constitutional protection of personal rights, which effectively began the NAZI PARTY dictatorship. The fire was widely believed to have been set by the Nazis themselves, while others have argued there was no proof of Nazi complicity; it remains the subject of debate and research.

Reid, Thomas (b. April 26, 1710, Kincardineshire, Scot.—d. Oct. 7, 1796, Glasgow) Scottish philosopher. He served as a Presbyterian pastor from 1737 to 1751. His lengthy studies of DAVID HUME convinced him that Hume's SKEPTICISM was false, because it was incompatible with common sense. According to Reid, both human behaviour and ordinary language provide overwhelming evidence to support the reality of a material world and the existence of an enduring self as the subject of continuously changing mental experience. His works include *An Inquiry into the Human Mind* (1764), *Essays on the Intellectual Powers of Man* (1785), and *Essays on the Active Power of Man* (1788).

Reign of Terror *French* **La Terreur** (1793–94) Period in the FRENCH REVOLUTION. It was established by the government on Sept. 5, 1793, to take harsh measures against those suspected of being enemies of the Revolution (including nobles, priests, and hoarders). Controlled by the radical COMMITTEE OF PUBLIC SAFETY and MAXIMILIEN ROBESPIERRE, the Terror eliminated enemies on the left (JACQUES HÉBERT and his followers) and the right (GEORGES DANTON and the Indulgents). A law passed in June 1794 that suspended a suspect's right to public trial or legal defense caused the THERMIDORIAN REACTION, and the Terror ended on July 27, 1794, with Robespierre's overthrow. About 300,000 suspects were arrested during the period; about 17,000 were executed, and many others died in prison.

Reims *or* **Rheims** \ˈrēmz,\ *French* \ˈrᵉⁿs\ City (pop., 1999: 187,206), northeastern France. The ancient capital of the Gallic tribe of the Remi, it was conquered by the Romans. In the 5th century the Frankish king Clovis was baptized there, and in honour of this occasion most later French kings were crowned in Reims. The city was badly damaged in World Wars I and II and was the scene of Germany's unconditional surrender in May 1945. It is a major wine-producing centre noted especially for champagne. Other industries include aircraft and automobile equipment manufacturing. The 13th-century cathedral of Notre-Dame is one of the most notable Gothic cathedrals in France.

The cathedral of Notre-Dame, Reims, Fr.
PAUL ALMASY

reincarnation *or* **transmigration of souls** *or* **metempsychosis** Doctrine of the rebirth of the soul in one or more successive existences, which may be human, animal, or vegetable. Belief in reincarnation is characteristic of Asian religions, especially Hinduism, Jainism, Buddhism, and Sikhism. All hold to the doctrine of karma, the belief that actions in this life will have their effect in the next. In Hinduism, a person may be freed from the cycle of birth and rebirth only by reaching a state of enlightenment. Likewise in Buddhism, discipline and meditation may enable a seeker to reach nirvana and escape the wheel of birth and rebirth. Manichaeism and Gnosticism accepted the concept of reincarnation, as do such modern spiritual movements as Theosophy.

reindeer Any species of Arctic deer in the genus *Rangifer* (family Cervidae), especially Old World species, some of which are domesticated. New World species are usually called caribou. The reindeer herded by the Sami (Lapps) are used as draft and pack animals and as a source of meat and milk; their skins are used for tents, boots, and other clothing. In Siberia they are used as pack animals and as mounts.

Reiner, Carl (b. March 20, 1922, Bronx, New York, N.Y., U.S.) U.S. actor, writer, director, and producer. He acted on the stage before appearing with Sid Caesar in the television comedy series *Your Show of Shows* (1950–54). He created and produced *The Dick Van Dyke Show* (1961–66), for which he won several Emmy Awards. His novel *Enter Laughing* (1958) was adapted as a play (1963) and a movie (1967). He directed film comedies such as *Where's Poppa* (1970), *Oh, God!* (1977), and *Fatal Instinct* (1993). His son Rob Reiner (b. 1945) acted in various television series, including *All in the Family* (1971–78), and became a director of note.

Reiner \ˈrī-nər**, Fritz** (b. Dec. 19, 1888, Budapest, Austria-Hungary—d. Nov. 15, 1963, New York, N.Y., U.S.) Hungarian-born U.S. conductor. After piano studies with Béla Bartók, he conducted opera in Budapest (1911–14) and Dresden (1914–22). In 1922 he immigrated to the U.S., where he conducted orchestras in Cincinnati (1922–31) and Pittsburgh (1938–48). From 1953 to 1962 he led the Chicago Symphony Orchestra, which under Reiner first won international acclaim. He also taught conducting at the Curtis Institute (Leonard Bernstein was among his students). A stern taskmaster, he inspired devotion on the part of many players.

reinforced concrete Concrete in which steel is embedded in such a manner that the two materials act together in resisting forces. The reinforcing steel—rods, bars, or mesh—absorbs the tensile, shear, and sometimes the compressive stresses in a concrete structure. Plain concrete does not easily withstand tensile and shear stresses caused by wind, earthquakes, vibrations, and other forces and is therefore unsuitable in most structural applications. In reinforced concrete, the tensile strength of steel and the compressive strength of concrete work together to allow the member to sustain these stresses over considerable spans. The invention of reinforced concrete in the 19th century revolutionized the construction industry, and concrete became one of the world's most common building materials.

Reinhardt, Ad(olf Frederick) (b. Dec. 24, 1913, Buffalo, N.Y., U.S.—d. Aug. 30, 1967, New York, N.Y.) U.S. painter. He studied art after graduating from Columbia University. He employed several abstract styles in the 1930s and '40s, but by the early 1950s he had restricted his works to monochrome paintings incorporating symmetrically placed squares and oblong shapes against backgrounds of similar colour, in which drawing, line, brushwork, texture, light, and most other visual elements were suppressed. He explained his style as a conscious search for an art that would be entirely separate from life. He influenced the Minimalist movement of the 1960s, more as a polemicist than as a painter.

Reinhardt, Django *orig.* **Jean-Baptiste Reinhardt** (b. Jan. 23, 1910, Liberchies, Belg.—d. May 16, 1953, Fontainebleau, France) Belgian-French guitarist. Of Roma (Gypsy) parentage, Reinhardt learned guitar at an early age, adapting his technique to accommodate the loss of the use of two fingers burned in a caravan fire in 1928. With jazz violinist Stéphane Grappelli (1908–97), he formed the Quintette du Hot Club de France in 1934. He toured the U.S. with Duke Ellington in 1946. Reinhardt was one of the first important guitar soloists in jazz; his blend of swing and the Roma musical tradition as well as his unconventional technique made him a unique and legendary figure.

Django Reinhardt, 1947

Reinhardt, Max *orig.* **Max Goldmann** (b. Sept. 9, 1873, Baden, near Vienna, Austria—d. Oct. 31, 1943, New York, N.Y., U.S.) German theatrical director. After studying drama in Vienna and acting in Salzburg, he joined Otto Brahm's company in Berlin in 1894. Reinhardt directed his first play in 1902 and managed a small theatre from 1903. He had directed more than 40 plays by 1905, when he became famous for his creative staging of Shakespeare's *A Midsummer Night's Dream*. He bought Berlin's Deutsches Theater and remodeled it with the latest innovations in scenic design and lighting. Known for the extravagant theatricality and stunning visual effects of his productions, he won much praise for his staging of the religious spectacle *The Miracle* (1911). In 1920 he cofounded the Salzburg Festival, where he staged *Jedermann* (an adaptation of *Everyman*) in the cathedral square. He left Germany in 1933 and eventually settled in the U.S. A major influence on 20th-century drama, he helped increase the creative authority of the director.

Reinsurance Treaty (June 18, 1887) Secret agreement between Germany and Russia. Arranged by Otto von Bismarck after the collapse of the Three Emperors' League, it provided that each party would remain neutral if either became involved in a war with a third nation, and that this would not apply if Germany attacked France or if Russia attacked Austria. Germany acknowledged the Russian sphere of influence in Bulgaria. After the treaty was not renewed in 1890, a Franco-Russian alliance began to take shape.

Rejang River See Rajang River

relapsing fever Infectious disease with recurring fever, caused by several spirochetes of the genus *Borrelia*, transmitted by lice, ticks, and bedbugs. Onset is sudden, with high fever, which breaks within a week with profuse sweating. Symptoms return about a week later. There may be 2 to 10 relapses, usually decreasing in severity. Mortality usually ranges from 0 to 6%, up to 30% in rare epidemics. Central nervous system involvement causes various (usually mild) neurological symptoms. The first microscopic organisms clearly associated with serious human disease (1867–68), the spirochetes mutate repeatedly, changing their antigens so that the host's immunity no longer is effective, which produces the relapses. Antibiotics can be effective, but inadequate therapy may leave spirochetes alive in the brain, and they may reinvade the bloodstream.

relation In logic, a relation R is defined as a set of ordered pairs, triples, quadruples, and so on. A set of ordered pairs is called a two-place (or dyadic) relation; a set of ordered triples is a three-place (or triadic) relation; and so on. In general, a relation is any set of ordered n-tuples of objects. Important properties of relations include symmetry, transitivity, and reflexivity. Consider a two-place (or dyadic) relation R. R can be said to be symmetrical if, whenever R holds between x and y, it also holds

© 2006 Encyclopædia Britannica, Inc.

between y and x (symbolically, (∀x) (∀y) [Rxy ⊃ Ryx]); an example of a symmetrical relation is "x is parallel to y." R is transitive if, whenever it holds between one object and a second and also between that second object and a third, it holds between the first and the third (symbolically, (∀x) (∀y) (∀z) [(Rxy ∧ Ryz) ⊃ Rxz]); an example is "x is greater than y." R is reflexive if it always holds between any object and itself (symbolically, (∀x) Rxx); an example is "x is at least as tall as y" since x is always also "at least as tall" as itself.

relational database DATABASE in which all data are represented in tabular form. The description of a particular entity is provided by the set of its attribute values, stored as one row or record of the table, called a tuple. Similar items from different records can appear in a table column. The relational approach supports queries that involve several tables by providing automatic links across tables. Payroll data, for example, can be stored in one table and personnel benefits data in another; complete information on an employee can be obtained by joining the tables on employee identification number. In more powerful relational data models, entries can be programs, text, unstructured data in the form of binary large objects (BLOBs), or any other format the user requires. The relational approach is currently the most popular model for DATABASE MANAGEMENT SYSTEM. See also OBJECT-ORIENTED PROGRAMMING.

relative density See SPECIFIC GRAVITY

relativism Any view that maintains that the truth or falsity of statements of a certain class depends on the person making the statement or upon his circumstances or society. Historically the most prevalent form of relativism has been See also ETHICAL RELATIVISM.

relativity Concept in physics that measurements change when considered by observers in various states of motion. In classical physics, it was assumed that all observers anywhere in the universe would obtain identical measurements of space and time intervals. According to relativity theory, this is not so; all measurements depend on the relative motions of the observer and the observed. There are two distinct theories of relativity, both proposed by ALBERT EINSTEIN. The special theory of relativity (1905) developed from Einstein's acceptance that the speed of LIGHT is the same in all REFERENCE FRAMES, irrespective of their relative motion. It deals with nonaccelerating reference frames, and is concerned primarily with electric and magnetic phenomena and their propagation in space and time. The general theory (1916) was developed primarily to deal with GRAVITATION and involves accelerating reference frames. Both theories are major milestones in the history of modern physics. See also EQUIVALENCE PRINCIPLE, SPACE-TIME.

relay race Race between teams in which each team member successively covers a specified portion of the course. In track events, such as the 4 × 100-m and 4 × 400-m relays, the runner finishing one leg passes a baton to the next runner while both are running within a marked exchange zone. In swimming competitions, such as the 4 × 100-m and 4 × 200-m freestyle races and the 4 × 100-m medley, the swimmer completing one leg touches the edge of the pool to signal the start of the next teammate's leg.

relief *or* **rilievo** \ril-'ye-vō\ (from Italian, *rilievare*: "to raise") In sculpture, any work in which the figures project from a supporting background, usually a plane surface. Basreliefs ("low reliefs"), in which the design projects only slightly, were common on the walls of stone buildings in ancient Egypt, Assyria, and elsewhere in the Middle East. High reliefs, in which the forms project at least half or more of their natural circumference, were first employed by the ancient Greeks. Italian Renaissance sculptors combined high and low relief in strikingly illusionistic compositions, as in LORENZO GHIBERTI's bronze doors in Florence. Baroque sculptors continued these experiments, often on a larger scale (e.g., ALESSANDRO ALGARDI's *Meeting of Attila and Pope Leo*, 1646–53). The dramatic possibilities of the Renaissance concept of relief were later notably employed by FRANÇOIS RUDE (*The Marseillaise*, 1833–36) and AUGUSTE RODIN (*The Gates of Hell*).

relief Public or private aid to people in economic need because of natural disasters, wars, economic upheaval, chronic unemployment, or other conditions that prevent self-sufficiency. A distinction may be drawn between relief targeting upheavals and natural disasters and relief of chronic social conditions, now usually referred to as WELFARE. In 17th-century China the government maintained EVER-NORMAL GRANARIES for use in the event of famine. Through the 19th century, disaster relief in Europe consisted largely of emergency grants of food, clothing, and medical care through hastily organized local committees. In the 20th century, disaster relief became one of the chief activities of the International RED CROSS and other international agencies. Assistance to the needy from public funds has traditionally been strictly limited; in England, the Poor Law Reform Act of 1834 required people able to work to enter a workhouse in order to receive public assistance. The U.S. government responded to the Great Depression with the NEW DEAL, which emphasized work relief programs such as the WORKS PROGRESS ADMINISTRATION. In the later 20th century, the work requirement was abandoned in most countries, and the needy received direct cash payments, though in the U.S. the movement for welfare reform resulted in the passage in 1996 of "workfare" laws cutting off relief for most able-bodied welfare recipients who failed to find a job or perform community service.

relief printing See LETTERPRESS PRINTING

religion Relation of human beings to God or the gods or to whatever they consider sacred or, in some cases, merely supernatural. Archaeological evidence suggests that religious beliefs have existed since the first human communities. They are generally shared by a community, and they express the communal culture and values through myth, doctrine, and ritual. Worship is probably the most basic element of religion, but moral conduct, right belief, and participation in religious institutions also constitute elements of the religious life. Religions attempt to answer basic questions intrinsic to the human condition (Why do we suffer? Why is there evil in the world? What happens to us when we die?) through the relationship to the sacred or supernatural or (e.g., in the case of BUDDHISM) through perception of the true nature of reality. Broadly speaking, some religions (e.g., JUDAISM, CHRISTIANITY, and ISLAM) are outwardly focused, and others (e.g., JAINISM, Buddhism) are inwardly focused.

religion, philosophy of Branch of philosophy that studies key metaphysical and epistemological concepts, principles, and problems of religion. Topics considered include the existence and nature of God, the possibility of knowledge of God, human freedom (the FREE WILL PROBLEM), immortality, and the problems of moral and natural evil and suffering. Natural THEOLOGY is the attempt to establish knowledge of God without dependence on revelation. Traditional arguments for the existence of God include the ONTOLOGICAL ARGUMENT, the COSMOLOGICAL ARGUMENT, and the ARGUMENT FROM DESIGN.

Religion, Wars of (1562–98) Conflicts in France between Protestants and Catholics. The spread of French CALVINISM persuaded the French ruler CATHERINE de Médicis to show more tolerance for the HUGUENOTS, which angered the powerful Catholic de GUISE family. Its partisans massacred a Huguenot congregation at Vassy (1562), causing an uprising in the provinces. Many inconclusive skirmishes followed, and compromises were reached in 1563, 1568, and 1570. After the murder of the Huguenot leader GASPARD II DE COLIGNY in the Massacre of SAINT BARTHOLOMEW'S DAY (1572), the civil war resumed. A peace compromise in 1576 allowed the Huguenots freedom of worship. An uneasy peace existed until 1584, when the Huguenot leader Henry of Navarra (later HENRY IV) became heir to the French throne. This led to the War of the THREE HENRYS and later brought Spain to the aid the Catholics. The wars ended with Henry's embrace of Catholicism and the religious toleration of the Huguenots guaranteed by the Edict of NANTES (1598).

Religious Science Movement founded in the U.S. by Ernest Holmes (1887–1960). After publishing his major work, *The Science of the Mind* (1926), Holmes established the Institute of Religious Science and Philosophy (1927). In 1949 Religious Science was established as a denomination; it soon split into two groups. It teaches that the individual mind and the Universal Mind are one and that the universe is the material manifestation of the Universal Mind. Like NEW THOUGHT, it teaches that evil stems from

ignorance of humanity's true higher identity and that prayer can bring about healing not only of spiritual but of physical ailments.

Remagen \'rä-ˌmäg-ᵊn\ Town (pop., 2002 est.: 16,134), western Germany. Located on the left bank of the Rhine River, southeast of Bonn, it originated as a Roman fortress and still has Roman remains. During World War II its railroad bridge was the site where Allied troops forced a crossing of the Rhine (1945) for the first time in the war.

Remak \'rä-ˌmäk**, Robert** (b. July 26, 1815, Posen, Prussia—d. Aug. 29, 1865, Kissingen, Bavaria) German embryologist and neurologist. He discovered and named the three germ layers of cells that develop in the early embryo: the ectoderm, mesoderm, and endoderm. He also discovered Remak fibres (nerve fibres with no myelin sheath) and Remak ganglia (neurons in the heart) and was a pioneer in electrotherapy for nervous diseases. He achieved enough eminence to obtain a lectureship at the University of Berlin despite Prussian laws barring Jews from teaching.

remanent magnetism See PALEOMAGNETISM

Remarque \rə-'märk**, Erich Maria** *orig.* **Erich Paul Kramer** (b. June 22, 1898, Osnabrück, Ger.—d. Sept. 25, 1970, Locarno, Switz.) German-born U.S.-Swiss novelist. Drafted into the German army at age 18, he served in World War I and was wounded several times. He is chiefly remembered for *All Quiet on the Western Front* (1929), a brutally realistic account of the daily routine of ordinary soldiers and perhaps the best-known and most representative novel about that war. He moved to the U.S. in 1939 and became a U.S. citizen but settled in Switzerland after World War II. His other works include *The Road Back* (1931), *Arc de Triomphe* (1946; film, 1948), and *The Black Obelisk* (1956).

Rembrandt (Harmenszoon) van Rijn \rīn\ (b. July 15, 1606, Leiden, Neth.—d. Oct. 4, 1669, Amsterdam) Dutch painter and etcher. The son of a prosperous miller in Leiden, he was apprenticed to masters there and in Amsterdam. His early works show the spotlight effects of light and shadow that were to dominate his later works. After moving to Amsterdam in 1631, he quickly became the city's most fashionable portrait painter, and in 1632 he was commissioned to paint the celebrated *Anatomy Lesson of Dr. Nicolaes Tulp*. Yearning for recognition as a biblical and mythological painter, in 1635 he produced his *Sacrifice of Isaac* and in 1636 the unconventional masterpiece *Danaë*. In 1634 he married Saskia van Uylenburgh, a woman of property, and he painted many tender pictures of her until 1642, when Saskia died. That same year he completed his largest painting, the extraordinary but controversial *The Militia Company of Captain Frans Banning Cocq* (known as *The Night Watch*), which was a watershed in his life and art. His portrait commissions thereafter declined and he turned increasingly to etchings and biblical subjects. His *Christ at Emmaus* (1648) exemplifies the quiet dignity and vulnerability of his later spirituality. In 1656, after transferring most of his property to his son, he applied for bankruptcy. In his last decade he treated biblical subjects like portraits, and also did a wealth of self-portraits; many of these paintings evoke a timeless world of quiet, deep emotion. His paintings are characterized by luxuriant brushwork, rich colour, and a mastery of chiaroscuro. The silent human figure, Rembrandt's central subject, contributes to the sense of a shared dialogue between viewer and picture, the foundation of Rembrandt's greatness and of his popularity today.

Remington, Eliphalet (b. Oct. 28, 1793, Suffield, Conn., U.S.—d. Aug. 12, 1861, Ilion, N.Y.) U.S. firearms manufacturer and inventor. The son of a blacksmith, he grew up on his father's farm near Utica, N.Y., where he made his first FLINTLOCK rifle (1816). In 1828 he built a large arms factory at present-day Ilion, N.Y. He and his son Philo improved arms manufacture with the reflection method of straightening gun barrels and the first successful cast-steel, drilled rifle barrel made in the U.S. In 1847 he supplied the U.S. Navy with its first breech-loading rifle. His Remington Arms Co. made small arms for the U.S. government during the American Civil War and World Wars I and II.

Remington, Frederic (b. Oct. 4, 1861, Canton, N.Y., U.S.—d. Dec. 26, 1909, near Ridgefield, Conn.) U.S. painter, illustrator, sculptor, and war correspondent. He studied at Yale University and New York's Art Students League. He traveled widely and specialized in depicting Native Americans, cowboys, soldiers, horses, and other aspects of life in the American West. His work is notable for its rendering of swift action and its accuracy of detail. He covered the Spanish-American War (1898) as a correspondent. The countless reproductions of his works as newspaper engravings brought him wealth and fame.

remora \'re-mə-rə\ *or* **sharksucker** *or* **suckerfish** Any of 8–10 species of marine fishes (family Echeneidae) noted for attaching themselves to, and riding about on, SHARKS, other marine animals, and oceangoing ships. Remoras adhere by means of a flat, oval sucking disk on top of the head. They are thin and dark, 1–3 ft (30–90 cm) long. They live in warm waters worldwide, feeding on the leavings or the external parasites of their hosts.

A remora (*Echeneis naucrates*) and its host, a leopard shark.
DOUGLAS FAULKNER

ren *or* **jen** \'rən\ In CONFUCIANISM, the most basic of all virtues, variously translated as "humaneness" or "benevolence." It originally denoted the kindness of rulers to subjects. CONFUCIUS identified ren as perfect virtue, and MENCIUS made it the distinguishing characteristic of humanity. In NEO-CONFUCIANISM it was a moral quality imparted by Heaven.

Renaissance \'re-nə-ˌsäns\ *French* **"Rebirth"** Late medieval cultural movement in Europe. The Renaissance brought renewed interest in Classical learning and values to Italy and subsequently the rest of western and central Europe from the late 13th to the early 17th century. Attracted by the values and rhetorical eloquence of ancient writers, figures such as PETRARCH, GIOVANNI BOCCACCIO, and LORENZO VALLA rejected medieval SCHOLASTICISM in favour of human-centred forms of philosophy and literature. In northern Europe, DESIDERIUS ERASMUS cultivated Christian HUMANISM, and writers such as FRANÇOIS RABELAIS and WILLIAM SHAKESPEARE produced works that emphasized the intricacies of human character. Inspired by ancient Greece and Rome, Renaissance painters and sculptors took the visible world for their subject and practiced according to mathematical principles of balance, harmony, and perspective. The new aesthetic found expression in the works of Italian artists such as LEONARDO DA VINCI, SANDRO BOTTICELLI, RAPHAEL, TITIAN, and MICHELANGELO, and the Italian city of Florence became the centre of Renaissance art. The term has also been applied to cultural revivals in England in the 8th century, the Frankish kingdoms in the 9th century, and Europe in the 12th century. See also RENAISSANCE ARCHITECTURE.

Renaissance architecture Style of architecture, reflecting the rebirth of Classical culture, that originated in Florence in the early 15th century and spread throughout Europe, replacing the medieval Gothic style. There was a revival of ancient Roman forms, including the column and round arch, the tunnel VAULT, and the dome. The basic design element was the ORDER. Knowledge of CLASSICAL ARCHITECTURE came from the ruins of ancient buildings and the writings of VITRUVIUS. As in the Classical period, proportion was the most important factor of beauty; Renaissance architects found a harmony between human proportions and buildings. This concern for proportion resulted in clear, easily comprehended space and mass, which distinguishes the Renaissance style from the more complex Gothic. FILIPPO BRUNELLESCHI is considered the first Renaissance architect. LEON BATTISTA ALBERTI's *Ten Books on Architecture*, inspired by Vitruvius, became a bible of Renaissance architecture. From Florence the early Renaissance style spread through Italy. DONATO BRAMANTE's move to Rome ushered in the High Renaissance (c. 1500–20). Mannerism, the style of the Late Renaissance (1520–1600), was characterized by sophistication, complexity, and novelty rather than the harmony, clarity, and repose of the High Renaissance. The Late Renaissance also saw much architectural theorizing, with Sebastiano Serlio (1475–1554), Giacomo da Vignola (1507–1573), and ANDREA PALLADIO publishing influential books.

renal cell carcinoma *or* **hypernephroma** Malignant TUMOUR of the cells that cover and line the KIDNEY. It usually affects persons over age 50 who have vascular disorders of the kidneys. It seldom causes pain, unless it is advanced. It may metastasize to other organs (e.g., lungs, liver, brain, bone) and go unrecognized until these secondary tumours cause symptoms. Blood can appear in the urine early on but is painless and usually disregarded. Even when the cancer is in the early stages, X-ray films can show deformity in kidney structures.

renal cyst Any of several types of CYSTS in the KIDNEYS. Some are present at birth; others are caused by tubular obstruction. Large cysts can cause backaches and a dragging sensation. Multiple cysts occur as a result of various disorders, including kidney vascular diseases, lymphatic vessel

© 2006 Encyclopædia Britannica, Inc.

blockage, congenital diseases, and tapeworm infestation. The most serious is medullary cystic disease, which has no warning symptoms but causes ANEMIA, low blood sodium levels, and UREMIA. The kidneys become shrunken, grainy, and scarred. Cysts should usually be checked surgically to rule out cancer. See also UROGENITAL MALFORMATION.

renal failure See KIDNEY FAILURE

renal system See URINARY SYSTEM

Renan \rə-'nä^{n}**, (Joseph-) Ernest** (b. Feb. 28, 1823, Tréguier, France—d. Oct. 2, 1892, Paris) French philosopher, historian, and scholar of religion. He trained for the priesthood but left the Catholic church in 1845, feeling that its teachings were incompatible with the findings of historical criticism, though he retained a quasi-Christian faith in God. His five-volume *History of the Origins of Christianity* (1863–80) includes his *Life of Jesus* (1863); an attempt to reconstruct the mind of Jesus as a wholly human person, it was virulently denounced by the church but widely read by the general public. His later works include the series *History of the People of Israel* (1888–96).

Renan, detail of an oil painting by Léon Bonnat, 1892; in the Musée Renan, Tréguier, Fr.
ARCHIVES PHOTOGRAPHIQUES

renga \'reŋ-ˌgä\ Japanese linked-verse poetry in which two or more poets supply alternating sections of a poem. The form began with the composition of a traditional five-line poem (tanka) by two people. A popular pastime from ancient times, even in remote rural areas, it developed fully in the 15th century. Composition spread to court poets, who drew up "codes" to establish renga as an art. An example of renga is the melancholy *Minase sangin hyakuin* (1488), composed by Iio SŌGI, Shōhaku, and Sōchō. Later the initial verse (*hokku*) of a renga developed into the HAIKU form.

Reni \'rā-nē**, Guido** (b. Nov. 4, 1575, Bologna, Papal States—d. Aug. 18, 1642, Bologna) Italian painter. Apprenticed to the Flemish painter Denis Calvaert at 10, he was later influenced by the novel naturalism of the CARRACCI FAMILY of his native Bologna, the frescoes of RAPHAEL, and ancient Greco-Roman sculpture. He executed many important commissions in Rome, including the celebrated ceiling fresco *Aurora* (1613–14). In his religious and mythological works, he tempered BAROQUE exuberance and complexity with Classical restraint, tender emotion, and delicate colouring. Until JOHN RUSKIN scorned him in the 19th century, he was highly regarded; his status as one of the great painters of the 17th century has since been reestablished.

Renner, Karl (b. Dec. 14, 1870, Unter-Tannowitz, Bohemia, Austria-Hungary—d. Dec. 31, 1950, Doebling, Austria) Austrian chancellor (1918–20, 1945) and president (1945–50). A lawyer, he served in the Reichsrat (lower house) from 1907. He became the first chancellor of the new Austrian republic in 1918 but was unable to prevent territorial losses at the end of World War I. In the 1920s he led the right wing of the Social Democratic Party and in 1938 favoured the ANSCHLUSS with Germany. In 1945 he worked to reestablish Austrian home rule and was elected president of the republic. He wrote numerous works on government and law.

Rennes \'ren\ City (pop., 1999: 206,229), western France. Located at the confluence of the Ille and Vilaine rivers, Rennes was once under Roman occupation. It was the capital of BRITTANY in the Middle Ages and a rival of NANTES. It was the seat of the Brittany parliament from 1561 to 1675. Rennes was almost completely destroyed by fire in 1720 and was rebuilt. It was bombed and partly destroyed in World War II. It is a commercial and industrial city, producing railway equipment, automobiles, and chemicals. It is also the cultural centre of Brittany.

Rennie, John (b. June 7, 1761, Phantassie, East Lothian, Scot.—d. Oct. 4, 1821, London, Eng.) Scottish civil engineer. He built three bridges across the Thames at London: Waterloo Bridge (since replaced), the old Southwark Bridge (1814–19), and the New London Bridge (completed 1831 and since replaced). He worked on extensive drainage projects in the Lincolnshire fens; built the London and East India docks on the Thames; improved naval dockyards at Plymouth, Portsmouth, Chatham, and Sheerness; and began the great breakwater that shelters Plymouth Sound.

Reno \'rē-nō\ City (pop., 2000: 180,480), western Nevada, U.S. It is located on the Truckee River, near the California border, Lake TAHOE, and the SIERRA NEVADA foothills. Until 1900 it was primarily a distribution point, but, after several well-known people were granted divorces or were quickly married there under liberal state laws, it became famous as a busy divorce and marriage centre. It is also a year-round vacation centre. When gambling was legalized in Nevada in 1931, Reno began to attract tourists to its many casinos.

Renoir, Jean (b. Sept. 15, 1894, Paris, France—d. Feb. 12, 1979, Los Angeles, Calif., U.S.) French film director. The son of PIERRE-AUGUSTE RENOIR, he discovered a passion for the cinema while recovering from wounds suffered in World War I. He directed his first film, *La Fille de l'eau*, in 1924. His films, in both silent and later eras, were noted for their deep appreciation for the unpredictability of human character. He cowrote the screenplays for many of his films, including *Boudu Saved from Drowning* (1932), *Madame Bovary* (1934), *The Crime of Monsieur Lange* (1936), and *La Bête humaine* (1938) as well as his two masterpieces, *Grand Illusion* (1937) and *The Rules of the Game* (1939). He lived in the U.S. (1940–51), where he directed *The Southerner* (1945), *The Diary of a Chambermaid* (1946), and *The River* (1951).

Jean Renoir
GLOBE PHOTOS

Renoir \rən-'wär**, Pierre-Auguste** (b. Feb. 25, 1841, Limoges, France—d. Dec. 3, 1919, Cagnes) French painter. His father, a tailor in Limoges, moved with his large family to Paris in 1844. Renoir began working as a decorator of porcelain at 13 and studied painting at night. He formed a close friendship with his fellow student CLAUDE MONET and became a leading member of the Paris IMPRESSIONISTS. His early works were typically Impressionist snapshots of real life, full of sparkling colour and light. By using small, multicoloured strokes, Renoir evoked the vibration of the atmosphere, the sparkling effect of foliage, and especially the luminosity of a young woman's skin in the outdoors. Because of his fascination with the human figure, he was distinctive among the others, who were more interested in landscape. Among his early masterpieces are *Le Moulin de la Galette* (1876) and *The Luncheon of the Boating Party* (1881). A visit to Italy (1881–82) introduced him to RAPHAEL and the expressive force of clear line and smooth painting, and by the mid 1880s he had broken with Impressionism to employ a more disciplined, formal technique. In works such as *Bathers* (1884–87), he emphasized volume, form, contours, and line. In his later works, he departed from the strict rules of Classicism to paint colourful still lifes, portraits, nudes, and landscapes of southern France, where he settled in 1907. Rheumatism confined him to a wheelchair by 1912 but he never ceased to paint, even though often with his brush attached to his hand. The filmmaker JEAN RENOIR was his son.

rent In common usage, payment made in return for the right to use property belonging to another. In CLASSICAL ECONOMICS, rent was the income gained from cultivated or improved land after the deduction of all production costs. In modern economic usage, rent is the difference between the total return to a factor of production (LAND, LABOUR, CAPITAL) and its supply PRICE, the minimum amount necessary to attain its services. Rent plus OPPORTUNITY COST make up the total income paid to a productive resource. Efforts made by a resource owner to obtain MONOPOLY profit is considered rent-seeking behaviour.

genera are *Orthoreovirus*, *Orbivirus*, *Rotavirus*, and *Phytoreovirus*. The first three infect animals; the last can destroy rice, corn, and other crops.

reparations Payment in money or materials by a nation defeated in war. After World War I, reparations to the Allied Powers were required of Germany by the Treaty of Versailles. The original amount of $33 billion was later reduced by the Dawes Plan and the Young Plan and was canceled after 1933. In the 1920s German resentment over reparations was used by ultranationalists to foment political unrest.

repertory theatre Production of several different plays in a single season by a resident acting company. The plays chosen may be classic works by famous dramatists or new works by emerging playwrights, and the companies that perform them often serve as a training ground for young actors. In Britain the practice, intended to make high-quality theatre available throughout the country, began in the early 20th century. Repertory companies, or stock companies, originally presented a different play each night of the week while preparing and rehearsing new plays. The system evolved to the current practice of presenting a series of short, continuous runs of each play.

Repin \'ryā-pyin,\ *English* \'rā-pin**, Ilya (Yefimovich)** (b. Aug. 5, 1844, Chuguyev, Russia—d. Sept. 29, 1930, Kuokkala, Fin.) Russian painter. After training with a provincial icon painter and at the St. Petersburg Academy of Fine Arts, he visited France and Italy on an academy scholarship. On his return he began painting subjects from Russian history. In 1873 he achieved international fame with *Volga Boatmen*, a grim, powerful image that became the model for Soviet Socialist Realism. Among his best-known works is *Ivan the Terrible and His Son Ivan* (1895), depicting Ivan's murder of his son. He also painted vigorous portraits (including Leo Tolstoy and Modest Mussorgsky). In 1894 he became professor of historical painting at the St. Petersburg Academy.

replacement deposit In geology, a mineral deposit formed by chemical processes that dissolve the original rock and deposit a new assemblage of minerals in its place. See also metasomatic replacement.

representation In politics, a method or process of enabling a constituency to influence legislation and government policy through deputies chosen by it. The rationale of representative government is that in large modern countries the people cannot all assemble, as they did in the marketplace of democratic Athens. If the public is to participate in government, citizens must select a small number from among themselves to act for them. Political parties have come to act as intermediaries between citizens and their representatives by helping to formulate systematically citizens' demands. Arguments persist about the proper role of representatives; some theories suggest that they should act as delegates carrying out the instructions of the public, whereas others argue that they should serve as free agents, acting in accordance with their best ability and understanding. See also proportional representation.

Representation of the People Acts (1918, 1928) Parliamentary acts that expanded suffrage in Britain. The act of 1918 gave the vote to all men over 21 and all women over 30, which tripled the electorate. The act of 1928 extended the franchise to women aged 21–30. The acts continued the voting reforms begun by the Reform Bills (see Reform Bill of 1832, Reform Bill of 1867, Reform Bill of 1884–85).

representationalism Theory of knowledge based on the assertion that the mind perceives only mental representations of material objects outside the mind, not the objects themselves. The validity of human knowledge is thus called into question because of the need to show that such images accurately correspond to the external objects. The doctrine, still current in certain philosophical circles, has roots in Cartesianism, the empiricism of John Locke and David Hume, and the idealism of Immanuel Kant.

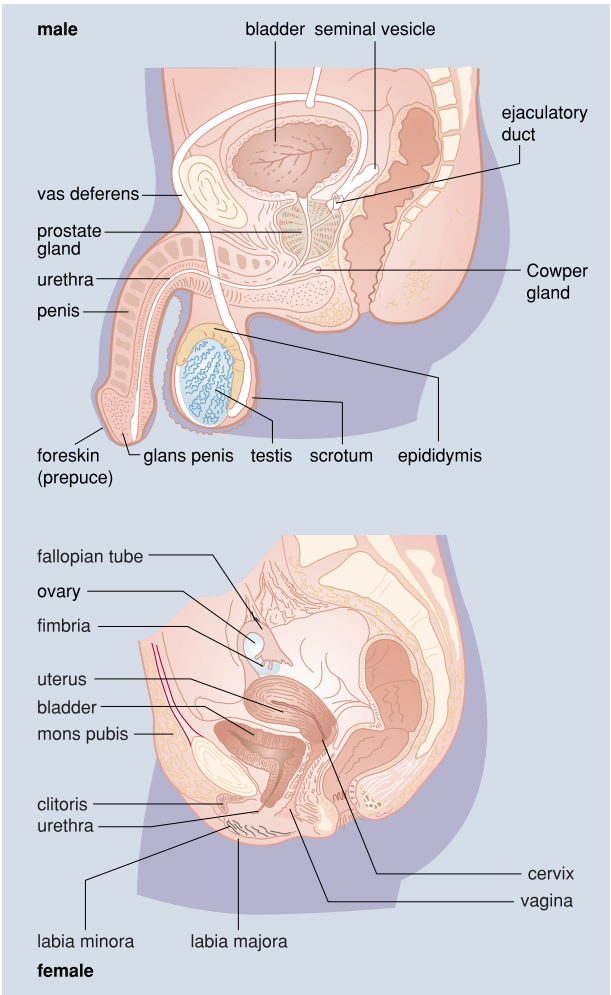
repression In metabolism, a control mechanism by which a protein molecule, called a repressor, prevents the synthesis of an enzyme by binding to (and thus hindering the action of) the DNA that controls the enzyme's synthesis. Though the process has been studied mainly in microorganisms, it is believed to occur in a similar way in higher organisms. See also inhibition.

repression In psychoanalytic theory, the exclusion of distressing memories, thoughts, or feelings from the conscious mind. Often involving sexual or aggressive urges or painful childhood memories, these unwanted mental contents are pushed into the unconscious mind. Repression is thought to give rise to anxiety and to neurotic symptoms, which begin when a forbidden drive or impulse threatens to enter the conscious mind. Psychoanalysis seeks to uncover repressed memories and feelings through free association as well as to examine the repressed wishes released in dreams. See also unconscious.

reproduction Process by which organisms replicate themselves, assuring continuation of their species. The two basic forms are asexual and sexual. Asexual reproduction (e.g., fission, spore formation, regeneration, and vegetative reproduction) produces an offspring genetically identical to its single parent. Sexual reproduction produces a new individual through the union of special sex cells (gametes), usually from different parents. Gametes result from meiosis. Gamete union results in a zygote, the first cell of a new organism. Sexual reproduction ensures that each offspring is genetically unique (except in cases of multiple offspring derived from divisions of one zygote). Most animals, including all vertebrates, reproduce sexually.

reproductive behaviour In animals, any activity directed toward perpetuation of a species. Sexual reproduction, the most common mode, occurs when a female's egg is fertilized by a male's sperm. The resulting unique combination of genes produces genetic variety that contributes to a species' adaptability. The stages of approach, identification, and copulation are well developed to avoid predators and the wastage of eggs and sperm. Most one-celled and some more-complex organisms reproduce asexually. See also courtship behaviour.

reproductive system, human Organ system by which humans reproduce. In females, the ovaries sit near the openings of the fallopian tubes, which carry eggs from the ovaries to the uterus. The cervix extends from the lower end of the uterus into the vagina, whose opening, as well as that of the urethra (see urinary system), is covered by four folds of skin (the labia); the clitoris, a small erectile organ, is located where the labia join in front. The activity of the ovaries and uterus goes through a monthly cycle of changes (see menstruation) throughout the reproductive years except during pregnancy and nursing. In males, the testes lie in a sac of skin (the scrotum). A long duct (the vas deferens) leads from each testis and carries sperm to the ejaculatory ducts in the prostate gland; these join the urethra, which continues through the penis. In the urethra, sperm mixes with secretions from the seminal vesicles, prostate gland, and Cowper gland to form semen. In early embryos, the reproductive systems are undetermined. By birth the organs appropriate to each sex have typically developed but are not functioning. They continue to grow, and at puberty their activity increases and maturation occurs, enabling sexual reproduction. See illustration on opposite page.



reptile Any of the approximately 6,000 species of the class Reptilia, air-breathing vertebrates that have internal fertilization and a scaly body and are cold-blooded. Most species have short legs (or none) and have long tails, and most lay eggs. Living reptiles include the scaly reptiles (snakes and lizards; order Squamata), the crocodiles (Crocodilia), the turtles (Chelonia), and the unique tuatara (Rhynchocephalia). Being cold-blooded, reptiles are not found in very cold regions, and in regions with cold winters they usually hibernate. They range in size from geckos that measure about 1 in. (3 cm) long to the python, which grows to 30 ft (9 m); the largest turtle, the marine leatherback, weighs about 1,500 lbs (680 kg). Extinct reptiles include the dinosaurs, the pterosaurs, and the dolphinlike ichthyosaurs.

republic Form of government in which a state is ruled by representatives elected by its populace. The term was originally applied to a form of government in which the leader is periodically appointed under a constitution; it was contrasted with governments in which leadership is hereditary. A republic may also be distinguished from direct democracy, though modern representative democracies are by and large republics.

Republican, Radical See Radical Republican

Republican Party *or* **GOP (Grand Old Party)** One of two major U.S. political parties. It was formed in 1854 by former members of the Whig, Democratic, and Free Soil parties who chose the party's name to recall the Jeffersonian Republicans' concern with the national interest above sectional interests and states' rights. The new party opposed slavery and its extension into the territories, as provided by the Kansas-Nebraska Act. Its first presidential candidate, John C. Frémont, won 11 states in 1856; its second, Abraham Lincoln, won the 1860 election by carrying 18 states. Its association with the Union victory in the American Civil War allowed it a long period of dominance nationally, though it was uncom-

© 2006 Encyclopædia Britannica, Inc.

Organs of the human reproductive system. In a male, the scrotum, a pouch of skin, is divided into two sacs, each containing a testis and its associated epididymis. Tubules within the testes contain sperm cells at different stages of development. As sperm leaves the testes, it passes into the epididymis, a highly coiled tube that serves as a reservoir for sperm. The vas deferens, a duct leading out from the epididymis, joins with the duct of the seminal vesicles as it passes through the prostate gland to form a single tube (ejaculatory duct) that opens into the urethra, the tube that conveys both sperm and urine out through the penis. In a menstruating woman, a follicle containing an egg matures each month in either of two ovaries. Ovulation occurs as the mature follicle ruptures and releases an egg, which is drawn into the ovary's associated fallopian (uterine) tube, which contains a fringe of fingerlike projections (fimbriae). Fertilization usually occurs in the fallopian tube as the egg travels to the uterus. Successful implantation of a fertilized egg in the uterus results in development of an embryo. The vagina, a muscular tube that leads to the uterus, allows sperm to pass into the uterus and serves as a passageway for the fetus during childbirth.

© MERRIAM-WEBSTER INC.

petitive in the South for more than a century after the war. Republican candidates won 14 of 18 presidential elections between 1860 and 1932, through support from an alliance of Northern and Midwestern farmers and big-business interests. In 1912 the party split between a progressive wing led by Theodore Roosevelt and a conservative wing led by Pres. William Howard Taft; the rift enabled the Democratic candidate, Woodrow Wilson, to win that year's election. The Republican Party's inability to counter the impact of the Great Depression led to its ouster from power in 1933; in 1953 the presidency of Dwight D. Eisenhower brought a moderate wing of the party to prominence. The party's platform remained conservative, emphasizing anticommunism, reduced government regulation of the economy, and lower taxes; many members also opposed civil rights legislation. In the 1950s the GOP gained new support from middle-class suburbanites and white Southerners disturbed by the integrationist policies of the national Democratic Party. Richard Nixon, who narrowly lost the 1960 presidential race, won narrowly in 1968 and by a landslide in 1972, but he was forced to resign in 1974 as a result of the Watergate scandal. Ronald Reagan, who had assumed the leadership of the conservative wing of the Republican Party after Barry Goldwater's defeat in the presidential election of 1964, won the presidency in 1980 and 1984; he introduced deep tax cuts and launched a massive buildup of U.S. military forces. Reagan's vice president, George Bush, was elected in 1988 and enjoyed enormous popularity after success in the First Persian Gulf War, but an anemic economy led to his defeat in 1992 by Democrat Bill Clinton. The defeat was offset in 1994, when the Republicans regained control of the House of Representatives for the first time in 40 years. In 2000 George W. Bush narrowly won the presidency in one of the closest and most controversial elections in U.S. history. In 2004 he won reelection. The party continues to emphasize tax cuts, traditional social values, and strong national defense.

Republican Party, National See National Republican Party

Republican River River, central U.S. Rising in eastern Colorado, it is 422 mi (679 km) long. It flows northeast and east through southern Nebraska, then southeast through northeastern central Kansas to unite with the Smoky Hill River at Junction City and form the Kansas River. It is part of the Missouri River Basin flood-control and land-reclamation project.

requiem mass Musical setting of the mass for the dead. (*Requiem*, Latin for "rest," is the first word of the mass.) The requiem's text differs from the standard mass Ordinary in omitting its joyous sections and keeping only the Kyrie, Sanctus, and Agnus Dei, which are combined with other sections, including the sequence *Dies irae* ("Day of Wrath"). The first surviving polyphonic setting is by Johannes Ockeghem; celebrated later requiems include those of Wolfgang Amadeus Mozart, Hector Berlioz, Giuseppe Verdi, Gabriel Fauré, Johannes Brahms, and Benjamin Britten.

resale price maintenance Measures taken by manufacturers or distributors to control the resale prices of their products (i.e., the prices charged by businesses that resell them). Such measures have been applied to a limited array of goods, including pharmaceuticals, books, photographic supplies, and liquor. Resale price maintenance first began to be employed in the 1880s, reflecting the success of brand promotion and the resulting increase in competition among retailers. It became especially common in the U.S. but declined after World War II. It is prohibited in some countries. The complexity of marketing channels in industrialized countries makes it increasingly difficult for manufacturers to establish and enforce a single price or even a minimum price for their goods. See also fair trade law.

research and development (R&D) In industry, two closely related processes by which new products and new forms of old products are created through technological innovation. The work generally focuses on two types of research, basic and applied. Basic research is directed toward a generalized goal (e.g., genetic research in a pharmaceutical laboratory). Applied research directs the results of basic research toward the needs of a specific industry and results in the development of new or modified products or processes. In addition to carrying out basic and applied research and developing models, R&D staff may evaluate the efficiency and cost of the product.

resin \'re-zᵊn\ Any natural or synthetic organic compound consisting of a noncrystalline (amorphous) solid or viscous liquid substance or mixture. Natural resins are usually transparent or translucent yellow to brown and can melt and burn. Most are exuded from trees, especially pines and firs (see conifer), when the bark is injured or stripped. The fluid secretion usually dries out and hardens into a material that can be worked. Natural resins have been used in perfumes and medicines (e.g., balsams), in paints and varnishes (e.g., turpentine and shellac, the latter derived from the secretion of an insect), and in decorative ware (e.g., amber, Oriental lacquer). Synthetic resins are all plastics; the term *resin*, though still used in the modern industry, dates from the years when synthetics began to replace natural resins. Thermoplastic resins are plastics such as polyethylene that can be shaped repeatedly on reheating, whereas thermosetting resins are plastics such as epoxy that set permanently and cannot be reshaped.

© 2006 Encyclopædia Britannica, Inc.

resistance Opposition that a material or electrical CIRCUIT offers to the flow of ELECTRIC CURRENT. It is the property of a circuit that transforms electrical energy into heat energy as it opposes the flow of current. The resistance *R*, the ELECTROMOTIVE FORCE or voltage *V*, and the current *I* are related by OHM'S LAW. The resistance of an electrical CONDUCTOR generally increases with increasing temperature and is utilized in devices such as lamps and heaters. The ohm (Ω) is the common unit of electrical resistance; one ohm is equal to one volt (see ELECTROMOTIVE FORCE) per ampere.

Resistance *or* **Underground** Clandestine groups opposed to Nazi rule in German-occupied Europe in World War II. The groups included civilians who worked secretly against the occupation and armed bands of partisans or guerrilla fighters. Resistance activities ranged from assisting the escape of Jews and Allied airmen shot down over enemy territory to committing sabotage, ambushing German patrols, and sending intelligence information to the Allies. Resistance groups were not always unified; in some countries, rival groups divided along communist and noncommunist lines. However, in France the clandestine National Council of the Resistance coordinated all French groups, which gave support to the NORMANDY CAMPAIGN and participated in the August 1944 uprising that helped liberate Paris. Resistance groups in other northern European countries also undertook military actions to help the Allied forces in 1944–45.

resistivity Electrical RESISTANCE of a CONDUCTOR of unit cross-sectional area and unit length. The resistivity of a conductor depends on its composition and its temperature. As a characteristic property of each material, resistivity is useful in comparing various materials on the basis of their ability to conduct ELECTRIC CURRENT. As temperature increases, the resistivity of a metallic conductor usually increases and that of a SEMICONDUCTOR usually decreases.

Resnais \rə-'nā**, Alain** (b. June 3, 1922, Vannes, France) French film director. After studying at the French cinema school IDHEC, he made short films on the visual arts (*Van Gogh* [1948]) and documentaries (*Night and Fog* [1956]). His first feature film, *Hiroshima mon amour* (1959), created a sensation with its alternation between past and present and is considered one of the earliest and best films of the NEW WAVE. He continued his exploration of the complex themes of time and memory in *Last Year at Marienbad* (1961). His later films include *Muriel* (1963), *Stavisky* (1974), *My American Uncle* (1980), *Love unto Death* (1984), *I Want to Go Home* (1989), *Smoking/No Smoking* (1993), and *Same Old Song* (1997).

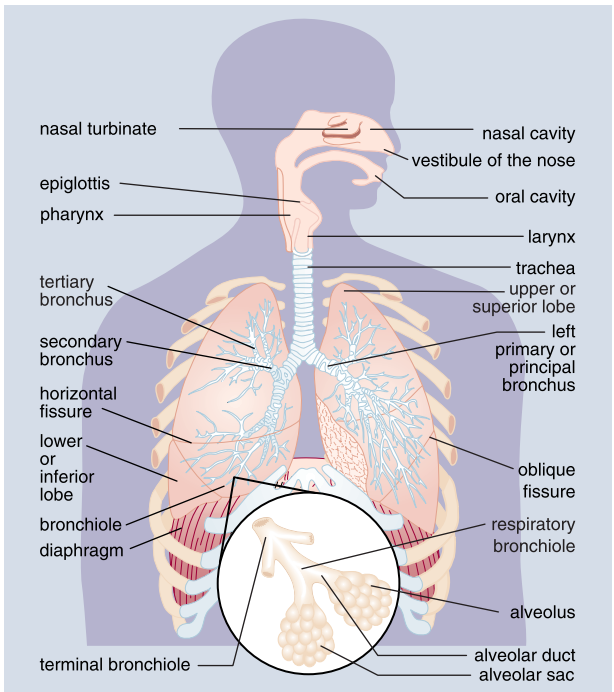
Resnais
COURTESY OF THE FRENCH FILM OFFICE, NEW YORK

resonance In physics, the relatively large selective response of an object or a system that vibrates in step with an externally applied VIBRATION. Acoustical resonance is the vibration induced in a string of a given pitch when a note of the same pitch is produced nearby, in the sound box of an instrument such as a guitar, or in the mouth or nasal cavity when speaking. Mechanical resonance, such as that produced in a bridge by wind or by marching soldiers, can eventually produce wide swings great enough to cause the bridge's destruction. Resonance in frequency-sensitive electrical CIRCUITS makes it possible for certain communication devices to accept signals of some frequencies while rejecting others. MAGNETIC RESONANCE occurs when electrons or atomic nuclei respond to the application of MAGNETIC FIELDS by emitting or absorbing ELECTROMAGNETIC RADIATION. See also NUCLEAR MAGNETIC RESONANCE.

Respighi \re-'spē-gē**, Ottorino** (b. July 9, 1879, Bologna, Italy—d. April 18, 1936, Rome) Italian composer. After musical studies in Bologna (1891–1901), he played viola in a Russian orchestra and studied with NIKOLAY RIMSKY-KORSAKOV, from whom he learned much about orchestration. His best-known works are the colourful tone poems *The Fountains of Rome* (1916) and *The Pines of Rome* (1924). Interested in early music, he also produced works such as *Gli uccelli* (1927), based on works by JEAN-PHILIPPE RAMEAU, and *La Boutique fantasque*, based on works by GIOACCHINO ROSSINI.

respiration Process of taking in air for oxygen and releasing it to dispose of carbon dioxide. The amount of air inhaled and exhaled in an average human breath (tidal volume) is about one-eighth the amount that can be inhaled after exhaling as much as possible (vital capacity). Nerve centres in the brain regulate the movements of muscles of respiration (DIAPHRAGM and chest wall muscles). Blood in the pulmonary circulation brings carbon dioxide from the tissues to be exhaled and takes up oxygen from the air in the PULMONARY ALVEOLI to carry it to the heart and the rest of the body. Because the body stores almost no oxygen, interruption of respiration—by asphyxiation, drowning, or chest muscle PARALYSIS—for more than a few minutes can cause death. Disorders affecting respiration include ALLERGY, ASTHMA, BRONCHITIS, EMPHYSEMA, PNEUMONIA, and TUBERCULOSIS. See also RESPIRATORY SYSTEM; RESPIRATORY THERAPY.

respiratory distress syndrome *or* **hyaline membrane disease** Common complication in newborns, especially after PREMATURE BIRTH. Symptoms include very laboured breathing, bluish skin tinge, and low blood oxygen levels. Insufficient surfactant in the PULMONARY ALVEOLI raises surface tension, hampering lung expansion. The alveoli collapse (see ATELECTASIS), and a "glassy" (hyaline) membrane develops in the alveolar ducts. Once the leading cause of death in premature infants, the syndrome is now usually treated for a few days with a mechanical ventilator (see RESPIRATORY THERAPY), with no aftereffects. An adult respiratory distress syndrome (ARDS) can follow lung injury.



respiratory system Organ system involved in RESPIRATION. In humans, the DIAPHRAGM and, to a lesser extent, the muscles between the ribs generate a pumping action, moving air in and out of the lungs through a system of pipes (conducting airways), divided into upper and lower airway systems. The upper airway system comprises the nasal cavity (see NOSE), SINUSES, and PHARYNX; the lower airway system consists of the LARYNX, TRACHEA, bronchi, bronchioles, and alveolar ducts (see PULMONARY ALVEOLUS). The blood and CARDIOVASCULAR SYSTEM can be considered elements of a working respiratory system. See also THORACIC CAVITY. See illustration on opposite page.

respiratory therapy Medical profession concerned with assisting the respiratory function of individuals who have severe lung disorders. Practices include suctioning to clear secretions from the airway, use of aerosol mists (sometimes medicated) or gases to ease breathing, and tilting the body and chest percussion to promote drainage. A respiratory therapist also manages mechanical ventilation, a process in which a machine generates a controlled flow of a gas mixture into the airway of a patient who cannot breathe efficiently.

restaurant Establishment where refreshments or meals are served to paying guests. Though inns and taverns served simple fare to travelers for centuries, the first modern restaurant where guests could order from a varied menu is thought to have belonged to A. Boulanger, a soup vendor who opened his business in Paris in 1765. The sign above his door advertised restoratives, or *restaurants*, referring to his soups and broths. By 1804 Paris had more than 500 restaurants, and France soon became internationally famous for its cuisine. Other European restaurants include the Italian *trattorie*, taverns featuring local specialties; the German *Weinstuben,* informal restaurants with a large wine selection; the Spanish tapas bars, which serve a wide variety of appetizers; and the PUBLIC HOUSES of England. Asian restaurants include the Japanese sushi bars and teahouses serving formal Kaiseki cuisine as well as the noodle shops of China. Most U.S. restaurant innovations have revolved around speed. The cafeteria originated in San Francisco during the 1849 gold rush; cafeterias feature self-service and offer a variety of foods displayed on counters. The U.S. also pioneered fast-food restaurants such as White Castle (founded 1921) and McDonald's (see RAY KROC), usually operated as chains and offering limited menus.

Reston, James (Barrett) (b. Nov. 3, 1909, Clydebank, Dumbartonshire, Scot.—d. Dec. 6, 1995, Washington, D.C., U.S.) Scottish-born U.S. columnist and editor. His family moved to the U.S. when he was 10 years old. He was a sportswriter before joining *The New York Times* in 1939, where he worked as a reporter, a nationally syndicated columnist, Washington bureau chief (1953–64), executive editor (1968–69), and vice president (1969–74) before retiring in 1989. One of the most influential U.S. journalists, he had unrivaled personal access to U.S. presidents and world leaders and was often the first to break major stories. He won two Pulitzer Prizes (1945, 1957), helped create the first Op-Ed page (1970; a forum for columnists' opinion pieces), and recruited and trained many talented young journalists.

© 2006 Encyclopædia Britannica, Inc.

As air enters the nasal cavity through the nostrils, it is warmed and moistened by mucous membranes of the nasal turbinates before entering the pharynx. Stiff hairs lining the vestibule inside the nostrils help filter the entering air. The air-filled sinuses adjacent to the nasal cavity produce mucus. The larynx connects the pharynx with the trachea or windpipe. The cartilaginous epiglottis prevents food from entering the larynx during swallowing. A left and right primary bronchus supply each lung with air from the trachea. They divide into smaller secondary and tertiary bronchi; the smallest divisions, bronchioles, lead to the cup-shaped, thin-walled alveoli, which occur in clusters (alveolar sacs). Oxygen and carbon dioxide are exchanged between the alveoli and surrounding capillaries. Oblique fissures or grooves of each lung separate the upper lobe from the lower lobe. The horizontal, or transverse, fissure of the right lung forms a middle lobe. Movement of the diaphragm along with the ribs and rib muscles causes expansion and contraction of the lungs during breathing.

Restoration Restoration of the monarchy in England in 1660. It marked the return of CHARLES II as king (1660–85) following the period of OLIVER CROMWELL's Commonwealth. The bishops were restored to Parliament, which established a strict Anglican orthodoxy. The period, which also included the reign of JAMES II (1685–88), was marked by an expansion in colonial trade, the ANGLO-DUTCH WARS, and a revival of drama and literature (see RESTORATION LITERATURE).

Restoration literature English literature written after the RESTORATION of the monarchy in 1660 following the period of the Commonwealth. Some literary historians equate its era with the reign of CHARLES II (1660–85), while others add the reign of JAMES II (1685–88). Many typical modern literary forms (e.g., the novel, biography, history, travel writing, and journalism) began to develop with sureness during the Restoration period. Pamphlets and poetry (notably that of JOHN DRYDEN) flourished, but the age is chiefly remembered for its glittering, critical, and often bawdy comedies of manners by such playwrights as GEORGE ETHEREGE, THOMAS SHADWELL, WILLIAM WYCHERLY, JOHN VANBRUGH, WILLIAM CONGREVE, and GEORGE FARQUHAR.

restraint of trade Preventing of free competition in business by some action or condition such as price-fixing or the creation of a MONOPOLY. The U.S. has a long-standing policy of maintaining competition among business enterprises through ANTITRUST LAWS, the best-known of which, the SHERMAN ANTITRUST ACT of 1890, declared illegal "every contract, combination…or conspiracy in restraint of trade or commerce."

restriction enzyme PROTEIN (more specifically, an endonuclease) produced by BACTERIA that cleaves DNA at specific sites along its length. Thousands have been found, from many different bacteria; each recognizes a specific NUCLEOTIDE sequence. In the living bacterial cell, these ENZYMES destroy the DNA of certain invading VIRUSES (BACTERIOPHAGES), thus placing a "restriction" on the number of viral strains that can cause infection; the bacterium's own DNA is protected from cleavage by methyl ($-CH_3$) groups, which are added by enzymes at the recognition sites to mask them. In the laboratory, restriction enzymes allow researchers to isolate DNA fragments of interest, such as those that contain GENES, and to recombine them with other DNA molecules; for this reason they have become very powerful tools of recombinant DNA BIOTECHNOLOGY (see DNA RECOMBINATION).

restrictive covenant In property law, an agreement acknowledged in a deed or lease that restricts the free use or occupancy of property, such as by forbidding commercial use or certain types of structures. The restrictive covenant is as old as the law of property, being well-established in Roman law. The term is also used in business law to refer to an agreement whereby one party promises not to engage in the same business or a similar business in a particular area for a period of time.

retailing Selling of merchandise directly to the consumer. Retailing began several thousand years ago with peddlers hawking their wares at the earliest marketplaces. It is extremely competitive, and the failure rate of retail establishments is relatively high. Price is the most important arena of competition, but other factors include convenience of location, selection and display of merchandise, attractiveness of the establishment, and reputation. The diversity of retailing is evident in the many forms it now takes, including VENDING MACHINES, door-to-door and telephone sales, DIRECT-MAIL MARKETING, the Internet, discount houses, specialty stores, DEPARTMENT STORES, supermarkets, and consumer COOPERATIVES.

retaining wall *or* **revetment** Wall constructed to hold in place a mass of earth or prevent the erosion of an embankment. It may also be battered, with the face inclined toward the load it is bearing. The most basic type of reinforced retaining wall is the massive concrete gravity wall, which is prevented from falling over by the sheer weight and volume of its mass. A CANTILEVER (L-shaped) retaining wall resists overturning by means of cantilever footings, spread footings (see FOUNDATION) shaped to resist overturning and sliding.

reticuloendothelial \re-ˌtik-yə-lō-ˌen-də-ˈthē-lē-əl\ **system** *or* **macrophage** \ˈmak-rə-ˌfāj\ **system** *or* **mononuclear phagocyte system** Part of the body's defenses, consisting of a class of cells widely distributed in the body. Reticuloendothelial cells filter out and destroy BACTERIA, VIRUSES, and foreign substances and destroy worn-out or abnormal cells and tissues. Precursor cells in bone marrow develop into monocytes (see LEUKOCYTE), which are released into the bloodstream. Most enter body tissues, developing into much larger cells called macrophages, with different appearances in various locations. Some roam through the circulation and between cells and can coalesce into a single cell around a foreign object to engulf it. Reticuloendothelial cells also interact with LYMPHOCYTES in immune reactions. Cells in the SPLEEN destroy old red blood cells and recycle their HEMOGLOBIN; uncontrolled, this process causes ANEMIA. TUMOURS of the reticuloendothelial system can be localized or widespread throughout the body. See also LYMPHATIC SYSTEM.

retina \ˈre-tᵊn-ə\ Layer of nerve tissue covering the back two-thirds of the eyeball. Light focused onto the retina by the lens of the EYE stimulates two types of light-sensitive cells: rods, which are sensitive to low light levels, and cones, which provide detailed vision and colour perception. Chemical changes in these cells trigger nerve impulses, which are assembled by complex connections among retinal nerves into a pattern to be carried through the optic nerve to the visual centres of the brain. Disorders affecting the retina or the macula in its centre decrease vision and can cause BLINDNESS. See also DETACHED RETINA; MACULAR DEGENERATION.

retriever Any of several dog breeds, bred to retrieve game, that have a thick, water-resistant coat, keen sense of smell, and "soft" mouth that does not damage game. Retrievers are 22–24 in. (55–62 cm) tall and weigh 55–75 lbs (25–34 kg). The golden retriever has a golden-brown coat that is long on the neck,

Golden retriever.
SALLY ANNE THOMPSON

© 2006 Encyclopædia Britannica, Inc.

legs, and tail. The Labrador retriever has a short black or brown coat. Both are often used as guide dogs, and both are highly popular as pets. Other retriever breeds include the Chesapeake Bay, curly-coated, and flat-coated retrievers.

retrograde motion In astronomy, the actual or apparent motion of a body in a direction opposite to that of the predominant (direct or prograde) motions of similar bodies. Observationally and historically, retrograde motion refers to the apparent reversal of the planets' motion through the stars for several months in each SYNODIC PERIOD. This required a complex explanation in Earth-centred models of the universe (see PTOLEMY) but was naturally explained in heliocentric models (see COPERNICAN SYSTEM) by the apparent motion as Earth passed by a planet in its orbit. It is now known that nearly all bodies in the SOLAR SYSTEM revolve and rotate in the same counterclockwise direction as viewed from a position in space above Earth's North Pole. This common direction probably arose during the formation of the SOLAR NEBULA. The relatively few objects with clockwise motions (e.g., the rotation of Venus, Uranus, and Pluto) are also described as retrograde.

retrovirus \ˌre-trō-ˈvī-rəs\ Any of a group of VIRUSES that, unlike most other viruses and all cellular organisms, carry their genetic blueprint in the form of RNA. Retroviruses are responsible for some cancers and viral infections of animals, and they cause at least one type of human cancer. The retrovirus HIV is the cause of AIDS in humans. The name signifies that they use RNA to synthesize DNA, the reverse of the usual cell process. This process makes it possible for genetic material from a retrovirus to enter and become a permanent part of the GENES of an infected cell.

Retton, Mary Lou (b. Jan. 24, 1968, Fairmont, W.Va., U.S.) U.S. gymnast. Retton began studying dance and acrobatics at age 4. At the 1984 Olympic Games she received perfect scores in her final two events to win a dramatic victory in the combined exercises, becoming the first American woman gymnast to win an individual Olympic gold medal. Her style, exhibiting speed, accuracy, and power, served to transform women's gymnastics. She was the first gymnast inducted into the U.S. Olympics Hall of Fame (1985).

Reuchlin \ˈrȯi̯k-lin**, Johannes** (b. Feb. 22, 1455, Pforzheim, Württemberg—d. June 6, 1522, Bad Liebnzell) German humanist. After obtaining his law degree in 1481, he held court and judicial posts in Württemberg and its capital, Stuttgart, from the 1480s until 1512. Second only to DESIDERIUS ERASMUS among the German humanists, Reuchlin was a pioneer in the scientific study of Classical Greek and translated many Classical texts. His grammar and lexicon, *On the Fundamentals of Hebrew* (1506), revolutionized Hebrew studies and advanced Old Testament research. His opposition to the Dominicans' plan to destroy all Hebrew literature was one of the great controversies prior to the outbreak of the REFORMATION, and in 1516 he was acquitted of heresy by a papal commission. PHILIPP MELANCHTHON was his nephew.

Réunion \rē-ˈyün-yən\ Island (pop., 2005 est.: 780,000) and French overseas department, Mascarene Islands, western Indian Ocean. Located 425 mi (684 km) east of MADAGASCAR, Réunion is about 40 mi (65 km) long and 30 mi (50 km) wide and has an area of 968 sq mi (2,507 sq km). Its capital is SAINT-DENIS. It consists mainly of rugged mountains dissected by torrential rivers. Most of the population is of mixed ancestry, with African descent predominant. Réunion was settled in the 17th century by the French, who brought slaves from eastern Africa to work on coffee and sugar plantations. It was a French colony until 1946, when it became an overseas department of France. Its economy is based largely on the export of sugar. Other products include meat and milk products, rum, molasses, tobacco, geranium essence, and vanilla.

Reuter \ˈrȯi-tər**, Paul Julius, Baron von Reuter** *orig.* **Israel Beer Josaphat** (b. July 21, 1816, Kassel, Electorate of Hesse—d. Feb. 25, 1899, Nice, France) German founder of the news agency REUTERS. He was a bank clerk and partner in a small publishing concern before initiating a prototype news service in Paris in 1849, using electric telegraphy and carrier pigeons in his network. He moved to England in 1851 and opened a telegraph office serving banks, brokerage houses, and leading business firms. He steadily extended his commercial news service, acquiring his first subscribing newspaper client in 1858. Undersea cables enabled him to expand the service to other continents.

Reuters \ˈrȯi-tərz\ British cooperative NEWS AGENCY. Founded in 1851 by PAUL JULIUS REUTER, it was initially concerned with commercial news but began to serve a growing newspaper clientele after the London *Morning Advertiser* subscribed in 1858. After a period of competition, Reuters and two rival agencies agreed on a division of territory and for many years held a virtual monopoly on world press services. The company remained in private hands until 1925, when its structure began moving toward a cooperative of British and Australasian press interests. By the late 20th century Reuters was a world leader in business and financial market coverage. In 1984 it became a public company under the name Reuters Group PLC.

Reuther \ˈrü-thər**, Walter (Philip)** (b. Sept. 1, 1907, Wheeling, W.Va., U.S.—d. May 9, 1970, Pellston, Mich.) U.S. labour leader. He became an apprentice tool- and diemaker at age 16. He traveled around the world in the 1930s, developing a lifelong distaste for communism after spending two years in a Soviet auto factory. He became a local union leader in Detroit, Mich., and helped organize sit-down strikes—during which he suffered brutal physical attacks—that made the UNITED AUTOMOBILE WORKERS (UAW) a power in the auto industry. As president of the UAW from 1946 until his death, he was an effective negotiator of wages-and-hours gains. He became president of the Congress of Industrial Organizations (CIO) in 1952 and was an architect of the AFL-CIO merger in 1955. He was second in power to GEORGE MEANY at the AFL-CIO; however, their repeated clashes, partly stemming from Reuther's strong support for civil rights and opposition to the Vietnam War, resulted in Reuther's leading the UAW out of the AFL-CIO in 1968 and forming a short-lived federation with the TEAMSTERS UNION. He died in a plane crash.

revelation Transmission of knowledge from a god or gods to humans. In the Western monotheistic religions of Judaism, Christianity, and Islam, revelation is the basis of religious knowledge. Humans know God and his will because God has chosen to reveal himself to them. He may communicate with his chosen servants through dreams, visions, or physical manifestations and may inspire PROPHETS who relay his message to the people. His will may also be translated directly into writing through the handing down of divine law (e.g., the TEN COMMANDMENTS) or SCRIPTURE (e.g., the BIBLE and the QUR'ĀN). Other religions emphasize "cosmic" revelation, in which any and all aspects of the world may reveal the nature of a single underlying divine power (e.g., BRAHMAN in the VEDAS).

Revelation, Book of *or* **Revelations** *or* **Apocalypse of John** Last book of the NEW TESTAMENT. It consists of two main parts, the first containing moral admonitions to several Christian churches in Asia Minor, and the second composed of extraordinary visions, allegories, and symbols that have been the subject of varying interpretations throughout history. A popular interpretation is that Revelation deals with a contemporary crisis of faith, possibly the result of Roman persecutions. It exhorts Christians to remain steadfast in their faith and hold firm to the hope that God will ultimately vanquish their enemies. References to "a thousand years" have led some to expect that the final victory over evil will come after the completion of a millennium (see MILLENNIALISM). Modern scholarship accepts that the book was written not by St. JOHN THE APOSTLE but by various unknown authors in the late 1st century AD. See also APOCALYPSE.

Revels, Hiram R(hoades) (b. Sept. 1, 1822, Fayetteville, N.C., U.S.—d. Jan. 16, 1901, Aberdeen, Miss.) U.S. clergyman and politician. The son of free blacks, he traveled to Indiana and Illinois to receive the education that was denied him in the South. Ordained a minister, he became a pastor and principal of a Baltimore school for African Americans. In the AMERICAN CIVIL WAR he helped organize African American volunteer regiments for the Union army. After the war he moved to Natchez, Miss., and was elected state senator in 1869. In 1870 he was elected to the U.S. Senate to fill the unexpired term of JEFFERSON DAVIS, becoming the first African American elected to that body. He later served as president of Alcorn A&M College (1871–74, 1876–83).

revenue bond *or* **limited obligation bond** BOND issued by a municipality, state, or public agency authorized to build, acquire, or improve a revenue-producing property such as a waterworks, electric generating plant, or railroad. Unlike general-obligation bonds, which are repaid through a variety of tax sources, revenue bonds are payable from specified revenues only, usually the revenues from the facility for which the bond was originally issued. Revenue bonds typically pay interest rates higher than those of general-obligation bonds. The separation of the revenue bond obligation from a municipality's other bond obligations allows the municipality to circumvent legislated debt limits.

revenue sharing Funding arrangement in which one government unit grants a portion of its tax income to another government unit. For example, provinces or states may share revenue with local governments,

© 2006 Encyclopædia Britannica, Inc.

or national governments may share revenue with provinces or states. Laws determine the formulas by which revenue is shared, limiting the controls that the unit supplying the money can exercise over the receiver and specifying whether matching funds must be supplied by the receiver. Forms of revenue sharing have been used in several countries, including Canada, India, and Switzerland. From 1972 to 1986 the U.S. pursued a revenue-sharing program in which state and local governments received federal funds to spend as they saw fit.

reverberatory furnace Furnace used for SMELTING, refining, or melting in which the fuel is not in direct contact with the contents but heats it by a flame blown over it from another chamber. Such furnaces are used in COPPER, TIN, and NICKEL production, in the production of certain CONCRETES and CEMENTS, and in ALUMINUM recycling. In steelmaking, this process (now largely obsolete) is called the OPEN-HEARTH PROCESS. The heat passes over the hearth and then radiates back (reverberates) onto the contents. The roof is arched, with the highest point over the firebox. It slopes downward toward a bridge of flues that deflects the flame so that it reverberates.

Revere, Paul (b. Jan. 1, 1735, Boston, Mass.—d. May 10, 1818, Boston) American patriot and silversmith. He entered his father's trade as a silversmith and engraver. An ardent supporter of the colonists' cause, he took part in the BOSTON TEA PARTY. As the principal rider for Boston's Committee of Safety, he arranged to signal the British approach by having lanterns placed in Boston's Old North Church steeple: "One if by land and two if by sea." On April 18, 1775, he set off to ride to Lexington to alert colonists that British troops were on the march and to warn SAMUEL ADAMS and JOHN HANCOCK to flee. Though he was stopped by a British patrol, he was able to alert the patriot leaders; because of his warning, the MINUTEMEN were prepared for the Battle of LEXINGTON and the start of the AMERICAN REVOLUTION. His ride was celebrated in a famous poem by HENRY W. LONGFELLOW (1863). During the war, Revere constructed a powder mill to supply colonial arms. After the war he discovered a process for rolling sheet copper and opened a rolling mill that produced sheathing for ships such as the USS *CONSTITUTION*. He continued to design handsome silver bowls, flatware, and utensils that are museum pieces today.

revetment See RETAINING WALL

Revillagigedo \rā-'vē-yä-hē-'hā-thō\ Group of islands, Mexico, in the Pacific Ocean. The islands are located about 300 mi (500 km) south of the BAJA CALIFORNIA peninsula and about 370 mi (600 km) west of mainland Mexico. Covering a total land area of 320 sq mi (830 sq km), it consists of numerous volcanic islands. The largest, Socorro, reaches an elevation of 3,707 ft (1,130 m). The islands are rich in sulfur, fish, and guano and are administered by COLIMA state.

revivalism Reawakening of Christian values and commitment. The spiritual fervour of revival-style preaching, typically performed by itinerant, charismatic preachers before large gatherings, is thought to have a restorative effect on those who have been led away from the right path. Various Protestant sects have experienced periods of revivalism at different times since the 17th century, and many, notably METHODISM, came into being during revivalist periods. Common themes are strict interpretation of the BIBLE, rejection of literary or historical study of the Bible, emphasis on the conversion experience, and a call to live devoutly. Revivalism can be interpreted as a precursor of 20th-century Christian FUNDAMENTALISM. See also GREAT AWAKENING; DWIGHT MOODY.

revolution In politics, fundamental, rapid, and often irreversible change in the established order. Revolution involves a radical change in government, usually accomplished through violence, that may also result in changes to the economic system, social structure, and cultural values. The ancient Greeks viewed revolution as the undesirable result of societal breakdown; a strong value system, firmly adhered to, was thought to protect against it. During the Middle Ages, much attention was given to finding means of combating revolution and stifling societal change. With the advent of Renaissance humanism, there arose the belief that radical changes of government are sometimes necessary and good, and the idea of revolution took on more positive connotations. JOHN MILTON regarded it as a means of achieving freedom, IMMANUEL KANT believed it was a force for the advancement of mankind, and G.W.F. HEGEL held it to be the fulfillment of human destiny. Hegel's philosophy in turn influenced KARL MARX. See also COUP D'ÉTAT.

Revolution of 1688 See GLORIOUS REVOLUTION

Revolutionary War See AMERICAN REVOLUTION

Revolutions of 1848 Series of republican revolts against European monarchies. The revolutions began in Sicily and spread to France, the German and Italian states, and the Austrian Empire. In France the revolution established the SECOND REPUBLIC, and in central Europe liberal political reform and national unification appeared likely. However, the armies loyal to the monarchies soon reestablished their power and rescinded most of the promised reforms. The revolts eventually ended in failure and repression, and they were followed by widespread disillusionment among liberals.

revolver PISTOL with a revolving cylinder that provides multishot action. Some early versions, known as pepperboxes, had several barrels, but as early as the 17th century pistols were being made with a revolving chamber to load cartridges into a single barrel. The first practical revolver was not designed until 1835, when SAMUEL COLT patented his version. He established the standard of a cylinder with multiple chambers, each of which successively locked in position behind the barrel and was discharged by pressure on the trigger. In Colt's early single-action revolvers, the cylinder revolved as the hammer was cocked manually. Double-action revolvers, in which the hammer is cocked and the cylinder revolves as the trigger is pulled, were developed soon afterward, along with metal cartridges.

revue Theatrical production of brief, loosely connected, often satirical skits, songs, and dances. Originally derived from the medieval French street fair, the modern revue dates from the early 19th century with the Parisian *Folies Marigny* and later at the FOLIES-BERGÈRE. The English revue developed in two forms: one as the costume display and spectacle of the Court Theatre productions in the 1890s and another as the *André Charlot Revues* of the 1920s and the London Hippodrome shows, which emphasized clever repartee and topicality. In the U.S. the *Ziegfeld Follies* began in 1907 and usually featured a star personality. Revues appeared periodically on Broadway and West End stages until competition from movies and television moved the form to small nightclubs and improvisational theatres.

Rexroth, Kenneth (b. Dec. 22, 1905, South Bend, Ind., U.S.—d. June 6, 1982, Santa Barbara, Calif.) U.S. painter, essayist, poet, and translator. The largely self-educated Rexroth spent much of his youth traveling in the West, organizing and speaking for unions. His early poems were experimental, influenced by SURREALISM; his later work was praised for its tight form and its wit and humanistic passion. He was an early champion of the BEAT MOVEMENT. His works include essays in *Assays* (1962) and *With Eye and Ear* (1970); and many translations of Japanese, Chinese, Greek, Latin, and Spanish poetry.

Rey See RHAGAE

Reye syndrome Acute neurological illness in children, following INFLUENZA, CHICKENPOX, or other viral infections. Vomiting, lethargy, and confusion begin as the child appears to be recovering. These symptoms are followed hours or days later by drowsiness, disorientation, seizures, respiratory arrest, and coma. At worst, the syndrome includes fatty liver degeneration and potentially fatal brain swelling. There is no specific cure, but treatment of imbalances helps over 70% of patients survive (some with brain damage). The incidence has decreased since the recognition that it often follows use of ASPIRIN or other SALICYLIC ACID derivatives in children during a viral illness. It can also result from AFLATOXIN or WARFARIN poisoning.

Reykjavík \'rā-kyä-ˌvēk\ City (pop., 1999 est.: 109,152), capital of Iceland. According to tradition, it was founded in 874 by the Norseman Ingólfur Arnarson. Until the 20th century it was a small fishing village at the southeastern corner of FAXA BAY, ruled and largely inhabited by Danes. It became the capital of a self-governing Iceland under the Danish king in 1918 and of the independent Republic of Iceland in 1944. During World War II it was a U.S. naval and air base. In 1986 arms-control talks between the U.S. and U.S.S.R. were held there. It is the commercial, industrial, and cultural centre of the island, its major fishing port, and the site of nearly half of the nation's industries.

Reymont \'rā-ˌmȯnt**, Władysław (Stanisław)** *or* **Władysław Stanisław Rejment** (b. May 7, 1867, Kobiele Wielkie, Pol., Russian Empire—d. Dec. 5, 1925, Warsaw, Pol.) Polish novelist. He never finished his schooling and worked in his youth as a shop apprentice, a lay brother in a monastery, a railway official, and an actor. His short stories and novels are written in a naturalistic, factual style with short sentences. His best work, *The Peasants* (1904–09), is a four-volume chronicle of peasant life over the

© 2006 Encyclopædia Britannica, Inc.

course of a year, written in peasant dialect. Translated into many languages, it won Reymont the 1924 Nobel Prize for Literature.

Reynaud \rā-'nō**, Paul** (b. Oct. 15, 1878, Barcelonnette, France—d. Sept. 21, 1966, Paris) French politician and premier (1940). After serving in World War I, he served in the Chamber of Deputies (1919–24, 1928–40) and in cabinet positions (1930–32). As minister of finance (1938–40) and premier (1940), he called on France to resist Nazi Germany. After the German invasion, Reynaud resigned rather than conclude an armistice; he was arrested and kept in captivity (1940–45). He returned to the Chamber of Deputies (1946–62) and helped draft the constitution of the FIFTH REPUBLIC.

Reynolds, Sir Joshua (b. July 16, 1723, Plympton, Devon, Eng.—d. Feb. 23, 1792, London) British portrait painter. Son of a clergyman-schoolmaster, he was apprenticed to a London portraitist in 1740. His large group portrait *The Eliot Family* (c. 1746) reveals the influence of ANTHONY VAN DYCK. The impressions he gained during two years in Italy (1750–52), particularly in Venice, inspired his painting for the rest of his life. He established a portrait studio in London in 1753 and was immediately successful. His early London portraits introduced new vigour into English portraiture. After 1760, with the increasing vogue for Greco-Roman antiquity, his style became increasingly Classical and self-conscious. He was elected the first president of the Royal Academy in 1768. Through his art and teaching, Reynolds led British painting away from the anecdotal pictures of the early 18th century toward the formal rhetoric of continental academic painting. His *Discourses Delivered at the Royal Academy* (1769–90), advocating rigorous academic training and study of the Old Masters, ranks among the most important art criticism of the time.

Reynolds, Osborne (b. Aug. 23, 1842, Belfast, Ire.—d. Feb. 21, 1912, Watchet, Somerset, Eng.) British engineer and physicist. Educated at Cambridge University, he became the first professor of engineering at the University of Manchester (1868). Best known for his work in HYDRAULICS and hydrodynamics, he formulated the law of resistance in parallel channels (1883), the theory of LUBRICATION (1886), and the standard mathematical framework used in TURBULENCE work (1889). He studied wave engineering and tidal motions in rivers and made pioneering contributions to the concept of group velocity. The Reynolds stress in fluids with turbulent motion and the REYNOLDS NUMBER are named for him.

Reynolds American Inc. *formerly* **R.J. Reynolds Tobacco Holdings, Inc.** U.S.-based tobacco company. Its origins date to the establishment of Richard Joshua Reynolds's tobacco-plug factory in Winston, N.C., in 1875, producing plug tobacco (compressed cakes). The Reynolds Tobacco Co. became a major manufacturer of tobacco products, notably Camel, Winston, and Salem cigarettes. After embarking on a program of diversification in the 1960s, the firm adopted the name R.J. Reynolds Industries, Inc., in 1970 and purchased Nabisco Brands in 1985. The new company, named RJR Nabisco in 1986, was acquired in 1989 by Kohlberg Kravis Roberts & Co. (KKR) for $25 billion, the largest corporate transaction of its time. KKR divested its ownership in 1995. R.J. Reynolds returned to its primary business of tobacco marketing and merged with British-owned rival Brown & Williamson Tobacco Corp. in 2004 to create Reynolds American.

Reynolds number In FLUID MECHANICS, a number that indicates whether the flow of a fluid (liquid or gas) is absolutely steady (in streamlined, or LAMINAR FLOW) or on the average steady with small, unsteady changes (in turbulent flow; see TURBULENCE). The Reynolds number, abbreviated N_{Re} or Re, has no dimensions (see DIMENSIONAL ANALYSIS) and is defined as the size of the flow—as, for example, the diameter of a tube (D) times the average speed of flow (v) times the mass density of the fluid (ρ)—divided by its absolute VISCOSITY (μ). OSBORNE REYNOLDS demonstrated in 1883 that the change from laminar to turbulent flow in a pipe occurs when the value of the Reynolds number exceeds 2,100.

Rg Veda See RIG VEDA

Rh blood-group system System for classifying BLOOD according to presence or absence of the Rh ANTIGEN (factor) in ERYTHROCYTES. Rh-negative persons who receive Rh-positive BLOOD TRANSFUSIONS produce ANTIBODIES to Rh factor, which attack red blood cells with the factor if they are ever received again, causing serious illness and sometimes death. The antibodies also attack the red cells of an Rh-positive fetus carried by an Rh-negative woman if she has had a previous Rh-positive transfusion or pregnancy (see ERYTHROBLASTOSIS FETALIS). The Rh-negative trait is rare worldwide but more common in some ethnic groups. See also BLOOD TYPING.

rhabdovirus \ˌrab-dō-'vī-rəs\ Any of a group of VIRUSES responsible for RABIES and vesicular stomatitis (an acute disease of cattle and horses, characterized by blisters in and about the mouth, that resembles foot-and-mouth disease). The bullet-shaped virus particle is encased in a fatty membrane and contains RNA.

Rhaetia See RAETIA

Rhaetian \'rē-tēən\ **Alps** Segment of the central ALPS located mainly in Switzerland but also extending along the Italian-Swiss and Austrian-Swiss borders. Bernina Peak, on the Italian border, is the highest point, at elevation 13,284 ft (4,049 m). In the eastern section is the Swiss National Park, founded in 1914, with an area of 65 sq mi (169 sq km); it is known for its rugged Alpine scenery and its wildlife.

Rhagae *or* **Ragae** \'rā-ˌjē\ *Persian* **Rey** Ancient city, MEDIA. It was formerly one of the great cities of Iran; its ruins are at modern Rey, near TEHRĀN. Settlement there dates from the 3rd millennium BC. Under the SĀSĀNIAN DYNASTY (3rd–7th centuries AD), it was a centre of ZOROASTRIANISM. It was captured by the Muslims in AD 641. It grew in importance until the 12th century, when it was weakened by religious conflicts. In 1220 it was destroyed by the MONGOLS, and its inhabitants were massacred. It was famous for its decorated silks and for ceramics. The ʿAbbāsid caliph HĀRŪN AL-RASHĪD, memorialized in *THE THOUSAND AND ONE NIGHTS*, was born there c. 765. The only remaining architectural features are two towers.

Rhazes See al-RĀZĪ

Rhea \'rē-ə\ Greek goddess, one of the TITANS. Daughter of URANUS and GAEA, she married her brother CRONUS, who swallowed all their children except ZEUS, whom Rhea concealed. Zeus then overcame Cronus and restored his siblings.

rhea \'rē-ə\ Either of two ostrich-like species of South American three-toed RATITE birds (family Rheidae). The common rhea (*Rhea americana*) is about 4 ft (120 cm) tall and weighs about 50 lbs (20 kg). It has luxuriant plumage, brown or gray above and whitish below. Darwin's rhea (*Pterocnemia pennata*) is smaller and has white-tipped brownish plumage. Rheas live in open country, often among grazing animals, and run from predators. They eat a wide variety of plants and animals. Both species are listed as endangered.

Rhee, Syngman (b. March 26, 1875, Whang-hae, Korea—d. July 19, 1965, Honolulu, Hawaii, U.S.) First president of the Republic of KOREA (South Korea). The first Korean to earn a Ph.D. at a U.S. university (Princeton), he returned to Korea in 1910, the year Japan annexed Korea. Unable to hide his hostility toward Japanese rule, he left again for the U.S. in 1912. For the next 30 years he spoke out for Korean independence; in 1919 he was elected president of a provisional government in exile. As the only Korean leader well known to the U.S., Rhee was returned to Korea ahead of his rivals at the end of World War II; he was elected president of the Republic of Korea in 1948. He held that post until 1960, when opposition to his authoritarian policies (which included outlawing the opposition Progressive Party) forced his resignation. He died in exile.

Rheims See REIMS

rhesus \'rē-səs\ **monkey** Sand-coloured MACAQUE (*Macaca mulatta*), widespread in South and Southeast Asian forests. Rhesus monkeys are 17–25 in. (43–64 cm) long, excluding the furry 8–12-in. (20–30-cm) tail, and weigh 10–24 lb (4.5–11 kg). They eat fruits, seeds, roots, herbs, and insects. They are held sacred in some parts of India. Hardy in captivity, highly intelligent, and lively, they make good pets when young but may become bad-tempered as adults. They have been used frequently in medical research. The determination of the Rh (from rhesus) factor in human blood involves reaction with the blood of this species. See also RH BLOOD-GROUP SYSTEM.

Rhesus monkeys (*Macaca mulatta*).
YLLA—RAPHO/PHOTO RESEARCHERS

© 2006 Encyclopædia Britannica, Inc.

rhetoric Art of speaking or writing effectively. It may entail the study of principles and rules of composition formulated by critics of ancient times, and it can also involve the study of writing or speaking as a means of communication or persuasion. Classical rhetoric probably developed along with democracy in Syracuse (Sicily) in the 5th century BC, when dispossessed landowners argued claims before their fellow citizens. Shrewd speakers sought help from teachers of oratory, called *rhetor*s. This use of language was of interest to philosophers such as PLATO and ARISTOTLE because the oratorical arguments called into question the relationships among language, truth, and morality. The Romans recognized separate aspects of the process of composing speeches, a compartmentalization that grew more pronounced with time. Renaissance scholars and poets studied rhetoric closely, and it was a central concern of humanism. In all times and places where rhetoric has been significant, listening and reading and speaking and writing have been the critical skills necessary for effective communication.

rheumatic \rü-ˈma-tik\ **fever** Generalized disease caused by certain types of STREPTOCOCCUS bacteria. It occurs mostly in children and young adults. Symptoms may be mild or severe. Sudden fever, joint pain, and inflammation may begin days to weeks after a streptococcal infection, usually of the throat (see PHARYNGITIS). Other symptoms may include skin nodules and rashes, CHOREA, abdominal pain, nosebleeds, and weight loss. HEART inflammation, with accompanying rapid heartbeat, murmurs, and enlargement, can lead to valve scarring, markedly shortening life. After recovery, survivors are prone to future attacks. PENICILLIN given when the initial infection is diagnosed can prevent it. Otherwise, SALICYLIC ACID derivatives or corticosteroids help the symptoms.

rheumatoid \ˈrü-mə-ˌtȯid\ **arthritis** Chronic, progressive AUTOIMMUNE DISEASE causing CONNECTIVE-TISSUE INFLAMMATION, mostly in synovial JOINTS. It can occur at any age, is more common in women, and has an unpredictable course. It usually starts gradually, with pain and stiffness in one or more joints, then swelling and heat. Muscle pain may persist, worsen, or subside. Membrane inflammation and thickening scars joint structures and destroys CARTILAGE. In severe cases, adhesions immobilize and deform the joints, and adjacent skin, bones, and muscles atrophy. If high-dose aspirin, ibuprofen, and other NSAIDs do not relieve pain and disability, low-dose corticosteroids may be tried. Physical medicine and rehabilitation with heat and then range-of-motion exercises reduce pain and swelling. Orthopedic appliances correct or prevent gross deformity and malfunction. Surgery can replace destroyed hip, knee, or finger joints with prostheses. There is also a juvenile form of the disease.

Rhiannon \hrē-ˈä-nōn\ Welsh manifestation of the Gaulish horse goddess EPONA and the Irish goddess Macha. She is best known from the MABINOGION, in which she makes her appearance on a pale, mysterious steed and meets King Pwyll, whom she marries. Unjustly accused of killing her infant son, she was forced to carry people on her back like a horse until she was vindicated by her son's return.

Rhine, Confederation of the See CONFEDERATION OF THE RHINE

Rhine River *German* **Rhein** River, western Europe. Rising in the Swiss ALPS, it flows north and west through western Germany to drain through the delta region of The Netherlands into the North Sea. It is 820 mi (1,319 km) long and navigable for 540 mi (870 km). Its many canals connect it with the RHÔNE, MARNE, and DANUBE river systems. It has been an international waterway since 1815 (see Congress of VIENNA). It has played a prominent part in German history and legend. During World War II its course was a major line of defense. Major cities along its banks include BASEL, MANNHEIM, KOBLENZ, COLOGNE, DUISBURG, and ROTTERDAM.

Rhineland *German* **Rheinland** Region of Germany. It is located west of the RHINE RIVER and encompasses the states of Saarland and Rhineland-Palantinate and portions of Baden-Württemberg, Hesse, and North Rhine–Westphalia. The chief city of the Rhineland is COLOGNE. In the 19th century the Rhineland became the most prosperous area of Germany. After World War I, Allied troops occupied portions of the area on the border with France, and it was the scene of recurrent crises and controversies during the 1920s. In 1936 ADOLF HITLER ordered German troops to enter the demilitarized zone of the Rhineland; weak objections by the Allies foreshadowed Hitler's later annexation of the SUDETENLAND.

rhinoceros Any of five extant African and Asian species (family Rhinocerotidae) of three-toed horned UNGULATES. One of the largest of all land animals (the white rhinoceros is second only to the elephant), the rhinoceros is particularly distinguished by one or two horns—growths of keratin, a fibrous hair protein—on its upper snout. All have thick, virtually hairless skin that, in the three Asian species, forms platelike folds at the shoulders and thighs. Rhinos grow to 8–14 ft (2.5–4.3 m) long and 3–6.5 ft (1.5–2 m) tall; adults weigh 3–5 tons. Most are solitary inhabitants of open grassland, scrub forest, or marsh, but the Sumatran rhino lives in deep forest. The African black rhino browses on succulent plants, the white and great Indian rhinos graze on short grasses, and the Sumatran and Javan rhinos browse on bushes and bamboo. In the second half of the 20th century, the rhinoceroses were brought to the brink of extinction by hunters, mostly seeking the horn, which is valued in Asia as an aphrodisiac. The white rhinoceros of Africa is no longer endangered, but the population of the other four species combined is only a few thousand, almost all of which live on reserves.

African black rhino (*Diceros bicornis*). CAMERA PRESS/PICTORIAL PARADE

rhinovirus \ˌrī-nō-ˈvī-rəs\ Any of a group of PICORNAVIRUSES capable of causing common COLDS in humans. The virus is thought to be transmitted to the upper respiratory tract by airborne droplets. Because of the great number of cold viruses, VACCINES against them are virtually impossible to develop. See also ADENOVIRUS.

rhizome Horizontal underground plant stem capable of producing the upward shoot and downward root systems of a new plant. This capability allows vegetative (asexual) propagation and enables plants to survive an annual unfavourable season underground. In some plants (e.g., WATER LILIES, many FERNS, and forest herbs), the rhizome is the only stem of the plant. In such cases, only the leaves and flowers are readily visible.

Rhode Island *officially* **Rhode Island and Providence Plantations** State (pop., 2000: 1,048,319), northeastern U.S. One of the NEW ENGLAND states and the smallest U.S. state, it covers 1,212 sq mi (3,139 sq km); its capital is PROVIDENCE. Rhode Island is bordered by Massachusetts on the north and east, and Connecticut on the west. The Rhode Island Sound on the south is the basis of the state's fishing industry. The original inhabitants of the area were Narragansett Indians. The first European settlement was in 1636 by ROGER WILLIAMS and his followers, who were banished from Massachusetts; in 1663 King CHARLES II granted a charter to Williams. Though it never officially joined the New England colonies in KING PHILIP'S WAR, it suffered greatly when many settlements were burned. It was at the forefront of the fight against British customs laws that led to the AMERICAN REVOLUTION. An original state of the Union, in 1790 it was the 13th state to ratify the Constitution, agreeing only after the BILL OF RIGHTS was included. The state's original charter remained in effect until Dorr's Rebellion (see THOMAS W. DORR) in 1842 led to extension of suffrage. The cotton-textile mill built by Samuel Slater in Pawtucket in 1790 initiated the Industrial Revolution in the U.S. Manufacturing is still important to the economy, and products include jewelry and silverware, textiles and clothing, and electrical machinery and electronics.

Rhode Island School of Design (RISD) One of the most eminent fine arts colleges in the U.S., located in Providence, R.I. It was founded in 1877 but did not offer college-level instruction until 1932. It combines professional arts training with a broad liberal arts curriculum, offering bachelor's and master's degrees in the design, fine arts, and other fields. Its art museum has extensive collections of American painting and decorative arts.

Rhodes *Greek* **Ródhos** \ˈrō-ˌthȯs\ Island of Greece. It is the largest island of the Dodecanese group and the most easterly in the Aegean Sea. Its main city, Rhodes (pop., 2001: 53,709), lies at the northern tip of the island. The earliest known settlers were the Dorians c. 1000 BC. During the Classical period the island's affiliations vacillated between Athens, Sparta, and Persia in attempts to preserve a balance of power. A devastating earthquake c. 225 BC destroyed the Colossus of RHODES, one of the SEVEN WONDERS OF THE WORLD. In the medieval period Rhodes was occu-

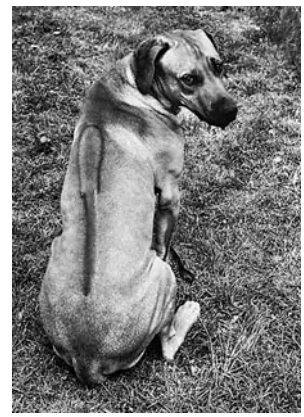
© 2006 Encyclopædia Britannica, Inc.

pied by the Byzantines, Muslims, and Knights of St. John (see KNIGHTS OF MALTA). The knights converted the island into a fortress and held it for two centuries until 1523, when the Turks took control. In 1912 it was taken from Turkey by Italy, and in 1947 it was awarded by treaty to Greece. A year-round tourist industry has brought prosperity to the island.

Rhodes, Alexandre de (b. March 15, 1591, Avignon, France—d. March 5, 1660, Eṣfahān, Iran) French missionary, the first Frenchman to visit Vietnam. He established a Jesuit mission in the region in 1619 and later estimated that he had converted some 6,700 Vietnamese to Roman Catholicism. Expelled in 1630, he spent 10 years teaching philosophy in Macau before returning, only to be exiled again in 1646. The Vatican sponsored a Vietnamese missionary program in 1658 based on de Rhodes's ideas, but he himself was sent to Iran (Persia), where he died. He wrote a Vietnamese-Latin-Portuguese dictionary and perfected the romanized script Quoc-ngu (developed by earlier missionaries), which facilitated communicating Christian doctrines to the Vietnamese and increased the literacy rate among the population.

Rhodes, Cecil (John) (b. July 5, 1853, Bishop's Stortford, Hertfordshire, Eng.—d. March 26, 1902, Muizenberg, Cape Colony) Financier, statesman, and empire builder of British South Africa. Rhodes grew up in the English countryside and in 1871 was sent to assist his brother in business in South Africa, where he became interested in diamond mining. He founded DE BEERS CONSOLIDATED MINES (1888), and by 1891 his company was mining 90% of the world's diamonds. Seeking expansion to the north and dreaming of building a Cape-to-Cairo railway, he persuaded Britain to establish a protectorate over Bechuanaland (1884), clashing with Boer president PAUL KRUGER. He obtained digging concessions from LOBENGULA (1889), but in 1893 Rhodes overran him militarily. At his instigation Britain chartered the British South Africa Co. (1889) and put Rhodes in charge. He extended the company's control to two northern provinces, which were eventually named after him as Southern Rhodesia (now Zimbabwe) and Northern Rhodesia (now Zambia). Interested in the mineral-rich TRANSVAAL, he plotted to overthrow Kruger (1895); the attempt was botched by LEANDER STARR JAMESON, and Rhodes was forced to resign as prime minister of Cape Colony and head of the British South Africa Co. His last years were marked by disappointment and scandal brought about by the scheming of Princess Radziwiłł. His will bequeathed most of his fortune to establishing the RHODES SCHOLARSHIP.

Rhodes, Colossus of Enormous bronze statue of the sun god Helios that towered more than 100 ft (30 m) over the harbour at the city of Rhodes in Greece. The work of Chares of Lindos, the statue commemorated the raising of Demetrios Poliorcetes' long siege of Rhodes (305–304 BC). One of the SEVEN WONDERS OF THE WORLD, it was toppled by an earthquake c. 225 BC. The fallen Colossus was left in place until AD 653, when raiding Arabs broke up its remains and sold the bronze for scrap.



Colossus of Rhodes, constructed c. 292–280 BC, wood engraving reconstruction by Sidney Barclay, c. 1875.
HISTORICAL PICTURES SERVICE, CHICAGO

Rhodes scholarship Grant to attend the University of OXFORD. The program was established in 1902 by the will of CECIL RHODES. Until 1976, candidates had to be unmarried male residents in a Commonwealth country, the U.S., or South Africa. In 1976 women were accepted. Two candidates each year are also chosen from Germany. The scholarships, which are highly competitive, are usually for two years.

Rhodesia Region, south-central Africa, now divided into ZIMBABWE in the south and ZAMBIA in the north. Named after British colonial administrator CECIL RHODES, it was administered by the British South Africa Company in the 19th century and exploited mostly for its gold, copper, and coal deposits. In 1911 it was divided into Northern and Southern Rhodesia; Southern Rhodesia became a self-governing British colony (1923) and Northern Rhodesia a British protectorate (1924). They joined with Nyasaland to become the Federation of Rhodesia and Nyasaland (1953–63). See also MALAWI.

Rhodesia See ZIMBABWE

Rhodesian ridgeback *or* **African lion dog** South African hound breed characterized by a narrow band of hair growing forward along its back, against the direction of the rest of the coat. The ridge is inherited from a half-wild local hunting dog that was crossbred with European dogs. Strong, active, and of great endurance, it is trim and short-haired, with hanging ears and a glossy brown coat. It stands 24–27 in. (61–69 cm) and weighs 65–75 lbs (30–34 kg). It is an able guard and hunter (especially of lions) and a good companion.

Rhodesian ridgeback.
WALTER CHANDOHA

Rhodian Sea Law \'rō-dē-ən\ Regulations governing trade and navigation in the Byzantine Empire. Based on a statute in the Code of JUSTINIAN and on ancient maritime law in Rhodes, the Rhodian Sea Law focused on liability for lost or damaged cargo. It divided the cost of the losses among the shipowner, the owners of the cargo, and the passengers, thus serving as a form of insurance against storms and piracy. It was effective from the 7th through the 12th century.

rhodium Metallic chemical ELEMENT, one of the TRANSITION ELEMENTS, chemical symbol Rh, atomic number 45. Chemically related to PLATINUM, it is a precious, silver-white metal mainly used as an alloying agent for the latter element. Rhodium added to platinum in small amounts yields alloys that are harder and that lose mass at high temperatures more slowly than pure platinum. Such alloys are used for laboratory furnace crucibles, spark-plug electrodes, CATALYSTS in very hot chemical environments (including automobile CATALYTIC CONVERTERS), and high-temperature THERMOCOUPLES. Because rhodium resists tarnishing at ordinary temperatures and is highly reflective, it is in demand as a surface electroplating for jewelry and other decorative articles. The plated metal is also used for reflecting surfaces in optical instruments.

rhodochrosite \ˌrō-də-'krō-ˌsīt\ CARBONATE MINERAL composed of manganese carbonate ($MnCO_3$), a source of MANGANESE for the ferromanganese alloys used in steel production. It is commonly found in ore veins formed at moderate temperatures, in high-temperature metamorphic deposits, and in sedimentary deposits.

rhododendron \ˌrō-də-'den-drən\ Any of about 800 diverse species of woody plants that make up the genus *Rhododendron* in the HEATH FAMILY, notable for their attractive flowers and handsome foliage. They are native chiefly in the northern temperate zone, especially in South Asia and Malaysia. Some are evergreens, others deciduous. Some are low-growing ground covers; others are tall trees. Flowers are usually tubular to funnel-shaped and occur in a wide range of colours: white, yellow, pink, scarlet, purple, and blue. See also AZALEA.

rhodonite \'rō-də-ˌnīt\ SILICATE MINERAL that occurs in various MANGANESE ores, often with RHODOCHROSITE. A manganese silicate, $MnSiO_3$, with small amounts of iron and calcium, it is found in the Ural Mountains, Sweden, Australia, California, New Jersey, and elsewhere. Rhodonite is the primary source of some important manganese oxide deposits, such as the manganese ores of India. Fine-grained rhodonite of clean, pink colour is a desirable gem and ornamental stone.

Rhodope \'rä-də-pē\ **Mountains** Mountain range, BALKAN PENINSULA, southeastern Europe. Extending southeast from Bulgaria through Macedonia and Greece, the range is drained by tributaries of the MARITSA RIVER. It forms an important climatic barrier, protecting the Aegean low-

© 2006 Encyclopædia Britannica, Inc.

lands from cold northerly winds. The mountains were a refuge for Slavic peoples during the period of Turkish rule (15th–19th century), and ancient customs survive. The lakes, river valleys, and extensive forests form the basis of a tourist industry.

rhodopsin \rō-'däp-sən\ *or* **visual purple** Light-sensitive, purple-red organic pigment contained in the rod cells of the RETINA that allows the EYE to see in black and white in dim light. It is composed of opsin, a PROTEIN, linked to retinal, a conjugated molecule (see CONJUGATION) formed from VITAMIN A. PHOTONS of light that enter the eye are absorbed by retinal and cause it to change its CONFIGURATION, starting a biochemical chain of events that ends with impulses being sent along the optic nerve to the brain. In bright light, to protect rod cells from overstimulation, rhodopsin breaks down into retinal and opsin, both of which are colourless. In dim light or darkness the process is reversed (dark adaptation), and purple-red rhodopsin is reformed. Similar light-sensitive compounds made of retinal and other opsin proteins are the pigments in the retina's cone cells responsible for colour vision in bright light.

Rhône River River, Switzerland and France. A historic southern gateway, as well as the only major European river flowing directly to the Mediterranean Sea, the Rhône is 505 mi (813 km) long and navigable for about 300 mi (485 km). It is Alpine in character, and its course has been shaped by neighbouring mountain systems. Rising in the Swiss ALPS, it flows into Lake GENEVA, then crosses into France through the JURA Mountains. It continues south through LYON, AVIGNON, and Tarascon to ARLES and enters the Mediterranean west of MARSEILLE.

rhubarb Any of several species of the genus *Rheum* (family Polygonaceae), especially *R. rhaponticum* (or *R. rhabarbarum*), a hardy perennial grown for its large, succulent, edible leafstalks. Rhubarb is best adapted to the cooler parts of the temperate zones. The fleshy, tart, and highly acid leafstalks are used in pies, compotes and preserves, and sometimes as the base of a wine or an aperitif. The roots withstand cold well. The huge leaves that unfold in early spring are toxic to cattle and humans; later in the season a large central flower stalk may bear numerous small, greenish-white flowers and angular, winged fruits. Rhubarb root has long been considered to have cathartic and purgative properties.

Rhubarb (*Rheum rhaponticum*)
DEREK FELL

rhyme Type of echoing produced by the close placement of two or more words with similarly sounding final syllables. Rhyme is used in poetry (and occasionally in prose) to produce sounds that appeal to the ear and to unify and establish a poem's stanzaic form. End rhyme (i.e., rhyme used at the end of a line to echo the end of another line) is most common, but internal rhyme (occurring before the end of a line) is frequently used as an embellishment. Types of "true rhyme" include masculine rhyme, in which the two words end with the same vowel-consonant combination (stand/land); feminine rhyme (or double rhyme), in which two syllables rhyme (profession/discretion); and trisyllabic rhyme, in which three syllables rhyme (patinate/latinate).

rhyolite \'rī-ə-ˌlīt\ IGNEOUS ROCK that is the volcanic equivalent of GRANITE, whose chemical composition is similar. Rhyolites are known from all parts of the Earth and from all geologic ages; they are found mostly on the continents or their immediate margins, but small quantities have been described from remote islands.

Rhys \'rēs**, Jean** *orig.* **Ella Gwendolen Rees William** (b. Aug. 24, 1890, Roseau, Dominica, Windward Islands, West Indies—d. May 14, 1979, Exeter, Devon, Eng.) Dominican-born British novelist. Rhys left the West Indies for London to study acting at age 16. She later moved to Paris, where she was encouraged to write by FORD MADOX FORD. She earned acclaim for short stories and novels set in the bohemian world of Europe in the 1920s and '30s, including *Good Morning, Midnight* (1939). After settling in Cornwall, she published nothing for nearly three decades before producing *Wide Sargasso Sea* (1966), a memorable novel about Mr. Rochester's mad first wife in Charlotte Brontë's *Jane Eyre* (see BRONTË SISTERS); and two story collections.

rhythm and blues (R&B) Any of several closely related musical styles developed by African American artists. The various styles were based on a mingling of European influences with JAZZ rhythms and tonal inflections, particularly syncopation and the flatted blues chords. They grew out of the BLUES of the rural South, which blended work chants with songs of deep emotion, and were greatly influenced by GOSPEL MUSIC. Three major forms were distinguishable. The earliest, called *race*, was the style of the "jump" band, which emphasized strong rhythm, solo work (especially by saxophones), and vocals in a shout-blues manner. A second form, often called *Chicago blues*, was exemplified by performers such as MUDDY WATERS and was typically played by a small group with amplified instruments. The third major form was primarily vocal, featuring close, gospel-influenced harmonies often backed by an orchestra. In the mid-1950s the term *rhythm and blues* was adopted by the music industry for music intended for the African American audience; with the gradual disappearance of racial barriers, the Chicago blues style began to seem less a vital form than a folk tradition, while the gospel style was transformed into the SOUL MUSIC of vast appeal. Rhythm and blues was the chief antecedent of ROCK MUSIC.

rhythm and metre Two aspects of the organization of time in music. Rhythm is the placement of musical sounds in time. Metre, like poetical METRE, is usually a regular pattern of beats and provides the context in which rhythm is understood. In Western notated music, metre is indicated by means of a time signature—in which the lower number specifies the basic unit or subunit of the beat (e.g., 8 usually indicates that eighth-notes are the basic subunit) and the upper number specifies the number of beats in a measure—at the beginning of a piece or movement, and by the vertical bar lines that divide the piece into measures.

rhythmic sportive gymnastics Athletic competition related to GYMNASTICS and dance in which participants, individually or in groups, perform exercise routines with the aid of hand apparatuses such as ropes, hoops, balls, clubs, and ribbons. In scoring points, artistry counts more than acrobatics. The sport dates from the 18th century. Though some gymnasts participated at the Olympic Games from 1948 to 1956, not until 1984 did it become an official Olympic competitive event.

Ribalta \rē-'bäl-tä**, Francisco** (b. 1565, Castellón de la Plana, Spain—d. Jan. 12, 1628, Valencia) Spanish painter. His early works are MANNERIST. After settling in Valencia in 1598, he developed a darker and more naturalistic style (e.g., his *Santiago* altarpiece, 1603) under the influence of CARAVAGGIO. After 1612 he achieved originality and grandeur in such paintings as *Christ Embracing St. Bernard.* His later paintings, marked by powerfully modeled forms, simplicity of composition, and naturalistic lighting, anticipate the work of DIEGO VELÁZQUEZ, FRANCISCO ZURBARÁN, and JOSÉ DE RIBERA.

Ribāṭ See RABAT

Ribaut \rē-'bō**, Jean** (b. c. 1520, Dieppe, France—d. Oct. 12, 1565, Florida) French naval officer and colonizer. He served in the French navy under Gaspard II de COLIGNY, who in 1562 sent him to found a French Huguenot colony in Florida. He landed at the mouth of the St. Johns River (Florida), then sailed north to establish Charlesfort (now in South Carolina). He returned to France, then was sent back to Florida (1565) to reinforce the French colony of Fort Caroline on the St. Johns River. Spanish claims to the region led to the attack and destruction of the colony by PEDRO MENÉNDEZ DE AVILÉS, who massacred the French, including Ribaut.

Ribbentrop \'ri-bən-ˌträp**, Joachim von** (b. April 30, 1893, Wesel, Ger.—d. Oct. 16, 1946, Nürnberg) German diplomat and foreign minister under the Nazi regime. After serving in World War I, he became a wine merchant. He met ADOLF HITLER in 1932 and became his chief adviser on foreign affairs. He negotiated the ANGLO-GERMAN NAVAL AGREEMENT and served as ambassador to Britain (1936–38), advising Hitler that Britain could not aid Poland effectively. As foreign minister (1938–45), he negotiated the Pact of Steel with Italy, the GERMAN-SOVIET NONAGGRESSION PACT, and the Tripartite Pact with Japan and Italy. His influence waned in World War II, after which he was found guilty at the NÜRNBERG TRIALS and hanged.

Ribble, River River, northwestern England. It is 75 mi (120 km) long. It rises in North Yorkshire and flows south and west through Lancashire into the Irish Sea through an estuary extending from PRESTON. The channel to the Irish Sea coast has been straightened to provide a shipping lane to Preston.

Ribera \rē-'ber-ə**, José de** *or* **Jusepe de Ribera** (baptized Feb. 17, 1591, Játiva, Spain—d. Sept. 2, 1652, Naples) Spanish painter and

© 2006 Encyclopædia Britannica, Inc.

printmaker. Though born in Spain, where he is said to have trained under Francisco Ribalta, he spent most of his life in Naples (then a Spanish possession). Most of his works are of religious subjects. Dramatic light and shadow and sometimes horrific detail emphasize the mental and physical suffering of penitent or martyred saints, as in *The Martyrdom of St. Bartholomew* (c. 1630). In later works his modeling is softer, his colours are richer, and he demonstrates strong human sympathy, as in *The Clubfooted Boy* (1642). His etchings are among the finest produced in Italy and Spain in the Baroque period.

riboflavin \ˌrī-bə-ˈflā-vən\ *or* **vitamin B_2** Yellow, water-soluble organic compound, abundant in whey and egg white. It has a complex structure incorporating three rings. Green plants and most microorganisms can synthesize it; animals need to acquire it in their diet. It exists in combined forms as coenzymes and functions in the metabolism of carbohydrates and amino acids. A syndrome resembling pellagra is thought to result from riboflavin deficiency. See also flavin.

ribose \ˈrī-ˌbōs\ Five-carbon sugar found in RNA. (In DNA the corresponding sugar is the closely related deoxyribose.) A ribose molecule combined with adenine, guanine, cytosine, or uracil forms a nucleoside; adding a phosphate group forms a nucleotide. The ribose of one nucleotide joins with the phosphate of the next to form the RNA backbone. Ribose phosphates are components of various coenzymes and are used by microorganisms in synthesizing histidine.

ribosome \ˈrī-bə-ˌsōm\ Tiny particle, the site of protein synthesis, that is present in large numbers in living cells. They occur both as free particles within cells and, in eukaryotes, as particles attached to the membranes of the endoplasmic reticulum. They are 40% protein and 60% RNA. Ribosomes account for a large proportion of the total RNA of a cell. Proteins newly formed on ribosomes detach and migrate to other parts of the cell to be used.

Ricardo, David (b. April 18/19, 1772, London, Eng.—d. Sept. 11, 1823, Gatcombe Park, Gloucestershire) British economist. The son of a Dutch Jew, he followed his father into the London stock exchange, where he made a fortune before turning to the study of political economy, in which he was influenced by the writings of Adam Smith. His writings in support of a metal currency standard were influential. In his major work, *The Principles of Political Economy and Taxation* (1817), he examined the movement of wages and the determination of value, asserting that the domestic values of commodities were largely determined by the labour required for their production. His *Iron Law of Wages* stated that attempts to improve the real income of workers were futile and that wages tended to stabilize at subsistence level. Though many of his ideas are obsolete, he was a major figure in the development of classical economics and is credited as the first person to systematize economics.
